From these considerations, Dr. Darwin infers, that such plants as are sheltered in a warm room, during the winter, ought to be occasionally exposed to a cooler atmosphere, in order to increase their irritability; otherwise their growth in the succeeding spring will be much retarded. For the same reason, the continual vicissitudes of the air and weather are essentially necessary to mankind; as the frequent changes of heat and cold have an obvious tendency to preserve or restore their irritability, and consequently the activity of the system. Hence not only the health and energy of men are more conspicuous in our variable climate, but their longevity is comparatively greater than on those tropical continents, which experience both a more considerable degree of heat, and a more steady atmosphere.

ISERLOHN, or **LOHN**, a town of Westphalia, with considerable manufactures in iron and tin, and of ribbands, velvets, silks, and stuffs. It is 32 miles N.E. of Cologne. Long. 7. 19. E. Lat. 51. 2. N.

ISMANING, a town of Bavaria, which gives name to a county, now united by purchase to the bishopric of Freisingen. It is situate on the Isar, eight miles N.N.E. of Munich, and 9 S.S.W. of Freisingen.

ISMID, or **IS-NIKMID**, a town of Turkey in Asia, supposed to have been the ancient Nicomedia, the capital of Bithynia. It is situate on a gulf or bay of the sea of Marmora, 45 miles E.S.E. of Constantinople. Long. 29. 47. E. Lat. 40. 37. N.

ISMID, a town of Turkey in Asia, in Caramania, 24 miles E.S.E. of Cogni.

ISPERLICK, a town of Turkey, in Europe, in Servia, 24 miles N.N.E. of Nissa. Long. 22. 40. E. Lat. 43. 32. N.

ISSELBURG, a town of Westphalia, in the duchy of Cleves, 14 miles E.N.E. of Cleves.

ISSELSTEIN, a town of the United Provinces in Utrecht, capital of a small territory, which formerly belonged to William III. king of England. It is situate on the Idel, 5 miles S. of Utrecht, and 21 S. of Amsterdam.

ISSIGEAC, a town of France, in the department of Puy de Dome, situate on the Couze, near the Allier, 15 miles S.S.W. of Clermont.

IS-SUR-TILLE, a town of France, in the department of Cote d'Or. In its vicinity are quarries of a white stone, which is not affected by the frost. It is seated on the Ignon, near the Tille, 12 miles N. of Dijon.

ITCHEN, or **ALKE**, a river in Hants, which rises near Alresford, in the centre of the county, and watering Winchester, enters the bay of Southampton, at the town of that name.

JUAN DE FUCA STRAITS OF, a large bay or gulf of the N. Pacific Ocean, on the W. coast of N. America. The entrance is in Long. 124. 55. W. Lat. 48. 25. N.

IVANITZ, a town of Croatia, on the river Lonja, 42 miles N.E. of Carlstadt. Long. 16. 14. E. Lat. 46. 5. N.

JUBO, a kingdom of Africa, on the coast of Ajan, with a capital of the same name, subject to the Portuguese. Long. 43. 20. E. Lat. 0. 50. N.

IVINGHO, a town in Buckinghamshire, with a market on Friday, 6 miles S.W. of Dunstable, and 32 N.W. of London. Long. 0. 35. W. Lat. 51. 54. N.

JULFAR, a town of Arabia, in the province of Oman, situate on a bay of the Persian Gulf, 100 miles N.W. of Oman. Long. 56. 14. E. Lat. 25. 55. N.

JUMELLA, a town of Spain, in the province of Murcia, 22 miles S.W. of Murcia.

JUNAGUR, a town of Hindoostan Proper, in the country of Guzerat, 170 miles S.W. of Amedabad. Long. 69. 58. E. Lat. 21. 45. N.

JUNGNAU, a town of Suabia, capital of a lordship of the same name, belonging to the princes of Furstenberg. It is 40 miles S. of Stuttgart. Long. 9. 12. E. Lat. 46. 40. N.

JUNKSEILAN, a fertile island in the India Ocean, near the S.W. coast of Siam, 63 miles long, and from 10 to 20 broad. The principal town, of the same name, is situate on the N. part of the island, and has a harbour capable of receiving vessels of a moderate size. Long. 98. 30. E. Lat. 8. 40. N.

JUSSEY, a town of France, in the department of Upper Saone, situate on the Amance, 15 miles N.W. of Vesoul, and 22 E. of Langres. Long. 5. 48. E. Lat. 47. 49. N.

JUSTINGEN, a town of Suabia, the capital of a lordship purchased in 1751, by the Duke of Wirtemberg. It gives a feat and voice in the diets of the empire. It is 32 miles S.E. of Stuttgart.

JUTERBOCK, a town of Upper Saxony, situate on the Angerbach, 18 miles N.E. of Wittenberg, and 24 S. of Potsdam. Long. 12. 52. E. Lat. 52. 1. N.

K.

K AFFUNGEN, a town and monastery of Germany, in Hesse, near Cassel. Long. 9. 30. E. Lat. 51. 15. N.

KAIRVAN, a city of Tunis, capital of a government of the same name. It is the second city in the kingdom for trade and population; is celebrated for the most magnificent mosque in Barbary; and is 20 miles W. of Sufa. Long 10. 25. E. Lat. 35. 40. N.

KAISARICH, or **KAISARIJAH**, a town of Turkey in Asia, in Caramania, the capital of a sangiacat. It was the ancient Cæsarea of Cappadocia. It is situate at the foot of a mountain always covered with snow; and is five miles in circumference, surrounded with walls, and defended by a castle. It is populous, and divided into 180 quarters, in each of which there is a mosque or chapel. The principal trade is in Morocco leather. It is 150 miles NE. of Cogni, and 250 E.S.E. of Constantinople.

KALAAH, a town of Persia, in Chilan, with a considerable manufacture of silk. Long. 58. 45. E. Lat. 36. 23. N.

KALIMBURG, a town of Denmark, in the isle of Zealand, the capital of a considerable bailiwick. Long. 11. 11. E. Lat. 55. 47. N.

KALRI, a town of Suabia, in the duchy of Wirtemberg, with a castle. Long. 9. 45. E. Lat. 48. 38. N.

KA-KAS, a tribe of the Mogul Tartars, in Chinese Tartary. They inhabit the country N. of the Mogul Tartars, properly so called, which stretches as far as the kingdom of the Eleuthes; and is near 300 leagues in extent from E. to W. They live in tents, on the banks of their numerous rivers. They adore a lama of the second order, who is held in such veneration that bonzes from China, Hindoostan, Pegu, &c. come to pay their devotions at his residence in then Pira.

KALMUNZ, a town of Bavaria, in the principality of Neuburg, situate at the confluence of the Vitz and Nab, 12 miles N.N.W. of Ratibon.

KALTENBRUNN, a town of Westphalia, in the principality of Sulzbach, 12 miles N.E. of Sulzbach.

KAMNITZ, a town of Bohemia, in the circle of Leitimetz, with a manufacture of stockings, which forms its principal trade. It is 21 miles N.N.E. of Leitimetz, and 30 S.E. of Dresden.

KANDEGHERE, a town of the peninsula of Hindoostan, in the Carnatic. In 1599 it was the capital of a kingdom, called Nartings, the residence of a Hindoo king, whose dominions extended over Tanjore and Madura; and in 1640, a descendant of that prince, who reigned here, permitted the English to form a settlement at Madras. It is 70 miles N.W. of Madras. Long. 79. 24. E. Lat. 13. 46. N.

KANG-HY, Emperor of China, and of both the Tartaries. He was son of Chun-Tchi, founder of the present reigning dynasty, called Tai Tsing. He ascended the throne in the year of our Lord 1662, and reigned sixty-one years. His will, which is translated and enriched with notes by Joseph de Grammont, missionary at Pekin, presents many curious facts and observations relative to the history, religion, laws, and manners of China. It runs in these words:

"From the foundation of the empire to the present time, every sovereign has paid religious respect to Heaven, and imitated the examples of his ancestors.

"According to this law, which is the basis of every good government, the principal duty of an emperor is to maintain order, peace, and plenty in his dominions; to watch, without intermission, for the purpose of averting from his subjects every thing which can tend to disturb their tranquillity and ease; to treat foreigners with kindness; to maintain a reciprocal commerce with other nations; and to enjoy with them the riches contained within the four seas*. Happy the prince whose conduct is regulated by this sacred duty.

"For me, I have attained the ninetyeth year of my age, and the sixty-first of my reign; I do not attribute my long life and reign to my feeble virtue, I owe this double blessing solely to the protection of Heaven and Earth †, to the benignity of that Spirit who governs all generations ‡, and to the singular merits of my ancestors §.

* As this small tract contains many things not well known to the majority of readers, it has been thought proper to elucidate it with notes. Chinese geographers represent the earth square, and surrounded on every side with water. The square continent is the empire of China only, which they call the middle kingdom *Tchou Kao*, because they suppose the other kingdoms to be nothing more than small islands dispersed among the four seas, which answer to the four sides of their land. They are now a little more enlightened on this subject, but their maps are unaltered.

† According to the Chinese, the heavens and earth joined together, *Tien-ty*, designate the Ruler of the universe.

‡ The Chinese superstition places genii and spirits every-where; fire, thunder, mountains, rivers, roads, houses, all places, and almost all beings, have their tutelary spirits; the spirit here alluded to is that of the earth.

§ The Chinese of distinguished birth, or dignity, are of opinion, that the *Cbang-ty*, or supreme Lord of heaven, confides to their ancestors the care of their whole family. Following this vain and presumptuous idea, when a Chinese is desirous of obtaining some signal blessing, he addresses his prayer to one of his ancestors; and the greater the merits of the ancestor, the more his descendant thinks himself secure of prosperity.

"I have perused, with attention, the history of the monarchy, from the reign of its founder, Hoang-ty*, to this time; four thousand three hundred and fifty-one years are elapsed. Of the three hundred and one emperors who have filled the throne, during these forty-three centuries, not one has had so long a reign as myself: I did not expect so long a career; when I attained my twentieth year, I did not expect to live till thirty, but never dared to flatter myself that I should reach forty. How distinguished, then, how favoured am I by Heaven, in being permitted to live to the age of ninety!"

"We read in the *Cbu King*†, that long life, riches, and strength of body, joined with peace of mind, love of virtue, and an easy death in an extreme old age, are the principal sources of human happiness. From this it may be inferred, that very few men are perfectly happy, for the last source of happiness is rarely conjoined with all the preceding: I know not, nor can I foresee, when the end of my days will arrive; but, at my present advanced age, I consider myself as having attained the summit of happiness. Lord of a mighty empire, I possess all that is envied by the four seas encircling China; at the head of a family, my sons and grandsons, who amount to fifty in number, give me assurance of long and brilliant posterity: moreover, wars and commotions have utterly ceased throughout my states; from one end of my empire to the other, my subjects, submissive and faithful, enjoy the most profound peace.

"When I reflect on the events of my reign, I see no probability that my tranquillity should be interrupted; and if this day were appointed to be my last, I think my mind would maintain the most perfect composure. Every one knows the cabals, the factions, and intrigues, and the system of plunder which preyed on the state when Heaven chose me as governor. I do not presume to arrogate to myself

the merit of those singular events which have so happily changed the face of affairs, and which fixed me on a tottering throne; but it affords me the purest consolation to see order, peace, plenty, and subordination now generally prevalent throughout the whole of my extensive empire.

"This glorious revolution, I own, cost me immense labour and pains; imitating the emperors of the three first dynasties‡, I keep a vigilant eye on all quarters of the empire. The parties and revolts which arose on all sides, at every moment rent my heart, engaged all my attention, kept me in perpetual uneasiness, and permitted me to take no repose night or day. What oppositions have I not submitted to! What griefs have I not concealed, and what obstacles have I not surmounted!

"When I reflect on the embarrassments and corporeal labours I have endured, I cease to wonder that the emperors of preceding dynasties did not reign longer. No, it was not intemperance and voluptuousness, as some inconsiderate historians, whose pleasure consists in censuring even the most irreproachable sovereigns, have pretended; it is not, I say, intemperance and voluptuousness which have abridged their days; but the immense weight of public affairs, the uninterrupted series of cares and solitudes, the short periods of their domination must be imputed: they have sunk under the weight of empire, like *Tchu-ke Leang*||, who terminated his career of glory exhausted with fatigues and labours. Oh, how few ministers of state endeavour to imitate this great man!

"A minister who assumes the management of affairs, can renounce it when he will; the engagement by which he is attached to his prince, only retains him while his zeal for the service continues; as soon as he is disgusted he dismisses himself from his employ, retires from court, and returns to his family; where, liberated from all cares and inquietudes,

* It is certain that Tou-hy and Chin-noug are looked upon by the Chinese as the first emperors who governed China, but they do not know the era and duration of their reign. Hoang-ty afterwards restored the peace of the empire, established ministers, and regulated the form of government. It is not surprising that he should be considered the founder of the empire.

† The *Cbu King* is one of the six sacred books of the Chinese; it includes the foundation of their ancient history, the principles of government of their first emperors, and their precepts of morality.

‡ To the sources of happiness here enumerated, the *Cbu King* opposes six sources of misery: 1st, a short and vicious life; 2d, poverty; 3d, disease; 4th, grief; 5th, weakness; 6th, cruelty.

§ The three first dynasties, or families, who governed the empire were distinguished by the appellatives of Hia, Chang, and Tcheou.

The first, Hia, founded by Yu the Great, began 2200 years before the Christian era, and in the space of 441 years, produced seventeen emperors.

The second, Chang, acknowledges Tching-tang for its founder; it began 1765 years before the Christian era, and produced twenty-eight emperors, who reigned 644 years.

The third, Tcheou, founded by Vu Vang 1121 years before Christ, reigned 875 years, and gave birth to thirty-five emperors. The reader is not to imagine that all these princes were models worthy to be followed: several in each dynasty were known only by their debauchery, cruelty, injustice, and impiety. The most celebrated in history are Ty-Kie, of the first, and Chen Sin, of the second dynasty, who deserve to be considered as the Neros of China: but Yu the Great, Chao Kang, Tchu, of the first; Ven-Vang, Tching-Tang, Tai-Kia, Vai-Jiu, &c. of the second; and Vu-Vang, Tching-Thang, &c. of the third dynasties, were emperors so distinguished for their wisdom, equity, moderation, love of their people, and zeal for the public good, that all wise emperors make a merit and glory of imitating their actions and virtues.

|| Tchu-Ke Leang rendered himself famous under the two last emperors of the dynasty of Han, about the year of Christ 220. His inviolable fidelity to his sovereigns, his constant application to business, his superior talents for government, raised him to the first dignities of the empire; but that which principally distinguished him in those times of trouble and disorder was his great bravery and ability in the conducting of armies. The greatest generals were afraid even of his shadow. He died in arms in the cause of his sovereign. The fall of the dynasty of Han speedily followed the death of this great man, who was its only support.

he finds consolation in the embraces of his offspring, and after spending an easy, mild, and agreeable life, he sinks quietly into the grave.

"How different the lot of an emperor! When once he has assumed the helm of affairs, whatever difficulties may attend the conduct of them, he is forbid to delegate his trust into other hands; the rest of his life is then only a web of troubles, uneasiness, and labour.

"Those who read the histories of Chün and Yu, will see with admiration that those two emperors * never for an instant abandoned the reins of empire, that they themselves entered into all the affairs of all their subjects, for them alone they lived, and both died exhausted with labour and fatigue, and far distant from their court and their families; the one at Zian-ow, the other at Hoi-Ki-Kien. Let any one consult the Y-King, that sacred book, where good and evil, virtue and vice, are exhibited without disguise, and painted in appropriate colours; he will find no trait of reproach on the imperial character. In fact, to be without a place of rest, to exert, and even exhaust his strength, is the lot of an emperor. But among all those who have govern-

ed the empire prudently, I dare pronounce that no one will be found whose reign has been so replete with troubles as my own.

"Neither jealousy, love of glory, nor ambition, placed my family on the throne of China. In consequence of the misunderstanding which prevailed between the Ming† family and mine, my father justly declared war against him; and the troubles† which then desolated China, rendered it an easy conquest. My father was even advised by his ministers and generals not to let pass so favourable an opportunity of making himself feared and respected by his neighbours; but, considering it contrary to the decrees of Heaven to dispossess a family who had been legally in possession of the throne for near 300 years, he resisted every solicitation, and could never resolve to adopt so violent a measure. Meanwhile the troubles of the empire daily increased. The Y-Tching was master of Pekin; the emperor T'iong-Tching hung himself through despair. All the empire in alarm and consternation then turned their eyes towards my father, and implored his aid against the tyranny of the usurper. Touched with the woes of the nation

* Yao-Chün and Yu have always been considered by the Chinese as the most perfect models for sovereigns; fathers of their people, their only aim was to render them happy and virtuous. Their reign may, with reason, be regarded as the reign of clemency, justice, prudence, and all the social virtues. The emperor Chün ascended the throne 2277 years before the christian era. After a reign of fifty years, he died at Hsün-ou, in the province of Kuang si, aged 110 years.

Before he attained the throne and acquired the love and esteem of his people by those virtues which make great kings, the emperor Yu had already entitled himself to their eternal gratitude by the important services he had rendered the state. The renewal and amelioration of agriculture, the liberty and facility of trade in all the provinces, but especially the draining of the waters with which all the low lands of the empire were overflowed, a work worthy of ancient Rome, were the immortal fruits of the indefatigable application and superior genius of this great prince. He began his reign in the year 2217 before Christ, and, after ten years, terminated his illustrious career at Hoi-Ki-Kien, a city of the third order, dependent on Chus-hü-tu, in the province of Tche Kiang.

† The dynasty of Ming was that which immediately preceded the reigning family, called Tai-T'ing. It was founded by Ming-tait-son, in the year of Christ 1384. It produced sixteen emperors in the space of 276 years. The misunderstanding between the two families originated solely in the haughtiness and contempt manifested by the last emperors of the Ming family, or rather by their eunuchs and mandarins, towards the Tartar princes. These misunderstandings occasioned frequent wars.

‡ China was then in a most critical situation. The Se-Schum, the Hu-Kuang, the Kiang-Si, the Ho-Nan, the Chen-Si, all these fine provinces were a prey to different parties of rebels, every chief of whom pretended to the empire; violence, murder, and plunder, were generally prevalent. Of all the chiefs of parties, Li-T'ie-T'ching was the most powerful and most to be dreaded: while the others by fire and sword destroyed cities and countries, and fought only to enrich themselves by the spoils of the great and of the poor, he, less ferocious and more cunning, still retained some vestiges of humanity; and if he despoiled individuals in high stations, he employed the booty in relieving the miseries of the people. By this artful conduct, he increased his party to such a degree, that his troops were equal to those of the emperor, not only in courage and discipline, but in numbers. Seeing himself at the head of such a fine army, after making himself master of the Ho-Nan and the Chen-Si, he did not hesitate to assume the title of emperor, and advance towards the capital. He knew that place, defended by a garrison of 60,000 men, to be impregnable; but informed of the misunderstanding which prevailed between the eunuchs and the military officers, and of the disposition of a great party which had been formed in his favour by means of his emissaries, he was secure that the gates would be opened to him. In fact, in three days after his arrival, he entered the city at the head of 300,000 men. The emperor T'iong Tching, who had bestowed all his confidence on the eunuchs, was entirely ignorant of all that was passing without. He thought his enemies were still at a great distance, when two eunuchs came to him from Li-T'ie Tching, announcing his arrival, and demanding the crown. By this distressing proposition, T'iong-Tching perceived he was betrayed. He wished to leave his palace without delay, accompanied by his guards, but no one had the courage to follow him. The unhappy prince, thus deserted, and feeling that he was now without resource, put his family affairs in the best order he could, and yielding implicitly to the dictates of his despair, retired into his garden, where he hung himself on the branch of a tree by his girdle. A few hours afterwards, the rebel entered the palace, and caused himself to be again proclaimed emperor.

While this revolution took place in the capital, prince V-Geer was commanding the Chinese troops in the Lea-Tong. Hardly had he learned the state of things, when, resolved to avenge his sovereignty, he immediately made peace with the Tartars, and called in their aid to expel the rebel, and give peace to the empire. Li-T'ie-Tching could not long hold out against the valour of the Chinese and Tartar troops united. After a few battles, in which he constantly had the disadvantage, he at length took to flight, and retired to the Chen-Si, with the wrecks of his army, where, after a time, he fell in a battle with the prince V-San-Quei.

which were already at their greatest height, my father yielded to the wishes of the people. He entered China, exterminated the rebel and all his party, and by the acclamations of the grandees and people was saluted and acknowledged emperor.

"His first care was to display his esteem for the emperor T'iong-T'ching, by decreeing that all due funeral obsequies should be performed, according to the customs of the empire.

"If we ascend further, to the preceding dynasties, we shall perceive that Han-Kao-T'fou*, founder of the dynasty of Han, was only a simple commissary of a district: that Ming-Tai-T'iu, founder of the dynasty of Ming, once served as footman in a monastery of bonzes†: that towards the end of the dynasty of Yuen‡, general T'ching-Yen-Leang, at the head of a considerable army, obtained the imperial dignity, which was soon snatched from him by the founder of the Ming family.

"My race is descended from the kings of Eastern Tartary; they took possession of the empire by virtue of a particular dispensation of Heaven, and the consent of the nation.

"In times of disorder and anarchy, when every department of a state is in confusion, he who by his prudence, his authority, or his superior talents, succeeds in restoring order and peace, always becomes master, and legitimate possessor of the supreme authority: this fact is proved by history. No man by his own single exertions can raise himself to sovereignty, for sceptres and crowns are given by Heaven. He on whom the choice falls has nothing to fear from man; if Heaven defines him to a long and peaceful reign, the united efforts of all mankind cannot impede or abridge its course.

"From my earliest youth I have studied the writing of

the ancients and moderns; and I am not unacquainted with their useful, curious, and instructive sentiments on every subject. In the vigour of my days, I could bend a bow of one hundred and fifty pounds weight, and shoot an arrow of thirteen handfuls long§. The leading of armies and conduct of battles and sieges are arts in which I am perfectly versed.

"Yet, although I am a great man of war, bred in the tumult and din of arms, no man can reproach me with having at any time violated the laws of justice and humanity. I never in my life put an individual to death unjustly: if I ordered the destruction of the three kings||, and the extermination of the family of Mo-pe¶, these sacrifices were required for the interest and welfare of the state.

"As to the imperial treasure, I have always considered it as the blood and sweat of the people; and accordingly I have never used it but for the support of my armies in the time of war, and the subsistence of the poor in times of dearth: I never made a superfluous or useless expenditure of it.

"Let any one enter the different palaces** in which I reside during my progress, he will find nothing rich or curious in the furniture or the ornaments. Ten or twenty thousand taels a year suffice for the expenditure incident to each palace. The repairs of the dykes cost the nation annually upwards of three millions of taels; thus for the maintenance of all my palaces, not a hundredth part of the money is expended which it costs to repair the dykes.

"Have I not reason, then, to feel perfectly at ease respecting the judgement of posterity?

"Formerly Leang-Vu-Ty by his valour obtained the diadem. At the age of fourscore he was dethroned by his vassal Hsu-King, who caused him to be shut up between

* Han-Kao-T'fou, before he attained the empire, was known by the name of Lien Pang. At first, he was a mere adventurer, who, from being a simple commissary of a district, put himself at the head of a troop of abandoned characters. His natural and persuasive eloquence, his moderation, his courage, and skill, by degrees formed for him a considerable faction, by which he was enabled to declare war against his sovereign, and to deprive him of the empire. He ascended the throne 205 years before the christian era. The history of China speaks in high terms of praise of his reign, which lasted twelve years. The dynasty of Han, founded by him, produced, in 426 years, twenty-five emperors.

† Ming-Tai-T'iu, before he was emperor, was known by the name of T'chiu, afterwards Hung-Vu: while he was yet a servant in a monastery of bonzes, he enrolled himself in a numerous troop of outlaws, and soon became their chief. By his valour and intrepidity, he succeeded in wresting the crown from the Mongol race, and in expelling them from the empire.

‡ The dynasty of Yuen, or of Eastern Tartars, known by the name of Mongols, was founded by Chit-Su, in the year after Christ 1280. In the space of 89 years it gave nine emperors. In the reign of the last, named Chun-Sy, a prince entirely taken up with trifles and frivolities, among the rebels who contended for the empire, T'ching-Yeu Leang was the most powerful. He had already caused himself to be proclaimed emperor, but soon afterwards lost his crown and his life in a sea fight with Tehu, or Ming-Tai-T'iu.

§ By a handful must be understood the breadth of four fingers. Thus, an arrow of thirteen handfuls long, is equal to thirteen times the breadth of four fingers. The Tartars, who are all extremely expert at archery, assert that to shoot an arrow of that length from a bow of 150 pounds weight, requires an extraordinary degree of force.

|| These three kings were the kings of Yun-Nan, Kung-Tong, and Fou-Kien. The past conduct of these three monarchs, their power, both in itself and in relation to that of Canton, its good understanding and trade with the Dutch, gave umbrage to the Manchou Tartars, then recently established in China.

** The text is supposed to refer to some West Tartar families.

¶ The emperors never leave the capital, unless it be to go to Cheu-Si-Chantong, Kiang-Nau, Leaotong, or Ge-Ho (a palace of pleasure, seven days' journey from Peking). On all the roads leading to these different places there are imperial palaces, called King-Kung, at the distance of about five or six leagues from each other. These King Kung are in number about 80 or 90. It is very remarkable, that they are all built in places so remote from habitation, that the emperor and his family can alone find accommodation; his suite, amounting often to 50,000 men, are obliged to lodge under tents.

four walls and starved to death*. The emperor Soui-Ven-Ty† also got possession of the crown without resistance, owing to a singular trait of feebleness in Tchong-Tching-Kung; yet he did not perceive that his son Yang-Ty would wrest from him his throne and life.

"These two emperors should, by timely precautions, have guarded against the ambition and the wickedness of these miscreants. An attentive observer speedily discerns plots, however studiously concealed.

"As for me, I know my subjects, and that they are all well affected towards me. Among the princes, the grandees, the ministers, and mandarins; among the soldiers and the lower order of people; even among the Mongol princes; there is not an individual who does not wish me well, and sincerely pray for a prolongation of my life and reigns.

"Old as I am, and approaching the utmost limit of life, I feel, nevertheless, that my mind and my heart are perfectly at rest; I even experience a delicious pleasure when I reflect that the sons and grandsons of the princes Y-Ting-Vang and Jao-Yu-Vang, my uncles, are still in full life and health.

"Oh, all you who compose my family, do not grieve at my return! So you live long in happiness and unanimity, I am content, and die with pleasure.

"Yong-Ting-Vang§, my fourth son, resembles me in many respects. He has all the talents requisite for government: I command him, after my death, to take possession of the empire; let a mourning of seven-and-twenty days, according to the prescribed forms be observed; and let my will be published at court and in the provinces."

KANT (Immanuel), regius professor of logic, metaphysics, and moral philosophy, in the university of Königsberg, in Prussia. This distinguished philosopher was born

on the 22d of April, 1722, of reputable parents, but who were unable to afford him a classical education, at their own expence: he was, therefore, at an early age placed in an excellent public seminary; which is supported partly by voluntary contributions, and partly by the alms or little pecuniary presents given by housekeepers to the boys; who, dressed in blue cloaks, on certain days in the week, chaunt their hymns or other songs of devotion in the public streets, before every respectable house; and are accompanied by one of their ushers. From the eleemosynary money, thus collected by deputations consisting of from twenty to thirty scholars in each, they are clad, fed, and instructed; whence the whole institution is called the *Pauper-house*.

These introductory circumstances will, perhaps, serve to explain several of the peculiarities and eccentricities in the character of this illustrious man; who, by his rigid manners, as well as by his stoical precepts, has alike excited the attention and admiration of his unbiassed contemporaries.—The writer of these lines would not have ventured to engage in such an arduous task, had he not, at an early age, been a pupil of Kant; a companion of his leisure hours; and, though too young to penetrate into the depth of his abstruse researches, an attentive observer of the actions occurring within the sphere of this extraordinary genius. Besides, he has attended several courses of the professor's lectures, between the years 1778 and 1781, when he quitted the *alma mater* of Königsberg, being then in the nineteenth year of his age: during this period he studied, under Kant, logic, metaphysics, the philosophical law of nature, geographical natural history, and maxims of education (*pädagogicum*); each of which branches was taught in a distinct course of lectures.

In tracing the gradual development of a mind that has given the world ample proofs of transcendent abilities,

* Leang-Vu-Ty, before he was emperor, was known by the name of Siao-Yuen. His virtues, political and military, had raised him to the dignity of prime-minister. Cloaking his ambition under various pretences, he succeeded in depriving two of his sovereigns of their life and crown. Having attained the throne, he governed with extreme judgment, application, and activity. At length, being infatuated with the reveries of the bonzes, he retired to a monastery, and almost entirely abandoned the reins of government. Murmurs were raised on every side. Heu-King, prince of Ho-Nan, immediately came at the head of an army, and took possession of the imperial city of Nan-King. The emperor was brought into his presence; struck with his venerable age, and firm, tranquil countenance, the rebel durst not take his life on the spot, but condemned him to be starved in prison. In spite of the endeavours and ambitious projects of Heu-King, the crown descended to a son of Leang-Vu-Ty: the dynasty of Leang, founded by him in the year of our Lord 502, reigned 54 years, and gave four emperors.

† Soui-Ven-Ty, before he was emperor, was a powerful prince in the north, known by the name of Yang-Kien. Being informed that the emperor Tchong-Tching-Kung, of the dynasty of Schin, had rendered himself odious to his subjects by his infamous and criminal debaucheries, he put himself at the head of a numerous army, and traversed the southern part of China, and, without resistance, entered the imperial city of Nan-King. On his arrival, the cowardly and voluptuous Tchong-Tching-Kung disappeared; and, for fear of falling into the hands of the enemy, went and threw himself into a well. Yang-Kien remained in peaceable possession of the empire. In the fifteenth year of his reign, he resolved to name a successor, and fixed upon his eldest son, a prince without any abilities. Yang-Ty, his second son, enraged at this preference, and inflamed with a lust of dominion, opened his way to the throne by the death of his father and brother. Sui-Ven-Ty founded, A.D. 590, the dynasty of Sui, which, in 28 years, had three emperors.

‡ In the language of the Tartars, to die, and to return, are synonymous. Thus, to express that a man is dead, they say, *petere he*, he is returned.

§ Yong-Ting-Vang, when he ascended the throne, took the name of Yong-Tching—he did not falsify the advantageous opinion entertained of him by Kang-Hy. During his government, he constantly displayed great vigilance, application, and firmness. The only spot on his annals is his inhumanity towards four of his brothers, some princes of the blood, and an entire family of christian princes. The Chinese historians will not impute as a crime his having driven from the empire all the missionaries who had been admitted by his father; but the Christians of Europe will not be equally indulgent. After a reign of 13 years, this prince left the throne to his son, by whom it is filled at this day.

|| This mourning of twenty-seven days is kept by the princes in the interior of the palace. The public mourning lasts 200 days.

many difficulties present themselves to the biographer, who is not less actuated by truth than personal regard towards a man, from whose oral and written instructions he has derived the first lessons of prudence and wisdom. Although the data in the life of Kant are but few, from which the discerning reader might discover the links of a great and almost boundless chain, yet there will be found some characteristics, marking the peculiar propensities of the juvenile philosopher.—When Kant commenced his literary career, both at the school before mentioned, and at the university of Königsberg (namely, between the years 1734 and 1744, and for some time after that period), it was customary to invite the fathers of the College of Jesuits to all public disputations, which were then held in the university every *semestre*, or half-yearly, in what is termed the *Auditorium Maximum*. In these polemical discussions, wit and sophistry rivalled each other: and he who could most pertinaciously adhere to the *forms* of his syllogisms, however sophistical the arguments, generally carried away the palm from the disputants. The students of the university, as well as those of the different schools advanced in learning, together with the most respectable inhabitants of the city, had free access to these literary tournaments. Our Kant, being naturally of an inquisitive disposition, and possessing acute powers of perception, devoted himself to the study of mathematics, in combination with natural and experimental philosophy. Animated by the high reputation which his countrymen Leibnitz, Wolf, Bernoulli, and others, had acquired both at home and abroad, after having repeatedly tried his powers of reasoning on abstruse subjects of divinity, which afforded him little satisfaction, he soon relinquished the idea of qualifying himself to perform the duties and ceremonies of that sacred profession, and turned his attention exclusively to the investigation of the different theories and proofs advanced by other philosophers “on the living or moving powers of bodies.” His first treatise on this subject appeared at Königsberg in 1745, 8vo. pp. 220, in the German language, with two plates. In this juvenile production, which is modestly entitled *Reflections*, he successfully combats the hypotheses of Leibnitz and Descartes; the former of whom had introduced the simple proposition, “that the mere velocity of bodies, even such as are in actual motion, serves as a rule for ascertaining their power;” and the latter had erroneously adopted the *square of velocities* in such computation. At this time, Kant was in the twenty-second year of his age, and supported himself at the university, chiefly by repeating the philosophical lectures of different professors, whom he also attended, to the more wealthy and less able students. Thus, he obtained considerable celebrity, both as a private tutor and as a very promising mathematician and naturalist, who was not born implicitly to adopt the erroneous notions of his predecessors. This feature of his character is sufficiently evident from the following motto, which he borrowed from Seneca, and prefixed to his first essay; *Nihil magis prestantum est, quam ne pecorum ritu sequamur antecessitum gregem, pergentes, non qua eundum est, sed qua iur.*

Although Kant did not, for many years, derive great emolument from either his writings or his instructions, yet his frugality, which nearly bordered on parsimony, enabled him to live at his native college with credit and respect, without any public salary or appointment. During this interval, he closely pursued his favourite study, the philosophy of natural history, and occasionally indulged in metaphysical speculations. His leisure hours were employed in the acquisition of modern languages, especially the French and English, which latter he acquired without a

teacher, principally with a view to examine the merits of Locke, Berkeley, Reid, Hume and Beattie; whose different philosophical works were deservingly, and still are highly, esteemed on the Continent. After investigating the principles of these excellent writers, and finding himself disappointed in his researches after a consistent analysis of the powers and faculties of the human mind, or what is commonly termed a system of metaphysics, he suspended his enquiries on this important subject for a series of years; delivered semestrial, or half-yearly, courses of lectures on pure and practical mathematics; and amused himself with the more pleasing contemplation of the planetary bodies and their revolutions. Thus, after an interval of nine years, he published his General History of Nature, or Theory of the Celestial Bodies, founded on Newtonian Principles; dedicated to the late Frederic the Great of Prussia: of which a new and improved edition (by the author) lately appeared in Germany.—In the same year, 1755, he completed the following Latin treatises; in which he gave the first specimens of his philosophical and critical talents: *Principiorum metaphysicorum nova elucidatio*; and *Dissertatio de principis primis cognitionis humane*; both 4to. Regiomonti. These were succeeded by his *Monadologia physica*; 4to. 1756.—Soon after their appearance, Kant presented the world with an ingenious and elaborate History of the most remarkable Events produced by the Earthquake which convulsed an extensive Part of the Globe, towards the Close of the Year 1755; 4to. Königsberg, 1756.—Next, in the order of time, are his New Theory of Motion and Rest, illustrated with Experiments on this Subject in Natural Philosophy, 8vo. 1758:—Reflections upon Opticism, 4to. 1759:—An Outline of a Course of Lectures on Physical Geography; with an Attempt to solve the Problem, Whether Westerly Winds are, for this Reason, accompanied with Moisture in Prussia; because they blow over an extensive Sea, 4to. Königsberg, 1759:—Demonstration of the Sophistical Subtlety contained in the four Syllogistic Figures, 8vo. 1762:—An Attempt towards introducing the Proposition of Negative Magnitudes into Philosophy, 8vo. 1763:—Enquiries into the Periplicity of the Principles relative to Natural Religion and Morals; or, an Essay on the Evidence required in Metaphysical Sciences; being an Answer to the Prize Question proposed by the Royal Academy of Sciences at Berlin, for the Year 1763:—On the only possible Method of proving the Existence of the Deity, 8vo. Königsberg, 1763:—Observations on the Effect of the Beautiful and the Sublime, 8vo. Königsberg, 1764:—Dreams of a Ghost-seer (Fœnic), illustrated by Dreams in Metaphysics, 8vo. 1766:—Remarks serving to explain the Theory of Winds, 4to. 1765.—These eleven treatises, last mentioned, are printed in the German language.

After a period of five years, Kant produced the outline of what is now called the *Critical System*; the principles of which are contained in the following work: *De mundi sensibilis atque intelligibilis forma et principiis*, 4to. Regiomonti, 1770.—The memorable occasion on which this abstruse enquiry was written, deserves to be stated. By the statutes of the university of Königsberg, every new professor, when raised to the academical chair, is obliged to publish and defend an inaugural dissertation, before he is admitted to exercise his public functions, or to become a member of the senate. It is further worthy of remark, that the new theory herein developed, though ingeniously opposed by three of the most expert disputants of the university, was ably defended by Marcus Herz, a gentleman of the Jewish nation, who then studied medicine and philosophy at Königsberg, and has since given many strong

proofs of his proficiency by several publications, which, by the Germans, are considered as *classical*: he is at present one of the first physicians at Berlin, aulic councillor, and a member of the Supreme College of Health.

In consequence of this elaborate and profound elementary work, the name of Kant refounded in the universities of Germany, especially those of the protestant persuasion; and the strenuous advocates or followers of Aristotle, Descartes, Leibnitz, Wolf, Baumgarten, and other authors, began to feel the instability of their systems, and to apprehend a general reform in philosophy. At the same time a general alarm spread through the German schools; where dogmatism on the one hand, and scepticism on the other, had long prevailed, to the great detriment and disgrace of learning. Kant, from this period, pursued his critical labours with redoubled vigour; entered into a philosophical correspondence with several of the first literary characters of the age, particularly with Lambert, then president of the Royal Academy of Sciences at Berlin; and whose endeavours not only tended to accomplish the same great object, but who had, in his Cosmological Letters, proposed theories which perfectly coincided with those of Kant, previously published in his General History of Nature.—We have the letters interchanged by these two great men before us, forming part of the second volume of Immanuel Kant's Miscellaneous Works, edited by Prof. Tieftrunk, of Halle, in three large volumes, 8vo. 1799, third edition. It clearly appears from their mutual communications, that both were led to pursue the same path of philosophising; with this difference only, that Lambert considered *time* and *space*, or rather the phenomena which take place in time and space, as *real* objects of perception; whereas Kant maintains, that they are merely *two essential forms of the mind*. Thus, *time* is the necessary condition of all intuitive perceptions, and the idea we have of it serves to ascertain the impressions received by the *internal* senses; such as the imagination, memory, reflection, &c. On the contrary, *space* is the characteristic of all external perceptions, being determined by the medium of the external senses, and chiefly by those of touch, vision, and hearing. No thinking person will deny the truth and accuracy of this distinction; for the necessity and importance of such division cannot be questioned, unless by those who are decided enemies to all innovation, or blind adherents to Aristotle and the school-men.

Although the Latin treatise, last mentioned, contained the elements of a comprehensive system, yet, as many new and abstruse propositions were not illustrated by examples, the whole theory remained for about *eleven* years in a manner confined to the university of Königsberg; where it was publicly taught and exemplified by Kant, in his logical and metaphysical courses. During this period the author employed himself almost exclusively in the elucidation of the *Critical System*; and we meet with no other publication between the years 1770 and 1781, than a short essay, On the different Races of Man, in 1775.—When the philosophers of Germany had nearly forgotten the bold attempt made by Kant, in his Inaugural Dissertation, he unexpectedly roused them from their dogmatical slumber. The Critique of Pure Reason at length appeared in 1781; a work which promised a total and beneficial reform in every philosophical department. For a long time, however, after its publication, it had been unaccountably neglected, or, at least, misunderstood. This was surely not in consequence of the difficulties with which the study of it, as well as of every metaphysical subject, is necessarily attended; but of a certain indifference to philosophy, and of a confirmed taste for shallow and popu-

lar discussions, which Kant directly opposed. But, as soon as the work was more studied and investigated, and had found several successful commentators, a revolution in philosophy immediately commenced. It soon met with numerous admirers and friends; and even its opponents could not withhold their admiration from this masterly production. They saw themselves every-where driven from their strong holds, and obliged to erect new fortifications for the defence of those philosophical tenets, which they wished to maintain. Nay, many of the enemies of this system became its friends; and the invaluable part of it, which treats of morals, met with an almost universal approbation. All the different branches of philosophy were examined with greater ardour; and new sources of knowledge, which formerly had scarcely been conceived, were now exposed to view. The limits of this science were more accurately defined, and the laudable researches after stable and simple principles, and after a rigid method, gave to philosophical enquiries a certainty, and an interest, of which they had hitherto been destitute. Long before this period, doubts had arisen in reflecting minds, concerning the systems of Leibnitz, Wolf, and Locke; but these had never been unfolded with sufficient clearness, nor had a better theory been substituted for that which was to be relinquished. Here all systems were examined with a critical acumen, and a solid foundation was laid for a new one. This new philosophy in a short time found friends and adherents, even among ranks of people who had not devoted themselves to science, or least of all, to metaphysics. It excited in Germany a sound philosophic spirit of enquiry, of which the present age was scarcely deemed capable. It contains such an immense store of new ideas and views, that, hitherto, only a small part of these materials can be considered as digested; and even, in a distant age, new branches of knowledge may shoot forth from it.

The work itself is arranged with a systematic spirit, and written with a noble philosophic impartiality. The style is somewhat obscure; the construction and arrangement of the periods, in many places, are ungraceful, heavy, and overloaded; but a reader who has a tolerable understanding, and an interest for truth, is sufficiently recompensed by the originality of thought, and by the new and striking images with which it abounds. The celebrated author discovers all the talents requisite to a reformer of philosophy, especially in our age;—not merely an admirable acuteness, and a rare talent of making *himself* the object of his reflection, but also a knowledge in mathematics and natural philosophy, of which he had formerly given proofs; a nice sensibility of the beautiful and sublime; and, in general, a cultivated manly taste; a thorough acquaintance with the different systems of philosophy that prevailed before his time; and a refinement of feeling which is truly honourable.

Such is the character given of this profound work, by one of the first German critics, the Rev. Dr. Stäudlin, professor of divinity at Göttingen, in his classical work entitled, *On the Spirit and History of Scepticism*, in two vols, 8vo. 1794. And, in order to convince the northern compilers of the *Encyclopædia Britannica*, that in their supplement they have inserted an erroneous and illiberal account of the Critical Philosophy, we shall previously observe, that the Kantian system ought to be examined on the strength or stability of those principles on which it is founded; that it is unjust and absurd to compare its individual parts with those of other philosophical theories; and that such contracted minds as are incapable of reasoning in the abstract, of distinguishing the perceptions of sense from

Intuitive operations of reason, or of conceiving the wide difference between experimental knowledge, and that derived from operations of the understanding, or of the judging faculty—such persons are not qualified either to understand or to criticise metaphysical propositions. Hence, we may easily account for the numerous and dissonant opinions which have, during the last twenty years, appeared in Germany, and other countries, respecting the merits or demerits of the Critical System. We admit that the philosophy of Kant, in all its details, requires a long and painful study; that his language is sometimes obscure, his phraseology is often inverted, and his reasonings are subtle; but we deny, that such study is unproductive of real advantage: on the contrary, we are firmly persuaded, that enquiries into the source and limits of human knowledge, are highly beneficial to the dearest interests of mankind; but, at the same time, we allow that such speculative disquisitions are not adapted to the imbecility either of youth, or of old age. What appears to one person “a wonderful jargon,” may, nevertheless, be perfectly intelligible to another, who commiserates the self-sufficiency of the Scottish editor when he, in the plural number, requests the reader “to reflect that it is not ours.” On this occasion, we shall quote Baumgarten; who, speaking of Aristotle and other acroasmatic writers, expresses himself in the following appropriate words: “Et revera habent hoc inter alia commodi, quod

Ignavum, fucos pecus, a præsepiis arcent, profanumque vulgus vel tacentes doceant, esse non nihil in scientiis, quod non quisvis a furno redux, vel lacu noverit, quamprimum ipsi libuerit, Philosophum agere.”

It would be superfluous, in this place, to enter into the motives which induced the Scotch compilers of their *Encyclopædia* (SUPP.), to give an unjust and unfavourable account of Kant's system; but we have good reason to think that, by their own confession, they were the most incompetent judges of the subject; as they neither understood the German language, nor the outline which Mr. Nitch published in the year 1796, entitled *A general and introductory View of Professor Kant's Principles concerning Man, the World, and the Deity*, submitted to the Consideration of the Learned.—There also appeared another View, by Dr. Willich, under the title of *Elements of Critical Philosophy*, containing a concise Account of its Origin and Tendency; a View of all the Works published by its Founder, Professor Immanuel Kant; and a Glossary for the Explanation of Terms and Phrases, 8vo. 1793.—From these two publications, we conceive an *unprejudiced* reader might derive a tolerably correct idea of the Critical System, provided he be not an utter stranger to metaphysical reasoning: in the former he will find a distinct analysis of the first principles, on which the new philosophy is founded; and to the latter is prefixed a concise history of its origin, together with an account of the most celebrated theories which prevailed in Germany, previously to the publication of Kant's *Critique of Pure Reason*. It cannot, however, be denied, that the title of this work, as well as the nomenclature which its author has adopted, is unintelligible to those who pertinaciously scoff at every new term, or mode of explanation, different from that which they have been taught to employ by their schoolmaster. Thus, the northern editor (who pretends to have received his account of the Critical Philosophy from an illustrious Frenchman, but we believe from the notorious alarmist Barruel) does not appear to understand Kant's division of human knowledge into *two* distinct sources, namely, that *à priori*, which is purely intellectual, being neither derived from, nor confirmed by, experience; and that *à posteriori*, for which we are indebted to our senses, or, in

other words, to external perceptions. Now, it is not very difficult to conceive that, by the constitution of the human mind, we possess a certain faculty of comparing, combining, and reflecting on subjects which lie far beyond the circle of experience: such, for instance, are the ideas of a Supreme Intelligence and its divine attributes; of immortality; of conscious rectitude in our actions; of the principles of equity and justice, both as to ourselves and others: nay, it includes all those subjective operations of the mind, which are performed in an uniform manner by all mankind, and to which the fanatic or lunatic only forms an exception. In illustration of this fact, we appeal to every reader of common sense, whether he requires any previous experience to decide, that *safety* is in general preferable to *danger*; that *reward* is always more desirable than *punishment*; and that *patient search* after truth is a more praise-worthy quality in intellectual beings, than either premature deduction, obstinate adherence to exploded doctrines, or that self-sufficient mode of reasoning, which is peculiar to the contracted mind of the pedant, or the illiberal enthusiast. Hence Kant's distinction between experimental and pure intellectual knowledge widely differs from the obscure notions of Aristotle; who indeed speaks of *general forms*, or *formal causes*, in the mind, but he does not consider them distinctly with a view to ascertain the true source of human knowledge. It is, however, not an easy matter to persuade those who are seized with a mixture of political and religious frenzy, and to convince them that abstract reasoning in metaphysics should never be extended to, or confounded with, the established tenets of church and state: such infuriated persons, in all ages and countries, flee through magnifying glasses; which shew sedition, atheism, and anarchy, where none of these consequences are apprehended by the calm observer. Hence they are utterly unqualified to write upon any other system of philosophy except that which is consonant with their narrow minds, and by which their grovelling or interested views are more immediately supported. But, when party spirit, together with that fashionable mania of a revolutionary age, which has convulsed the social circles of Europe during the last fifteen years, have again subsided, the name of Kant, together with his sound critical doctrines, will be duly revered.—In justice, therefore, to one of his commentators, it ought to be observed, that the Scotch reviewer of this philosophy, after sophistically pointing out the “futility of the system, of which (according to him) the fundamental principles are not new;” after endeavouring to shew “the improper use of terms with its consequences; groundless or false assertions, bad logic, &c.,” is anxious to persuade the world that the “*transcendental philosophy* of Kant inverts the order of nature, and is as little calculated to promote the progress of science as the syllogistic system of Aristotle, which was likewise built on *categories* or *general forms*.” That such assertion is egregiously false, will be allowed by every novice, who has only learnt to distinguish between abstract reasoning and demonstration *in concreto*; between the manner of acquiring experimental or physical knowledge, and that of studying or teaching the principles of metaphysical science;—provided the latter, in the present state of things, deserve that denomination. Without adhering to Kant's definitions of *knowledge à priori*, and *knowledge à posteriori*, the Scottish critics continually confound the former with the latter; though they could not fail to understand, that our ideas *à priori* are produced *with* experience, but they are not produced *by* it, or do not proceed from it: as, therefore, they are constitutional in the human mind (though *not innate*), being only the forms of the mind, they are distinguished by two marks,

namely, by their being *universal* and *necessary*, so that the contrary of such ideas is impossible. Hence twice two is four, &c. among all nations; and in all ages of mankind. In short, we meet with a furd of paradoxical and contradictory assertions in the reviews of those very men; who, for want of understanding his propositions, chiefly deal in absurd invectives and declamations against Kant. Such conduct, however, is highly injurious to the progress of true science, and stamps disgrace on the publications in which it is recorded. Those readers who are inclined to doubt the truth of this accusation, may easily convince themselves of the justice of our remarks, by referring to the Supplement to the Enc. Brit. vol. II.; where, in the 357th page, No. 20. the critical philosophy of Kant is strangely compared with the inductive reasoning of Bacon; a man whose talents we all revere, but whose excellent doctrine of induction is applicable chiefly to physical, and not to metaphysical, demonstrations: further, in the next paragraph, the reviewer boldly asserts, that "the distinction between knowledge *a priori*, and knowledge *a posteriori*, is as old as speculation itself; and the mode in which Kant illustrates that distinction, differs not from the illustrations of Aristotle on the same subject."—After grossly comparing the general forms of the human mind to the form of the statue in the rough block of marble; a comparison which the Stagyrte, or some of his talkative disciples, may probably have made 2000 years ago;—and after inaptly contrasting Kant's general forms of general ideas, with those of Plato; then again confounding this proposition with the probable meaning of Aristotle, "that particular sensations give occasion to the intellect to form general ideas;"—the Caledonian editor sagaciously observes, that "his (namely Kant's) doctrine on this subject differs not essentially from that of Locke and Reid, and many other eminent metaphysicians of modern times." Thus, it will be evident that the object of the Scottish critics was to perplex the reader with a variety of heterogeneous notions, and to leave him in doubt and confusion.

Whether we have contributed in some degree to the elucidation of the *critical system*, by the preceding remarks and illustrations, must be decided by the unbiassed reader; but, we trust, our good intentions will not be questioned. We are convinced, that such system leads neither to atheism, nor to immortality: on the contrary, the most able philosophers of France and Germany have not only studied the works of Kant, but have declared his doctrines, from the pulpit, to be consonant with both moral and religious duties. Hence, we shall proceed to enumerate the different publications which he produced in the German language, since the year 1781, or the memorable era of the elementary book before criticised.—*Prolegomena*; or, introductory Observations applicable to every future System of Metaphysics that may deserve the Name of a Science; 8vo. pp. 222; Riga, 1783. This is a concise and perspicuous abstract of the preceding *Critique* in an analytical method, which the author has here adopted, with a view to return by the same path on which he had before advanced synthetically.—*Reflections upon the Foundation of the Powers and Methods which Reason is entitled to employ in judging of its Stability*; 8vo. Königsberg, 1784.—*Ideas for an Universal History, in a Cosmopolitical View; and Reply to the Question, What is Illumination of Mind?* These two Essays were originally inserted in the Berlin Monthly Magazine for November and December, 1784.—*Fundamental Principles of the Metaphysics of Morals*, 8vo. Riga, 1785; (2d edit. 1792).—*On the Volcanoes in the Moon*; *ibid.* for March, 1785.—*On the Injustice of printing spurious Edi-*

tions of Books; *ibid.* for May, 1785.—*Definition of the Idea connected with the Expression, a Race of Men*; Berlin Monthly Magazine for November, 1785.—*On the probable Origin of Human History*; *ibid.* for January, 1786.—*What's understood by the Expression, to become familiar with the Origin of our Thoughts?* *ibid.* for October, 1786.—*Metaphysical Principles of Natural Philosophy*, 8vo. Riga, 1785; (2d edit. 1787, pp. 182).—*Some Remarks on Mr. Jacob's Examination of a Work written by M. Mendelssohn, and entitled Morning Hours*, published in 1786, and reprinted in Kant's Miscellaneous Works; vol. III. pp. 89 to 93.—*Fundamental Principles of the Critique of Taste*, 8vo. Riga, 1787.—*A Treatise concerning the use of Theological Principles in Philosophy*; published in the *German Mercury* for January and February, 1788.—*Critique of Practical Reason*; 8vo. Riga, 1788; (2d edit. 1792).—*On the Failure of all Philosophical Attempts made by Leibnitz, in his work entitled Theodicea*; Berlin Monthly Magazine for September, 1791.—*On the Radical Evil in Human Nature*; *ibid.* for April, 1792.—*On the common-place Assertion, that a Thing may be true in Theory, but is not applicable to Practice*; *ibid.* for September, 1793.—*Religion considered within the Limits of mere Reason*; Königsberg, 1793; (2d edit. enlarged, pp. 340, 1794).—*Some Observations respecting the Influence of the Moon on the Weather*; Berlin, Monthly Magazine for May, 1794.—The following treatises having partly appeared in different periodical collections, and partly in distinct publications, we shall merely translate their titles:—*On the End or Termination of all Things*; 1795.—*Epistle to Sömmering, respecting the Organ of the Soul*; 1796.—*On the Peculiarity of the haughty Tone lately raised in Philosophical Discussions*; 1796.—*Proposals for deciding a Mathematical Dispute which had arisen from Misunderstanding*; 1796.—*Annunciation of the approaching Conclusion of a Treaty for perpetual Peace in Philosophy*; 1796.—*On the supposed Right of speaking Falsehood from philanthropic Motives*; 1797.—*Declaration on Mr. Schlettwein's literary Challenge directed to Kant*; on the 11th of May, 1797.—*On the Art of Book-making*; in two Letters addressed to M. Frederic Nicolai, the Author and Publisher; 1797.—*On the Power of the Mind to overcome morbid Sensations by mere Reflection*; in Reply to the Aulic Councillor and Professor Hufeland; 1797.—*Answer to the reiterated Question, Whether the Human Race is in a progressive State of Improvement?* 1798.—*Contest between the Faculties*; namely, 1. between the Theological and Philosophical Faculties; 2. between the Juridical and Philosophical Faculties; and 3. between the Medical and Philosophical Faculties; 1798.

Beside these smaller tracts, Professor Kant has published various other performances, which are not contained in the collection of his miscellaneous works above quoted; and have been separately printed. Of this class are, his Project for a perpetual Peace; a Philosophical Attempt; 8vo. pp. 104; Königsberg, 1795; and which has also been translated into French and English.—*Metaphysical Elements of Jurisprudence*; 8vo. pp. 299; Königsberg, 1797.—*Metaphysical Elements of Ethics, or Doctrinal Virtue (Zugendlehre)*; 8vo. Königsberg, 1797.—As the tendency of the last-mentioned work has been maliciously misrepresented by the Scottish editor, or his associates, as leading "naturally to atheism," we think it our duty to add a few words on the subject. Kant is said to make the following strange observation: "As it would be absurd to swear that God exists, it is still a question to be determined, whether an oath would be possible (or rather *admissible*) if it were made thus: *I swear on the supposition that God*

exists." The true meaning of the author, however, is not *supposition*; because the German word *voraussetzung*, when used in a philosophical sense, signifies previous *admission*, or taking it for granted that, &c. In this sense, Kant's *formula juramenti* is perfectly reconcilable; because a person who does not admit the existence of the Deity, should on no account be allowed to swear; for, if he be suffered to payal himself of an oath, it will be an abuse of that sacred invocation, and consequently his promise will not be binding. Hence Kant justly remarks that "all *sincere oaths*, taken with reflection, have very probably been taken in no other sense."—We do not profess to defend the accuracy of Kant's phraseology; but only to shew in what manner the hyper-critic may distort the most solid and harmless reasoning, partly by abruptly selecting such passages as may serve the base purpose of perverting the sense of the whole inference; partly by translating words so as to change their signification: for the German term above quoted, is never used in an *objective* sense, in which it would be literally *supposition*; on the contrary, it is always employed *subjectively*, and expresses neither more nor less than what we have before advanced. Thus, we believe it to be alike unjust and illiberal to bestow such invectives as "mire of atheism—detestable doctrines," &c. on the writings of a man who is respected by distant nations, not only for his profound erudition; but also for the purity of his manners through a long and active life of seventy-eight years. Had he been guilty of the least immoral transaction—had he espoused the cause of democracy, atheism, or any other junto of fanatics—his numerous friends and admirers would no doubt have been reproached with his errors by inimical enthusiasts; especially by those alarmists who have lately amused the public with Proofs of Conspiracies, and Memoirs of Jacobinism, which the writers themselves believed only during their political fits, and while they were deprived of their senses.

Let these observations suffice for the defence of the Critical System, which will probably stand long after its adversaries, and their scurrilous refutations, have been consigned to oblivion. We shall conclude with giving a short sketch of the author's peculiar habits and conduct through life.

Kant is of a middle stature, rather thin, though well formed, and of sufficient bone. His head is uncommonly large; the front elevated, his eye lively, bespeaking great acuteness and penetration; but the face is disproportionately small to the size of his head. In his countenance there is an air of dignity mingled with complacency; and, when smiling, the grave philosopher appears to be lost in the cheerful aspect of the philanthropist. His private character perfectly corresponds with this external description: the writer of these pages well remembers the affable and courteous manner in which Kant received him, when he applied for his immatriculation as *Civis academicus*, on the 7th of March, 1778, before he had completed the fiftieth year of his age; and on which occasion Kant presided as Dean of the Philosophical Faculty. In the following year, the professor was elected *Rektor Magnificus*, being the highest dignity in the academical senate, with which he has, since that period, been repeatedly invested; a new president being chosen every six months. During a residence of nearly four years at Königsberg, he found Kant uniformly beloved and respected both by the students and other professors. If this great man were not parsimonious in his domestic economy, and poignant in his satire among his best friends, he would form an exception to all mankind: for the strict morality and stoicism, which he inculcates by his precepts as well as by his example, are universally admired. Kant is no ad-

miration of the fair sex, and has ever lived in celibacy. It is, however, remarkable, that he is peculiarly attached to English company, and scarcely visits any houses in his native city, excepting those of Green, Hay, Motherby, Barkley, and other English merchants; with most of whom he has been in habits of friendship during the last thirty or forty years of his life; and almost every evening amuses himself with a social game of whist, or ombre. His remarks are, on all occasions, sparing, but sometimes pointedly acute; and his wit, especially when directed to females, is often wounding. During the last three or four years, we understand, he has resigned his academical chair, and lives more retired than usual; his health is nevertheless good; as his mode of life is exemplarily regular. He retires to rest at nine o'clock in the winter, and ten o'clock in the summer; rising at five o'clock in the former, and four o'clock in the latter season. Daily exercise on foot, serenity of mind, temperance in eating and drinking, constant employment, and cheerful company, have prolonged the life of Kant to the 79th year of his age: though his body is weak, the powers of his mind are still unimpaired; and the whole of his moral conduct is the best refutation of the foul and absurd tendency, which ignorant or malevolent men have falsely ascribed to the principles of the *Critical Philosophy*.

KAO-TCHEOU-FOU, a city of China, in the province of Quang-tong. In its vicinity is found a kind of marble, that represents, naturally, rivers, mountains, landscapes, and trees: it is cut into slabs, and made into tables, &c. Kao-tcheou-fou has one city of the second class, and five of the third, under its jurisdiction.

KATABA, a town of Arabia, in Yemen, defended by a citadel. It is situate in a fertile country, near a river which runs into the sea at Aden, 75 miles N. of Aden. Long. 44. 39. E. Lat. 13. 54. N.

KAYSERSECH, a town of Germany, in the electorate of Treves, 12 miles W. of Coblenz, and 36 N.E. of Treves. Long. 6. 48. E. Lat. 50. 21. N.

KEMNAT, a town of Germany, in Bavaria, 26 miles N. of Amberg. Long. 11. 58. E. Lat. 49. 49. N.

KENTALIFFE MOUNT, a ridge of mountains, in the S. part of Thibet, bordering on Hindoostan Proper. On the W. side of this ridge are the two heads of the Ganges, and from its E. side issues the Burrampooter.

KENTZINGEN, a town of Suabia, in the Brisgau, seated on the river Elz, 13 miles N.W. of Friburg.

KERKUK, a town of Kurdistan, the capital of a government and residence of a pacha. It is surrounded with walls, and defended by a castle; 95 miles E. of Mosul, and 120 S.E. of Betlis.

KETTLE, a vessel of copper, tin, iron, or other metal, calculated for boiling, melting, or cooking different articles in, over a common fire. The following description of a kettle for boiling inflammable fluids, by Mr. T. P. Smith, appears in the Transactions of the American Philosophical Society. "When we consider," says Mr. Smith, "the many unhappy accidents that occur from vessels containing inflammable fluids boiling over and setting fire to the buildings in which manufactories of them are carried on, it must strike us as a matter of importance to form a vessel which should be so constructed as to prevent any of those accidents, and yet of so simple a form as to render it fit for general use. Impressed with these ideas, I take the liberty of offering for your approbation the following plan:

"Let A B C D (Plate 34) represent a large kettle, B E, a spout running out to the distance of three or four feet, commencing at B, four or five inches from the brim of the kettle, and the termination of it E, just as high as the

Kettle for Boiling Inflammable Liquids.

Electrical Kite.

Walker's Portable Kitchen.

Elevation
bSection
b

Mr. Coppinger's Malt Kiln.

brim A. Let the bottom of this spout be covered with wet sponges or rags. Now suppose the kettle to be filled up to B with any fluid, then as soon as it commenced boiling it would rise in the kettle, and in rising but a small perpendicular height would pass a considerable distance up the spout B E: here the liquor would soon cool, and of consequence fall back into the kettle, and the whole subside to its original height. This would occur as often as the fluid rose above B, as the evaporation from the wet sponges or rags would keep B E constantly cool.

"It would perhaps be best to pass the spout through the side of the building into the open air, as thereby the evaporation would be increased, and consequently the spout kept at a lower temperature; in this case it might be covered.

"In case of the fluid to be boiled possessing a very strong elective attraction to caloric or the matter of heat, the spout might be extended to the width of the diameter of the kettle, or a projecting shelf might be formed all round it, lined below with wet sponges or rags.

"In conformity to the will of the society, I procured a vessel of the form here proposed. I first tried the experiment with water, it boiled very rapidly, but every time the water rose into the spout it immediately subsided, although the spout had for some time been directly exposed to the heat of one of Lewis's furnaces: I afterwards attempted it with oil; but before the oil boiled the folding of the vessel, which was made of tin, melted."

KEUSCHBERG, or KIABE, a town of the electorate of Saxony, in Milnia, remarkable for a victory obtained by Henry the Fowler over the Huns, in 933. It is six miles S.E. of Merzbürg.

KIA-KING-FOU a city of China, in the province of Tche-kiang remarkable for its streets ornamented by beautiful piazzas, that shelter passengers from the sun and rain. Seven cities of the third class are dependent upon it.

KIANGARI, a town of Turkey in Asia, chief place of a sangiacat, in Natolia. It is defended by a castle, on a rock; and is 256 miles E.S.E. of Constantinople. Long. 34. 19. E. Lat. 39. 54. N.

KIEMA, a promontory of Switzerland, on the W. shore of the lake of Zug. It is remarkable, that the ground belongs to the canton of Lucern, the timber to that of Zug, and the leaves to that of Schweitz.

KIEN-NING-FOU, a city of China, in the province of Fo-kién. At the time of the conquest of China by the Tartars, it sustained two sieges, in the last of which it was taken, and all the inhabitants were put to the sword. It was afterwards re-established by the same Tartars that destroyed it, and has eight cities of the third class under its jurisdiction. It is 260 miles S.E. of Nanking.

KILCALMONIL, a town of Scotland, in Argyshire, and in the peninsula of Kintire, 17 miles N. of Campbellton.

KILGARREN, a town of Pembrokehire, with a market on Wednesday. It had formerly a castle, now in ruins; and near it is a remarkable falcon-leap, where that fish is caught in great abundance. Above this place, are large works for fabricating tin plates. It is seated on the Tyvy, 30 miles N. of Pembroke, and 227 W.N.W. of London. Long. 4. 40. W. Lat. 54. 4. N.

KILHAM, a town in the east riding of Yorkshire, with a market on Saturday, 36 miles N.E. of York, and 200 N. of London. Long. 0. 16. W. Lat. 54. 5. N.

KILIA, a fortified town of Turkey in Europe, in Bessa-

rabia; seated on an island, at the mouth of the Danube. It was taken by the Russians in 1790, but restored at the subsequent peace. It is 86 miles S.W. of Bialogrod, and 290 N.E. of Constantinople. Long. 28. 46. E. Lat. 45. 22. N.

KILLANY BAY, a bay of Ireland, on the east coast of the island of Arranmore, in the county of Galway. Long. 9. 36. W. Lat. 52. 44. N.

KILLBEGGAN, a borough of Ireland, in the county of Westmeath, 14 miles E. of Aithlone, and 42 W. of Dublin. Long. 7. 55. W. Lat. 53. 23. N.

KILLFENORA, a town of Ireland, in the county of Clare, and see of a bishop, founded in the twelfth century, united to Killaloe in 1752. It is 12 miles N.W. of Ennis.

KILLINAULE, a town of Ireland, in the county of Tipperary, 14 miles N. of Clonmell. Long. 7. 26. W. Lat. 52. 27. N.

KILN-DRYING, a process by which vegetable substances, such as hops, grain, &c. are deprived of their moisture and rendered fit for keeping, heat being applied to them in a kiln properly constructed for the purpose. The important practice of kiln-drying corn in wet weather, first attempted by Mr. John Palmer, of Maxtock, near Colehill, in Warwickshire, is described, in the following terms, in the Transactions of the Society for the encouragement of Arts, Manufactures, and Commerce, who presented their silver medal to Mr. Palmer for his ingenuity.

"The weather proving extremely rainy," says Mr. Palmer, "and my corn then standing, taking much damage, I determined upon cutting it wet, and thrashing it immediately, and then drying it on a kiln: in consequence of this, I collected as many men as were sufficient for the purpose, and employed them as follows, viz.

"I caused a part of my men to cut the corn in the common method with sickles, and bind it into sheaves. A second part I employed to load it on waggons, and carry it to the barn; and as many as could work in the barn, to thrash it. The next morning I winnowed it, and carried it to a malt-kiln to be dried; which operation was always completed in less than twenty-four hours.

"As it is impossible for me to send you two sheaves of the corn harvested as above described, I have sent you the produce of two sheaves and upwards, which I declare to be a fair sample of the produce of four acres and upwards.

"A timber stove or a hop-kiln, will answer the purpose of drying corn equally well; or the malt-kiln (Pl. 34).

The Expence per Acre was as under stated:

Reaping and carrying to the barn	-	-	£. s. d.
Thrashing and winnowing	-	-	0 12 0
Kiln-drying	-	-	0 5 0
			£. 1 9 0

"N.B. Only a part of the above sum should be charged to my new method of harvesting corn, viz. the extra expence, which is as follows:

"Five shillings per acre for drying, and four shillings for the extra trouble of thrashing it.

"After the wheat above mentioned was thrashed in the common method of flails, and dried, I so far completed a machine for thrashing, that I thrashed a very considerable quantity of wheat, and ten acres of barley, with it, carried from the field in November; and it was dried in the manner described in my claim. I did not however state this to the Society, because I had taken out a patent, dated the 6th day

of December, 1799, for my thrashing machine; and was that day going to London to give in my specification, dated the 4th of January, 1800.

"Part of the straw of the four acres, described in my claim, was used for thatch immediately after it was thrashed; and part stacked in small narrow ridges, for litter for my fold-yard.

"The grain was very well separated from the straw by the flails; but that thrashed by the machine was completely cleaved, though in a very wet state. This would not be the case with the common machines of the North.

"The quantity of wheat upon an acre was about 21 bushels, which is nearly as much as there would have been if it had been dried by fine weather. When the advantage of getting in an acre of wheat per day, in seasons like the last, is properly considered, and making it immediately useful, at the small additional expence of 9s. per acre, there can be but little doubt respecting its utility; for probably these men could not be employed at any other work."

The above was accompanied with three certificates, which testify that Mr. Palmer did harvest four acres of wheat and upwards in the year 1799; that his plan is likely to be of general advantage; and that his thrashing machine is in high repute, and answers every end purposed.

KIMPOLUNG, a town of Turkey in Europe, in Moldavia, on the river Moldava, 92 miles N.E. of Colofwar.

KIN, a town of Persia, in the province of Segestan, situate at the foot of a chain of mountains, near the lake Zare, 320 miles E. of Isfahan.

KINDASSA, a town of Hindoostan Proper, in the country of Molwa, 172 miles E.N.E. of Oagein. Long. 78. 42. E. Lat. 24. 15. N.

KINE POX, another name for the Cow-pox. See Cow-Pox, *Supp.*

KINGSTEIN, a strong fortress of Norway. See **Fædericstad**.

KING TE-TCHING, a town of China, in the province of Kiang-si and district of Jao-tcheou-fou. It is famous for its beautiful porcelain, is computed to contain a million of inhabitants, and extends a league and a half along the banks of a river, which here forms a kind of harbour, about a league in circumference.

KINROSS-SHIRE, a county of Scotland, surrounded by the shires of Perth and Fife. It is about 30 miles in circuit, its length and breadth being nearly equal; and sends one member to parliament, alternately with the county of Clackmannan.

KINTAIL, a peninsula in Ross-shire, between Loch Garron and Loch Duich. It forms the S.W. corner of the county.

KIN-TCHEOU FOU, a city of China, in the province of Hou-quang. Its district contains two cities of the second, and 11 of the third class.

KIN-TCHING, the capital of the island of Lieou-kiou, in the China Sea, and of all the islands under that appellation. The king's palace, reckoned to be four leagues in circumference, is built on a neighbouring mountain. Kin-tching is seated in Cheonli, the south part of the island. Long. 127. 30. E. Lat. 26. 2. N.

KIO FEOU, a city of China, in the province of Chang-tong and district of Yen-tcheou-fou. It is celebrated as the birth-place of Confucius, several monuments to whose memory are still to be seen here.

KIRCHBACH, a town of Germany, in the duchy of Stiria, 34 miles S.E. of Graz.

KIRCHBERG, a town of Germany, in the circle of Upper Rhine, and county of Sponheim, 22 miles W.N.W.

of Creutznach, and 41 W. of Meatz. Long. 6. 58. E. Lat. 49. 59. N.

KIRSBERG, a town of Suabia, capital of a territory of the same name, subject to the house of Austria. It is seated on the Danube, nine miles S. of Ulm. Long. 10. 12. E. Lat. 48. 16. N.

KIRCHHAYN, a town of Germany, in the principality of Hesse Cassel, situate on the Werra, 35 miles S.S.W. of Cassel.

KIRCHHEIM, a town of Suabia, capital of a lordship, 18 miles S.W. of Augsburg, and 25 E.S.E. of Ulm.

KIRCHHEIM FOLAND, a town of Germany, in the circle of Upper Rhine, and principality of Weiburg, 16 miles W. of Worms, and 28 N.W. of Mannheim. Long. 7. 49. E. Lat. 49. 39. N.

KIRDORF, a town of Germany, in the principality of Upper Hesse, 11 miles E. of Murgurg.

KIRIN, one of the three departments of E. Chinese Tartary, bounded on the S. by the river Saghalien, on the E. by the sea of Japan, on the S. by Corea, and on the W. by Leaotong. This country, which is extremely cold, from the number of forests by which it is covered, is scarcely inhabited. It contains only two or three ill-built cities, surrounded by mud walls. The valuable plant ginseng grows here; and the emperor sends hither the criminals banished by the laws.

KIRIN, the capital of the province of Kirin, in E. Chinese Tartary, situate on the river Songari, which is here called Kirin. It is the residence of a Manchew general, who is invested with the authority of a viceroy.

KIRKPATRICK, a town in Dumbartonshire, lying E. of Dumbarton. It is said to be the birth-place of the tutelary saint of Ireland. The vestiges of the Roman wall built by Antoninus, extend from the firth of Clyde at this place, to the firth of Forth. It is called, by the country people, Graham's Dike.

KIRN a town of Germany, in the circle of Upper Rhine, situate on the Nahe, 17 miles W. of Creutznach. Long. 7. 6. E. Lat. 49. 50. N.

KIRSHEHR, a town of Turkey in Asia, capital of a district, in Nardlia. It was formerly a considerable city, and called Diocæsarea. Salt is made in the neighbourhood. It is 84 miles N.E. of Cogni. Long. 34. 15. E. Lat. 39. 10. N.

KIRSOVA, a town of Turkey in Europe, in Bulgaria, on the Danube, 76 miles S.W. of Ismail. Long. 28. 4. E. Lat. 44. 47. N.

KISHENAGUR, a town of Hindoostan Proper, in Bengal, 45 miles N. of Calcutta, and 50 S. of Moorshedabad.

KISMISH, a fertile island at the entrance of the gulf of Persia, 50 miles long and five broad. It is well inhabited, and has been remarkable for its pearl fishery. Its E. end is 12 miles S. of Gombroon.

KISSINGEN, a town of Germany, in the bishopric of Wurzburg, in the environs of which are some medicinal and salt springs. It is 24 miles N. of Wurzburg. Long. 10. 3. E. Lat. 50. 5. N.

KISTNA, a river of Hindoostan, which rises on the E. side of the Gaus, forms the boundary between the Deccan and the peninsula, and falls into the bay of Bengal, S. of Masulipatam.

KISTNAGHERI, a town and fortress of the peninsula of Hindoostan, in Mysore. This town was attacked by the British troops under Colonel Maxwell, in 1789; he carried the lower fort and suburb, without much difficulty; but the garrison in the upper fort made so desperate a resistance,

that, after two hours' vigorous assault, he found it necessary to desist from the attempt. It is 54 miles S.E. of Bangalore, and 66 W.S.W. of Arcot.

KITCHEN (*Encycl.*). Under that article we gave some account of the kitchen fitted up at the Foundling, under the direction of Count Rumford, which at that period might be considered as an experiment. The matron of that charity, however, has since drawn up the following particulars, which have been published by the Society for bettering the Condition of the Poor, &c. These may have the effect of shewing how far the trial has succeeded.

"The kitchen (says the writer) has now had a fair trial, having been in constant use for above a twelvemonth. The saving to the hospital in fuel is very considerable, being about twenty-five chaldrons of coals a year. The quantity annually consumed has been hitherto 35 chaldrons; at present it is only 10. There were two cooks in the old kitchen, and they had a severe and hot service: one cook, in the present kitchen, has a very easy one; and the food, particularly the roast beef, is better dressed than formerly.

"There are difficulties which attend the use of all new and valuable inventions at first. In this kitchen they were very few, and they were soon obviated; and the cook now manages her new kitchen, with much more ease and satisfaction to herself, than she did her old one. The kitchen (the size of the room being 17 feet by 21), contains a large iron boiler divided into two parts, one of 82, and the other of 41 gallons; at the further end of which, and just above it, is a steam-box; which, with the waste steam of the boiler, and without any addition of fuel, is capable of dressing 200lb. weight of potatoes. This double boiler and box will dress a dinner for above 400 persons. They are both served by one small fire, which does not consume, for a day's dinner, more than a peck of coals and a peck of cinders, the price of the peck of coals (reckoning them as dear as 2*l.* 12*s.* a chaldron) being four pence; the cinders are saved from the consumption of the former day. On the other side of the room, there are two lesser boilers, one of them divided into two parts; and in the centre of the wall, opposite the windows, is the roasting machine*, which is five feet deep, two feet wide, and fifteen inches high. In this, on the roast-meat days, the dinner, being 112lb. of beef for the officers and children, is now dressed in four hours and a half, with a peck of coals and a peck of cinders; (see *ROASTER, Supp.*) Sixteen months have passed since this roaster has been in constant use for dressing large dinners; I have just had the flue of the chimney cleaned: the dust which was taken out (and that not more than a peck), was

a mixture of small ashes and soot; but more of the former than the latter. Indeed there did not appear to be any real soot found among it. This can only be accounted for by the circumstance, of all the smoke being actually consumed and used in heating the roaster, instead of being discharged, as is usual, out of the chimney, to assist in increasing and darkening the atmosphere of London. The dampers mentioned by Count Rumford, in page 153 of his sixth Essay, were put up before the kitchen was finished, and have been of great use. I think the new kitchen does not require so much repair as the old one. The iron bars, at the bottom, are not burnt out near so soon as they used to be in the first place under the old boilers. They generally wanted repairing once in six weeks; there are four fire-places in the new kitchen, and in 16 months they have wanted only six new bars."

These boilers would be very useful in all parish work-houses. They would cause a very considerable saving of fuel, and almost as much of food; the waste by evaporation, being, in general, much more than can be supposed, without an actual experiment made. In the usual mode of boiling, the waste by steam is about one-fifth. That this vapour carries with it a considerable part of the food and nourishment, may be easily ascertained by any one, who passes by any of the kitchens in London, where much soup is made; he will find the atmosphere around loaded with the waste of a great deal of valuable nourishment. There is another advantage belonging to these boilers, which is, that by means of the double rim, which is impervious to steam, they not only preclude waste in the food, but prevent its being contaminated by smoke; an inconvenience, to which the kitchens and cookery of the poor are peculiarly subject.

The double rim is filled by water, into which the projection of the cover of the boiler defends, so as absolutely to preclude any communication with the outward air or smoke.—The benefit of this double rim may be obtained without an entire new boiler, by making the double rim of lead, folded round the mouth of the old copper, and fitting the cover to it. The expence is about a guinea for a common sized copper. It answered very well, when tried in the poor-house at Auckland.—The double rim would be very useful also in smaller boilers, especially if intended for soup. Mr. Hopkins of Greek street, Soho, afterwards made one of ten quarts, for a village soup shop at Langley in Buckinghamshire.

Of the cautions in the use of Count Rumford's kitchens, one of the most necessary, and the most difficult to procure attention to, relates to the quantity of coal to be used†, If,

* "Enquiries having been made respecting the dimensions of the iron-work and flues of the roaster and boilers, I add this note.—The roaster is 60 inches deep, 26½ wide, and 16 high: the grate, which is under the roaster and supplies it with heat, is 22 inches long, 10 inches wide, and 14½ high; the ash-hole under the grate is 23 inches high; and the doors of this and of the other grates and ash-holes are each 10 inches wide, and 7½ high. The two pipes, for forcing hot air into the roaster, are two inches and three quarters diameter. The lower flue of the roaster is 15 inches high, and four and a half wide, and winds partly under it; and the upper flue is also four inches and a half wide, spreading in a semicircle over the top of the roaster.—The larger boiler is 60 inches long, by 36 wide, and 10 inches high: the grate under it is 24 inches long, 14½ wide, and 14 inches high; and the ash-hole under the grate 18 inches high. The lower flue is six inches square, winding partly under the boiler; the upper one eight inches high, and 5½ wide.—Of the lesser oblong boiler the length is 36 inches, the width 24, and the height 18 inches: of the grate under it, the length is 17 inches, the width 10, and the height 14 inches; the ash-hole is 14 inches high. The size of the steam-box, which is supplied by the waste steam of the large boiler, is 44 inches long, 24 wide, and 18 high; the false cullender bottom being placed five inches above the bottom of the box."

† "The necessity of limiting the quantity of fuel (says the worthy editor of the Reports) to be used, cannot be too strongly or too frequently enforced; and it should be observed, that large coal is not so proper to mix with the cinders,

instead of the peck of coals, which is all that is necessary for one of these boilers, the cook follows her acquired instinct, and lays on twice the quantity, or more, the operation, instead of receiving benefit, is prejudiced, and the roaster very much injured by the waste of coals. Where coals are used without limitation, there is very little chance of these boilers or roasters answering.

Three roasters, after the model of that at the Foundling, have been put up at Christ's hospital; and now, when (instead of nine bushels of coals, formerly used on roasting days) they are limited to something less than one bushel, being about a tiche of the former consumption, this quantity answers very well dressing 560 lb. weight, the allowance of their roast-meat days.

In those cases where public bodies may be induced to adopt Count Rumford's kitchen, it is presumed that they may think proper to refer to the account of the Foundling kitchen; for which see our original article *KITCHEN*.

The following is the specification of a patent granted to Mr. Walker, of Rathbone Place, Mary-le-bone, for a portable kitchen, for dressing and cooking victuals. It is dated May 12, 1801.

"The whole is to be made of cast or wrought iron, with a fire place in the centre, inclosed with a door, ash-hole under, a closet on each side, one of which will serve for the purpose of baking, &c. the other to contain two spits, racks, &c. complete, the top to be used for the purpose of a broiling plate heated by the same fire, the smoke conveyed through an iron funnel, in which is fixed a smoke-jack to turn the spits."

No further verbal description is given, but the reader is referred to the drawings, for which see Pl. 34. where *a* is a funnel for smoke; *b*, the top which can be used as a boiling plate; *c*, a place for fire; *d*, the ash-hole; *e*, a closet to roast meat in or broil; *f*, a hot closet or oven.

KITCHEN-GARDEN (*Encycl.*) Under the article *GARDENING*, we have spoken fully on the different requisites for a kitchen-garden. We wish, nevertheless, further to observe, that the most important points in this, as well as every other branch of horticulture, consists in digging and manuring the land well; and, above all, in the proper watering of gardens, for which the implements commonly employed appear indeed to be very inadequate. The filling, and carrying, of these vessels to the spot where they are to be used too, are attended with great labour and loss of time. To remedy these inconveniences, different machines have been invented: one of the most ingenious and useful, is that contrived by M. Sylvestre, and of which an accurate representation is given in Pl. 35.

It consists simply of a cask, capable of holding a sufficient quantity of water, for the purpose of irrigating the garden. The hinder part of this vessel is furnished with a cock that communicates with the watering pipes, and the cask is supported on a strong frame, with one or two wheels, calculated for walks about eighteen inches wide. The carriage may be drawn by a mule or an ass, and requires a person to guide the animal, to support the vessel when it is liable to be overturned, and to open and shut the cock as often as is necessary. Thus, one man will be able to water a considerable space of ground in a short time, and to sprinkle that fertilizing fluid in an equable and regular manner.

KITE, a well-known ingenious paper machine, originally contrived to serve as a toy for children, but which has lately been applied to the more useful purpose of conducting the electric matter of the atmosphere from the clouds.

Different electrical kites have been constructed by Cavallo, and other philosophers; and, though such contrivances are not very difficult, yet there are some fixed principles, which ought to be observed in manufacturing electrical kites to a certain degree of perfection. To accomplish this object, we have given a representation of it in Pl. 34. The following are the necessary rules, given in a treatise published in German, by the late Professor Lichtenberg, of Göttingen, and copied into the Domestic Encyclopædia.

The body of the kite consists of a long slender lath, *a, b*, and a wooden bow, *d, a, e*. The former must be made of slender dry deal, properly planed, about five feet in length, one inch in breadth, and half an inch thick, so that it may neither be too heavy, nor too light to resist strong gusts of wind.

The bow *d, a, e*, is formed of a round hoop, that may be taken from a dry cask; or it may consist of split cane or whalebone, rendered perfectly smooth, and of equal thickness. Particular attention, however, is requisite to adapt it to the proper size; for if too weak, it will not be sufficiently elastic to expand the cord *c, c*. The dimensions of the bow must likewise be carefully adjusted to those of the lath *a, b*; and as the utility of the machine in a great measure depends on the accuracy of such proportions, we shall briefly state the rules by which they may be easily ascertained.

The two ends of the bow are first to be contracted by means of the cord, which ought to be properly stretched. The middle of the bow must be exactly fixed to the lath *a, b*, so that one inch only of the latter project; and the place which is intersected by the string *c, c*, should be accurately marked. The lath, from this mark to its extremity *b*, ought

as coal-dust that will hardly burn on a common fire. In every instance, that has come to my knowledge, of these kitchens not having succeeded, the failure has been owing to the improper waste of fuel. The operation of the fire is so much increased by the manner in which the grates and flues of these boilers and roasters are arranged, that the use of the same quantity of fuel in them, as in a common boiler, will very soon destroy all the iron-work, by the intenseness of the heat. In one instance, where a Rumford boiler of fifty gallons had not answered, but was quite worn out at the end of five months, my first enquiry respected the quantity of coal used; and, by the answer, I found that there had been six times as much coal applied there, as is used in the Foundling kitchen for a boiler of more than twice that size. The wonder then was that the apparatus had lasted so long; but, upon examining it, this was explained; I found a hole broken between the flues, and that the stones (that are taken out to clean the flues), had not been properly put in again. By these means much of the heat had escaped; but enough had remained, to destroy entirely several sets of bars in the grates, and to burn out the bottom of the boiler.—Many similar instances might be quoted, to shew the necessity of keeping strictly to the quantity of coals; which, for either the roaster or boiler at the Foundling, is a peck of coal-dust, mixed with a peck of cinders; and with this little quantity of fuel, there is warm water kept in the boiler the whole day, merely by the heat that remains after the dinner has been dressed."

to extend somewhat further than double the length of its upper part.

Having found the proportion between the length of the lath, and the semi-circle of the bow, every thing depends upon the proper joining of these two essential parts. Hence a superficial excavation should be made at about an inch from the extremity of the lath *a*, and a similar cut in the centre of the bow; both are then to be brought into contact, and fastened with strong thread or silk.

The extremities of the hoop should now be made exactly of equal length; when one end is to be tied with thin packthread to the bow at *d*, about half an inch from the point; and, after having made small excavations into the lath *f*, on all its sides, one arm of the hoop *d* ought to be drawn close to the transverse piece; the packthread twisted several times round *f*; and at length tied to the other arm at *e*. Now the two sides from *d* to *f*, and from *f* to *e*, ought to be measured; if they happen to be unequal, the difference may be adjusted by pulling the thread towards the shorter side. Next, the thread is to be extended from *e* towards *a*, where it should be turned round several times; and thence conducted to *d*, the place in which it is fastened, so that it will form the angle *d, a, e*, as represented in the figure.—A small incision must further be made in the part of the lath marked *b*, to which the thread is extended in the direction from *d* to *b*, and thence again to *e*, where it is ultimately secured.

Thus the skeleton of the kite will be arranged; and it now remains to ascertain its equilibrium, which may be effected in the following manner: the end of the lath projecting at *a*, should first be rounded by the knife, and placed on a table, when the opposite end *b* is to be poised on the tip of the finger. If both sides of the bow are in perfect equilibrium, the skeleton is then complete; but, if either of them incline to one side, the want of symmetry may be remedied by cutting or shaving off the preponderating side of the lath, so as to reduce it to an equipoise. The frame, thus finished, is to be covered either with silk stuff, or thin paper previously oiled, that it may resist the effects of moisture; and to prevent folds either in the silk or paper cover, they should be wetted before they are applied, and afterwards dried in a cool place. In order to secure the whole covering to the frame, narrow slips of silk or paper should be passed across the lath, and over the packthread in all the parts marked *g*; and, when the whole is perfectly dry, its equilibrium must again be adjusted, by putting such additional pieces on the light side, as may be requisite to restore the balance.

In constructing electrical kites, it is of the utmost consequence to apply the strings *h, h*, below the body of the machine to its proper place: when the latter is five feet long, the cord ought to be eleven, one end of which should be passed through the two holes of the lath; namely, one in the direction of the uppermost slip marked *g, g*, and the other through the central part of the bow: then two similar holes must be perforated through the lath where the lowermost slip is denoted at *g*, that is, at a little distance from each other; and, after properly drawing out the string, so as to form an obtuse angle over the body of the kite, it ought to be well secured behind, and afterwards tied with a knot, exactly in the middle, to make both parts of equal length. Another difficulty must arise from the uncertainty of determining the exact point of the cord last mentioned, at which the main string governing the kite should be applied. Hence the following general rule requires attention; namely, that according to the impetuosity of the wind, the principal string must be fastened higher towards the head of the kite, with a view to facilitate its rising; and, on the contrary, lower towards the middle, in less blowing weather. The most advisable method will be, to

tie the leading cord at a few inches only from the upper hole, and to ascertain its exact situation by experience.

The tail of the kite, *k, k*, now remains to be fixed, and is perhaps the most critical part of the whole machine. If it be too short, the latter instantly descends; and, if it be too long, its weight prevents the kite from rising. The most effectual way to avoid both extremes, will be to make the tail seven times the length of the frame: fine packthread should be chosen for this purpose, and double or triple folded slips of paper, two or three inches long, ought to be tied into the pendant string, at short intervals; when the latter is to be affixed to the body of the kite at *b*.

With respect to the flying of this machine, an open place and a fine day should be selected, when a gentle breeze agitates the air: after launching it against the wind, the person who holds the string ought to advance speedily to the distance of thirty or forty yards; and gradually to relax the whole clue, according as the rising is more or less rapid. In order to adapt kites to the attraction of lightning from the clouds, a thin metallic point is to be affixed to the highest end *a*, and connected with the string of the machine by means of a thin wire: in this application, however, the greatest caution is necessary; and those who amuse themselves with experiments of such precarious nature, ought by no means to make the first attempt during thunder-storms, but only when the sky is serene: nor should any person affix a metallic point, or wind the wire round the string, or even moisten it, unless he be perfectly acquainted with the principles on which their joint action depends. Hence, smaller kites which do not ascend too high, must be first employed, till we become better acquainted with the rules of flying, and of fastening the machinery: thus, every danger may be obviated, and this apparently puerile contrivance, be rendered subservient to a very useful purpose. See the articles LIGHTNING and ELECTRICITY.

KITTERY, a town of the United States, in the district of Maine. It is famous for ship-building, and seated on the E. side of the mouth of Piscataqua River.

KITZINGEN, a town of Franconia, on the Maine. It is large and handsome, and owes its rise to a noble convent of Benedictines, founded in the year 745, by Duke Pepin. It is 10 miles E.S.E. of Wurtzburgh, and 34 N.N.W. of Ansbach. Long. 10. 4. E. Lat. 49. 40. N.

KIUTAJA, or **CUTAJA**, a town of Turkey in Asia, the residence of the beglerbeg of Notoja. Near it are some warm baths, much esteemed in several disorders. It is situate at the foot of a mountain, near the river Purlak, 136 miles S.E. of Constantinople. Long. 30. 44. E. Lat. 39. 12. N.

KIZBUHL, a town of Germany, in the Tyrol, on the river Acha, 36 miles E. of Ispruck. Long. 12. 27. E. Lat. 47. 25. N.

KLATTAU, a town of Bohemia, built in the year 775, and surrounded with walls in the year 1000. There are some silver mines in the neighbourhood. It is 46 miles S.W. of Prague. Long. 14. 6. E. Lat. 50. 30. N.

KLETTENBERG, a town of Switzerland, seated on the Aar, three miles from Waldschut. The spiritual jurisdiction belongs to the Bishop of Constance; and the sovereignty to the cantons. Long. 8. 12. E. Lat. 47. 35. N.

KLUNDERT, a strong fortress of the United Provinces, in Holland, near the arm of the sea, called Hollands Diep. It was taken by the French, in 1793, after a gallant resistance; but they were obliged to evacuate it soon after. It is nine miles S.E. of Williamstadt.

KNITTELFELDT, a town of the duchy of Stiria, on the river Muehr, 78 miles S. W. of Vienna. Long. 14. 57. E. Lat. 47. 29. N.

KNOXVILLE, a town of the United States, capital of the district of Hamilton and the whole state of Tennessee. It is seated on the river Holston, 494 miles W.S.W. of Richmond, in Virginia. Long. 84. 8. W. Lat. 35. 58. N.

KOANG-FIN-LOU, a city of China, in the province of Kiang-si. Its jurisdiction contains seven cities of the third class.

KOBI, called by the Chinese **CHAMO**, a vast desert of Chinese Tartary, which occupies almost all the south extremity of the country of the Kalkas. It is more than 100 leagues from E. to W. and almost as much from N. to S.

KOEI-TCHEOU-FOU, a commercial city of China, in the province Setchuen. Its district contains one city of the second class, and nine of the third.

KOEI-YANG, the capital of the province of Koei-tcheou, in China. The remains of temples and palaces still announce its former magnificence. It is 420 miles N.W. of Canton.

KOLA, a town of the Russian government of Archangel, capital of Russian Lapland. It has a good harbour on the river Kola, near a bay of the same name in the Frözen Ocean. Long. 32. 26. E. Lat. 68. 34. N.

KOLYVAN, a government of the Russian empire, comprehending a part of Western Siberia, and formerly included in the government of Tobolsk. Its capital, of the same name, is seated on the Oby, near the mouth of the Berda, and was known, before the institution of this government, under the name of Berdikoi Ostrog. This country has very productive silver mines, which have been called the Potosi of Russia. They lie between the Oby and Irtys, near the mountains which form the frontiers of Siberia, and separate that country from Chinese Tartary.

KOM, a large and populous town of Persia, in the province of Irac, with a celebrated mosque, an asylum for debtors, who are protected and supported. It is 150 miles N. of Ispahan. Long. 51. 14. E. Lat. 34. 20. N.

KONGSWINGER, a town of Norway, on the frontiers of Sweden. It is seated near the river Glomme, at the foot of a steep rock, on which stands an impregnable citadel; at last Charles XII. who reconnoitred it, thought it prudent to decline attempting a siege.

KONG-TCHANG-FOU, a city of China, in the province of Chen-si. It is surrounded by inaccessible mountains, where a tomb is seen, which the Chinese pretend to be that of Fo-hi. Its district contains three cities of the second, and seven of the third class. It is 700 miles S.W. of Peking.

KONIGSBERG, a town of Franconia, belonging to the House of Saxe-Weimar, three miles N.E. of Schweinfurt. Long. 10. 44. E. Lat. 50. 5. N.

KONIGSBERG, a town of Upper Saxony, in the marquisate of Brandenburg, 47 miles S. of Stetin. Long. 14. 40. E. Lat. 52. 50. N.

KONIGSEGG, an ancient castle of Suabia, in a principality of the same name, eight miles N.W. of Ravensburg.

KONIGSGRATZ, a town of Bohemia, with a bishop's see, seated on the Elbe, 35 miles S.W. of Glatz, and 115 N. by W. of Vienna. Long. 16. 8. E. Lat. 50. 6. N.

KONIGSHOFEN, a strong town of Franconia, with a bishop's see, 25 miles N.N.W. of Bamberg. Long. 10. 46. E. Lat. 50. 24. N.

KONIGSTEIN, a town of Upper Saxony, in the territory of Milnia, with an impregnable fort. It is a place of confinement for state prisoners, and is seated on the Elbe, ten miles S.E. of Pyrna, and ten S.W. of Dresden. Long. 13. 43. E. Lat. 51. 2. N.

KONIGSTEIN, a town of Germany, in the archbishopric

of Mentz, with a strong fort, twelve miles N.E. of Mentz. It surrendered to the French in 1796. Long. 8. 25. W. Lat. 50. 5. N.

KONIGSTUTER, a town of Germany, in the territory of Bratwisk Wolfenbuttel, with a celebrated abbey. Long. 11. 7. E. Lat. 52. 25. N.

KONITZ, a town Western Prussia, ten miles N.W. of Culm, and fifty S.W. of Dantzic. Long. 18. 16. E. Lat. 53. 36. N.

KOOCH, a town of Hindoostan Proper, in the country of Agra, sixty miles E. of Gwalior, and ninety-five S.S.E. of Agra.

KOONJOOR, a town of the Decan of Hindoostan, in the province of Orissa, eighty-six miles N.N.W. of Cattack, and 163 W.S.W. of Calcutta.

KOPYS, a fortified town of Lithuania, seated on the Dnieper, eighteen miles N. of Mohilef. Long. 31. 2. E. Lat. 54. 32. N.

KOKSAW, or **KOSOL**, a town of Denmark, in the Isle of Zealand, with a fort, forty-five miles W. by S. of Copenhagen. Long. 11. 10. E. Lat. 55. 29. N.

KOSAL, or **KOSTA**, a fortified town of Silesia, near the river Oder, seventeen miles N. of Ratibon. Long. 17. 54. E. Lat. 50. 26. N.

KOSTROM, a town of Russia, capital of a government, to which it gives name. It is situate on the Volga, surrounded by a strong wall, 168 miles N.E. of Moscow, and 380 E.S.E. of Peterburgh. Long. 41. 14. E. Lat. 57. 30. N.

KOSTROM, a government of the Russian empire, formerly included in that of Moscow. It is divided into the provinces of Kostrom and Unzha. The capital of the former is Kostrom, seated at the mouth of the Volga; the capital of the second is Makarief, situate on the Unzha.

KOTTA, a town of Hindoostan Proper, in the country of Malwa, seated on the Jesul, 100 miles S.E. of Agimere, and 215 S. of Delhi. Long. 76. 20. E. Lat. 25. 15. N.

KOUET-TE-FOU, a city of China, in the province of Ho-nan. The inhabitants are remarkably mild, and treat strangers with uncommon hospitality. It is seated between two large rivers, 312 miles S. of Peking. Long. 115. 29. E. Lat. 34. 30. N.

KOUS, or **Coss**, a town of Egypt, on the east bank of the Nile, once a place of great wealth and trade, being the staple of commerce between the Nile and the Red Sea. It is eighteen miles S. of Dendera, and forty-five N.N.E. of Ene.

KOWNO, a town of Lithuania, seated on the Wilna and Niemen, 40 miles W. of Wilna. Long. 24. 12. E. Lat. 54. 56. N.

KRAANENBERG, a town of Westphalia, in the duchy of Cleves, seated on the declivity of a hill, between Negenen and Cleves. Its name, which signifies Crane-hill, is derived from the number of cranes that used to assemble round the castle, when the adjacent plain was a marsh. It is celebrated for an image of the Virgin, pretended to be miraculous.

KRAINBURG, a town of Bavaria, seated on the Inn, 35 miles E. of Munich.

KRAINBURG, a town of Germany, in the duchy of Carniola, seated on the Save, 18 miles N.W. of Laubach. Long. 14. 5. E. Lat. 56. 15. N.

KRAINOWITZ, a town of Upper Silesia, between Ratibor and Troppaw. Long. 17. 49. E. Lat. 50. 7. N.

KRAINSRAW, a town of Poland, in the province of Red Ruffia and palatinat of Chelm, 110 miles S.E. of Warsaw. Long. 23. 0. E. Lat. 51. 15. N.

KRANICHFELD, a town of Upper Saxony, in the princi-

*M. Hølemberg's Patent Lock.**Fig. 1.**Fig. 2.**Fig. 3.**Fig. 4.**M. Arkwright's double bolted Lock.*

pality of Altenburg, 12 miles S.E. of Erfurt, and 48 W. of Altenburg. Long. 11. 4. E. Lat. 50. 43. N.

KREKITH, a corporate town in Carnarvonshire, with a market on Wednesday. It is seated on the Irish Sea, near Traeth Amawr Bay, where a castle formerly stood, now in ruins. It is 13 miles S. by E. of Carnarvon, and 237 N.W. of London. Long. 4. 18. W. Lat. 52. 57. N.

KREMPEN, a strong town of Denmark, in Holstein, with a castle. It is five miles north of Gluckstadt, and 30 N.W. of Hamburg. Long. 9. 15. E. Lat. 53. 58. N.

KREMS, a town of Austria, seated on the Danube, 35 miles west of Vienna. Long. 15. 40. E. Lat. 48. 18. N.

KREUTZENACH, a town of Germany, in the circle of Lower Rhine, with a castle, on an eminence. It was once an imperial city, and is seated on the Nahe, 20 miles S.W. of Mentz.

KRUMLAW, a town of Germany, in Moravia, 50 miles S.W. of Olmutz. Long. 16. 49. E. Lat. 48. 46. N.

KRUTZOW, a strong town of Lithuania, seated on the Soz, 30 miles S.W. of Mozeislav. Long. 32. 4. E. Lat. 54. 30. N.

KRYLOW, a strong town of Poland, in the palatinate of Kiof, seated on the Dnieper, 140 miles S.E. of Kiof. Long. 33. 30. E. Lat. 48. 50. N.

KUBESHA, a strong town of Asia, in the country of the Lelguis, situate on a hill, between high mountains. Its inhabitants call themselves Franki (Franks, a name common in the east to all Europeans), and relate, that their ancestors were brought hither by some accident, the particulars of which are forgotten. The common conjecture is, that they were cast away upon the coast; but others say, that the Greeks and the Genoese carried on, during several centuries, a considerable trade, not only on the Black Sea, but on the Caspian, and were acquainted with the mines contained in these mountains, from which they drew, by their trade with the inhabitants, great quantities of silver, copper, and other metals. In order to work these upon the spot, they sent hither a number of workmen, to establish manufactures. The subsequent invasion of the Arabs, Turks, and Moguls, during which the mines were filled up, and the manufactures abandoned, prevented the strangers from effecting their return; so that they continued here, and formed a republic. What renders this account the more probable is, that they are still excellent artificers, and make very good fire arms, fabres, coats of mail, and several articles in gold and silver, for exportation. They have, likewise, for their own defence, small copper cannons, of three pounds calibre, cast by themselves. They coin Turkish and Persian silver money, and even rubles, which readily pass current, because they are of the full weight and value. In their valleys, they have pasture and arable land, as well as gardens; but they purchase the greater part of their corn, trusting chiefly for support to the sale of their manufactures,

which are much admired in Turkey, Persia, and the Crimea. They are generally in good circumstances, and are a quiet inoffensive people, but high spirited and independent. Their town is considered as a neutral spot, where the neighbouring princes can deposit their treasure with safety. They elect yearly twelve magistrates, to whom they pay unlimited obedience; and, as all the inhabitants are on a footing of the most perfect equality, each individual is sure to have, in his turn, a share in the government. In 1725, their magistrates acknowledged the sovereignty of Russia, but without paying any tribute. Long. 67. 59. E. Lat. 42. 30. N.

KUFSTEIN, a strong town of Germany, in the Tyrol, with a castle, on a rock. It is seated on the Inn, 46 miles S. by E. of Munich. Long. 12. 5. E. Lat. 47. 26. N.

KUHLSCHEIM, or KULTZHEIM, a town of Germany in the electorate of Mentz, 32 miles E.N.E. of Heidelberg.

KUNERSDORF, or CUNNERSDORF, a town of Upper Saxony, in the Middle Marche of Brandenburg, near which the King of Prussia was defeated by the Russians, in 1759. It is three miles E.N.E. of Francfort on the Oder.

KUR, a river of Persia, which rises in mount Caucasus, and passing by Teflis, falls into the Caspian Sea.

KURSK, a government of the Russian empire, formerly part of that of Bielgorod. Its capital, of the same name, is seated on the Tukur, which falls into the Seine or Sem.

KUSISTAN, or CHUSTAN, a province of Persia, bounded on the north and east by Irac-Agemi, on the south by Faristan, and on the west by Irac-Arabia. Sufter is the capital.

KUTTENBERG, a town of Bohemia, seated near a mountain, remarkable for its silver mines, 35 miles S.E. of Prague. Long. 15. 37. E. Lat. 49. 56. N.

KUTTORE, a country of Asia, between the N.E. part of Cabul, and the N.W. of Cashmere. The Mahometans call it Caferistan, or the Land of Infidels. It has a town and fortrefs of the same name, 100 miles N.E. of Cabul, and 280 N.W. of Lahore. Long. 70. 17. E. Lat. 35. 27. N.

KUYNDER, or FORT KUYNDER, a sea-port and fortrefs of the United Provinces, in Friesland, situate on the west side of the river Kuynder, at its entrance into the Zuyder Zee, 23 miles south of Lewarden. Long. 5. 24. E. Lat. 52. 50. N.

KYLBURG, a town of Germany, in the electorate of Treves, seated on the Kyll, 16 miles N.W. of Treves. Long. 6. 17. E. Lat. 50. 1. N.

KYNETON, a town in Herefordshire, with a good trade in narrow cloth, and a market on Wednesday. It is 15 miles N.W. of Hereford, and 149 W.N.W. of London. Long. 2. 50. W. Lat. 52. 12. N.

KYNETON, a village in Somersetshire, N.E. of Somerton. It is naturally paved, for half a mile, with one smooth rock, which looks like ice.

L

L A A, **LAAB**, or **LAHAB**, a town of Germany, in Austria, seated on the river Teva, twenty-seven miles N. W. of Vienna. Long. 16. 9. E. Lat. 48. 48. N.

LABADIA, a strong town of Italy, in the peninsula of Rovigo, subject to the Venetians. It is seated on the river Adige, twenty miles N. W. of Ferrara. Long. 11. 54. E. Lat. 45. 39. N.

LABIA, a town of Turkey in Europe, in Servia, sixty-two miles S. W. of Nissa.

LABOUR (*Encycl.*). The price of labour has at all times varied; and, as the poorer classes feel with additional rigour every evil arising from the pressure of the times, different expedients have been devised, with a view to alleviate their burthens, supply their wants, and render them more comfortable.

From these investigations, it appears that, in the middle of the 14th century, the usual price of labour was 2d. per day; and wheat was sold at from 3s. 4d. to 4s. per quarter.

In the middle of the 15th century, the pay of a labourer per day was 3d.; and wheat cost from 5s. to 5s. 6d. per quarter.

In the earlier part of the 16th century the price of labour rose to 3½d. and that of a quarter of wheat to 7s. 6d. About the middle of the 17th century, the pay of a labourer, upon an average, was (in Essex) 13d.; and corn had risen to 40s. per quarter.

Toward the latter end of the 18th century, the daily pay of a labourer was from 14d. to 18d. in the country, and from 2s. to 2s. 6d. in the metropolis; while the price of wheat was 48s. per quarter.—We forbear to state the average pay of labour during the late exorbitant prices of grain, and every other article of food; when all proportion between merit and reward appeared to have been suspended.

The payment of daily wages, however, serves but imperfectly to ascertain the real price of labour, as a considerable portion of work is performed by the piece; so that a labourer in general earns from 3d. to 6d. per day more than by the common pay. For, without this, or some similar method, the reward of labour would be inadequate to the maintenance of those numerous persons who possess no other means of providing for their infirm wives, or helpless children. And we conceive, that if their wages could be so regulated as to rise and fall with the price of wheat, considerable benefit would thus result to society.

The rapid increase of poor-rates throughout the kingdom can be attributed only to the low and insufficient recompence of labour, in consequence of which the poor are obliged to resort to the parish for relief. Indeed, when the average price of wheat for the last ten years is considered, we presume not to exceed the limits of moderation in saying, that no country labourer, in the full possession of his health and strength, ought to be paid less than the value of a half-peck loaf per day, according to the price of wheat, and a proportionable sum by piece-work. In populous towns, however, an addition of twenty per cent. should be allowed, if vegetables and butchers' meat are sold at the present unreasonable prices.

The curious and philanthropic reader, who feels an interest

in this popular enquiry, will be fully gratified by a perusal of Mr. Davies's "Cate of Labourers in Husbandry stated and considered, &c." and Sir F. M. Eden's "State of the Poor, &c." in which the situation of the labouring classes is clearly developed.

By the 2d and 3d Edw. VI. c. 15, all labourers who combine or conspire together concerning their work or wages, incur a penalty of 10l. for the first offence, which sum is doubled in case of repetition; and if the money be not paid, they are to be set in the pillory. Justices of the peace, and the stewards of courts leet, &c. are likewise empowered by the 4th Edw. IV. c. 1, to hear and determine all complaints relative to the non-payment of labourers' wages; which, by the stat. 5 Eliz. c. 4, are to be annually settled for every county by the sheriffs and justices of the peace, in every Easter session, and in corporations, by the chief magistrates, under certain penalties in case of neglect. And such assize, when made, is ordered by the 1 Jac. I. c. 6. to be proclaimed.

Besides these laws in behalf of the labouring classes, others have been enacted for the benefit of the employer. Thus, by the stat. 4 Eliz. all persons who are fit for labour are compellable to serve by the day during the season of making hay and the corn-harvest; but those labourers who have obtained proper testimonials, are permitted to go into other counties. It is further provided, that such labourers, from the middle of March to the middle of September, ought to work from five o'clock in the morning till seven or eight at night, being allowed two hours for breakfast and dinner, and half an hour for repose during the three hottest months; in the other six months of the year they are obliged to work from twilight to twilight, excepting one hour and a half for breakfast and dinner, on the penalty of forfeiting one penny (at present it should be two pence) for every hour's absence.

An excellent mode of encouraging labour amongst the poor, is the distribution of bounties on their earnings. The following account of a plan for allowing the poor a bounty on their work, by Thomas Hall, esq. is published by the Society for bettering the Condition of the Poor.

"In my neighbourhood, in Hampshire," says Mr. Hall, "there has been for near twenty years back, a bounty allowed the poor on their work; which has been found to produce very good effects in the increase of industry. In this way the sum of 3s. a-week, thus dispensed by the overseers in the aid and encouragement of the industry of a family of six persons, has, as a bounty on work, eventually produced them the comfortable income of 9s. a-week; whereas, in the common mode, 3s. a-week would have gone but a very little way to their maintenance. By the advice of a manufacturer, the bounty is now proportioned to each shilling earned; so as to apply to the quality of the work, as well as to the quantity."

OBSERVATIONS.—It is presumed that in this manner great part of the able-bodied poor might be supported at half the expence that is now incurred on their account; and that better order and regularity would be kept up among them, and the national stock of industry increased. The plan is simple and easy in its execution; and the meanest cottage may, by the bounty proposed, become a working house for

one family, so long as it is wanted.—We cannot help making an observation, connected with this subject, as it relates to industry and the encouragement of it, that if parish certificates were granted for a limited period, as for two or more years, there would be eight or ten granted under such a limitation for one that is granted in the present mode; and thereby the number of industrious people in the nation would be much increased, it being found that certificated labourers are in general more active and industrious than settled inhabitants, resident in their own parishes. See the articles, CHARITY, HOUSE OF INDUSTRY, POOR, &c.

LABOURD, a late territory of France, part of that of Basques. It abounds in fruit, and the inhabitants are said to be the first that went to fish for whales. It is now included in the department of the Lower Pyrénées.

LACK, or **BISCHOF'S-LACK**, a town of Germany, in Carinthia. Here is a great deal of iron, steel, quicksilver, and corn; and a large quantity of linen is sent hence to Fiume and Trieste. It is 26 miles west by north of Laubach, and 35 north of Triest. Long. 14. 7. E. Lat. 46. 31. N.

LADOGA, a lake in Russia, between the gulf of Finland and the lake of Onega. It is 150 miles long and 90 broad, and esteemed to be the largest lake in Europe. Among the fish with which it abounds are seals. It is full of quicksands, which, being moved from place to place by the frequent storms, cause several shelves which often prove fatal to the flat-bottomed vessels of the Russians. This induced Peter the Great to cut a canal 67 miles in length, from the S.W. extremity of this lake to the river Neva, by which it has a communication with the gulf of Finland.

LAGNASCO, a town of Piedmont, 24 miles south of Turin.

LAHN, a river of Germany which rises in Hesse Cassel, and flowing by Marburg, Wetzlar, and Nassau, falls into the Rhine, above Coblenz.

LAHORE, a province of Hindoostan Proper, bounded on the west by Candahar, on the north by Cashmere, on the east by Sirinagur and Delhi, and on the south by Moultan. It is often called Panjab, or the country of Five Rivers. It is very extensive and remarkably fertile; affording, in addition to all the necessities of life, wine, sugar, and cotton wood. In the tract between the Indus and the Chelun are salt-mines, wonderfully productive, and affording fragments of rock salt, hard enough to be formed into vessels, &c.

LAHR, a town of Westphalia, in the bishopric of Munster, 12 miles N.W. of Munster.

LAHR, a town of Germany, in the principality of Nassau-Saarbrück Ufingen, 18 miles S.S.E. of Straßburg, and 19 N. of Friburg.

LAIRNO, a town of Naples in Calabria Citeriore, near a river of the same name. Long. 16. 11. E. Lat. 31. 25. N.

LAJOON, a town of Persia, in the province of Mezanander, near the coast of the Caspian Sea, 20 miles E. of Resht.

LAITCHEOU-FOU, a city of China, in the province of Chang-tong, with a convenient harbour on the Yellow Sea. Its jurisdiction contains two cities of the first, and five of the third class.

LALAND, a small island of Denmark, in the Baltic, lying south of Zealand, from which it is separated by a narrow channel. It is fertile in corn, with which it supplies Copenhagen. Naxkow is the capital.

LALANG, an island near the north coast of the island of Sumatra, in the straits of Malacca. Long. 99. 20. E. Lat. 1. 45. N.

LAMA (*Encycl.*). The following curious account of the ceremonies employed at the burning of the body of a deceased

Lama, among the Calmuc Tartars, which never before appeared in English, was written by Mr. Nitschmann, who attended Professor Pallas, of Peterburgh, during his travels through the Russian empire, as draftsman; and who made a drawing on the spot, from which the engraving (see Pl. 36.), representing the chief part of the scene, was executed.

In the year 1772, the chief lama of the Derbet horde of the Calmucs, on the Wolga, named Abagai, died at his residence not far from Sarepta, in the ninety-fourth year of his age, after a tedious illness. When this event was made known, all the *Labuns*, or *Gellongs*, that is, priests, then present, assembled to deliberate how they should dispose of the body, according to the rules prescribed in their sacred books; and an account of this remarkable death was immediately transmitted to the prince of the horde, Zebek Ubuchfi, and to his ministers. He was visited also by all the priests, who requested that he would order the one next in rank to the deceased to repair to his late residence, for the purpose of carrying into execution the command of the sacred books. This office fell to the lot of Samptan, or Dajantshi lama, who had received the latter title of honour on account of his having lived in a monastery, or hermitage, till he had attained to that rank. Early in the morning, next day, he set out for Sarepta with a numerous train of priests, as the intended successor of the deceased lama.

As on such occasions each priest receives a considerable part of the property left by the deceased lama, the number assembled was exceedingly great; so that, in the course of a day and a half, above seventy gellongs, and many others of inferior rank, were collected. For those of the highest rank a sufficient number of horses, partly saddled and partly unsaddled, were provided and distributed among them according to their dignity. There was also plenty of sheep and other animals, intended to be killed for food. The Dajantshi lama then called the priests together to regulate the funeral ceremonies. For that purpose the sacred books, which had till that period been kept closely shut up, were produced; and after all the circumstances attending the lama's death, together with the time, had been compared with the rules in these books, it was concluded that the body should be burnt.

The place appointed by the new lama for performing the ceremony was the Moo-Chammur, or summit of a sandy hill, near Sarepta; from which the hut of the deceased, where strict guard was kept to prevent any one from approaching it, was distant only a few hundred paces. The foundation of a furnace was then accurately measured out by the lama himself; and the earth was dug up with great care and solemnity by the gellongs and priests; for no person of any other condition durst put a hand to the work. During this labour the lama, accompanied by the most distinguished of the priests, returned to the habitation of the deceased, where they sat down in a circle, and prayed from books with great earnestness and fervour. While they were thus employed, the deceased was stripped of his usual clothing, and his yellow ornaments, *jamou chubzsums*, were put upon the body; together with a yellow lacerated five-pointed crown, called *col-mala-chai*. His throne, on which he had breathed his last, with a devout benevolent aspect, sitting cross-legged, with his hands folded, was raised up, and after his wide yellow drefs had been spread out around it, he was suffered to remain in that state. The entrance of the habitation was covered by a particular kind of curtain, and guards were placed on each side to prevent the common people from looking in when the priests entered or went out.

In the mean time the prayers were continued at intervals; and, on a certain signal being given, the people assembled without were suffered to go in one by one, uncovered, in or-

der that they might pay their last respects to the deceased, by kneeling and touching his yellow robe with their foreheads. As the number collected was, however, too great, the new lama at length went out, and bestowed his benediction on all those within his reach, by laying his *rosary (chen)* on their heads; but as the throng around him increased more and more, he distributed a general benediction among the whole multitude, by waving the rosary, after which he returned to pray with deep sighing and sobbing. Such of the people as had not obtained the lama's benediction, showed their respect and veneration by walking round the hut of their deceased, and as it were deified lama; and counting their beads amidst continual sighs, while they repeated by way of prayer, the monosyllables *om ma ni pat me chang*; and every now and then, in going round, threw themselves down, with their faces towards the earth, before the door of the hut.

After some time two singular figures, made of dough, were brought out from the hut, on wooden trenchers, and borne towards the place defined for the furnace. They had each two legs and two arms; but, in other respects, they bore a greater resemblance to devils than to men.

While prayers were performing in the hut of the deceased, the rest of the priests sat together in circles, dispersed here and there, filled with conformation, and viewing attentively what was going on. A deputation, appointed by the new lama, made a distribution to the priests, according to their rank, of the cattle and other property left by the deceased; and, by command of the prince, six hundred rubles, in ready money, were collected from the horde, to defray the expence of the funeral, and to be divided among the priests.

The four sides of the foundation, dug for the furnace, in which the body was to be burnt, were directed towards the four cardinal points. On the north, south, and east sides, large fire holes were dug, and covered towards the side of the furnace with earth, that the wood might lie under the covering, and not within the furnace itself, to prevent any of the ashes of the wood from being mixed with the ashes of the body. The bottom was then constructed of tiles, which had been conveyed on horseback by gellongs from the distance of some versts; and, instead of lime, clay was employed to cement them. When the furnace was raised about a foot above the earth, a large iron tripod, made for the purpose, was fixed in the middle of it, and one of the gellongs immediately placed himself in the furnace, cross-legged, on the tripod, in order to try whether it would answer the intended purpose. A kind of hut was then erected around the furnace with poles, which were covered up to the top with pieces of old felt. This hut was about eighteen or twenty feet in height; and at the top was a large opening, to afford a passage to the flame and the smoke.

All the priests who were present, after viewing the furnace, went in procession, accompanied by the new lama, to the habitation of the deceased, where the fifteen priests who were to officiate put on the dresses peculiar to their office. This dress consisted, first, of a sort of shirt, called *bishkan mujak*, which the priests use instead of breeches and stockings. It is worn next the skin, and is gathered in plaits, and fastened round the middle by means of a broad girdle. Over this was put the *shih-tsi chubzusun*, which is a short red shirt without sleeves, and open at the breast; also the *gikh mujak*, a piece of red cloth placed around the body in folds above the first short *mujak*, and fastened by means of a red sash; the second *mujak* must hang down almost to the heels. The chief lama alone had a *jumohn chubzusun*, or red shirt, with short sleeves, which was fastened by means of a broad yellow girdle. In the last place all of them had a *tychogh chubzusun*, or large

square piece of silk, which, except a border two spans in breadth, consisted of red and yellow patches, four inches square, disposed chequer-wise. Some, however, had this piece of silk entirely yellow. It was thrown over the shoulders, so as to reach the ground behind; and the two corners of it before were fastened over each other on the breast. The arms, head, and legs, during the ceremony, were bare; and each had wound his rosary around his arm; all which gave them a very terrible appearance.

After they had put on their dress, a certain kind of vessel, called *ordu churachik*, was brought forth, and put into the hands of the *Bakshi*, or instructing priest, who walked next to the lama; and who, instead of the variegated piece of silk, had one entirely red. Another small metal vessel, of costly workmanship, containing sacred water, mixed with spices and sugar, and ornamented at top with a very beautiful peacock's feather, was delivered to the lama, and borne by him at the head of the procession. Eight of the gellongs, dressed as above described, supported the bier, and the other five had in their hand each a bell. The habitation of the deceased was torn open behind with the utmost expedition, and the body, after the large yellow silk cloth suspended from its shoulders had been thrown entirely over it, and the high-spiked crown had been put on its head, was taken out, and placed, in a sitting posture, on a bier made for the purpose. The bier was borne by the eight gellongs, and the procession moved towards the furnace in the following order: first, the lama, then the *bakshi* after him the dead body, then the five gellongs with their bells, and, in the last place, the remainder of the music and the people. During the procession the lama, every now and then, dipped the peacock's feather in the sacred water, and sprinkled it every-where around him.

The instruments of music, besides the bells, were three long copper trumpets, which emitted, at most, two or three bass notes, and which followed behind. They were full three yards in length, and therefore were suspended by rings to two poles, and, in that manner, carried by two men. There were also four drums suspended from a pole; and two musicians, with brass cymbals, which were beat in the same manner as the Turkish.

The people, who had assembled in crowds on all sides, were kept off by priests appointed for that purpose, and armed with strong cudgels. As soon as the procession reached the furnace, the musicians placed themselves in a semicircle before the entrance of the hut, and made a loud noise with their instruments. The body of the deceased lama was then carried with great speed into the hut, and placed on the tripod, after the crown and yellow covering had been taken from it. Both these articles were afterwards conveyed back, with the same procession and music, to the habitation of the new lama. The next operation was to complete the construction of the furnace, which was done with great privacy. Two pieces of iron were put round the neck of the deceased, projecting so far on each side, that the ends of them could be built into the wall. These served to keep the body upright in the midst of the fire. The top of the furnace was arched in a sloping manner over the head of the dead body; and on the west side, where there were no fire-holes, a square opening was left at top, through which, while the body was in a state of combustion, tallow and other inflammable substances were poured. The wood destined for fuel was all cut exactly of the length of the fire-holes, and a great quantity of butter, incense and resin, was intermixed with it. Near the furnace was placed a kettle, in which the butter was melted with the other ingredients; and on both sides of the furnace there were small altars, covered, as usual, with sacred vessels and lamps. A

Burying the dead body of a Lama.

magnificent throne was prepared on the west side for the officiating lama; and, when every thing was ready, the lama put on the yellow wrapper of the deceased, placed his crown on his head, and seated himself on the throne. The gellongs, who had laid aside their sacerdotal habits, and assumed their usual dress, sat down in a circle around him. Each had a bell in his left hand, and a book lying before him, on his knees; and on a signal given by the lama, the small lamps on the altar, and the wood in the three fire-holes of the furnace, were immediately lighted. The two figures of dough already mentioned appeared also on one of the altars. The fire was lighted about seven o'clock in the evening, amidst prayers, singing, and the noise of bells and musical instruments, which was sometimes interrupted by conversation between the lama and the bakichi, respecting some passages of the sacred books. The priests who kept guard were, in the mean time, strictly forbidden to suffer any person to peep in through the holes in the tent. Wood was continually thrust into the fire-holes; and the lama, by means of a ladle with a long handle, furnished at the fore part with small spouts, poured some of the grease which stood near him through the aperture upon the body; by which means the fire was so strengthened, that the flames rose in a continued column to the height of eighteen or twenty feet above the furnace. It was found necessary, therefore, to enlarge the aperture in the top of the tent, to prevent it from being destroyed. The gellongs also, were soon obliged to stand so far back, that every thing which took place within the tent, or hut, could be plainly seen. At certain times the lama threw the bark of trees, daubed over with resin, and pieces of consecrated white silk, into the top of the furnace; and as he was exposed to great heat by standing so near it to pour the fat over the body, a screen was held constantly before his face by one of the gellongs, which secured him from the flames, but permitted him to see the aperture in the top of the furnace. The prayers offered up in the Tangut language, while the body was burning, became always longer, and were uttered with a louder tone of voice. They were intermixed with the ringing of bells, the clapping of hands, snapping of fingers, thrusting the fingers through each other, and then drawing them back, great contortion of the eyes and face, and various movements of the head.

This formidable fire was kept up for three hours, after which the furnace was suffered to stand some hours to cool. One can scarcely believe with what strength the fire was maintained by the air which passed through the furnace; and the different aromatic substances which were thrown into it prevented any disagreeable effect from the smoke, or the smell of the body. Next morning, when the furnace had cooled, it was opened with great secrecy, under cover of the tent, and the body, shrivelled like a mummy, being taken out, was divided in portions among the priests. Some of the poor people also, who were able to force their way through the crowd, obtained small bits of the little which was left. This burnt substance of the lama's body (*lamain-djinder*) is considered by the superstitious people, as a sacred medicine; and it may therefore be said, that the lama is gradually consumed by his own worshippers.

This mode of burning the body produces scarcely any ashes, as the skin, flesh, and bones, are so baked, by continually pouring fat over it, that the whole mass has the appearance of a cinder, and is equally friable. The few ashes, however, which remain, are carefully scraped, together with the ashes in the fire-holes, and are preserved by the priests. After the furnace was opened, it was entirely raised to the foundation, and not a single stone of it left. All the materials were carried in a cart to the other side of the Wolga,

where the horde at that time resided. All the four corners of the spot where the furnace had stood, high flags (*moni*) were erected; and at the end of some weeks, when the horde returned to the district of Sarepta, a small stone chapel was constructed in the middle of the four flags, and filled in the inside with inscriptions, images, rags of old clothes, and the like, and surrounded by a ditch. This formed the conclusion of the whole ceremony.

LAMBALE, a town of France, in the department of the North Coast. It is the chief town of the late duchy of Penthièvre, and gave the title of princeps to the unfortunate lady who was massacred at Paris, in 1792, for her inviolable attachment to her unhappy mistress, the late queen of France. Lambale has a good trade in cattle, linen, and parchment, and is 37 miles N.W. of Rennes. Long. 2. 21. W. Lat. 48. 27. N.

LAMBESC, a town of France, in the department of the Mouths of the Rhone, nine miles N. of Aix. Long. 5. 31. E. Lat. 43. 40. N.

LAMBETH, a village in Surrey, on the Thames, opposite Westminster. Here the Archbishop of Canterbury has an ancient palace. By the vast increase of buildings, Lambeth is now joined to the metropolis, in a direction to each of the three bridges. Here is a manufacture of artificial stone, which answers every purpose of stone carving, and extends, not only to statues from the finest models, but to every kind of architectural ornaments. Here likewise are extensive works for vinegar and home-made wine, a patent shot manufactory, and numerous timber yards, supplied with almost incredible stores of foreign timber.

LAMBORN, a town in Berks, with a market on Friday; seated on a river of the same name, seven miles N. by W. of Hungerford, and 68 W. of London. Long. 1. 26. W. Lat. 51. 30. N.

LAMEGO, a town of Portugal, in Beira, with a bishop's see, and a strong citadel. It contains two cathedral churches, an hospital, four convents, and about 4500 inhabitants. In this town the states assembled to confirm the election of Alfonso Henriquez, the first king of Portugal, and enacted the fundamental laws, now forgotten. It is 50 miles N. of Lisbon. Long. 7. 30. W. Lat. 41. 12. N.

LAMLASH, a town of Scotland, on the east coast of the isle of Arran, situate on a bay to which it gives name, and which, Mr. Pennant says, forms the safest harbour in the universe, with depth of water for the largest ships.

LAMMERMUIR, a mountainous ridge in Scotland, which divides the county of Berwick from that of Haddington for above twenty miles. These mountains are bleak and barren, affording but scanty pasture for sheep. Scoura Hill is the most elevated of this ridge.

LAMO, a kingdom and island of Africa, on the coast of Melinda, between the island of Pate and Cape Formosa. Its capital, of the same name, is well fortified. The king and government being Mahometans, are frequently at war with the rest of the inhabitants, who are pagans. In 1580, the king of this island, being accused by the Portuguese of having betrayed the governor of the coast, was seized with four of his subjects, in his own capital, and carried to Pate, where they were publicly executed, in the presence of the king of that island, and of several kings of the neighbouring islands; ever since which, Lamo has been tributary to the Portuguese.

LAMPEDOSA, a desert island on the coast of Tunis, 12 miles in circumference. It is 50 miles from Tunis, and 112 from Malta; and has a good harbour, where ships water. Long. 11. 0. E. Lat. 36. 10. N.

LAMPASAC, an ancient town of Natolia, with a Greek

archbishop's fee. It is now an inconsiderable place, seated on the sea of Marmora, six miles from the Dardanelles. Long. 27. 20. E. Lat. 40. 12. N.

LAMPSPRINGE, a town of Lower Saxony, in the bishopric of Hildersheim, situate at the source of a small river, called Laine, 17 miles south of Hildersheim.

LANCASTER, a town of Pennsylvania, 41 miles long and 40 broad. In 1790, it contained 36,147 inhabitants.

LANCASTER, the capital of a county of the same name, in Pennsylvania. Besides its churches, and other public buildings, it contains a college founded in 1787, and named Franklin college, after the late Dr. Franklin. It is a place of considerable trade, seated on the Conestogo Creek, near the river Susquehanna, 66 miles W. by N. of Philadelphia. Long. 76. 17. W. Lat. 40. 2. N.

LAND (*Encycl.*) The following account of "*A Method of gaining Land from the Sea*," by the Rev. Henry Bate Dudley, of Bradwell Lodge, in the parish of Tillingham, is inserted in the Transactions of the Society for the Encouragement of Arts, Manufactures, and Commerce; who conferred on the ingenious and enterprising writer their gold medal.

"A tract of land," says Mr. Dudley, "which I inclosed on the same line of coast within this parish about eleven years ago, being already under a profitable course of tillage, I was induced to undertake the present inclosure as a lessee of the collegiate estate of St. Paul's. The front line of embankment against the sea is nearly one mile in length, and, with the returning banks on each wing to the old wall, forms an inclosure of contents, as expressed in the certificate already in your possession. The whole of the embankment is composed of earth alone, borrowed from the irregular salting land in the front, called *chatts*, and taken at the limited distance of twelve feet from the base of the new work, to leave a sufficient foreland for its protection. I found, from experience, in my former embankment, that I had not given it a sufficient angular declension in front, for an easy ascent and descent of the waves. This error was therefore corrected in the last work. I began it on a base of thirty-two feet, and wrought it to the height of seven feet, leaving it a plane of five feet on the top, and making the land-side of the embankment as nearly perpendicular as the security of the base would allow.

"Within, on the land side, is cut a ditch, twelve feet wide, five feet deep, and four feet at bottom; the earth from which was thrown into the mound. My former sea-embankment, in Bradwell parish, had nearly given way to the great inundating tide of February, 1792, from this erection of new earth being made on the surface. To guard against similar danger in the present work, a spit-deep trench, six feet wide, was previously cut along the centre of the whole line, on which the mound was to rest; this, by admitting the new earth into an incorporative adhesion with the base soil, renders a future separation almost impossible. Before this, the main rills had been filled and rammed, to give these parts equal solidity with the rest.

"The whole operation was performed by a gang of twelve sea-wallers, with barrows and planks only, at 11. 10s. the marsh-rod, of twenty feet, and perfectly inclosed in seven months; but it must be observed, that the soil, composed of rich vegetable matter, is without one particle of stone or gravel, and cuts with iron-edged scoop-tools, so as to load the barrows with great facility. At each end of the front line is laid an out-fall gutter, or sluice, through the whole embankment, five feet in width, by three feet deep, clear in the run; and another of smaller dimensions in the centre, for discharging the land-waters freely to sea. The construction of these aqueducts is too well known to require further description here; probably, however, the little addition given to

those erected on this occasion may be found of some use. Observing it often happen, that, either from accident or design, the outward lid of the sea-slucices remained open, and admitted the tide to the great injury of the fresh waters within the marshes, I introduced here a light fly-lid within the centre of each sluice, which is out of reach, and yields to the slightest pressure of the water going out; but shuts closely against that of the tide, when it passes inward of the external flap. These sluices are laid upon as solid a foundation as can artificially be made on such soils, to prevent the crabs, and other sea-fish, from undermining them, which must otherwise be the case. The frame and flooring are of fir, which lies under water as durable as oak.

"The land thus inclosed is partitioned into four nearly equal parts, by new-cut ditches, twelve feet wide, five deep, and four at the bottom, which, with small intersecting rills, from various parts, give the whole a good drainage of its salts, on the fall of heavy rains: and, by a course recently made from a distant brook, each division of this land is now amply supplied with fresh water. Not less than 800 South-Down sheep, and from sixty to eighty horses, are almost constantly grazed, and even winter thereon remarkably well. The established opinion of the best farmers of the country was, that land, thus taken from the sea, would not grow corn under thirty years at least after their inclosure. But as no experiment had been made, by which this fact could be clearly ascertained, as soon as I had shut out the sea from a part of it, about six yards square were immediately dug, and sown with horse beans and oats, which, though the summer proved very dry, and consequently unfavourable, produced each a fair return of sound good corn; and the last harvest the same spot being sown with wheat, yielded an excellent crop. The next spring I mean to try it with barley and turnips. My first inclosed lands in this parish have produced two succeeding crops of fine oats, and are now growing to a very promising breadth of rape feed.

"It may here be remarked, that the lower oozy parts of the new inclosure, on which no vegetable ever grew before, begin to be coated with various grasses; and as the saline parts die away in other spots, for want of their natural moisture, fresh grasses replace them, so that the whole is now nearly covered with grazing plants of good quality, amongst which appear the different *clovers*, *trefoil*, and *rye-grass*, &c. Hence I conclude, but contrary to the general opinion, that though all these grew artificially from seed sown, it does not follow of necessity that they cannot be produced without. I think that the natural operation of the sun and air upon certain soils will alone effect it; and my experience in lands taken from the sea confirms very strongly this opinion."

The Rev. J. H. Wright, in a certificate, which accompanies the above account, alleges that the Rev. Henry Bate Dudley had completed an embankment, with all the sluices and other necessary works appertaining thereto, and had thereby effectually obtained 206 acres of land from the sea, which he had subdivided by twelve-foot ditches into four spacious marshes. For other means by which this important object may be effected, see **EMBANKMENT**, *Supp.*

LAND for Cottagers. The following extract from an account of the advantages of cottagers renting land, by the earl of Winchelsea, is published by the Society for bettering the Condition of the Poor.

"Upon my estate in the county of Rutland," says his lordship, "there are from seventy to eighty labourers, who keep from one to four cows each. I have always heard that they are hard-working industrious men. They manage their land well, and pay their rent very regularly. From what I have seen of them I am more and more confirmed in the opi-

nion I have long held, that nothing is so beneficial both to them and to the land owners, as their having land to be occupied either for the keeping of cows, or as gardens, according to circumstances.

"By means of these advantages the labourers and their families live better, and are consequently more fit to endure labour; they are more contented, and more attached to their situation, and acquire a sort of independence, which makes them set a higher value upon their character. In the neighbourhood in which I live, men so circumstanced are almost always considered as the most to be depended upon and trusted: the possessing of a little property certainly gives a spur to industry; as a proof of this, it has almost always happened to me, that when a labourer has obtained a cow, and land sufficient to maintain her, the first thing he has thought of has been, how he could save money enough to buy another; and I have almost always had applications for more land from those people so circumstanced. There are several labourers in my neighbourhood, who have got on in that manner, till they now keep two, three, and some four cows, and yet are

amongst the hardest working men in the country, and the best labourers.

"With regard to the profit they make of a cow, those who manage well might, as the prices of the market were two or three years ago, have cleared twenty pence a-week*, or 4*l.* 6*s.* 8*d.* per ann. by each cow; supposing the rent of the land, levies, expences of hay-making, &c. to cost them 4*l.* exclusive of house-rent. This clear profit, over and above rent, &c. may now be set at 2*s.* a-week, or 5*l.* a-year at least; so as to make the whole 9*l.* a-year, on a supposition that all the produce is sold. Whether, however, this calculation is too low, or how it is, I cannot say; but certainly those who have a cow, appear to be (in comparison with those who have none) much more than 2*s.* per week richer. It may probably be owing to the superior industry of those families.—I must observe, that they keep sheep during the winter upon their cow pasture, at the rate of two, and in some cases three, at 2*s.* 6*d.* each, for each cow-pasture. This is included in the above estimate of profit. The skim-milk is also valued. Some of them, where the land is not

* "The profit of a cow to a family of the description in question, is stated by Lord Winchelsea at only 1*s.* 8*d.* a-week; but the value of a cow, supposing her to give only six quarts of milk a-day (which must be allowed to be a low average, if the cow be properly kept), will be worth, at a penny a quart, 3*s.* 6*d.* a-week, or 9*l.* 2*s.* a-year; setting the profit of the calf against the loss sustained while the cow is dry. Three acres of land, of the quality of 30*s.* an acre, will in general keep a cow in good condition the whole year, by admitting about an acre to be parted off, for mowing in the summer, to furnish a little hay for the winter: to this rent must be added, for tithes and parochial rates, perhaps, 14*s.* more, making the whole charge 4*l.* 4*s.* which is not half the value of the produce; and if a further allowance be made for the labour attending the object, there will still be left at least 30 per cent profit; and in every other article of a cottager's consumption, he is obliged to purchase at 30 per cent loss. But, when it is considered that milk is the natural food for children, that it is of a nutritious quality, and that, where there is a cow, a pig is generally an appendant to her, the advantage is ineffimable!" Mr. Kent (who makes the foregoing remarks) has been for many years so impressed with the propriety and good policy of this plan, that he has never failed of giving it all the encouragement he possibly could; and flatters himself, that, in the different estates which he has had the regulation of, with the assistance of his partners, Messrs. Claridge and Pearce, they have been instrumental in establishing a great deal of real comfort; but no where upon so extensive a scale, as in the course of the last year, upon the great property of the Earl of Egremont in Yorkshire. His lordship, who is considered not only as one of the most liberal encouragers of all rational experiments in agriculture, but a steady friend to the working farmer and industrious labourer, gave them, on this occasion, *carte blanche*; and their feelings were highly gratified, in being able to accommodate a considerable number of men, of the description in question, with the means of supporting their families, in a much more comfortable manner, than they were before enabled to do. This seems to be the true and best exercise of power; and when it is further considered, that much good may often be done, merely by parting off a few acres from a large farm, or by breaking up one farm out of twenty, which may frequently be done, without injury to any person, it is rather a matter of surprise, that this thing is not oftener done than it is! But though the before-mentioned plan is confessedly good, it is very often defeated for want of capital in the cottager, which has induced him to recommend another scheme for keeping cows for them, in his opinion, preferable to the former, as it may have a more general tendency to improvement, and does not require any capital, nor is attended with any risk. The hint is taken from the western dairies. In most parts of Wiltshire and Dorsetshire, there are few farmers but what let off a dairy, upon the following plan:—The farmer finds, keeps, and renews a certain number of cows to a sub-tenant, at a fixed price, generally from five to six pounds a cow yearly, allowing the calf into the bargain. The management of the dairy is done by the sub-tenant.—Why should not every farmer, in a less degree, accommodate such of his labourers as have a family of children in the same way? There is no farmer, but has some land better adapted for cows than for any other stock; there is no farmer, but keeps two or three cows for his own family.—Why should he not keep one or two in addition for his labourers? The wife or daughter of the labourer would milk them, without being attended with any inconvenience. The farmer would run no risk, as the rent of the cow might be stopped out of the labourer's weekly pay. No loss could be sustained, as he could not make a better return from any other stock than this. The power of doing good in this way, without losing any thing by it, is offered to every farmer; and the great objection to cottagers keeping cows, namely, that of their injuring the farmers' fences by running in the lanes, is, by this mode of letting, done away. As to the allowance that should be made, we would propose that it should be 2*s.* a-week, the year round, besides the farmer's retaining the calf. This would certainly be better for a poor man, than even renting land; for, as was observed before, no money would be requisite in the first instance.—The milk of the cow would be more certain, by her being more regularly kept, and having greater scope and change of food; and no time in mowing and making hay for her, would be lost by the labourer. The public is indebted to Mr. Kent for a valuable work, entitled, "Hints to Gentlemen of landed Property," in which, above twenty years ago, he pointed out the disadvantages to which cottagers are subject in the purchase of all the necessary articles of life, the want of proper habitations for them, and the expediency, not to say necessity, of gentlemen of fortune paying more attention to the situation of the labourers, who work on their estates.—See p. 228 of Mr. Kent's book to the end.

good, do not pay so much. I put down 4*l.* supposing the land * tolerably good; and it is certainly more advantageous to them to occupy good land at a high rent, than poor land at a low one. They all agree, that two cows are more than twice as profitable as one; particularly where the suckling of calves is the system pursued. The generality of the people near me suckle calves; some make butter, and a few make cheese; some buy the supernumerary lambs of the farmers, and rear them by hand; and where they have more than one or two cow-gates, stock with sheep at the rate, in summer, of three for a cow-gait. Those who have families, and only one cow, generally make butter for the sake of having skim-milk for their children, which is an article rarely to be obtained by the poor. When a labourer has the offer of a cow-gait, and land for winter provision, and has not money enough to purchase a cow, he generally applies to his employer, who will, in all probability, advance him some money; and the inhabitants of the parish, if the man has a good character, frequently subscribe to set him up, from charitable motives, and from a persuasion that by this means his family will never want relief from the parish: and this is so much the case, that when a labourer dies, and his son takes his land and stock, he in some cases maintains the widow †. I know of several instances of labourers' widows, now past work, who are maintained by their sons, but could not otherwise have lived without parish relief.

“When a poor man's cow dies, it is certainly a great distress; and sometimes the owner is obliged to ask assistance to replace her. Somehow or other, they always contrive to get one; as I scarcely ever knew a cow-gait given up for

want of ability to obtain a cow, except in the case of old and infirm women, who are left without children: for they cannot, without some assistance, live upon the profits of a cow, nor can they manage it properly. Should a case of this sort occur, the parish officers would act very unwisely in refusing assistance, as a very trifling allowance, together with the cow, would enable a woman to live; whereas, by refusing any assistance, they oblige the woman to part with her cow, and then the mistress have her whole subsistence from them.”

To what is here said on a subject which we have also urged under the articles *COTTAGER* and *Cow* (*Supp.*), the following observations are annexed.

“When a labourer is possessed of cattle, his children are taught early in life the necessity of taking care of them, and acquire some knowledge of their treatment; and, if he has a garden, they learn to dig and weed, and their time is employed in useful industry, by which means they are more likely to acquire honest and industrious habits, than those who are bred up in the poverty and laziness which we too often see; for I believe it is a certain fact, that extreme poverty begets idleness.”

“In the neighbourhood of large towns, and in countries where there is hardly any thing but arable land, the value of grass land is too great to allow of labourers renting it with advantage †; a garden, however, may be allotted to them in almost every situation, and will be found of infinite use to them. In countries, where it has never been the custom for labourers to keep cows, it may be difficult to introduce it; but where no gardens have been annexed to the cottages, it is sufficient to give the ground, and the labourer is sure to

* The quantity of land, which is let for the support of a cow in this county, varies much according to the goodness of the land. In one parish, the cow-pasture, which contains 114 acres, feeds during the summer 100 cows; in another it contains forty-two acres, and feeds seventeen cows; in another thirty-five acres, and feeds twenty-five cows. The price varies much; but, in general, the cottager can afford to pay as much as the farmer can, or, in my opinion, ought. In another parish there is no cow-pasture; but the cottagers have inclosed land, some having fields to themselves, others uniting, and grazing, and manuring two fields alternately: the rents in all these cases varying according to the quality of the land, the quantity assigned to them, and the time when they were first let. The cottagers, whose cows have the run of a cow-pasture, have small fields for hay: these also vary much in quantity and quality, and consequently in price. Where the quantity of land is more than is requisite for their cow, or cows, they keep sheep of their own, or let the pasture to a butcher. Where there is no meadow land, which is the case in one parish near me, they have fields of about six acres of ploughing ground, where they raise winter provision for the cow.—The rent of the new-built cottages is from 2*s.* to 3*s.* for the house, and 5*s.* for the garden, which is about a rood of land, and frequently not so much.

† In the parish of Burley, and the two adjoining parishes of Hambledon and Eggleton, where there are a great number of labourers who keep cows, the rate collected for the relief of the poor last year did not on an average amount to 6*d.* in the pound. No rents are better or more regularly paid on my estate, than those for the cottagers' land. There has not been, for several years back, any arrear of them.—In these parishes there are several labourers with very large families, and several aged persons past work, who must have had relief from the parish if they had not cows: they do not receive any parochial aid; the sums raised for the relief of the poor, in those parishes, being for those who, from various circumstances, are not possessed of cows. The lowness of the rates, in these instances, may therefore be fairly imputed to the custom of letting land to labourers.—With regard to the amount of the poor's rate, the best way to judge of the management of the poor, is to ascertain the number of inhabitants, and the annual sum raised for the poor: this will shew what proportion of these persons can maintain themselves, and what are paupers. The following is an account of the number of inhabitants, and of the sums raised for the poor, and also of the amount of the poor's rate per pound, in these three parishes, from Easter, 1796, to Easter, 1797.

	Number of inhabitants.	Sums raised for the poor.	Amount in the pound.
Burley	225	38 12 1	33 <i>d.</i>
Eggleton	144	15 11 5	43 <i>d.</i>
Hambledon	335	74 16 6	62 <i>d.</i>
	740	129 0 0	

‡ As land cultivated as a garden will produce a greater quantity of food for man than in any other way, and as four fifths of the labour bestowed upon their gardens will be done by the labourers at extra hours, and when they and their children would otherwise be unemployed, it may not be too much to say, that 100,000 acres, allotted to cottagers as garden ground, will give a produce equal to what 150,000 acres cultivated in the ordinary way would give; and that, without occupying more of the time they would otherwise give to the farmers who employ them, than the cultivation of 20,000 acres would require.

know what to do with it, and will reap an immediate benefit from it. Of this I have had experience in several places, particularly in two parishes near Newport Pagnell, Bucks, where there never had been any gardens annexed to the labourers' houses, and where, upon land being allotted to them, they all, without a single exception, have cultivated their gardens extremely well, and profess receiving the greatest benefit from them.

"Those very small spots of a few square yards, which we sometimes see near cottages, I can hardly call gardens: I think there should be as much as will produce all the garden stuff that the family consumes, and enough for a pig with the addition of a little meal. I think they ought to pay the same rent that a farmer would pay for the land, and no more. I am persuaded that it frequently happens, that a labourer lives in a house at 20s. or 30s. a-year, which he is unable to pay, to which, if a garden of a rood was added, for which he would have to pay 5s. or 10s. a-year more, that he would be enabled, by the profit he would derive from the garden, to pay the rent of the house, &c. with great advantage to himself.

"Whoever travels through the midland counties, and will take the trouble of enquiring, will generally receive for answer, that formerly there were a great many cottagers who kept cows, but that the land is now thrown to the farmers; and if he enquires still further, he will find, that, in those parishes, the poor's-rates * have increased in an amazing degree, more than according to the average rise throughout England. It is to be hoped, that as the quantity of land required for gardens is very small, it will not excite the jealousy of the farmers."

That exemplary, and truly benevolent prelate, the bishop of Durham, has also given an account of three cottagers keeping cows, and renting land in Rutlandshire.

"Among the cottagers," says the bishop, "on Lord Winchilsea's estate in the county of Rutland, which I have very lately visited, I have selected for the society three examples of the benefit of cottagers renting land. They are as follows:

1. "A day labourer, his wife, and eight small children.
2. "An old man of fourscore, and his wife of nearly the same age.
3. "The first and second of these families have each two cows, and the old single woman has one cow, with land to keep them on. They have each of them gardens. With this benefit, and that of his labour, the day labourer has bred up ten children, two of which are put out to service; and he is now maintaining himself, his wife, and his other eight children, without any call for parochial relief. The two old people cannot make any thing of their labour; but yet, with the benefit of their cow and garden, and the exertions which these call forth, and with a little occasional assistance that the old man and his wife receive from their son, and which the other old woman has from her younger neighbours, they all appear to enjoy much more comfort than old age in general possesses. They satisfied me that, but for the cow and the garden, they could not have subsisted without parochial relief.

"I have selected these three examples, from many similar ones on the same estate, in proof of the utility of the measures, which Lord Winchilsea has adopted for the benefit of his cottagers. There are two circumstances which I learnt upon enquiry, and which I think will shew that the benefit I have stated, was not local or partial, but diffused over his estate; one, that the rate collected for the relief of the poor, in his three parishes, is not so much, on an average, as an annual six-pence in the pound; the other, that his cottagers' rents (for their cottages and little closes of ground) are, of all his rents, the earliest and best paid; and that there has been no arrears of them for several years.

"There was an air of content and gratitude marked in the countenances, and expressed in the language of all the cottagers, that convinced me that what had been done for them by their landlord, had not only made them more happy, and improved their means of subsistence, but that it had produced very beneficial effects on the heart and the morals. The advantages, however, are not confined to the poor man and his family; they extend to the parish, and prevent its being burthened with a heavy poor's-rate; and to the community at large, on account of the children of the lower classes of the people being educated in habits of industry and good order; and having, at an early age, a spirit and energy infused into them by the examples of their parents; which teach them that their best and surest dependence, in future life, will be on their own exertions and good conduct for the maintenance and welfare of themselves and their families."

LANDAU, a town of Germany, in the circle of Upper Rhine, 12 miles N. of Waldeck, and 34 S.E. of Paderborn.

LANDAU, a town of Lower Bavaria, situate on the Isar, 32 miles W. of Passau. Long. 12. 41. E. Lat. 48. 32. N.

LANDERON, a town of Switzerland, in the principality of Neuchâtel. In 1707 this town refused to acknowledge the King of Prussia for sovereign, and was reduced by force of arms. It is situate at the S.W. extremity of the lake of Bienné, seven miles N.E. of Neuchâtel, and nine S.W. of Bienné.

LANDES, a department of France, including the late territory of Marlian. It takes its name from a district called Landes, extending along the coast of the bay of Biscay. It is a barren sandy country, covered with fern, pines, and the holm-tree, of the bark of which corks are made. Mount-de-Marian is the capital of this department, and Dax the episcopal see.

LANDRIANO, a town of Italy, in the Milanese, 11 miles S.S.E. of Milan.

LANDSBERG, a town of Bavaria, near the river Lech, 23 miles S. of Augsburg.

LAND'S-END, a promontory of Cornwall, the most westerly point of Great Britain, and a vast aggregate of moorstone. Long. 5. 40. W. Lat. 50. 6. N.

LANDSCHUT, a town of Silesia, in the duchy of Schweidnitz. It has a flourishing linen trade, and is seated on the Zelder, 12 miles W. of Schweidnitz.

LANDSCHUT, a town of Lower Bavaria, with a strong castle, on an adjacent hill. It is seated on the Isar, 35 miles N.E. of Munich. Long. 12. 10. E. Lat. 48. 30. N.

* In the Dillorn inclosure act, passed in 1781, there is a clause for securing to cottagers, in fee-simple, houses built by them upon the waste, with the gardens belonging to them, and also for securing to them an estate for one, two, or three lives, in the inclosures previously made by them on the waste, not exceeding two acres. This clause was suggested by a principal proprietor, Mr. Holliday of Lincoln's-Inn, from whom we learn, that the custom of joisting the cottager's cow is prevalent in that parish; and the rent is usually made up out of the extra wages during harvest. Mr. Holliday has declared that, during the sixteen years that have passed since the inclosure, there has been hardly any instance of a cottager, who kept a cow, standing in need of, or seeking relief from the parish.

LANDSCHUT, a town of Moravia, seated on the Morava, on the confines of Hungary and Austria.

LANERK, a borough in Lanerckshire, seated on the Clyde, 20 miles S.E. of Glasgow. Long. 3. 49. W. Lat. 55. 40. N.

LANGANICO, the ancient Olympia, a town of Turkey in Europe, situate on the small river Carbon, the ancient Alpheus. Here anciently the famous Olympian games were celebrated. It is 32 miles S.S.E. of Chiarenza, and 60 S.W. of Corinth.

LANGÉAC, a town of France, in the department of Cantal, seated near the Allier, among mountains, 17 miles E. of St. Flour. Long. 3. 35. E. Lat. 45. 5. N.

LANGENTHAL, a town of Switzerland, in the canton of Berne. Here are three great annual fairs, at which great quantities of linen, as also cattle, cheese, and grain, are sold. Near the town are some medicinal springs. It is 10 miles E. of Soleure, and 18 N.E. of Berne.

LANGOGNE, a town of France, in the department of Lozere, 21 miles N.E. of Mende, and 33. W. of Privas. Long. 3. 45. E. Lat. 44. 44. N.

LANGON, a town of France, in the department of Gironde. It is noted for excellent wine, and seated on the Garonne, 15 miles N. of Bazas. Long. 0. 10. W. Lat. 44. 33. N.

LANGPORT, a town in Somersetshire, with a market on Saturday. It is seated on a hill, by the river Parret, which is navigable for barges to Bridgewater. It is 10 miles S.E. of Bridgewater, and 128 W. by S. of London. Long. 3. 0. W. Lat. 51. 0. N.

LANGUAGE (*Encycl.*). It appears to be not without the most powerful reasons, that a general custom of a great part of Europe has devoted a considerable portion of the time allotted to education to the study of languages; for, besides the convenience and pleasure of being enabled to comprehend and appropriate, without difficulty, the ideas of writers of various nations in their original purity, it is impossible to learn a language without gaining a variety of other knowledge connected with that of words; without learning to make logical and metaphysical distinctions on the most substantial grounds; and without acquiring a taste for the beauties, and sensibility to the perfections, of the works of genius, which must necessarily be studied in order to attain a familiarity with that language. Unfortunately, indeed, men are too prone to mistake the means for the end, and to devote such a degree of attention to the form of expression, as is only due to the beauty or deformity of the sense; and that pedantry, which always accompanies a little mind, has been most conspicuously exhibited in verbal scholars. But there is a point of view in which every language may be considered, which renders it an object highly worthy the attention of a philosophical observer. The different character of each language, their general derivation, dependence, and connection; the progress of the primitive expression of an idea through different forms and modifications; the various metaphysical relations which are more or less openly expressed or implied in a sentence; and other historical and critical enquiries of this kind, still leave a wide field of research open to those who are disposed to cultivate it. Considerable progress has already been made by M. Court de Gebelin, Professor Buettner, Mr. Horne Tooke, and Professor Hunter; and two other gentlemen might be named who promise to add much to our knowledge of the affinity of languages in general; and it is to be hoped, that successive attempts will extend our views of the subject as far as our means of information will allow. A perfect language should be capable of expressing every possible idea, and combination of

ideas, accurately and concisely: but if we compare any existing language with this model, we shall find great imperfections in both these respects; but more particularly in point of conciseness; for imaccuracy is generally precluded by a disproportionate prolixity. The same test will apply to the delineation of a language by written characters; and here we have the greatest reason to complain, in most languages, of innumerable inaccuracies. No man of cool judgment would attempt to introduce a general philosophical language into common use; for when a country is once enlightened and civilized, its language, in all essential points, is unalterably fixed; and no literary authority is powerful enough to increase or diminish it, excepting technical terms, by a single word; as, on the other hand, it is equally vain for the pedantry of fashionable fools to endeavour to give currency, in elegant conversation, to such terms, for words they are not, as a quiz, a gig, a bore, and a row. But it may be worth while to attempt a comparative view of the degrees in which various languages approach to the standard of perfection in point of conciseness; and it is remarkable, that the English seems to be the least objectionable of all in this respect; unless perhaps the Hebrew, considered without points, may be reckoned more simple. For, in fact, the immense mass of concordances, declensions, conjugations, and inflections, with which the memory and patience of many a poor school-boy is overpowered, is entirely composed of so many pleonasm, which add nothing to the sense but an unnecessary repetition of an unimportant idea; although, like many other amiable weaknesses, they are admired as elegancies; especially, when by the capricious inventions of the poets, they are rendered, in some degree, subservient to perspicuity. "The scorching sun," in English, is equally expressive with the corresponding expression in Greek, Latin, Italian, or French, where the idea of the masculine gender is not only unnecessarily, but falsely added to each of two or more words; or, in German, where the feminine gender is, with equal impropriety, applied as often. In speaking of "a handsome girl," the idea of the female sex is repeated in most languages; in German that of neutrality is added, with the same impropriety as frequently occurs in Greek and Latin. But the German, by sometimes omitting, and sometimes repeating the ideas of gender and case implied in the termination, render their language exceedingly complicated; for when several adjectives come together, they sometimes add the form of case and gender to each; and sometimes make the first the only echo, leaving the remainder in a kind of indifferent state with respect to both. The conjugations of verbs, as far as they express person and number, add no new limitation to the sense; and the English auxiliaries define the time of an action with far more accuracy than the more complicated temporal terminations in other languages. Not but that the English have pleonasm in this respect too; "he give" would be as intelligible as "he gave;" and "you loves I," and "I loves you," inelegant as they appear, are yet more truly logical than the received expressions. But as it is impossible to accommodate actual language to rules perfectly analogous, all these defects must, in practice, be tolerated; although it is absolutely necessary to pay regard to them in every metaphysical analysis of the nature and construction of languages. The imperfections of written characters are productive of more serious inconvenience, as they greatly and unnecessarily increase to foreigners the difficulty of learning any modern language. The least imperfectly delineated language is, perhaps, the Italian; next the Spanish; then the German; the French; and, last of all, the English; which is more irregular in its orthoepy, than, perhaps, any other language that ever existed. There is reason to suppose that

the Greeks and Romans deviated but little from an uniform pronunciation of similar characters. The evil is, perhaps, too inveterate to admit a radical cure; not so much from any essential difficulty, as from the inconveniences of a change; but certainly some very considerable palliatives have lately been administered; and it is to be hoped, that when the formation of articulate sounds shall have been more attentively examined, it may be, in great measure, practicable to describe the found of every word with perfect accuracy.

Another superfluity in many languages is the use of a *sub-junctive mood*, which is conceived to signify a kind of contingency that still requires an auxiliary particle to define it. It is certain, that no rule has ever yet been laid down which will sufficiently limit every case of its application; and for a very obvious reason, that the best authors have never been perfectly consistent in their use of the moods. But it is presumed, that a rule may be given which approaches very nearly to the practice of correct writers; and which may, in every case, be followed with perfect safety and elegance. It is, to confider it simply as a future tense following a conditional particle. A few examples will make this rule more intelligible than a prolix explanation would do. 'If the Elbe "is," now open, we shall soon have the mails; and then, if there "be" any news from the army, I will send it you immediately.' If Catiline "was" generous, it was in order to serve his ambition.' 'If it "were" not certain that some men of good sense maintain the nineteenth century to have commenced, it would appear utterly incredible that to simple a question could admit of dispute,' &c.

LANJAN, or LANCHANG, a city, and the capital of the kingdom of Laos, at least of the southern part, to which it gives name. It is the usual residence of the king, whose palace is of vast extent. The houses of the grandees and persons of condition are lofty and elegant; but those of the inferior people are no better than huts. The priests alone have the privilege of building their houses and convents with brick and stone. Lanjan is situate on the W. side of the river Mecon, 400 miles N.N.W. of Cambodia. Long. 101. 38. E. Lat. 18. 30. N.

LANION, a town of France, in the department of the North Coast. Its trade consists in wine and hemp, and it has some mineral waters. The inhabitants of Lanion, Guingamp, and the environs, speak the Welsh language, which was probably brought hither by the Britons, who took refuge in these parts, in the fifth century. Lanion is 15 miles W. of Treguier.

LANNŌY, a town of France, in the department of the North, five miles S.E. of Lille.

LANSINBURGH, a town in the state of New York, formerly called the New City. It stands on the east side of Hudson's River, opposite the fourth branch of Mohawk River, nine miles N. of Albany.

LANZO, a town of Piedmont, on the river Stura, 12 miles N.W. of Turin. Long. 7. 28. E. Lat. 45. 9. N.

LAPELA, a town of Portugal, in Entre Douero e Minho, seated on the Minho, 13 miles E. of Valenço do Minho.

LAR, a town of Persia, in the province of Laristan, with a castle. It carries on a great trade in silk. Long. 52. 45. E. Lat. 27. 30. N.

LARACHA, a strong town in the kingdom of Fez, seated at the mouth of a river of the same name, with a good harbour. It was once in possession of the Spaniards, but the Moors took it from them. Long. 5. 59. W. Lat. 35. 40. S. LARGENTIÈRE, a town of France, in the department of Ardèche, 18 miles S.W. of Privas. Long. 5. 11. E. Lat. 44. 32. N.

LARGO, a town of Scotland, in Fifeshire, situate on the

north coast of the frith of Forth, in a large bay to which it gives name. It is six miles S. of Cupar.

LARISTAN, a province of Persia, which lies N. of the gulf of Persia. It abounds in oranges, lemons, and very large tamarinds. Lar is the capital.

LARNE, a town of Ireland, in the county of Antrim, situate at the mouth of a river of the same name, eight miles N. of Carrickfergus, and 16 N.E. of Antrim. Long. 5. 43. W. Lat. 54. 51. N.

LARNIO, a sea-port on the S. coast of Cyprus, the see of a Greek bishop, and the residence of several European consuls. It is 30 miles S.W. of Famagusta.

LARVIGEN, or LAURVIGEN, a sea-port of Norway, capital of a county to which it gives name. It is a place of considerable trade, and its iron-works are esteemed among the most valuable in Norway. It is 55 miles S.S.W. of Christiania. Long. 16. 15. E. Lat. 59. 3. N.

LASNEBOURG, a town of Savoy, in the county of Maurienne, on the Arc, at the foot of Mount Cenis, the passage of which is the principal import of the inhabitants. The fun is hidden from the inhabitants of this town by the mountain during two months of the year: 20 miles N.N.W. of Susa, and 23 miles E. of St. Jean-de-Maurienne.

LASSA, or LAHASSA, the capital of the country of Great Thibet, in Asia. It is not a large city; but the houses are of stone, and are spacious and lofty. About seven miles on the east side of the city, is the mountain of Putala, which contains on its summit the palace of the grand lama, the high-priest and sovereign of Thibet. Lassa is 24 miles N.E. of the crossing place of the river Sanpo, which is seven miles from the foot of Mount Kambala; and it is 850 miles N. by E. of Calcutta. Long. 91. 40. E. Lat. 30. 34. N.

LATACUNGA, a town of South America, and principal place of a jurisdiction of the same name, in the audience of Quito, containing 10,000 inhabitants. This town was destroyed by an earthquake in the year 1698, and great numbers of the inhabitants were buried in the ruins; 50 miles S. of Quito.

LATAKIA, formerly LAODICEA, an ancient and considerable town of Asia, in Syria, with a harbour, bishop's see, and beautiful remains of antiquity. It is become the most flourishing place on the coast, and is 75 miles S.W. of Aleppo, and 245 N. of Jerusalem. Long. 34. 30. E. Lat. 35. 40. N.

LATTON, a village in Essex, between Epping and Harlow. It had once a priory of Augustine monks, whose church, now used for a barn, stands about three miles S. of the parish church. Latton is about 21 miles N. by W. of London.

LAVAL, a considerable town of France, in the department of Maine and late province of the same name. It has been recently erected into a bishopric, suffragan to Rennes. The inhabitants are computed at 24,000. Linen of all kinds and qualities is manufactured here; and the neighbouring quarries produce green marble, or black, veined with white. It has two castles, and is seated on the river Maine, 15 miles S. of the town of that name, and 40 W. of Mans. Long. 6. 42. W. Lat. 48. 7. N.

LAVAMUND, or LAVANT MANDE, a town of Germany, in Carinthia, with a castle, and a bishop's see. It belongs to the archbishop of Salzburg, and is seated on the river Drave, 40 miles E. of Clagenfurt. Long. 15. 18. E. Lat. 46. 44. N.

LAVAU, a town of France, in the department of Tarn and late province of Languedoc. Before the revolution it was a bishop's see; and it is seated on the river Agout, 20 miles N.E. of Toulouse. Long. 1. 52. E. Lat. 43. 40. N.

LAUBACH, a handsome and strong town of Germany, in Carniola, with a bishop's see, and a castle. It is seated on a

river of the same name, in which are the largest crawfish in Europe, 32 miles S. of Clagenfurt, and 155 S. by W. of Vienna. Long. 14. 25. E. Lat. 46. 24. N.

LAUDA, a town of Germany, in the bishopric of Wurtzburg, 18 miles S.W. of Wurtzburg. Long. 9. 45. E. Lat. 49. 28. N.

LAUDER, a borough of Scotland, in Berwickshire; a small town, but lately much improved. Near it, is Lauder Castle, 22 miles S. of Edinburgh. Long. 3. 5. W. Lat. 55. 39. N.

LAVELLO, an ancient town of the kingdom of Naples, with a bishop's see; 30 miles E. by N. of Naples. Long. 15. 55. E. Lat. 41. 5. N.

LAVELT, or LAELT, a village in the bishopric of Liege, near Maestricht, remarkable for a battle gained here by the French in 1747.

LAUENSTEIN, a town of Upper Saxony, on the margrave of Meissen, 18 miles S. of Dresden. Long. 13. 45. E. Lat. 51. 42. N.

LAUFEN, a town of Germany, in the duchy of Wirtemberg, seated on the Neckar, 10 miles S. of Hailbron. Long. 9. 25. E. Lat. 49. 3. N.

LAUFEN, a town of Switzerland, in the canton of Basle, seated near the river Birs, 12 miles S.W. of Basle.

LAUFEN, a village of Switzerland, in the canton of Zurich, three miles S. by W. of Schaufhausen. Here is a celebrated cataract of the Rhine; the perpendicular height of which is 50 or 60 feet, and the breadth 300.

LAUFFENBURG, a strong town of Suabia, and one of the four Forest-Towns, with a ruined castle. It belongs to the house of Austria, and is seated on a rock, on the Rhine, which divides it in two parts. Here is a small cataract, noted for the beauty of the scenery. It is 17 miles E. of Basil. Long. 8. 2. E. Lat. 47. 35. N.

LAUGHTON, a village in the W. riding of Yorkshire, on a high hill, six miles E.S.E. of Rotherham. It is noted for its church, whose tower and spire are not excelled by any Gothic piece of the kind; and it is seen, in some places, at the distance of 60 miles.

LAVIGNA, a town of Italy, in the territory of Genoa, at the mouth of a river of the same name, eight miles from Rapallo.

LAUINGEN, a town of Suabia, formerly imperial, but now subject to the duke of Neuburg. It is seated on the Danube, 32 miles N.W. of Augsburg. Long. 10. 25. E. Lat. 48. 38. N.

LAUNU, a town of Bohemia, near the river Eger, 27 miles N.W. of Prague. Long. 14. 20. E. Lat. 50. 21. N.

LAUREATE (*Encycl.*). Degrees in grammar, which included rhetoric and verification, having been anciently conferred in our universities, that circumstance has occasioned much confusion, and has led some writers too hastily to suppose that persons were invested with the office of poet laureat, who, in truth, had no claim to it. A wreath of laurel being presented to the new graduate on taking his degree, he was afterwards frequently styled *poeta laureatus*; and this scholastic laureation certainly gave rise to the appellation by which the

court poet was distinguished. The king's poet laureat, therefore, strictly speaking, is only a graduate rhetorician, employed in the service of the king.

On this subject, Fuller (in his *Worthies of England*, c. x. p. 27.) makes the following observation: "As for our English poets, some have assumed unto themselves the title of English poets, as John Kay, in his dedication of *The Siege of Rhodes* to King Edward the Fourth, subscribing himself his *humble poet laureat*. Others have, in compliment, given the title to such persons as were eminent in that faculty; and nothing is more usual than to see their pictures before their books, and statues on their tombs, ornamented accordingly. However, all this is done by civil courtesy, or common custom; no ceremonious creation in court or university."

So early as the thirteenth century, *Henry d'Avranches*, a Frenchman (*Henricus Abrincensis*), was entertained by our Henry III. as a poet attached to his court; and under the title of "Master Henry the versifier" received from that monarch an annual stipend, which seems to have been ten pounds a-year.

In the 36th year of the same king's reign (1252), forty shillings a-year and a pipe of wine were granted to *Richard*, the king's harper; which perhaps gave rise, at a subsequent period, to a similar bounty to the poet laureat.

Gulielmus Peregrinus, who composed a poem on the crusade of Richard I. appears to have been the royal poet of that time; and *Robert Baskon*, whom Ball calls *poeta Oxonii laureatus*, and whom Edward II. carried with him to the siege of Stirling-castle, to record his Scottish exploits in verse, may be considered as exercising the same office under that monarch. Of these versifiers, as they were then called, the compositions produced in their character of poets laureat were in Latin.

Chaucer, perhaps, in the time of Edward III. and Richard II. as a poet, and as receiving a royal pension, not without a due allowance of sack; and in the time of Henry IV. *Henry Scogan*, master of arts, who, if we may credit *Ben Jonson*, made disguises for the king's sons, and wrote in fine tinkling rhyme and *flowand wofe*; may with sufficient propriety be enrolled in the same tuneful and honourable band: yet neither these poets nor *Gower*, though two of them were afterwards enumerated in Dryden's patent, as having worn the laurel, were ever regularly and expressly appointed to this office; nor does the title of *poet laureat* occur earlier than the time of Edward IV., to whom *Jon Kay* (*Caius*), about the year 1470, dedicating a prose translation of a Latin history of the Siege of Rhodes, styles himself *hys humble poet laureate*. None of his poetry, however, either in Latin or English, is known to be extant.

Andrew Bernard, a Frenchman, and an Augustine monk, who was blind, was successively poet laureat and historiographer to Henry VII. and Henry VIII. and was living in 1522.

In 1489, *John Skelton* was laureated as a rhetorician at Oxford, and a few years afterwards was permitted to wear the laurel publicly at Cambridge. Previously to which he had been honoured by Henry VII. with a grant to wear either some peculiar dress, or some additional ornament on his ordi-

* Fuller (*Worthies*, ubi sup.) asserts, that till the time of his writing (about 1660), there was no regular appointment of a poet laureat. "There want not those," he observes, "who do confidently aver that there is always a laureat poet in England, and but one at a time; the laurel importing conquest and sovereignty; and so, by consequence, solennity in that faculty; and that there hath been a constant succession of them at court, who, beside their salary from the king, were yearly to have a tun of wine, as very essential to the heightening of fancy." This last is founded on what we find given to *Geoffrey Chaucer*, *Vigesimo secundo anno Richardi secundi, concessum Guillelmo Chaucer unum dolium vini per annum durante vita in porta civitatis London, per manus capitulis pincerna noster*. But Chaucer, besides his poetical accomplishments, did the king service both in war and peace, as soldier and ambassador, in reward whereof, this and many other boons were bestowed on him.

mary apparel. That he was poet laureat to Henry VIII. may be presumed from the titles of some of his works, but there is not sufficient proof of his ever having received an annual salary, which is a criterion for forming a conjecture, at least, concerning the possession of the office, for none of the persons who may be considered as filling the station before Dryden, except Andrew Bernard, are expressly denominated *poets laureate* in any authentic record.

Thomas Churchyard, a voluminous poetaster in the time of Queen Elizabeth, in consequence of having addressed many of the noblemen of her court for near 40 years, in such rhymes as he could spin, is called by one of his contemporaries *the old court poet*; this has given rise to a conjecture that he was peculiarly countenanced and patronised by the queen, and formally placed at the head of the poetical band of that time; but, undoubtedly, Elizabeth had no poet laureat till in February, 1590-1, she conferred on *Edmund Spenser* a pension of 50*l.* a-year; from which time to his death, in 1598-9, he may properly be considered as filling the office, though not expressly styled *Laureat* in his patent.

Samuel Daniel has been represented by Anthony Wood, and others, as the next successor to the laurel, but he never was thus honoured; for from the death of Spenser to the year 1616 the poetical throne was vacant, though in that period *Daniel*, *Jonson*, *Dekker*, and others, furnished the court with pageants and masques, and may, during that interval, be considered as *volunteer laureates*. About four months before the death of Shakspeare, January 1, 1615-16, King James granted to *Ben Jonson* a pension of one hundred marks a-year (66*l.* 13*s.* 4*d.*) during his life, "in consideration of his good and acceptable services past and future;" a grant which invested him with all the dignity and functions of poet laureat. This consideration, however, is common to many other crown grants not conferred on poets; nor did any patent expressly mention the duty and peculiar services expected from a poet laureat, before that of Charles I. to the same person; in which the character and functions of this office are, for the first time, specifically pointed out. On the 23*d* of April, 1630, that King, "in consideration of good and acceptable services done by the said Benjamin Jonson, and especially to encourage him to proceed in those services of his wit and pen which we have enjoined unto him, and which we expect from him," was pleased to augment his annuity of one hundred marks to one hundred pounds per annum, during life, payable from the preceding Christmas. Old Ben had not long before been struck with the palsy, on which account, perhaps, as well as to gratify his well-known propensity, his majesty, by the same instrument, granted him a tierce of Canary wine yearly, during his life, out of the royal cellars at Whitehall.

It has been generally supposed that Sir *William d'Avenant* succeeded to the bays immediately on Jonson's death, in August, 1637; but he then received no favour from the crown. About sixteen months afterwards, December 13, 1638, letters patent passed the great seal, granting an annuity of one hundred pounds a-year to the said William d'Avenant, during his majesty's pleasure. By this patent no Canary wine was given, nor is any mention made of the office of poet laureat, or the duties belonging to it.

In 1670, some time after the death of Sir William d'Avenant, Dryden was made poet laureat by letters patent, and held the office till he was compelled to forego it in consequence of the revolution.

On the 29*th* of August, 1689, he was succeeded by *Shadwell*.

Shadwell's successor was *Nahum Tate*, December 23*d*, 1692, with an annual pension of one hundred pounds, and a butt of Canary wine.

VOL. X.

On the death of Tate, 1716, the laurel was given to *Rewie*; who dying in December, 1718, the Rev. *Laurence Eustien* was, in the following year, invested with this office.

On the death of Eustien, September 27, 1730, *Colley Cibber* was appointed poet laureat. His reign extended to the end of the year 1757.

To him succeeded *William Whitehead*, who dying April 14, 1785, the Rev. *Thomas Warton* obtained the laurel, which he held for five years.

Shortly after his death, which happened May 21, 1790, *Henry James Pye*, esq. was appointed poet laureat, and now fills the poetical throne.

There is no grant in the chapel of the rolls, constituting Rowe poet laureat. The practice of conferring this office by a warrant signed and sealed by the lord chamberlain, nominating A. B. to the office, with the accustomed fees thereunto belonging, then commenced, and has prevailed from that time to the present.

LAURINGEN, a town of Germany, in the bishopric of Wurzburg, 24 miles N.W. of Bamberg, and 30 N.E. of Wurzburg. Long. 10. 21. E. Lat. 50. 5. N.

LAURVIG, a town of Norway, in the province of Aggarhuus, 55 miles S. of Christiania. Long. 10. 15. E. Lat. 59. 3. N.

LAUTERBRUNN, a village of Switzerland, six miles S. of Interlaken. It is seated in a valley of the same name, celebrated for its picturesque and romantic scenery. See **STAUBBACH**.

LAUTERBURG, a town of Western Prussia, in the palatinate of Culm, 50 miles N.E. of Thorn.

LAUTERBURG, a town of Germany, in the circle of Upper Rhine, but subject to the French. It is 10 miles S.E. of Weissenburg. Long. 8. 26. E. Lat. 48. 48. N.

LAUTERECK, a town of Germany, in the circle of Upper Rhine, and county of Veldenz, situate on the Glan, 24 miles N. of Deux Ponts, and 46 S. of Coblenz. Long. 7. 17. E. Lat. 49. 39. N.

LAUZERTE, a town of France, in the departments of Lot and Garonne, 15 miles N.E. of Marmande. Long. 9. 22. E. Lat. 44. 58. N.

LAWRENCE, *St.* the largest river of North America, proceeding from Lake Ontario, from which it runs 700 miles to the Atlantic. It is navigable for large ships of war, as far as Quebec, which is above 400 miles; but beyond Montreal, it is so full of shoals and rocks, that it will not admit large vessels without danger. It is here called the *Iroquois*.

LAXENBURG, a town of Austria, with a palace, where the princes of the house of Austria go for pleasure. It is seated on a small river, 10 miles S. of Vienna. Long. 16. 28. E. Lat. 48. 5. N.

LAYBACH, a town of Carniola, on a navigable river of the same name, 28 miles N.E. of Trieste. Long. 14. 32. E. Lat. 46. 12. N.

LAZZARONI, a peculiar description of the lowest class of people, that have, for a number of years, constituted a very singular, as well as a very considerable, part of the poor of Naples. Their origin, which is but little known, is said to be as follows: the romantic and enterprising Duke of Guise, who defended the city of Naples against the Spaniards for a long time with very inadequate forces, tells us, in the third book of his *Memoirs*, that two secret enemies of his, "*Genaro* and *Vincenzo*, cherished underneath the aversion the rascality had for the better sort of citizens, and civiler people, who, by reason of the insolencies suffered from them, justly hated them. The latter of these, by whom the greatest part of the Virgin's suburbs was inhabited, were called *black-cloaks*, and the ordinary sort of people took the name of *Lazares*, at

the beginning of the revolutions; as the revolvers in Flanders formerly had done that of *beggars*, those of Guienne that of *eatres*, those of Normandy of *barefoot*, and of Beaulieu and Soulogne of *wooden pattens*." The Lazzaroni's quondam opponents, the *black-coats*, and all the others, are now completely blotted out of the remembrance of men, but they still survive, and were never more conspicuous, nor of more importance, than in the present era, after the lapse of a century and half. Titles, similar to those above, in times of public disorder, have been assumed by combinations of the lower classes of society in almost every age, but have seldom long survived their existence who originally constituted those confederacies. Perhaps in another century the *Chouans* and the *fans culottes* will be as little talked of in the districts which gave them birth as are now the *barefoot* and the *wooden pattens*.

LEA, a river which rises near Luton in Bedfordshire, flows to Hertford and Ware, and dividing Essex from Hertfordshire and Middlesex, falls into the Thames below Blackwall. By this river large quantities of corn and malt are brought out of Hertfordshire to London.

LEAD (*Encycl.*). Though we have spoken fully on the nature, qualities, and chemical combinations of this metal, under the articles LEAD and CHEMISTRY, and also under ACETITE in this Supplement, the following extracts from a Memoir on the Preparation of Sugar, or Acetite of Lead, by Citizen Marchais, which was read before the Société Académique des Sciences, in France, seem to deserve notice in this place.

"Machy," says he, "the only French author who has given circumstantial details concerning this manufacture, has represented it as being so difficult in the execution, that its success cannot always be certain. Those who have written since this author, have either added nothing to our knowledge, or have at least not been able to determine what was good in the ancient processes, and what might be proper to be added to them; neither have they pointed out the grounds of the superiority of one process over the other, as they were unable to determine the theory of the operation in a clear manner, the evidence of which was supported by facts. Basil Valentin, and Isaac the Hollander, who are mentioned as the first who gave an account of the action of vinegar upon lead, and the salt thereby produced, required for that purpose much less science, and were obliged to make much fewer experiments than were afterwards required, in order to ascertain the uses of this salt in the arts, and especially in that of dyeing, in which it is of so great importance. At that time, in order to make chemical discoveries, it was sufficient to place substances in contact, and see whether they exerted any operation upon each other. From thence to the knowledge of the theory of this action, the road was much longer than that which had led to the first observation; thus almost all the explanations which chemistry gave of her operations, prior to the discoveries of the immortal Lavoisier, have rather retarded than accelerated the progress of the science. Every sound theory points out the route we are to take in a certain manner, but when the theory itself is erroneous, it leads us astray, and the arts receive no improvement. Local circumstances may render the error less perceptible, or cause it to disappear; but, when we do not well know what we are doing, which is almost as bad as not knowing it at all, we can never rectify our course, nor know whether or not it be the best which we could take, if perchance that should happen. What I have to say concerning the preparation of the sugar of lead is evident, is known, and yet it has never been said before; for the operation has remained obscure, uncertain, little productive in France,

whilst other nations know how to derive profit from it: this is what must have happened, as the facts will prove.

"It had been discovered that distilled vinegar was less concentrated than the same vinegar not distilled; because, in distillation, more water raises itself than acid, the latter concentrating itself in the alembic; but this portion cannot be employed, as it is only after having been distilled, that it becomes proper for preparing the acetite of lead. My first idea was, to combine the oxyd of lead with vinegar not distilled but, however, without any colour, as I attributed to its extractive part, the impossibility of obtaining a crystallisable product from the direct combination of the oxyd and the acid. The preparation known in pharmacy by the name of extract of lead, yields no crystals on condensation, but merely the appearance of an extract, such as is obtained from vegetables. I believed that I had found, in the oxygenated-muriatic acid gas, a means of destroying the colouring matter of the vinegar. It was white-wine vinegar that I used.

Experiment 1. "The apparatus which I employed is a known one; it is that which chemists use for obtaining the muriatic acid gas, suspended in water; instead of water I had put vinegar into it: this lost its colour, and became very white. I ought to remark that it no longer retained its peculiar odour; neither had it that of oxygenated muriatic acid; but it had acquired one peculiar to this combination, which no author has hitherto treated of. Into 18 ounces 5 drachms 60 grains of this liquor, I put three ounces of the white oxyd of lead; of this there was a little that was not dissolved, and a small part precipitated in a pulverulent form; this was muriate of lead. The liquor poured off, subjected to a very slow evaporation, and cooled in its sand bath, presented nothing to the eye but a brown extract, having the smell of mucous-saccharine matter when beginning to burn but no appearance of crystals was observed in it, after it had been kept cool for eight hours. I gently stirred it, inclining the vessel at the same time, in order to examine whether there might not be some crystals at the bottom; immediately the liquid was converted into a solid, and I had nothing more than a saline mass, irregularly crystallised and very brown. This was acetite of lead; but it ought to have been the acetite of commerce, with respect to the whiteness and regularity of the crystals; it was only the chemist who could discover in it the principles of the acetite of lead.

Experiment 2. "I endeavoured to bleach the vinegar, if I may be allowed the expression, by the admixture of oxygenated muriatic acid dissolved in water; the vinegar was deprived of its colour, but the state in which I found it was precisely the same as in the first experiment; I therefore judged it superfluous to employ it for dissolving the white oxyd of lead, as I could foresee the result from the former experiment.

Experiment 3. "Chemists having frequently employed the sulphurous acid for depriving vegetable substances of their colour, I disposed the apparatus used in Experiment 1, and distilled the sulphuric acid upon a combustible substance; (it was oil straw): a considerable disengagement of sulphurous acid took place; the vinegar became turbid, a very light precipitate was formed; but the colouring matter was not attacked: I therefore judged it useless to treat the white oxyd of lead with this acid.

Experiment 4. "I thought I ought to try, for the sake of comparison, the solution of the white oxyd of lead in strong red vinegar. A pound of this acid was able to dissolve an ounce, and some particles remained in the form of a brown powder. I tried in vain every expedient I could devise, in order to make this solution crystallise. I had only a blackish-brown extract, of the consistence of honey, but which exhibited

no appearance of crystals; distilled vinegar poured upon it very easily effected its complete solution; the solution was brown, and served me for some experiments foreign from the subject of this memoir.

"The experiments which I have just related had taught me that if the colouring matter was an impediment to the crystallisation, one ought not to attribute to it alone the more or less red appearance of the crystals of acetate of lead.

Experiment 5. "I put several pounds of the same vinegar into a distilling apparatus of glass. I divided the whole into four portions in the following order: $\frac{1}{2} + \frac{1}{2} + \frac{1}{2}$, so that there remained only $\frac{1}{2}$ in the distillatory vessel: the three first products presented no apparent diversity to the eye; they were equally limpid and colourless; the fourth was very high coloured, very acid, and when cooled, deposited crystals of tartarite of potash.

Experiment 6. "Eight ounces of the first fourth were combined with six drachms 44 grains of white oxyd of lead*; the solution took place under a continued effervescence; the pieces of oxyd did not assume a brown colour, as in experiments 1 and 4; the salt which I obtained was beautiful, very white and brilliant; I had 5 ounces 36 grains of it; the mother-water was somewhat coloured, and yielded 70 grains of a reddish salt. The portions of the vinegar, No. 2 and 3, on being subjected to the same operation, yielded a salt much inferior to that of No. 1, especially No. 3; the mother-water was in larger quantity and more coloured, as were also the crystals which were more irregular. The consideration of these three facts gave me reason to conclude, that the oil, which exists in considerable quantity in vinegar, was the real cause of the difficulty which had been found in obtaining the acetate of lead. Machy was not aware of this difficulty, though he was in the way to discover it; he relates that the manufacturers of Grenoble pour several ounces of alcohol into each of the vessels in which the crystallisation is performed. What I have just said may serve to demonstrate the utility of this precaution. Alcohol has a decided affinity on the one hand with the acetate of lead, and on the other with the oil furnished by the vinegar; it will therefore dissolve in preference the oily and red crystals, or even the oily part, so that what remains in the vessel will be more beautiful, and freed from that substance which impaired its whiteness. Machy, and those who have repeated it after him, are wrong, in asserting that the manufacturers use this alcohol in order to prevent evaporation from taking place, during the crystallisation of the salt: its direct object is to free it from that substance which would impair its whiteness. In order to demonstrate this theory with the most convincing evidence, it was necessary to take acetic acid that contained no oil, consequently not that which is obtained from wine; I therefore procured vinegar prepared from cyder.

Experiment 7. "I distilled it in glass vessels, and twice stopped the distillation, in order to filter the salt, which the liquor might contain, to crystallise; but not having perceived any crystallisation, I continued it to exsiccation; a small quantity of extractive matter remained, which could be re-dissolved by water. I dissolved the white oxyd of lead in the distilled acid; the liquid remained white and transparent, it crystallised completely, without any coloured mother-water, and the last crystals were no less beautiful than the first. Success, so complete and conformable to theory, proved to me, that the real superiority of the Dutch consists in their employing in the manufacture of this salt, vinegar exempt from oily particles; such as are the vinegars prepared from grain. It is known

that they manufacture these vinegars of very superior quality, and that they very carefully keep secret the details of this operation. I have been informed upon good authority, that at the time when the Dutch territory was covered by our troops, and when the influence of France, in that country, was at its greatest height, it was never possible to penetrate into these manufactories of vinegar, many of which even ceased for the time to work. The beautiful appearance of the sugar of lead which they sell us, depends therefore upon local circumstances; they naturally would employ the acid which they manufacture themselves, in preference to that for which they would have been obliged to procure the materials from abroad, as their soil produces no wine; our country, on the other hand, knows in general of no other vinegar than that produced from wine, which consequently has been employed, and all those inconveniences have resulted with which its use is naturally attended. It may perhaps be objected to me, that it is said in the works that have been quoted, that the Dutch come to buy up the hucks of grapes in the Artois and Bordelais territories; mysterious as they are in whatever they undertake, if the Dutch pretend that the use for which these hucks are destined is the manufacture of sugar of lead, I should be induced to believe the contrary; but, besides, might not the manufacture of white lead and that of verdigris consume these hucks? Do not the four stalks serve to develop an acid principle in fermentation. Besides, it is not said that the English, who likewise excel in the manufacture of the acetate of lead, come to our ports to buy these hucks; but it is certain that they make use of vinegar prepared from grain.

"I cannot conclude this memoir without remarking, that though I have used the term of white oxyd of lead, I have done so only in order to conform to the denomination generally adopted; but it is nevertheless certain that this is not a pure oxyd, but a carbonate of lead, and it consequently dissolves in vinegar in a larger proportion than the oxyds of lead, even than that which is termed litharge, which amongst all is the most of an oxyd. If a continued effervescence takes place during the solution, it is owing to the disengagement of the carbonic acid, which yields to a more powerful affinity; we must therefore conclude, that the acetic acid undergoes a decomposition in the fermentation, excited by the heat of the layers of dung, with which the pots in which this preparation is made are covered; but chemistry is at present familiarised to the changes which the vegetable acids undergo of the one into the other, so that the observation here presented coincides with those that have already been made."

LEADHILLS, a village in Lanerkshire, situate among the mountains of Clydesdale, and said to be the highest human habitation in Great Britain. Here reside many hundreds of miners, with their families. These miners, though, in a great measure, excluded from society by their habitation, pay great attention to the cultivation of the mind, and have provided a circulating library for the instruction and amusement of the little community belonging to the village.

LEAO-TONG, or **CHEN-YANG**, one of the three departments of East Chinese Tartary, or country of the Manchew Tartars, who hence entered and conquered China. It is bounded on the S. by the great wall of China and the gulf of Lea-tong; and is enclosed on the east, north, and west, by a palisade, constructed of stakes seven feet high, without either bank of earth or ditch. Chen-yang, or Mougden, is the capital.

LEATHER (*Encycl.*). To what has been already offered under that head, we are induced to add the following account

* To the quina of vinegar, 10 lb. 5 oz. 2 dr. 16 grs. of oxyd, a little more than one-tenth.

of a mode of manufacturing morocco leather, as practised at Fez.

The goat being stripped of his skin by doubling it over itself, and so drawing it off as one would pull off a stocking by the upper part, the hide, entire and covered with its hair, is thrown into water, in which it is left to soak during three days. It is then exposed to the air, and, when dry, coarsely stripped of the hair; after which it is plunged into flaked lime.

To clear the skins more thoroughly from the hair, they are powdered over with quick lime, which takes away even the smallest hairs. They are next washed in running water, and very carefully rinsed. They are suffered to remain in that water during the space of a night, then hanged up to drain in the open air. After this, they are laid in bran, in the proportion of a hundred and eighty skins to three hundred pounds of bran. They continue in the bran, being each day turned inside out, until they have acquired a considerable degree of pliability.

They are next washed again in running water, by trampling them with the feet; after which operation, they are thrown into a second bath prepared with white figs—about a hundred and ninety pounds of figs to a hundred and eighty skins. The figs render the water soapy. The skins remain in it four or five days, in which time they are frequently turned. And, during the period of their soaking in it, they are, on three successive days, sprinkled with *sal gemmæ* very finely powdered: after which, the water being suffered to drain from them, they are again sprinkled with *sal gemmæ*, and laid in a heap in a flat vessel, where the process of impregnating them with the salt is completed: The water is then squeezed out by wringing the skins; after which they are very pliant, and fit to receive the colour.

If red be the intended colour, half a pound of cochineal and three ounces of alum are employed for sixty skins. Finally, they are tanned by placing them in pits, where beds of tan are made, of about fifty pounds of tan for each skin. The skin is tanned so as to have the grain side within, and filled with the tanning water. After the expiration of eight days it is again turned, and again filled with the tanning water, which is suffered to remain in it six days. During the whole of this term, the skins are carefully stirred and shaken. They are then rinsed in running water, scraped with an iron instrument, opened up along the belly, and rendered pliant by the application of a little oil. They are dried in the sun, set to cool in the shade, slightly moistened with water, and finally scraped down to a proper thinness with three different instruments of iron.

When the red colour is too deep, it is weakened with a decoction of a plant called *razoul at achi*, which is the *mesembrianthemum annuum*. This liquor is used warm, a spoonful of it being poured on each skin.

If the hides are intended to be dyed yellow, they are prepared in the same manner as for the red, except that the operation of salting is not prolonged beyond the time of their soaking in the fig-water. And, besides, only twenty-five pounds of tan are, in this case, used for five dozen of skins. The yellow dye is made of powdered pomegranate-rind and alum.

An inferior red is produced from Brazil wood and alum. Instead of Brazil wood, the manufacturers frequently use the *fouah*, which is a species of *gallium* or *rubia* (*madder*) that is brought in great quantities from Morocco.

LEATHERHEAD, a town in Surrey, which had formerly a market. Here is a bridge of many arches over the river Mole. It is 18 miles S.W. of London.

LEATHES-WATER, called also **WYTHBURN**, or **THIRL-MERK-WATER**, a fine lake of Cumberland, which lies S. by E.

of Kefwick. It begins at the foot of Mount Helwellyn, which it skirts for the space of four miles, receiving numerous torrents that descend from the mountains. The singular beauty of this lake is its being almost intersected in the middle by two peninsulas, that are joined by a bridge. Its outlet joins the rapid river Greta, at New Bridge, and thus has a communication with the lake of Derwentwater.

LEAWAVA, a sea-port on the E. coast of the island of Ceylon, which yields a great deal of salt. Long. 83. 15. E. Lat. 6. 40. N.

LECASELLO, a town of Italy, in the state of Genoa, 23 miles N.E. of Genoa. Long. 8. 53. E. Lat. 44. 37. N.

LECCE, a city of Naples, in Otranto, with a bishop's see. It contains 18,000 inhabitants; is the residence of the governor, and sometimes called the capital of the province; and by some the province is called Lecce, instead of Otranto. It is 17 miles N.W. of Otranto, and 195 E.S.E. of Naples. Long. 18. 20. E. Lat. 40. 36. N.

LECCO, a town of Italy, in the Milanese, seated on the lake Como, 26 miles N. of Milan. Long. 9. 21. E. Lat. 45. 55. N.

LECH, a river of Germany, which rises in Tirol, divides Suabia from Bavaria, and falls into the Danube, below Donawert.

LECK, a river of the United Provinces, which branches off from the Rhine at Wyck-by-Dourfede, and enters the Merve, 10 miles E. of Rotterdam.

LEDUM (*Encycl.*). The following observations have been made by Dr. Maton on *Ledum Palustre*, and on the uses to which it may be applied in medicine. He considers it a plant which seems to possess very active properties. Its very odour indicates an aromatic quality, though this is not so strong in the spring as during the state of florescence. Westring mentions a curious fact respecting the permanence of the aroma. A dried specimen, which he found in the Burserian Herbarium at Upsal, retained a very sensible fragrance, though upwards of 150 years had elapsed from the time of its being gathered. An infusion of the leaves is somewhat bitter, and conveys a sensation to the palate similar to that produced by turpentine; a good evidence of its possessing an astringency. There is undoubtedly a narcotic quality in a strong decoction of the plant, some of the northern nations being accustomed to boil sticks of it in beer, for the sake of imparting to the latter an inebriating effect; and this liquor has been observed to occasion violent vomiting, cephalalgia, and even syncope. Some caution, therefore, is necessary in the exhibition of this vegetable; and though in many cases it may be advisable to keep up that state, resembling stupor, by which the advantageous effects of cicuta and other narcotics are produced, the dose ought to be small at first. Of the recent plant, four ounces may be infused in a quart of boiling water, and two ounces of the strained liquor are sufficient for the first exhibition.

Ledum Palustre grows so abundantly in all the northern parts of the Continent, that large quantities may be obtained without difficulty; though, as its favourite soil is of a moist, boggy nature, and as it is found on the declivities of lofty mountains, the cultivation of this plant may not often prove very successful. No animals appear to be fond of it, excepting the goat, which Linnaeus tells us (in the *Pan Succus*) will often browse it; and there is a species of palæna that dwells on its leaves; but insects in general shun, and are so much affected by its odour, that the smoke is used for the extermination of lice and other vermin. The spirit obtained by distillation seems likely to be most efficacious for this purpose.

There is another species of *ledum* (scarcely deserving, however, to be considered as different) which grows very plentifully in the vicinity of Hudson's Bay, in North America, and

is generally known by the name of *Labrador Tea*, an appellation that indicates its being used as a beverage by the natives of that district, probably on account of this plant possessing qualities similar to those of *ledum palustre*.—I mean more particularly, that of intoxicating. *Ledum latifolium*, as the name implies, is distinguished by its broader leaves; but in no other respect does it appear to differ from its congener. Dr. Maton has tasted infusions of the dried leaves, and found the flavour the same. This plant is well described by Jacquin in his *Collectanea*, tom. ii. and in the new edition of the *Species Plantarum*, by Willdenow, distinguished thus, *Ledum (latifolium) foliis oblongis, margine revolutis, subtis tomentosis floribus subpentandris*, tom. ii. p. 602. There is given in the Transactions of the Academy of Sciences of Stockholm, for 1774, an account of the efficacy of *ledum palustre* as a remedy for lepra. Dr. Odhelius speaks of his success in the exhibition of it in that disease, with the highest satisfaction.

LEE, a river of Ireland, which rises on the confines of Kerry, and flows E. to Cork, below which city it forms a fine harbour, and enters St. George's Channel.

LEEFOOGA, one of the Friendly Islands, in the South Pacific Ocean, visited by Captain Cook in 1776. Many parts of the country, near the sea, are sandy and barren; but in the internal parts, the marks of considerable population, and of an improved state of cultivation, are conspicuous. Many of the plantations are inclosed in such a manner, that the fences, running parallel to each other, form spacious public roads. Large ipots, covered with the paper mulberry-tree, were observed, and the plantations in general were abundantly stocked with plants and fruit-trees. To these Captain Cook made some addition, by sowing the seeds of melons, Indian corn, &c. The island is seven miles in length; its breadth, in some places, is not above three.

LEER, or LEHR, a town of Westphalia, in East Friesland, on a river of the same name, which soon after falls into the Embs. It is 11 miles S.E. of Embden, and 24 W.N.W. of Oldenburg. Long. 7. 11. E. Lat. 53. 21. N.

LEERDAM, a town of the United Provinces, in Holland, seated on the Linghe, 17 miles N.E. of Dort. Long. 5. 13. E. Lat. 51. 56. N.

LEEROT, a fortress of Westphalia, in East Friesland, seated at the confluence of the Lee with the Embs, 10 miles E. by S. of Embden.

LEERS, or LIERS, a town of Westphalia, in the bishopric of Liege, near which a battle was fought on the 1st of October, 1746, between the allies, commanded by Prince Charles of Lorraine, and the French under Count Saxe. It is four miles N. of Liege.

LEESTOWN, a town of Kentucky, in the county of Fayette, seated on the E. bank of the river Kentucky. As the banks of the river are remarkably high, there are few crossing places; and the best being at Leestown, is a circumstance which contributes to its increase. It is a few miles W. of Lexington. See KENTUCKY RIVER.

LEEWARD ISLANDS, that part of the Caribbee Islands, in the West Indies, commencing at Dominica, and extending to Porto Rico.

LEEWEE, a fortified town of Austrian Brabant, seated on the Geete, 12 miles E. of Louvain. Long. 5. 7. E. Lat. 50. 53. N.

LEGACY, a sum of money, or gift bequeathed to any one in the last will and testament of a deceased person. See TESTAMENT. The following duties have of late years been laid upon legacies. By the act of 20 Geo. III. c. 28, s. 1; 23 Geo. III. c. 58, s. 2; and 29 Geo. III. c. 51, s. 2; every executor for a legacy, whether pecuniary or specific, or share of

a personal estate, payable to the wife, children, or grandchildren of the deceased, shall be chargeable as follows:

Where the amount shall not exceed twenty pounds, 2s. 6d.

Where the amount thereof shall be of the value of twenty pounds and under one hundred pounds, 5s.

Where the amount thereof shall be of the value of one hundred pounds or upwards, 1l.

And for every such receipt for a legacy or share of a personal estate, payable to a husband:

Where the amount shall not exceed twenty pounds, 2s. 6d. by 20 Geo. III. c. 28, and 2s. 6d. by 23 Geo. III. c. 58. Total 5s.

Where the amount thereof shall be of the value of twenty pounds and under one hundred pounds, by 20 Geo. III. c. 28, 5s. and by 23 Geo. III. c. 58, 5s. Total 10s.

Where the amount thereof shall be one hundred pounds, by 20 Geo. III. c. 28, 1l. and 23 Geo. III. c. 58, 1l. Total 2l.

And by 23 Geo. III. c. 58, for every further sum of one hundred pounds, an additional 1l.

And by 29 Geo. III. c. 51, if of four hundred pounds, an additional 1l. and for every further sum of one hundred pounds, a further additional 1l.

And for every such receipt for a legacy or share of a personal estate, payable to collateral relations or strangers, there shall be charged:

Where the amount shall not exceed twenty pounds, 2s. 6d. by 20 Geo. III. c. 28, and 2s. 6d. by 23 Geo. III. c. 58. Total 5s.

And by the last act, 36 Geo. III. c. 52,

Upon any legacy of the value of 20l. or share of the personal estate of a person dying intestate, and leaving a personal estate of the clear value of 100l. after payment of debts, &c. which shall pass to a brother or sister of the deceased, or any descendant of a brother or sister of the deceased, there shall be charged a duty of 2l. for every one hundred pounds of the value, and so after the same rate for any greater or less sum.

To a brother or sister of a father or mother of the deceased, or any descendant of a brother or sister of a father or mother of the deceased, 3l. for every one hundred pounds of the value, and after the same rate for any greater or less sum.

To a brother or sister of a grandfather or grandmother of the deceased, or any descendant of a brother or sister of a grandfather or grandmother of the deceased, 4l. for every one hundred pounds of the value, and after the same rate for any greater or less sum.

To any person in any other degree of collateral consanguinity to the deceased than before described, or any stranger in blood to the deceased, 6l. for every one hundred pounds of the value, and after the same rate for any greater or less sum.

The duties are placed under the management of the commissioners of stamps, who are to appoint receivers in the different counties.

The duties are to be paid by executors or administrators on retaining or paying legacies or shares, and if duty be not paid before legacies or shares are retained by executors, or administrators, or discharged, they having deducted it, the amount shall be a debt from them to his majesty; and if they pay without deducting the duty, it shall be a debt, not only from them, but also the party receiving the same.

The value of any legacy given by way of annuity for life or lives or for a term of years, and the duty chargeable thereon, shall be charged according to the tables annexed to the act; and the duty chargeable on such annuity shall be paid by four equal payments, the first before or on completing the payment of the first year's annuity, and the three others in like manner successively, before or on completing the respective payments

of the three succeeding years' annuity respectively; but if any such annuity shall determine by death, or any other contingency, before four years' payment shall become due, then the duty shall be payable in proportion only, and all future payments of the duty shall cease.

The duty on legacies given to purchase annuities to be calculated on the sums necessary to purchase them, according to the tables before mentioned.

The duty on legacies whose value can only be ascertained by application of the allotted fund, to be charged on the money as applied.

The duty payable on a legacy given to different persons in succession, shall be paid thereout, as in the case of a legacy to one person; and where the same shall go to different persons in succession, some of whom shall be chargeable with no duty, or some with different rates, so that one rate cannot be immediately charged; all persons entitled for life, or other temporary interest, shall be chargeable in the same manner as for an annuity, and paid by equal portions in four years; and the duty on partial interests shall be charged as the duty on property given, otherwise than to different persons in succession; and persons who shall become absolutely entitled in succession, shall, when they begin to enjoy the benefit, pay the duty in the same manner as if the same had come immediately on the death of the party.

No duty shall be paid on any articles of plate, furniture, or other things, not yielding any income, and given to be enjoyed by different persons in succession, whilst the same shall be so enjoyed in kind only by any person not having any power of disposing thereof; but if the same shall be actually sold or disposed of, or come to any person having power to dispose thereof, then duty shall be paid thereon.

Duty on legacies in joint tenancy to be paid in proportion to the interest of the parties.

Any legacy, subject to any contingency which may defeat the gift, and whereupon the same may go to some other person (unless chargeable as an annuity), shall be charged with duty as an absolute bequest to the person who shall take the same, subject to such contingency, and such duty shall be paid out of the legacy.

Any legacy, subjected to any power of appointment for the benefit of persons specially described, shall be charged with duty as property given to different persons in succession.

Any money or personal estate, directed to be applied in the purchase of real estate, shall pay duty as personal estate.

Estates *pur autre vie*, applicable as personal estate, shall be charged as personal estate.

But if any direction shall be given, by any will, for payment of the duty out of some fund, so that the legacy may pass free of duty, no duty shall be chargeable upon the money applied for payment of the duty.

In cases of specific legacies, and where the residue of any personal estate shall consist of property which shall not be reduced into money, the executor or administrator, or the person to whom the duty thereon ought to be paid, may set a value thereon, and offer to pay the duty according to such value; or may require the commissioners of stamps to appoint a person to set such value, at their expense; and the commissioners may either accept the duty offered, or appoint a person to appraise such effects, and to set the value, on which the commissioners shall assess the duty; but if the party shall not be satisfied with the commissioners' valuation, they may cause such valuation to be reviewed by the commissioners of land tax, who may also (if they think fit) appoint a person to appraise the effects, and set a value thereon, whose judgment shall be final.

Duty on legacies not satisfied in money, &c. to be paid according to the value of the satisfaction.

If legatees refuse to accept legacies, duty deducted, the court, in case of suit, may order them to pay costs; and in suits where the party sued may wish to stop proceedings on payment of bequests, deducting duty, the court may make order therein.

If suit be instituted concerning administration, the court to provide for payment of the duty.

Executors and administrators may, at any time, discharge legacies, or pay shares of the personal estate, on payment of the duty accrued.

No legacy, liable to duty, to be paid without a receipt, expressing the date thereof, and the names of the testator, or intestate, and of the person to whom such receipt shall be given, and of the party to whom such legacy or residue shall belong, and the amount of the legacy or residue for which such receipt shall be given, and also the amount of the duty payable thereon; and no receipt shall be available, unless stamped.

But a copy of the entry, in the books of the commissioners of stamps, of payment of duty, shall be admitted as evidence; and payment of any annuity shall not be deemed a payment for which such stamped receipt shall be required, except it be the payment which shall complete the payment for each of the first four years during which such annuity shall be payable.

Any executor, administrator, or trustee, who shall pay any legacy, or residue, without taking such receipt as aforesaid, and causing the same to be stamped within the time hereby allowed for stamping the same, shall forfeit ten pounds *per cent.* on the amount of such receipt; and all persons receiving such money, or property, without giving a written receipt, as aforesaid, shall forfeit ten pounds *per cent.* on the money or property received.

Every such receipt shall be brought within twenty-one days after the date, to the next stamp-office, to be stamped, paying duty for the same, and upon such payment, an acknowledgment of the payment of the duty so paid, in words at length, and bearing date the day on which such payment shall be made, and subscribed with the officer's name, shall be wrote upon the receipt, and afterwards the same shall be duly stamped, in the manner directed in the act.

But if any such receipt shall not be brought to such office, within such space of twenty-one days as aforesaid, it shall nevertheless be lawful to carry such receipt to the head office to be stamped in like manner, within three calendar months after the date thereof, paying the duty, and a further sum of ten pounds *per cent.* on such duty, by way of penalty; but the commissioners shall not, on any pretence whatever, stamp any receipt unless the duty be paid, and such receipt be brought to be stamped as aforesaid, within the times before limited.

Upon oath or affirmation, administered by a justice, or master in chancery, that less duty has been paid than ought to have been paid, by mistake, the commissioners may rectify such mistake, and accept the difference between the money paid and the just duty, together with ten pounds *per cent.* on such difference, by way of penalty.

Persons paying or receiving money contrary to this act, indemnified on discovering the other offender.

If by infancy or absence legacies cannot be paid, the money may be paid into the bank, and laid out in the *3l. per cents.* and if such money be improperly paid in, the chancery may dispose thereof.

[And when money is paid into the bank in pursuance hereof, the accountant-general's certificate shall be filed in the

Report Office, where his drafts on the bank for the money for investment shall be entered, and be a warrant to the bank for the payment. 37 Geo. III. c. 135.]

If more than the proper duty has been paid, the commissioners for stamps may return the excess; and if less, on payment of the full duty, the chancery may order re-payment to the party.

If it shall appear to the commissioners for stamps, at the end of two years after the death of any person, that it will require time to collect the effects, or be difficult to ascertain the residue of the personal estate, the duty may be compounded for.

But the duty shall be paid on any part of personal estates not included in the composition.

If at any time after payment of duty on any legacy, or residue, any debt should be recovered against the estate, by reason whereof any legatee or entitled person shall be obliged to refund, the commissioners are, on proof thereof on oath as aforesaid, to repay the duty.

Executors, previous to retaining their own legacies, to transmit the particulars, with the duty offered, to the commissioners of stamps, who shall charge the same agreeably to this act; and in case any person shall neglect to pay such duty within fourteen days, such person shall forfeit treble the value of the duty which ought to have been paid.

If administration be made void, and any duty shall have been improperly paid, it shall be repaid; but if it ought to have been paid, it shall be allowed in account with the rightful executor.

Persons swearing falsely, are guilty of perjury. Penalty of 500. for altering receipts. And persons forging stamps, &c. to suffer death.

The penalties are recoverable in the courts of law.

The form of an account and receipt to be taken by the executor and administrator, is also annexed to the act, and is as follows:

On account of the personal estate of
deceased, between taking the administration of
the said estate, and legatee [or next
of kin, as the case may be]:

	L.	s.	d.
Amount of the sum [or value, if not in money] accounted for			
Duty allowed at the rate of per centum			
Balance received			

Received the day of the above balance in
[full, or part, as the case may be] of my [legacy, or share, as
the case may be] out of the personal estate above mentioned.

(Signed)

LEGENICH, or LECHENICH, a town of Germany, in the circle of Lower Rhine, and archbishopric of Cologne, 10 miles S.S.W. of Cologne, and 50 E.N.E. of Liege. Long. 6. 31. E. Lat. 50. 50. N.

LEGIUNCARA, a town of Naples, in the province of Bari, 21 miles N.W. of Matera.

LEGNAGO, a fortified town of Italy, in the Veronese. It surrendered to the French in 1796, and is seated on the Adige, 25 miles S.E. of Verona.

LEIBNITZ, a town of Germany, in the duchy of Stiria, seated on the Sulm, 16 miles S. of Gratz.

LEIGH, a sea-port in Essex, on a creek at the mouth of the Thames, opposite the east extremity of Canvey Island. It is noted for oysters, and has a good road for shipping. It is 18 miles S.E. of Chelmsford, and 40 E. of London. Long. 0. 42. E. Lat. 51. 31. N.

LEIGH, a town in Lancashire, whose market is now dissolved. It is seven miles N.N.E. of Warrington, and 191 N.W. of London.

LEIGHTON-BUZZARD, a town in Bedfordshire, with a market on Tuesday, considerable for fat cattle. It is seated on a branch of the Ouse, 18 miles S. of Bedford, and 41 N.W. of London. Long. 0. 35. W. Lat. 51. 55. N.

LEININGEN, a town of Germany, in the palatinate of the Rhine, seven miles S.W. of Worms. Long. 8. 22. E. Lat. 49. 30. N.

LEINA, a river of Germany, which flows through Brunswick-Lunenburgh, and passing by Helligensstadt, Gottingen, Calenberg, and Hanover, falls into the Aller.

LEIPHEIM, a town of Suabia, in the territory of Ulm, on the fourth bank of the Danube, 11 miles N.E. of Ulm; and 22 W.N.W. of Augsburg.

LEISZNIG, a town of Upper Saxony, in the circle of Leipzig, seated on the Mulde, where are manufactures of cloth, lace, stockings, &c. It is 24 miles E.S.E. of Leipzig, and 32 N.W. of Dresden. Long. 12. 53. E. Lat. 51. 7. N.

LEMBRO, the ancient Imbros, an island of the Archipelago, on the coast of Romania, 22 miles in circumference, with a town of the same name, and a harbour. Long. 26. 0. E. Lat. 40. 25. N.

LEMGOW, a town of Westphalia, in the county of Lippe, 17 miles N. of Paderborn. Long. 9. 0. E. Lat. 52. 5. N.

LEMNOS, a celebrated island of the Archipelago, now called STALIMENE, situate near the strait of Gallipoli. It is above 112 miles in circumference according to Pliny, who says, that it is often shadowed by Mount Athos, though at the distance of eighty-seven miles. The poets made it sacred to Vulcan, who was hence called Lemnius Pater. Lemnos was also celebrated for its labyrinth, of which not a trace remains; and what historians relate of it, serves only to excite, but not to gratify, curiosity. The modern Greeks entertain the same opinion of that earth of Lemnos, which is said to have cured Philoctetes, and which Galen went to examine. It is never dug up but on one particular day in the year, and then with great ceremony. This earth, called terra figillata, formed into small loaves, and sealed with the grand signior's seal, is then dispersed over all Europe. The greatest virtues are attributed to it; and yet a chemist can discover nothing but a mere clayey earth, incapable of producing the effects that have been attributed to it. Lemnos is subject to the Turks; but the inhabitants are almost all Greeks, and very industrious. Its capital is of the same name, and the see of a Greek archbishop. Long. 25. 28. E. Lat. 40. 3. N.

LENHAM, a town in Kent, with a market on Tuesday; seated on an eminence, 10 miles east of Maidstone, and 47 E.S.E. of London. Long. 0. 45. E. Lat. 51. 18. N.

LENNEP, a town of Westphalia, in the duchy of Berg, 20 miles E.S.E. of Dusseldorf. Long. 6. 56. E. Lat. 51. 11. N.

LENS, a town of France, in the department of the Straits of Calais, eight miles N.E. of Arras.

LENTINI, a town of Sicily, in Val di Noto. It is a small remainder of the ancient Leontium, contains 4000 inhabitants, and is situate at the foot of a height; on the top of which Charles V. built a new town, called Carlentini, which

contains 3000 people. Lentini was greatly damaged by an earthquake in 1693, and is seated on the Leonardo, 17 miles S.W. of Catania.

LENTZEN, a town of Upper Saxony, near the Elbe, 74 miles N.W. of Berlin. Long. 11. 32. E. Lat. 53. 6. N.

LENZBURGH, a town of Switzerland, in the canton of Bern, which has a considerable manufacture of flowered linens and cottons. It is seated on a small river, eight miles west of Baden.

LEOBEN, a town of Germany, in the duchy of Stiria, situate on the Muehr. At this town the preliminaries of peace between the emperor and the French were signed April 20, 1797. It is 68 miles S.W. of Vienna.

LEOBESCHUZ, a town of Silesia, in the principality of Jagerndorf, 14 miles N.N.E. of Jagerndorf, and 27 W.N.W. of Ratibon. Long. 17. 28. E. Lat. 50. 14. N.

LEOGANE, a town and fort with a good harbour, on the W. side of St. Domingo. It was taken by the English and the French royalists in January, 1794, but retaken by the republicans in October following; and it was unsuccessfully attacked by the English in March, 1796. Long. 72. 37. W. Lat. 18. 38. N.

LEON, an island of Spain, separated from the Continent by a strait about ten miles long, and scarcely three broad in any part. The town of Cadiz is built at its N.W. extremity.

LEON, NEW, a kingdom of North America, lying between New Mexico on the north, the gulf of Mexico on the east, Panuco on the south, and New Biscay on the west.

LEON DE NICARAGUA, a town of New Spain, in Nicaragua, the residence of the governor, and a bishop's see. It was taken by the buccaners in 1685, in fight of a Spanish army, who were six to one. It is seated at the foot of a volcano, at the N.W. extremity of the lake Nicaragua, 30 miles from the Pacific Ocean, and 104 N.W. of Niagara. Long. 88. 10. W. Lat. 12. 25. N.

LEONARD DE NOBLET, Sr. an ancient town of France, in the department of Upper Vienna, with a considerable manufacture of paper, and another of cloth for clothing the army. It is seated on the Vienna, 12 miles N.E. of Nimoges, and 195 south of Paris. Long. 1. 32. E. Lat. 45. 54. N.

LEONBERG, or LEONSBERG, a town of Suabia, in the duchy of Wirtemberg, situate on the Glem, six miles west of Stuttgart, and 34 N.N.E. of Freudenstadt. Long. 8. 51. E. Lat. 48. 46. N.

LEONESSA, a town of Naples, in Abruzzo Ulteriore, 19 miles N.W. of Aquila.

LEONHART, a town of Germany, in Carinthia, 42 miles east of Clagenfurt. Long. 15. 23. E. Lat. 46. 57. N.

LEOPOLDSTADT, a strong town of Upper Hungary, built by the emperor Leopold in 1665. It is seated on the Waag, 36 miles N.W. of Neuhausel, and 62 E. of Vienna. Long. 18. 6. E. Lat. 48. 35. N.

LEPERS, ISLE OF, one of the New Hebrides, in the South Pacific Ocean. Long. 168. 0. E. Lat. 15. 23. S.

LERICI, a sea-port of Italy, on the east coast of the gulf of Specia, in the territory of Genoa. Long. 9. 55. E. Lat. 44. 5. N.

LESINA, a town of Naples, in Capitanata, with a bishop's see, 26 miles N.N.W. of Manfredonia, and 86 N.N.E. of Naples. Long. 15. 14. E. Lat. 41. 44. N.

LESKO, a town of Poland, in the palatinate of Lemberg, and Austrian kingdom of Galicia, 68 miles S.W. of Lemberg.

LESNEVEN, a town of France, in the department of

Finisterre, ten miles north of Landernau, and 13 N.E. of Brest. Long. 4. 21. W. Lat. 48. 38. N.

LESPARE, a town of France, in the department of Girondet. In its environs are found transparent pebbles, resembling the false diamonds of Alençon, and known by the name of Medoc stones. It is 30 miles N.N.W. of Bourdeaux.

LETTERE, a commercial town of Naples, in Principato Citeriore, with a bishop's see. It is seated at the back of a mountain, 12 miles N.W. of Salerno, and 20 S.E. of Naples.

LEVANTINE VALLEY, a valley of Switzerland, on the confines of Italy, lying between Mount St. Gothard and Lake Maggiore. It is divided into two parts by the river Tesino; and is eight leagues long, but the breadth inconsiderable. The lower part is populous, rich in pastureage, and produces much hemp and flax. The houses are entirely of wood, and have externally the appearance of Swiss cottages; but a neglect of cleanliness proves the vicinity and greater similarity to the Italians. It is a bailiwick, subject to the canton of Uri; and Olisogna, the residence of the bailiff, consists only of a few houses.

LEUCATE, a town of France, in the department of Aude, 18 miles south of Narbonne. Long. 3. 9. E. Lat. 43. 0. N.

LEUCHTENBERG, a town of Germany, in the upper palatinate of Bavaria, seated on a mountain, near the river Eiseimpt, 50 miles N.W. of Ratibon. Long. 12. 26. E. Lat. 49. 40. N.

LEVEN, LOCH, a beautiful lake in Kinrossshire, twelve miles in circumference, and somewhat of a circular form. It has several small islands, on one of which is a ruinous castle. Here the unfortunate Mary, queen of Scots, was confined by the confederate lords, after the murder of her husband Lord Darnley, and her marriage with Bothwell; but she escaped in 1568 by the assistance of the brother of the governor of the castle. Another island, named St. Serf's Isle, is said to have been a residence of the Pictish priests: it was afterwards the seat of a priory, of which some remains are to be seen. This lake produces trout of peculiar excellence; of which great quantities, at certain seasons, are sent to the Edinburgh markets. In autumn, a singular species, called the gully trout, is here fatted and dried for winter provision.

LEVER (*Encycl.*). Levers are of various kinds, according to the purposes for which they are designed; and, being eminently serviceable for the lifting of weights, we have subjoined the following description of a *crus-bar lever*, which is particularly calculated for raising earth that abounds with great quantities of stones; though this machine is likewise applicable to other objects.—It was invented by Mrs. Wyndham, of Petworth, in Suffex, on whom the Society for the Encouragement of Arts, &c. in 1796, conferred their silver medal.

A (Plate 35), is the lever.

B, an upright piece of wood, to be affixed to the lever; care being taken to place the side marked with this letter opposite to that marked A on the lever; by which means it inclines backwards, and thus increases the power.

C, is a cross-bar, being the hand by which the workmen exert their strength.

D, is another cross-bar to be placed at the bottom, behind the upright piece of wood, on which the labourers are to stand, and through which the end of the lever passes. These additions are so constructed, that they may be occasionally fixed and removed, because they are to be employed only

when the strength of the rock, or earth, requires an increase of power.

Should the rock be elevated so considerably above the ground, as to endanger the men by its fall, when the separation takes place, the lever may be reversed; so that the labourers will stand upon the bar intended for the application of their hands, in common cases; and thus all danger will be effectually prevented.

Sliding-LEVER, an invention of Mr. Snart's for transferring the weight of a loaded cart from a fallen horse; called also *ALEXIPPOS*, and *HORSE-HELPER*. See the latter in this Supplement.

LEUGNE, a village of France, in the department of Upper Saone, lying to the east of Vesoul. Here is a cavern, thirty-five paces deep and sixty wide, which serves as a barometer to all the country people. A fog at the entrance of this glacier, is an infallible sign of rain the next day. From the roof, which is fifty feet high, descends columns of ice, of a prodigious size. The brook, which runs through a part of this grotto, is frozen in summer, but flows in winter.

LEVROUX, a town of France, in the department of Indre, with a castle, 35 miles S.W. of Bourges. Long. 1. 40. E. Lat. 47. 0. N.

LEUSE, a town of Austrian Hainault, seated on the Dender, 14 miles N.W. of Mons. Long. 3. 45. E. Lat. 50. 35. N.

LEUTMUEHL, a town of Bohemia, in the circle of Chrudim, erected into a bishopric in 1144, but the town having suffered greatly by the Hussites, the bishopric was suppressed. It is 22 miles east of Chrudim, and 76 east of Prague.

LEUTSCH, a town of Germany, in the duchy of Carinthia, eight miles S.S.E. of Idria.

LEWENSTEIN, a town of Franconia, capital of a county of the same name, with a fortress, 10 miles east of Hailbron, and 30 N.N.E. of Stuttgart. Long. 9. 38. E. Lat. 49. 18. N.

LEWISBURGH, a town of Northumberland county, in Pennsylvania, seated on the Susquehanna, 140 miles N.W. of Philadelphia.

LEWISTOWN, the county town of Mifflin, in Pennsylvania, seated on the Juniata, 150 miles W.N.W. of Philadelphia. Long. 78. 13. W. Lat. 40. 35. N.

LEWISHAM, a village in Kent, on the river Ravensbourne, five miles S.E. of London. The church is an elegant new edifice.

LEXINGTON, the capital of the state of Kentucky, and county of Fayette. Near this town are to be seen curious sepulchres, full of human skeletons, which were thus fabricated: first, on the ground were laid large broad stones; on these were placed the bodies, separated from each other by broad stones, covered with others, which served as a basis for the next arrangement of bodies. In this order they are built, without mortar, growing still narrower to the height of a man. This method of burying appears to be totally different from that now practised by the Indians. In the neighbourhood also are the remains of two ancient fortifications, with ditches and bastions; one containing about six acres of land, and the other nearly three. Pieces of earthen vessels have also been ploughed up near Lexington; a manufacture with which the Indians were never acquainted. These, with the fortifications, and the sepulchres, have been urged as an argument, that this country was formerly inhabited by a people different from the present Indians, and further advanced than they in the arts of life; and Mr. Filson, in his account of this country, has advanced arguments to prove, that these people were, in all probability, an ancient colony from Wales.

Lexington stands at the head of the river Elkhorn, 470 miles west of Washington. Long. 85. 10. W. Lat. 38. 20. N.

LEXINGTON, a town of the state of Massachusetts, celebrated for being the place where hostilities commenced between the British troops and the Americans, in April, 1775. It is 12 miles N.W. of Boston.

LIAMONE, or *LIMONE*, a river of Corsica, which falls into the sea, ten miles north of Ajazzo. It gives name to a department in the new French division of the island.

LIBRARY (*Encycl.*). The following extract from an account of a Parish Library for the Poor, by Mrs. Bernard, is published by the Society for Bettering the Condition of the Poor.

"At Steeple Morden, in the county of Cambridge, the poor have been furnished with a circulating library of short tracts of a religious and moral nature. The idea had been originally suggested by a similar plan, useful in its way, but not so peculiarly required, which has been adopted for the benefit of the children at the Foundling. The collection at Steeple Morden consists of the Cheap Repository tracts, and some few others of a similar kind; and has already, even at the beginning, proved of considerable benefit to the parish. On Sunday afternoon, when the business of the Sunday school is over, Mrs. King, the lady who has founded the library, reads one of the tracts to the children, and to such of the parents as choose to attend. It is then made the subject of conversation; and a few copies of the tract are lent to different children, who read it over again in the evening with their parents and neighbours; and by these means spend their Sunday evening well, and with useful amusement. Copies of the same tract are afterwards lent out for the week, and generally go round the parish. On the Sunday following they are brought back, when they receive others, which have been first read over to them in the same manner. Fifty-two tracts furnish the year's reading; and ten or twelve copies of each are sufficient for a moderate sized parish. It is very gratifying to contemplate the pleasure, the amusement, and other more material effects, which are produced in this parish by a measure perfectly simple and easy in itself, and executed at a trifling expence. It answers, in one respect, the end of the Sunday friendly societies at Winslow and Auckland, and with more general extension to the different ages in the parish.

"There is hardly any thing which will be found more useful in promoting moral and religious improvement in a parish, than the supply of Sunday reading for the poor, to fill up those hours which are not occupied by worldly employment. Many cottagers have been induced to an habitual attendance on the ale-house, to the entire ruin of themselves and their families, not so much by natural disposition, as by want of occupation, for the hours of cessation from labour. Perhaps the remark of dissipation being the consequence of want of employment, will apply with still more force to higher life; and it may be found that the disease is of a more incurable nature. But, among the poor, the remedy is neither expensive nor troublesome; and its application will be as beneficial to the benevolent dispenser of relief, as to the object for whose benefit it is applied. I will therefore," says Mrs. Bernard, "express my humble hope, that this plan, which has been also adopted by the same lady in two other parishes, and with the same success, may be imitated by those of our own sex, who feel gratefully the advantages they derive from the sources of religious and moral improvement, which are opened to them; and are therefore anxious to express their gratitude, by communicating those advantages to every individual who is dependent upon them."

LICENCE (*Entycl.*). The following are the regulations under which the licences granted to ale-house keepers, are placed by the act of 30 Geo. III. c. 38.

To retail foreign wines in England, if the party has not a spirit or beer licence

£. s. d.
5 4 0

If the party has a beer licence, and not one for spirits

4 4 0

If the party has also a spirit licence

2 4 0

For every licence to retail British made wines or sweets, either in England or Scotland

2 4 0

To retail foreign wines in Scotland if the party has not a spirit or beer licence

3 6 8

If he has a beer licence, but not one for spirits

2 13 4

If he has also a spirit licence

1 6 8

For every licence to retail spirits in Great Britain, if the party's house be rated to the house duty under the flat. 38 Geo. III. c. 40 (see p. 40, 41), at a sum not amounting to 1*l.* per annum

4 14 0

If at 15 and under 20

5 2 0

If at 20 and under 25

5 10 0

If at 25 and under 30

5 18 0

If at 30 and under 40

6 6 0

If at 40 and under 50

6 14 0

If at 50 or upwards

7 2 0

These licences to be renewed annually; every person who sells foreign wine retail without a licence, or renewing it in time, forfeits 5*l.*

On death or removal, upon application to the commissioners, or collectors, or supervisors, as before recited, the ex-
cutors, &c. will be authorized to carry on the trade for the remainder of the term.

All persons shall be deemed retailers of foreign wine who sell it in any less quantity than the quantity imported.

Any person selling 25 gallons or under of British made wine or sweets is deemed a retailer of that article.

All persons who shall sell spirits, mixed or unmixed, in any less quantity than two gallons, shall be deemed retailers.

N. B. The stamp duty on the justices' licence to retail ale, &c. is 1*l.* 1*s.* 6*d.* and by 41 Geo. III. c. 86. 1*os.* 6*d.*—Total two guineas.

LICH, or **LICHA**, a town of Germany, in the landgraviate of Hesse, and county of Selms, 21 miles north of Francfort. Long. 8. 42. E. Lat. 50. 15. N.

LICHTSTALL, a town of Germany, in the circle of Upper Rhine, and bishopric of Basle, seven miles S.E. of Basle.

LICHTALLEN, or **LIESTAL**, a town of Switzerland, in the county of Basle, seated on the Ergetz, eight miles S.E. of Basle. Long. 7. 39. E. Lat. 47. 29. N.

LICHTENAU, a town of Westphalia, in the bishopric of Paderborn, nine miles S.E. of Paderborn. Long. 8. 23. E. Lat. 51. 52. N.

LICHTENAU, a town of Germany, in the principality of Hesse Cassel, 13 miles S.E. of Cassel, and 24 east of Naumburg. Long. 5. 28. E. Lat. 51. 1. N.

LICHTENBERG, a town and castle of Germany, in the duchy of Deux Ponts, 25 miles north of Deux Ponts.

LICHTENBERG, a town of Germany in Franconia. In the neighbourhood are quarries of marble, and mines of copper and iron. It is 22 miles north of Bayreuth, and 26 E. of Coburg. Long. 11. 41. E. Lat. 50. 16. N.

LICHTENSTEIG, a town of Switzerland, capital of the county of Tockenburg, seated on the Thur, 31 miles east of Zurich. Long. 9. 8. E. Lat. 47. 15. N.

LICHTENSTEIN, a castle and village in the archduchy of Austria, nine miles S.S.W. of Vienna.

LIDA, a town of Lithuania, in the palatinate of Wilna, 56 miles south of Wilna. Long. 25. 34. E. Lat. 53. 50. N.

LIDDEL, a river in Roxburghshire, and the only one in that county that flows southward. It falls into Solway Frith, near the mouth of the Eik.

LIDDISDALE, a district in Roxburghshire, comprehending the southern angle of that county. It admits of little cultivation, and is chiefly employed in pasture.

LIEBENWERDER, a town of the electorate of Saxony, 22 miles north of Meissen, and 33 N.N.W. of Dresden. Long. 13. 20. E. Lat. 51. 30. N.

LIEN-TCHEOU-FOU, a city and sea-port of China, in the province of Quangtung. Its territories border on the kingdom of Tonquin, from which it is separated by inaccessible mountains. It is 325 miles S.W. of Canton.

LIEOU-KIEOU, the general name of 36 islands lying between Corea, Formosa, and Japan. They form a powerful empire, the inhabitants of which are civilized, and ought not to be confounded with the other savage nations dispersed throughout the islands of Asia. Each island has a particular name; the largest and principal, called Lieou-kieou, extends 146 miles from north to south, and 38 from east to west. They have a king, who is tributary to China. Kint-ching, the capital, in Checuli, the fourth part of Lieou-kieou, is in Long. 127. 30. E. Lat. 26. 2. N.

LIERE, a town of Austrian Brabant, at the junction of the Great and Little Lethes, nine miles N.N.E. of Mechlin, and 12 S.E. of Antwerp. Long. 4. 16. E. Lat. 51. 9. N.

LIESINA, an island of Venetian Dalmatia, in the gulf of Venice, 58 miles long and 12 broad. It abounds in corn, olives, saffron, and wine.

LIPSSENSHOECK, a fortress of Dutch Flanders, on the west side of the Scheldt, opposite Fort Lillo, and seven miles N.W. of Antwerp.

LIESSE, a town of France, in the department of Aisne, famous for an image of the Virgin Mary, to which a great number of pilgrims used to resort. It is six miles east of Laon. Long. 3. 51. E. Lat. 49. 35. N.

LIFFEY, a river of Ireland, which rises in the county of Wicklow, runs west thence into Kildare, and then turning N.E. passes through the county of Dublin, and by the city of that name, below which it falls into the Irish Sea.

LIFFORD, a borough of Ireland, in the county of Donegal, situate on the Foyle, 24 miles N.E. of Donegal. Long. 5. 45. W. Lat. 54. 47. N.

LIGHT (*Entycl.*). Mr. Walker, the author of "Familiar Philosophy" has endeavoured to shew, that the earth and planets perform both their diurnal and annual revolutions in consequence of the *impulse* which they receive from *solar light*, and that their respective distances from the sun may be determined by the balance subsisting between this projectile force of luminous matter, and their gravitating tendency towards the sun, as their common centre.

That the revolution of the sun on his own axis (which is easily ascertainable by observing the change of place that happens in the spots on his surface) answers some essential purpose in our system, that this purpose may be to give velocity and force to the light which emanates from him, and that the aggregate momentum of that light may occasion the daily and annual motions of the planetary world, which is subject to his influence, are all conjectures so exceedingly probable, that he who should have proposed them to the world unsupported by experimental investigation would, in our opinion, have deserved

praise for his ingenuity, and credit for the originality of his speculations.

Mr. Walker has not, however, rested his theory on the unstable basis of conjectural reasoning, but, from direct experiments, has shewn that light, contrary to the idea which many philosophers have entertained, *possesses an impulsive power*; a fact which neither the experiments of Homberg nor Michell had satisfactorily proved, but which is of high importance at a time when every circumstance which respects that first and fairest bounty of Providence is eagerly enquired into, in the conviction that we have but just begun to be acquainted with its all-pervading influence—an influence which justifies the beautiful observation of the regretted Lavoisier.

“L’organisation, le sentiment, le mouvement spontané, la vie, n’existent qu’à la surface de la terre, et dans les lieux exposés à la lumière.”

Mr. Walker calculates, from his experiments, that the impetus of solar light on $1\frac{1}{4}$ square foot of the earth’s surface is equal to the 100th part of a grain, and that it amounts to 20 tons on the whole disk of the earth; a force sufficient, according to him, to cause not only the diurnal rotation of this orb upon its own axis, floating as it is in an unresisting medium, but also its annual revolution round the great source of light, in consequence of the luminous impulse being greater on one half of the earth than on the other.

If there be some errors in the quantity of momentum which the author of this theory ascribes to solar light (for it does not arrive at the earth’s surface in a concentrated state, or as when brought to a focus by a mirror or lens), and if, therefore, a proportionate deduction must be made for this diminished force on the different planets, still it is of importance to know that small bodies are sensibly moved by the *impulse of light*, and until the contrary can be shewn, it will still remain probable that even the lessened momentum of the sun’s equatorial emanation acting upon the earth’s surface may be adequate to the production of its different motions, and to the preservation of its proper distance from the sun.

Light is essentially necessary to vegetation: in our climate it is seldom productive of injury by its excess, though the want of it is often pernicious. This fluid acts as a kind of stimulus on the more irritable parts of plants; as appears from the sun-flower and others, that expand or bow when exposed to the rays of the sun: hence Dr. Darwin supposes there may be diseases in plants, arising from the excess of this stimulus, but which, he thinks, have hitherto been disregarded. To corroborate this conjecture, he specifies the goat’s-beard, or false *tragopogon*, L.), and some other vegetable productions, which close their flowers about noon, in order to prevent the influence of such stimulus.

On the contrary, the absence or defect of light produces a disease called *etiolation*, or *blanching*, because vegetables deprived of that fluid become white. It has a similar effect on animal bodies; which, as Dr. Darwin has pointedly remarked, are in consequence rendered pale and inert: this is confirmed by the languid and *etiolated* countenances of the young ladies in some boarding-schools, where from false motives of delicacy, they are secluded both from the light of the sun, and the invigorating influence of the air: it is still farther evinced in those studious persons, who pass their waking hours in unventilated apartments, especially during a considerable part of the night.

But, though such *etiolation* be naturally injurious to vegetation, it has been artificially employed with success, in rendering certain plants esculent, by depriving them of their acrimony, cohesion, and colour. This method is chiefly practised on celery, by earthing up that plant nearly to the top; on sea-kale, by covering it entirely with horse-litter or straw;

and, lastly, on lettuces and endive, by tying the root-leaves together with a bandage.—On the chemical effects of light, the opinions of the learned are quite as unsettled as upon its nature.

Mr. Boeckmann has made several experiments respecting the particular influence of light on phosphorus dissolved in different gases. It has always been a matter of enquiry and discussion, whether there is any real difference between heat and light, some naturalists having attempted to prove the identity of those two matters; while others maintained, that there existed a great diversity between them. From the experiments of Mr. Boeckmann, however, it seems to result, that dark heat, and heat combined with light, produce phenomena essentially differing from each other; and that accordingly we ought not to adopt an identity in the nature of heat and light. As it would lead us too far to relate the single experiments, we shall only enumerate the facts that have arisen from them, and which are the following.

1. The solution of phosphorus in hydrogen gas proceeds not only at a heat combined with light, but also at a dark heat.

2. It proceeds with more speed when the temperature is increased, whereby, at the same time, a greater quantity of phosphorus dissolves than at a less degree of heat.

3. When the solar light is kept off by opaque bodies, either solid or fluid, from the glass tubes in which the phosphorus is exposed to solution, no phosphoric particles are found to adhere to the sides of the tubes, even when the degree of heat is so considerable as to melt the phosphorus; whereas,

4. When direct or reflected solar light falls on the glass tubes, the phosphorus is, as it were, sublimed at the sides of the tubes.

5. The phosphoric particles lay themselves on the inner sides of the tubes more or less quickly, according to the degree in which light acts upon them.

6. Those sublimations of phosphorus are even produced when the light is faint.

7. When the glass tubes are covered on the outside with opaque stripes, alternately with places uncovered, the phosphorus only adheres at these spots.

8. The difference of temperature has no influence on the phosphorus adhering to the places where light acts.

9. The experiments were made in vessels very closely shut, so that the atmosphere had not the least share in producing the crystallizations of phosphorus that adhered to the inner sides of the tubes.

On the whole, in these experiments we meet with two phenomena, viz. the solution of phosphorus in gases, and the adhesion of it to the sides of the vessel in which the solution was undertaken, when they are exposed to the light of the sun. The solution is undoubtedly promoted by heat, though the adhesion never takes place without the action of light. But how this is caused, is not so easily to be resolved.

LIGNAC, a town of France, in the department of Indre, 11 miles S.E. of Blanc. Long. 1. 20. E. Lat. 46. 31. N.

LIGNE, a town of Austrian Hainaut, on the river Dender, 12 miles N.W. of Mons. Long. 3. 45. E. Lat. 50. 35. N.

LIGNEROLLES, a town of France, in the department of Allier, four miles south of Montluçon.

LIGNIERES, a town of France, in the department of Cher, with a collegiate church and a castle, 22 miles S.S.W. of Bourges. Long. 2. 24. E. Lat. 46. 47. N.

LIGNITZ, a town of Silesia, capital of a principality of the same name, with a castle, seated on the rivulet Cet, 30 miles south of Glogaw. Long. 16. 36. E. Lat. 51. 10. N.

LIGNY, a town of France, in the department of Meuse,

with a castle, a collegiate church, and a handsome park. It is seated on the Orney, eight miles S.E. of Bar-le-Duc, and 125 of Paris. Long. 5. 26. E. Lat. 48. 39. N.

LIGON, a sea-port in the peninsula of Malacca, capital of a small territory of the same name, with a magazine belonging to the Dutch East-India Company. It is seated on the east coast. Long. 100. 5. E. Lat. 7. 40. N.

LIGUEIL, a town of France, in the department of Indre and Loire, seated on a brook, 23 miles S.S.E. of Tours. Long. 0. 52. E. Lat. 47. 3. N.

LILIENTHAL, a town of Lower Saxony in the duchy of Bremen, situate on the Warp, 10 miles N.N.E. of Bremen, and 20 N.N.W. of Verden.

LILLERS, a town of France, in the department of the Straits of Calais, seated on the Navez, 17 miles N.W. of Arras. Long. 2. 35. E. Lat. 50. 30. N.

LILLO, a fort of Dutch Brabant, on the east side of the Scheld, seven miles north of Antwerp. It was taken, in 1793, by the French, who soon after evacuated it, retaking it, however, in 1794. Long. 4. 18. E. Lat. 50. 30. N.

LIMALE, a town of Austrian Brabant, seated on the Dyle, 13 miles S.E. of Brussels. Long. 4. 42. E. Lat. 50. 42. N.

LIMAVADY, a town of Ireland. See *NEWTOWN LIMAVADY*.

LIMBURG, a town of Germany, in the electorate of Treves. The Austrians defeated the French on the heights near this place, in 1796. It is seated on the Lahn, 10 miles east of Nassau, and 20 north of Mentz. Long. 7. 51. E. Lat. 50. 24. N.

LIME, or QUICKLIME (*Encycl.*). Though we have already spoken of this substance as a valuable manure (see *HUSBANDRY*), we are induced to add the following particulars respecting the principle on which lime is of use in agriculture. Lime is prepared from various materials of the calcareous class, by the application of proper degrees of heat, by which one of their constituent principles is dissipated or forced off, and its place supplied by another; carbonic acid, or fixed air, being disengaged, and caloric, or the matter of heat, being taken in its stead. In this state lime possesses the greatest power over animal and vegetable substances, being capable of breaking down their texture, and destroying their organization, in the most expeditious manner. Hence it has been denominated *quick* or *caustic* lime. But on exposure to the atmosphere, moisture is absorbed, the caloric or heat disengaged, the carbonic acid or fixed air readily restored. This constitutes the mild *effete* or *carbonated* state of lime. In this situation, though it is far from acting with such violence on those animal or vegetable matters that come in its way, it has much effect in accelerating the putrefactive process, and in promoting their solution.

However well these different conditions of lime may have been discriminated by the chemist, they seem to us to have been but very little regarded by the practical agriculturist. The term *lime* being applied, without distinction, to the different states, it is easy to perceive that they must frequently have been used in an improper manner, and that, of course, much confusion, as well as contrariety of effect, must have been engendered.

The differences that have proceeded from the want of proper chemical examinations of the several kinds of calcareous substances that have been made use of for the purpose of lime, are perhaps not less productive of error or uncertainty than those which have arisen from the other cause which we have assigned; for it appears from the late experiments of that very able and ingenious chemist, Mr. Tennant (see the *Philos. Trans. Royal Society*, 1799, part II.), that there are sub-

stances contained in some sort of limestone that are highly injurious to vegetation, while other kinds do not possess them at all. He found, upon reducing two different sorts of limestone to a coarse powder, and sowing in them seeds of different plants, that in both the seeds grew equally well, and nearly in the same manner, as they would in sand or other substances that afford no nourishment to plants; but that, after burning them into lime, and exposing them for some weeks to the air, in order to lessen their causticity, and then sowing seeds in them, in that sort of lime which had been found the most advantageous when applied to land, almost all the seeds came up, and continued to grow so long as they were supplied with water, the roots of the plants having many fibres which penetrated to the bottom of the vessels in which they grew. The composition of this kind of lime, on examination, turned out to be entirely calcareous earth; and, on exposure to the air for about three months, was found to have absorbed four-fifths of the carbonic acid, or fixed air, that was necessary to saturate it. But in the other sort, which had been found injurious to land, only a few of the seeds grew, and the plants produced by them had scarcely any stalks or roots, being formed almost entirely of the two seed-leaves which lay quite loose on the surface. On spreading this sort of lime on a garden soil, to the thickness of the tenth of an inch, it prevented nearly all the seeds that had been sown from coming up, while no injury at all was occasioned by common lime applied in the same way. This lime, on being examined, was found to contain three parts of calcareous earth, and two of magnesia; it only absorbed, on being exposed to the air for nearly the same length of time as the other, forty-two hundredths of the carbonic acid that was combined with it before it was burnt into lime. As it seemed extremely probable, from these trials, that the magnesia contained in lime of this kind was the cause of its extraordinary properties, some experiments were made to ascertain the effects of that substance upon vegetation. Seeds of colewort, as growing rapidly, were sown in uncalcined magnesia, which, though they sprouted, the leaves never rose above the surface, and the plants were without roots: they did not appear to grow better in magnesia that had been washed in water, which contained carbonic acid or fixed air. Calcined magnesia was still more prejudicial, the seeds not coming up in it. In order to compare its effect on vegetables with those of lime, each of these earths were mixed in different proportions with sand in small cups, and seeds then sown in them. The lime being obtained from marble, and made to fall to powder from being moistened with water before it was put to the sand. In a mixture of four ounces of sand with three or four grains of calcined magnesia it was long before the seeds came up, and the plants had scarcely any roots or stems; and with ten grains or upwards of magnesia there was not the least sign of vegetation: thirty or forty grains of the lime not retarding the growth of the seeds more than three or four of the magnesia, and the injurious effects not so lasting. The lime, from its absorbing carbonic acid or fixed air, soon lost its destructive properties; so that after keeping the mixtures four or five weeks, seeds were found to grow in that with forty grains of lime nearly as well as in pure sand; but in that with four grains of magnesia they produced only the seed-leaves as stated before. It is necessary to break the sand occasionally where much lime is used, in order to allow the seeds to push through it. It was found that plants would bear a much larger proportion of magnesia in vegetable soil than in sand; but with twenty grains of calcined magnesia in as much soil as was equal in bulk to four ounces of sand, the seeds, however, only produced the seed-leaves without roots; and with forty grains they were totally prevented from coming up. As land

is frequently rendered barren for some time by the application of this sort of lime. Mr. Tennant made experiments with mortar constituted of this lime, which had been prepared three and eight years, and constantly exposed to the air. There, on being reduced to powder, had seeds sown in them, but only a few came up, and these merely produced the seed-leaves without roots. As plants would grow in the limestone from which this sort of lime was made, but not in the mortar prepared from it, he next endeavoured to ascertain what proportion of the carbonic acid contained originally in the limestone had been absorbed by the mortar. To prove this, a piece of it was finely powdered, and trials made of the quantities of this powder and of the limestone that would saturate the same measure of acid, from which he found that the mortar and limestone contained equal quantities of the magnesian lime; and the carbonic acid or fixed air being obtained from them and measured, it was found that the mortar which had been exposed three years had absorbed forty-three, and that of eight only forty-seven hundredths of the quantity originally combined with the limestone. Common mortar that had been exposed to the air for a year and three quarters had regained sixty-three hundredths of its full proportion of carbonic acid. The lime which contains magnesia may, Mr. Tennant observes, be readily distinguished from that which is purely calcareous by the slowness of its solution in acid, which is to be considered that the softest kind of the former is much longer in dissolving than marble. The crystallised structure which is generally observed in the magnesian limestone, he thinks, demonstrates that it has not been formed by the accidental union of the two earths, but that it must have been the result of their chemical combination. The difficulty of dissolving it, he supposes to arise from the greater attraction of its different constituent parts to each other. Mortar formed from this kind of lime is as soluble in acids as common marble; and the substances of which it consists are readily separated. The magnesia may be taken from it by boiling it in muriated lime, and lime precipitated by it from lime water; but these effects can neither of them be produced by the stone previous to its calcination. This able experimenter has offered several other observations and conclusions as to the different proportions of calcareous and magnesian earths contained in different specimens of this sort of limestone, which perhaps do not less deserve the attention of the agriculturist than the chemical enquirer; but the above are amply sufficient for the purposes of this work, as they abundantly prove that not only much error and confusion must have been caused in the practice of husbandry, but very different effects produced by the want of sufficient knowledge of the chemical properties of the various sorts of calcareous matter that are employed for the preparation of lime.

LIME, or LEMEN, a village in Kent, three miles west of Hithe. It was formerly a port, till choked up by the sands, and is now a poor town; but it has the horn and mace, and other tokens left of its ancient grandeur. It used to be the place where the lord warden of the Cinque Ports was sworn, at his entrance upon his office. The Roman road from Canterbury, called Stane-street, ended here; and from the brow of its hill may be seen the ruins of the Roman walls. Here was formerly a castle, now converted into a farm-house.

LIME-TREE; (see *TILIA*, *Encycl.*) The following is an extract of a paper on the genus *tilia*, read at the National Institute in France, by Citizen Venenat.

Linnaeus has mentioned in his *Species Plantarum*, only two species of lime-tree, to which he gave the name of *Europaea*

and *Americana*; but as there are more distinct species of this tree to be met with in Europe as well as in America, those names cannot conveniently be retained, because one might suppose by them, that the other species do not grow in Europe or in America.

Miller, in his *Gardener's Dictionary*, describes two American species of lime-tree, retaining the name of *Americana* for that which was known to Linnaeus, and assigning to the other, brought from Carolina by Catesby, the name of *Caroliniana*; but this cannot likewise be adopted, since Michx and other botanists have discovered in Carolina another species of lime-tree, different from that found by Catesby. Mr. Aiton, in his *Hortus Kewensis*, has probably changed, on that account, the name of *Caroliniana* into that of *pubescens*. Mr. Walther distinguishes a species of lime-tree, native of Carolina, "*Tilia Americana, floribus nectario instructis, stipulis floriferis*;" but as this description agrees evidently with all the lime-trees that may grow in the whole extent of America, it is obvious how difficult it would be to determine which species Walther may have meant; if the naturalists who travelled in Carolina had not brought with them specimens of the tree, which the English botanist meant to characterise.

After having given the generic character, Mr. Venenat describes the following species, of which he has given figures:

Lime-trees of Europe, with naked petals.

Tilia microphylla.—Folii cordato-subrotundis, acuminatis, argute serratis, capsula subglobosa, minime costulata, tenuissima, fragili. Var. fructu oblongo, utrinque acuminato. Tili Hort. Pisan. T. 49. fig. 3.

T. platyphyllos.—Folii cordato-subrotundis, acuminatis, inaequaliter serratis, capsula turbinata, costis prominentibus, insignita, lignosa, crassa. Var. Carolina. Ait. Hort. Kew.

Lime-trees of America; petals provided with a scale, at their bases.

T. glabra.—Folii profunde cordatis, serratis, glabris; petalis apice truncatis, crenatis, capsula ovata, subcostata (T. Americana L.).

Habitat in Virginia et Canada.

T. pubescens. Ait.—Folii basi truncatis et obliquis denticulato serratis, subtus pubescentibus, petalis emarginatis, capsula globosa levi.—T. Caroliniana Mill.

Habitat in Carolina.

Var. leptophylla, foliis tenuissimis, subpapyraceis. Habitat in Louisiana.

T. rotundifolia.—Folii cordato-subrotundis, subsinuatis, dentatis verticalibus subtus tomentosis; capsula ovata, obscuri nervosa. T. alba Ait. argentea Mus. Nat.

Habitat in America septentrionali.

T. heterophylla.—Folii ovatis, argute serratis, basi nunc cordatis nunc oblique aut aequaliter truncatis subtus tomentosis, capsula globosa, multinervosa.

Habitat in Carolina inferiori, et in Marylandia.

Mr. Venenat terminates this paper, by presenting some observations on the culture of the species of this genus, on the soil that agrees with them, and on the advantages that may result from them to the community.

LIMEUIL, a town of France, in the department of Dordogne, 20 miles S. of Périgueux. Long. o. 50. E. Lat. 44. 52. N.

LIMMAT, a river of Switzerland, formed by the junction of the Mat and the Linth; the former issuing from the N.W. extremity of the lake Wallenstadt, and the latter flowing from the S. The Limmat, continuing its course N.W. flows through the lake of Zurich, and falls into the Aar, below Baden.

LIMOUX, a commercial town of France, in the department of Aude. It has a manufacture of cloth; and the environs produce an excellent white wine, called the Perry of Limoux. It is seated on the Aude, 37 miles W. by S. of Narbonne, and 50 S.E. of Toulouse. Long. 2. 16. E. Lat. 43. 4. N.

LINCHE, or **LINKE**, a strong town of France, in the department of the North, seated on a river, 10 miles S.W. of Dunkirk. Long. 2. 20. E. Lat. 51. 0. N.

LINDAU, a free imperial town of Suabia. Here is a celebrated abbey of canons, whose abbess is a princess of the empire, and a Roman-catholic, though the inhabitants of the town are protestants. The French took possession of this town in July 1796. It is a trading place, seated on an island of the lake of Constance, joined to the main land by a long beautiful bridge, 12 miles S.E. of Buchorn, and 75 S. by W. of Augburg. Long. 9. 50. E. Lat. 47. 38. N.

LINDAU, a town of Upper Saxony, in the principality of Anhalt Zerbst, five miles N. of Zerbst.

LINDENFELS, or **LINDENFELD**, a town of Germany, in the palatinate of the Rhine, 14 miles N.N.E. of Manheim, and 17 of Heidelberg. Long. 8. 47. E. Lat. 49. 42. N.

LINDKOPING, or **LINKIOPING**, a town of Sweden, capital of West Gothland, with a bishop's see. It is seated on the lake Wenner, 12 miles N.W. of Skar, and 178 S.W. of Stockholm. Long. 13. 5. E. Lat. 58. 25. N.

LINDOW, a town of Upper Saxony, in the Middle Marche of Brandenburg, eight miles S.S.W. of Frankfort on the Oder.

LINDSEY, the largest of the three principal divisions of Lincolnshire, including all the county that lies N. of Lincoln, and the Fossidike, which Henry I. cut between the Witham and the Trent. It is the most elevated part of the county: and the air is generally esteemed healthy, especially on the W. side. To the N.E. is a large tract of heathy land, called the Wolds, the S. part of which is well inhabited, but the N. is thin of people: great flocks of sheep are bred throughout this tract. See **ARHOLM**.

LIN-KIANG-FOU, a city of China, in the province of Kiang-si, seated on the river Yu-ho. It has only four cities of the third class in its district; but is of some note, on account of one of its villages being the general mart for all the drugs sold in the empire. It is 410 miles N. by E. of Canton.

LIN-TCHEOU-FOU, a city of China, in the province of Kiang-nan; including, in its jurisdiction, two cities of the second, and six of the third class.

LIN-TCHIN-TCHEOU, a city of China, in the province of Chan-tong, seated on the Great Canal. Among the edifices admired here, is an octagonal tower, divided into eight stories, the walls of which are covered on the outside with porcelain; and near this are some temples of beautiful architecture. It is 225 miles S. of Peking.

LINEN, a general name given to those garments that the people of England, and other countries, usually wear immediately next the skin; these being, for the most part, of flaxen manufacture. That this is the most conducive to longevity, however, especially in so variable a climate as that of Britain, has been long doubted; and the more wholesome practice now prevails, not only with valetudinarians, but with confederate persons who even enjoy good health, to wear flannel or fleecy-hosiery (see **FLEECY-HOSIERY**, *Supp.*) under their linen.

The following extract from an account of an annual distribution of linen to the poor, with a proposal as to a mode of supplying them with blankets, by the Rev. Mr. Dolling, late vicar of Aldenham, Herts, is published by the Society for bettering the Condition of the Poor.

"A worthy friend," says Mr. Dolling, "annually confided to me the distribution of five guineas, for the benefit of the poor. With them I purchased about 110 yards of linen cloth, which was cut out chiefly into shifts, the pieces of each being pinned together. I kept an annual linen list, giving at Christmas a shift each to about thirty-seven women, and occasionally a shift to a girl, or a shift to a boy; so that they all had this benefit in their turns, and some more deserving mothers, with large families, constantly; the preference being given to those who did not receive parochial relief.—When- ever they attended together at my house to receive the linen, I took the opportunity of pointing out to them any improprieties in their conduct, deserving of observation. What was then said was often attended with good effect."

On this plan the following observations are made:

"At the same time that it must be admitted that the poor are not provident, it should be observed in their exculpation, that they frequently have not the means of being so. It seldom happens, when winter approaches, that they have been able to make, or at least that they have made, a sufficient provision for clothing during the severity of the season; and their health often suffers for want of it. If blankets were purchased, and lent out to cottagers in November, a register book being kept, and the blankets marked, and No. 1, 2, &c. placed against each name, and signed by the borrower, to be returned again clean in the ensuing month of May, unless the cottager could become the purchaser of it, at a limited and reduced price, it would contribute greatly to their health and comfort during the winter."

We cordially agree with the benevolent writer of these remarks, well knowing how greatly the miseries of the poor are aggravated, as well as their diseases promoted, in severe weather, from the mere want of the means of warmth and cleanliness. Nothing is more common amongst the poor, especially in great towns, than the use of sheets, and body linen that are worn for a continuance, perhaps till they are worn out, without once undergoing the purifications of a washing tub!

LINNE, a town of Germany, in the archbishopric of Cologne, 32 miles N.N.W. of Cologne.

LINNICH, a town of Westphalia, in the duchy of Juliers, five miles N.N.W. of Juliers. Long. 6. 2. E. Lat. 51. 2. N.

LINOSA, an island of the Mediterranean, on the coast of Africa, 12 miles from Lampedosa. It is 12 miles in circumference. Long. 12. 30. E. Lat. 36. 50. N.

LINSELLES, a town of Flanders, where, in 1794, a battle was fought between the allies, but chiefly the English commanded by the Duke of York, and the French. It is five miles N. of Lille.

LINTON, a town in Cambridgeshire, with a market on Thursday, 12 miles S.E. of Cambridge, and 46 N. by E. of London. Long. 0. 22. E. Lat. 52. 8. N.

LIPOUREC, a town of Poland, in the palatinate of Cracow, 32 miles W. of Cracow.

LIPPEHNE, a town of Upper Saxony, in the New Marche of Brandenburg, 26 miles N. of Cultrin. Long. 14. 52. E. Lat. 52. 53. N.

LIPSTADT, a considerable town of Westphalia, capital of the county of Lippe. It was once free and imperial; afterwards subject to its own counts, and now to the king of Prussia. It carries on a good trade in preparing timber for building vessels on the Rhine, with which it has a communication by the river Lippe. It is seated in a morass, 17 miles W.S.W. of Paderborn, and 30. S.E. of Munster. Long. 8. 30. E. Lat. 51. 42. N.

LIQUE, a town of France, in the department of the

Straits of Calais, 12 miles W. of St. Omer. Long. 2. o. E. Lat. 50. 45. N.

LIS, a river of the Netherlands, which has its source in Artois, and running N.E. into Flanders, passes by Aire, St Venant, Armentieres, Menin, Courtray, and Deynse, and then falls into the Scheldt, at Ghent.

LISCA, or LISCA-BIANCA, one of the Lipari Islands, three miles S.W. of Stromboli. It is a small desert spot.

LISIER, St. a town of France, in the department of Arriège, lately an episcopal see. Here is a chapel, which has been famous for the resort of pilgrims. It is situated on the Satat, 50 miles S.E. of Auch, and 390 S. by W. of Paris. Long. 1. 15. E. Lat. 42. 56. N.

LISONZO, a river, which rises in Carinthia, runs through part of the republic of Venice, and falls into the gulf of Venice, at the harbour of the same name.

LITHAY, a town of Germany, in the duchy of Carniola, situate on the Save, 15 miles E. of Lansbach.

LITIZ, a town of the state of Pennsylvania. Here is a flourishing settlement of the Moravians, begun in 1757. It is eight miles from Lancaster, and 70 W. of Philadelphia.

LITSCHAU, a town of Germany, in the archduchy of Austria, 70 miles N.W. of Vienna. Long. 14. 55. E. Lat. 48. 48. N.

LITTERMORE, an island near the W. coast of Ireland, and county of Galway, about four miles long and two broad. Long. 9. 40. W. Lat. 53. 17. N.

LIVADOSTA, a town of Livadia, seated on the gulf of Lepanto, in the isthmus of Corinth, to the N. of the city of that name, with a bishop's see.

LIVENZA, a river of Italy, in the territory of Venice, which runs on the confines of Trevisano and Friuli, and falls into the gulf of Venice, between the mouth of the Piava and the town of Caorlo.

LIVERDON, a town of France, in the department of Meurthe, seated on a mountain, near the river Moselle, eight miles N.E. of Toul. Long. 6. 5. E. Lat. 48. 45. N.

LIZARD; (see *BASILISCUS*, *Encycl.*). Some have insisted on the efficacy of lizards in curing the leprosy. The following translation of a letter from M. Rey Demourande, a French merchant settled in Spain, inserted in the *Journal de Bourdeaux*, together with a letter from M. Delarche at Madras, to George Smith, esq. at Calcutta, contain some curious accounts of this fact. The writer of the former expresses himself eager to communicate to his country what he calls "a most useful and precious discovery for human nature." "It is," says he, "a wonderful specific against the leprosy, cancers, venereal disorders, and every kind of ulcers. We owe the knowledge of this remedy to the Indians of the village of Saint Christoval Amalelace, dependent on the kingdoms of Guatemala. The trials which have been made of it in that country, at Malaga, and at Cadiz, have been so surprising and favourable, that about a month ago there was printed in the latter city a small pamphlet of twenty pages, containing an account of its discovery, and a detail of the miraculous cures which have been derived from it, as well at Guatemala as at Mexico and Malaga. This remedy is small lizards eaten or swallowed raw, either those called in the *Encyclopædia anolis de terre*, or *gobe mouches*; and the manner they are described by Doctor Joseph Storey, of the royal university of the city of Guatemala, is this: "These reptiles are very properly called small lizards, for their figure is exactly that of a lizard; they are eight or ten inches in length, and a little more than half an inch in breadth; they are very active and vivacious; some of them are gilt between a yellow and green, and others are grey with spots; both of them have their skin covered with

triangular scales from the head to the tail. I apprehend that the gilt ones, or those of the colour de *tourne fol*, are the female, because their bellies are larger and more protuberant. The Indians," adds the doctor, "are neither averse to them nor disgusted with them. They take a small lizard, and with much dexterity cut off its head and tail, immediately they extract the entrails, and with a single exertion tear off the skin. In this raw state, the flesh trembling and fill hot, they chew them slowly, and swallow them with great composure. They take daily one of them fasting. It is said they are accustomed not to take more, but it has happened that they have taken two and even three." Disgust has prevented the Spaniards, both in Europe and America, from taking the medicine in this manner: to render it more supportable and less repugnant to their feelings, after having cut off the head and tail, and feet of the animal, and taken away its entrails and skin, the remainder has been divided into small pieces, and being covered over with a paste of flour, administered to the patient in pills; the body of a small lizard making two, each a little less than a musket-ball. Every experiment which has been made, both at Guatemala, Mexico, and Malaga, in the most desperate cases, has been attended with the greatest success. It appears, nevertheless, that although at Guatemala and Mexico only five or six *anolis* are necessary to cure a patient radically, yet a much greater number is requisite at Malaga to produce the same effect, for it was not till after a leper's having swallowed thirty or forty at Malaga, in a like number of days, that his cure was completed. The effects which this remedy produces are constantly an extraordinary heat and burning, accompanied with a profuse sweat, and a salivation thick, plentiful, and yellow. There have been patients who have neither salivated or perspired much from it, but in lieu thereof have had plentiful evacuations either by the way of urine, which was excessively acrid and fetid, or from considerable excrements. In America a patient has never been prepared by bleeding, purging, or other course of medicine; but at Malaga in some cases it has been thought expedient to bleed slightly previous to administering the remedy.

"Although my letter is already very long, the subject is so interesting to human nature that I deem it incumbent on me to add some few observations; the first is to remark, that these small lizards, or anolis, retire during the winter into the holes of walls, old trunks of trees, in the sand, and in the earth, where they remain torpid until the return of heat. I believe as well from this circumstance as from the burning abundant sweats which the medicine causes, and to approach as near as possible the method made use of at Guatemala, that it will be proper to administer them only in summer; too much care cannot be taken to oblige the patient to swallow these animals whilst hot, and as soon after being killed as possible, it being probable that their singular and wonderful property arises from the animal spirits, and a salt, extremely volatile, which every part of their body contains, and which the smallest degree of fire or the least cooling after their death would dissipate. Here is a fine field for discoveries in physic! for if, as I am persuaded it will, this remedy produce the same effects in France as in America and Spain, it is not to be doubted but that the animal species being the most perfect and analogous to mankind, we ought to find in that class the most salutary remedies. I am alike convinced, that, after the example of the present discovery, if, instead of making use of the viper in broth, it were to be given raw, or in pills, it would produce a much greater effect, and might have the same efficacy as that attributed to the lizards.

"M. de Malzac, an experienced physician of Kaifres,

having promised to make experiments with these lizards or *analis*, I have given him a copy of the translation which I made of the pamphlet printed at Cadiz."

Mr. Delarache writes thus from Madras, 7th May, 1785, to Mr. Smith.

"I have, in conformity with the accompanying receipt, attempted to administer this cure to a leper here, who laboured under this malady for twenty years, and who had lost the joints of his toes on both feet, and who was all over covered with pimples and ulcers, especially about the ears and nose, which discharged a fetid and vicious matter. I caused him to take 180 of these lizards warm, and almost trembling, and for three months without interruption. The fifteenth day of the remedy he began to spit, or salivate, in great abundance, which he did for a month and a half, when it ceased of itself; during this time of his salivation, the pimples and ulcers, with which he was covered, dried up, and they fell off in scales, in such manner, that it would not seem that this man had ever been affected with the leprosy; but ulcers which he had on his feet, though without toes, did not dry up, but continued to discharge matter, though in smaller degree than before. In other respects, this man, who for fifteen years had not slept two hours in the twenty-four, and even that a broken and disturbed sleep, began on the thirteenth day of his cure to sleep soundly, and sometimes for six hours without interruption, recovering his appetite, which he had before lost. This, sir, is the present state of this man; if the leprosy should not again break out on his body, he may think himself very happy, though not radically cured. I intend next month, when it becomes very hot, to recommence the remedy, and to administer it for forty days without interval, for probably the lizards will then have more animal spirits, and more volatile salts, than they have in the months of October, November, and December, which you know is our rainy and cold season. May it please God, for the sake of human kind, that this man be radically cured; in such event, I shall inform you.—N. B. No fish or pickles must be eaten by the patient during this cure."

LIZARD, the most southerly promontory of England, whence ships usually take their departure, when bound to the westward. Long. 5. 10. W. Lat. 49. 57. N.

LLANARTH, a town in Cardiganshire, with a market on Tuesday, 17 miles east by north of Cardigan, and 212 west by north of London. Long. 4. 20. W. Lat. 52. 13. N.

LLANBEDER, a town in Cardiganshire, with a market on Tuesday. It is seated on the Tywi, over which is a bridge into Carmarthenshire, 24 miles east of Cardigan, and 197 west by north of London. Long. 4. 8. W. Lat. 52. 9. N.

LLANDILOVAWR, a town in Carmarthenshire, with 2 market on Tuesday and Saturday. It is seated on an ascent, in the river Towy, over which is a bridge, 13 miles east by north of Carmarthen, and 194 west by north of London. Long. 3. 58. W. Lat. 51. 55. N.

LLANELLY, a town in Carmarthenshire, with a market on Tuesday. It trades much in coal, and is seated on a creek of the Bristol Channel, 13 miles south by east of Carmarthen, and 216 west by north of London. Long. 4. 10. W. Lat. 51. 43. N.

LLANGADOC, a town in Carmarthenshire, with a market on Thursday. It is seated between the rivers Brane and Sawth, which soon join the Towy, 18 miles east by north of Carmarthen, and 185 west by north of London. Long. 3. 48. W. Lat. 51. 54. N.

LLANGOLLEN, a town in Denbighshire, with a beautiful bridge of four arches over the river Dee, seven miles S.W. of Wrexham, and 184 N.W. of London.

LLANGUNNER, a village in Carmarthenshire, a mile and a half from Carmarthen, noted for being the private seat of Sir Richard Steele, who died here in 1729.

LLANROOST, a town in Denbighshire, with a market on Tuesday, seated on the Conway, 15 miles S.W. of Denbigh, and 222 N.W. of London. Long. 3. 58. W. Lat. 53. 6. N.

LLANTRISSETT, a town in Glamorganshire, with a market on Friday. It is an ancient place, governed by a portreeve, who is sworn by the deputy constable of the castle that stands near it. It is 10 miles N.W. of Landaff, and 166 west of London. Long. 5. 22. W. Lat. 51. 28. N.

LLANWILLING, a town in Montgomeryshire, with a market on Tuesday. It is seated in a flat, among hills, near the river Cane, 15 miles north by west of Montgomery, and 179 N.W. of London. Long. 3. 8. W. Lat. 52. 40. N.

LLANYDLOS, a town in Montgomeryshire, with a great market on Saturday, for woollen yarn. It is seated on the Severn, near its source, 18 miles S.W. of Montgomery, and 180 W.N.W. of London. Long. 3. 28. W. Lat. 52. 19. N.

LLANYMDDOVRY, a town in Carmarthenshire, with a market on Wednesday and Saturday. It had once a castle, now in ruins, seated near the Towy, 26 miles E.N.E. of Carmarthen, and 181 west by north of London. Long. 3. 42. W. Lat. 51. 56. N.

LLAUGHARN, a town in Carmarthenshire, with a market on Friday; seated at the mouth of the Towy, near the ruins of two castles, seven miles S.W. of Carmarthen, and 233 west by north of London. Long. 4. 28. W. Lat. 51. 48. N.

LLERENA, a town of Spain, in Estremadura, 53 miles east of Cordova, and 54 north of Seville. Long. 5. 23. W. Lat. 38. 24. N.

LOREI, a town of Spain, in Catalonia, 20 miles N.E. of Mataro. Long. 2. 39. E. Lat. 41. 47. N.

LO, St. a town of France, in the department of the Channel, with a good citadel. It has considerable manufactures of ferges, thalloons, ribbons, and gold and silver lace. It is seated on the Vire, 12 miles east of Coutances, and 125 west by north of Paris. Long. 0. 53. W. Lat. 49. 6. N.

LOAN, or **LOVANO**, a town of Italy, in the state of Genoa, near the sea, six miles S.S.W. of Finale. Long. 7. 58. E. Lat. 44. 9. N.

LOBAW, a town of Western Prussia, with a castle, where the bishop of Culm resides. It is 25 miles east of Culm. Long. 19. 0. E. Lat. 53. 25. N.

LOBENSTEIN, a town of Upper Saxony, in the county of Reussen, 26 miles north of Barchin. Long. 11. 37. E. Lat. 50. 20. N.

LOBOA, a town of Spain, in Estremadura, seated on the Guadiana, 22 miles east of Badajoz. Long. 6. 22. W. Lat. 38. 32. N.

LOBSTADT, a town of the electorate of Saxony, in the circle of Leipzig, 10 miles S.S.E. of Leipzig.

LOBURG, a town of Lower Saxony, in the principality of Magdeburg, 22 miles east of Magdeburg. Long. 12. 7. E. Lat. 52. 12. N.

LOCCO, a town of Naples, in Abruzzo Citeriore, situated on the Pelicera, 10 miles north of Solmona.

LOCHEM, a town of Dutch Guelderland, in the county of Zutphen. It was taken by the French in 1672, who abandoned it in 1674, after having demolished the fortifications. It is seated on the Borrel, 10 miles east of Zutphen. Long. 6. 13. E. Lat. 52. 12. N.

LOCHEER MOSS, a morass in Dumfriesshire, 10 miles long and three broad. Here vast oak trees, and also canoes and anchors, have been dug up.

LOCHES, a town of France, in the department of Indre and Loire, with a strong castle, the prospect from which is very extensive. Here was one of those horrid dungeons, built by the cruel Lewis XI., the walls, floors, ceilings, and doors of which were lined with plates of iron fastened to bars of the same metal. The unfortunate Ludovic Sforza, duke of Milan, taken in battle, under Lewis XII., ended his days in one of them. In the choir of the late collegiate church, is the tomb of the celebrated Agnes Sorel, mistress of Charles VII., to whose patriotic exhortations that monarch owed almost all his glory. Loches is seated on the Indre, near a forest, 15 miles south of Amboise, and 20 S.E. of Tours. Long. o. 51. E. Lat. 47. 10. N.

LOCHMABEN, a borough in Dumfriesshire, situate on the west side of the Annan, nearly opposite the place where it receives the united streams of Yea and Kinnel, 10 miles N.E. of Dumfries. Long. 3. 19. W. Lat. 55. 19. N.

LOCHRIDA, or **OCRIDA**, a town of Turkey in Europe, in Albania, with a Greek archbishop's see. It is well fortified, and seated on a hill, near a lake of its own name, 62 miles S.E. of Durazzo. Long. 20. 40. E. Lat. 41. 40. N.

LOCHTA, a sea-port of Sweden, in East Bothnia, seated on the gulf of Bothnia, 90 miles south of Tornea. Long. 24. 16. E. Lat. 64. 20. N.

LOCHWINNOCH, a lake in Renfrewshire, called also Castle Semple Loch, near three miles in length. On an island in this lake, is an old fortress, called the Peel; a name frequently given to old fortresses in Scotland. From this lake issues the river Black Cart.

LOCHY, Loch, a lake in the S.W. part of Invernesshire, 10 miles in length, and from one to two in breadth. From the N.W. the waters of Loch Arkel descend into this lake. Out of it runs the river Lochy, which, about a mile below, receives the Spean, and after flowing through the district of Lochabar, falls into Loch Eil, at Port William.

LOCK (*Encycl.*). Under that article we have minutely described the ingenious inventions of Mr. Braham to prevent private depredation and pilfering; justice to the inventions of others, however, remains to be done, and we accordingly subjoin the following particulars on the subject of locks.

An account of a door or chest lock, of a peculiar construction, by Mr. Thomas Arkwright, of Chorley-moor, in Lancashire, appears in the Transactions of the Society for the Encouragement of Arts, Manufactures, and Commerce, who conferred fifteen guineas on Mr. Arkwright for his invention.

This lock has two bolts, so formed, that, if the key should by any accident be left in the lock, it would be scarcely probable that a servant could unlock it.

In Pl. 37. A, shews the pointer on the flank of the key.

B, the pin on which the key turns.

C, top bolt of the lock.

D, the upper higher tumbler for the top bolt.

E, another tumbler for the top bolt, and placed underneath

F, a lever, which works both bolts, and moves on a centre G.

H, the lower bolt, with a joint I upon its head.

K, the lower tumbler, with two joints L, which fall into two notches of the top bolt. Underneath the lower bolt is another tumbler, similar to that marked E. There are five springs within the lock, four of which act upon the upper and lower tumblers, the other on the joint bolt H.

M, the bottom part of the key. The dark ring in the centre represents the hollow to be applied to the lock-pin B, above mentioned.

Vol. X.

The directions given for working the double-bolted lock, are these:

First, place the head or bolts of the lock towards the left hand; then take the key with the right hand, with the small pointer A, in the flank of the key, towards the right: after this, put the key down to the bottom of the socket upon the centre pin B, in the lock, and give one half-turn with the pointer in the flank of the key, upwards; by which the bolt C at the top will be locked. In the next place, draw back the key about one inch, so that the webs or bits of the key may clear the tumblers in the lock; then turn the key with the small pointer towards the right hand, and put down the key in the manner above mentioned. After this, make one half-turn with the pointer in the flank of the key downwards, by which means the lower bolt H is locked, and the higher bolt C unlocked. Then draw up the key as aforesaid, and turn it with the pointer in the flank to the right hand. In the last place, thrust down the key, and give one half-turn with the pointer in the flank of the key, upwards, by which means both the bolts C and H will be locked; so that, when the bolts are to be unlocked, the pointer in the key must be towards the left hand, and must be worked as above directed.

We shall next lay before the reader a specification of the patent granted to Mr. Hølemberg, of Silver-street, Bridge-water-square, London, for locks or fastenings on an improved construction. It is dated June 24, 1801.

In Plate 37. fig. 1, shews the front of the lock finished:—1, the four fastening screws;—2, flat plate;—3, the box;—4, key hole;—5, 5, catch fastening to the door-post, &c. with two screws. Fig. 2:—1, second or inner plate on which the key turning opens number 4;—2, 3, screws fastening inner plate to the bottom of lock;—3, spring flat bolt to double fasten the lock;—4, circular or principal bolt;—5, key-hole. Fig. 3:—1, spring screw;—2, inside tumbler, designed for greater security of the principal bolt, as appears from the drawing;—3, the orbicular bolt, the principle of the whole, for security unequalled;—4, key-hole, exhibiting foot of the key;—5, stopper, for the recurrency of principal bolt;—6, quadra-circular conductor, for the principal bolt;—7, the catch. Fig. 4:—A fastening for sashes, shutters, and doors, upon the same principle with the above described. The dimensions, thickness, works, &c. may be varied at pleasure, according to the intended use and designation of the locks and fastenings.

In the year 1784, the Society for the Encouragement of Arts, &c. conferred their silver medal on Mr. Taylor, of Petworth, for his improvement on the latch or spring-bolts of common locks. This is effected by simply reversing the tumbler, so that its curved side acts against two studs fixed on the tail of the latch, and thrusts back the latter with ease, whether the knob be turned to the right or to the left, when the lock is opened. Mr. Taylor has also, behind the tail of the latch, fixed a guide containing a groove, in which runs a small friction-wheel, that serves to keep the latch in its direct situation, and at the same time to diminish its friction: the arms of his tumbler are somewhat contracted, in order that the latch or spring-bolt may move with greater facility. By this construction, the parts of the tumbler and latch, which are in contact, move in a line, so that they pass over the greatest space, under the smallest angle; and the lock itself may be constantly used for several years, without requiring the application of oil.

The same Society also granted, in the same year, the sum of ten guineas to Mr. Marhal, for a *secret escutcheon*, which, when fixed to a lock, may be so repeatedly varied, that even the artist who made it, is unable to open the lock: A satisfi-

factory description of its mechanism is given in the 3d volume of the Society's Transactions.

LOCKING-POLE, an ingenious piece of mechanism, to be affixed to the wheels of waggons or other carriages, when descending steep hills.

As many distressing accidents happen from loads overpowering the shaft-horse, when proceeding down declivities, Mr. Colley laid before the Society for the Encouragement of Arts, &c. a contrivance for preventing such casualties; in consequence of which, he was rewarded with their silver medal. See Pl. 35.

A. The hollow, which lies on the nave of the wheel.

BC. The chains, that clip the felly of the wheel.

D, the front part of the pole, shod with iron: and which is further strengthened by a rib of iron, that is rivetted along its side, as is indicated by the black line.

In order to apply this locking-pole, the chain C is put round the felly of the wheel: the pin B is passed through the last link of C, and turned back through the moveable ring *e*: thus the wheel is secured, and any waggon, however laden, may descend the steepest hill with safety.

To prevent the locking-pole from breaking, Mr. Colley directs it to be made of the stem of an ash-tree, the *spurns*, that is, the beginnings of which, have not been cut off in felling. He further remarks, that if a horse, which has been accustomed to such situation and to descents, be put in the shafts, the animal will be so much inclined to hold back, that it will be extremely difficult to make him draw. This exertion, however, is absolutely necessary; as otherwise the chain-horse, which should always be linked to the locked side, will be obliged to pull an unnecessary weight, occasioned by his being considerably lower than the points of the shafts.

Lastly, in conveying the locking-pole from one declivity to another, it is to be placed between the lower part of the cart and the axle-tree, while the smaller end is to be buckled with a strap fixed under the body of the cart, on the driving side.

LODDON, a town in Norfolk, with a market on Friday, eight miles S.E. of Norwich, and 113 N.E. of London. Long. 1. 18. E. Lat. 52. 36. N.

LODESAN, a district of Italy, in the duchy of Milan. It is very fertile and populous, and its cheeques are in high esteem. Lodi is the capital.

LODEVE, a town of France, in the department of Herault. It was lately a bishop's see; and has manufactures of hats and of cloth for the army. It is seated in a dry barren country, on the river Logue, at the foot of the Cevennes, 27 miles N.W. of Montpellier. Long. 3. 30. E. Lat. 42. 47. N.

LODI, a town of Italy, in the Milanese, and capital of the Lodofan, with a fortress. The French defeated the Austrians near this place, in 1796. It is seated on the Adda, 15 miles N.W. of Placentia, and 20 S.E. of Milan. Long. 9. 26. E. Lat. 45. 15. N.

LODRONE, a town of Italy, in the bishopric of Trent, seated on the small lake Idro, at the place where it receives the river Chiese, 31 miles S.W. of Trent. Long. 10. 46. E. Lat. 46. 0. N.

LOFINGEN, a town of Suabia, in the lordship of Furfenberg, with a famous medicinal bath, six miles west of Furfenberg.

LOFSTA, a town of Sweden, in the province of Upland, with a hammer-mill, eight forges, and a smelting furnace. These works were destroyed by the Russians, in 1719, but have since been again erected. It is 32 miles north of Upland.

LOGOWOGOROD, a town of Poland, in Volhonia, seated on the west bank of the Dnieper, 25 miles N.W. of Kiof. Long. 31. 7. E. Lat. 50. 46. N.

LOGRONO, an ancient town of Spain, in Old Castile, seated on the Ebro, in a country abounding with excellent fruits and good wines, 52 miles east of Burgos, and 115 north by east of Madrid. Long. 2. 20. W. Lat. 42. 29. N.

LOHEIA, a town of Arabia, in the province of Yemen. It has a great trade in coffee, and is 360 miles S.S.W. of Mecca. Long. 42. 49. E. Lat. 15. 42. N.

LOITZ, a town of Upper Saxony, in Anterior Pomerania, 16 miles north of Treptow, and 24 south of Stralsund. Long. 13. 4. E. Lat. 53. 56. N.

LOMBARDY, a part of Italy, which comprehends almost all the ancient Cisalpine Gaul. It lies towards the north, and is divided into the Upper and Lower. Upper Lombardy, the western part, comprehends Piedmont, with its dependencies, and the duchies of Montferrat and Milan. Lower Lombardy, the eastern part, contains Parma, Modena, Mantua, Ferrara, the Bolognese, the territories of the Church, the Paduan, Vicentino, Veronese, Bresciano, Cremasco, and Bergame. In the late war, the whole of these provinces were overrun by the French republicans, who not only levied exorbitant contributions on the inhabitants, but also demanded many of their finest pictures and statues, which they transported to Paris.

LOMBEZ, a town of France, in the department of Gers, lately a bishop's see. It is seated on the Save, 27 miles S.W. of Toulouse. Long. 1. 0. E. Lat. 43. 29. N.

LOMOND, BEN, a great mountain, in the north of Stirlingshire, about 3200 feet above the level of the lake, at its bottom. It stretches along the east side of Loch Lomond several miles; and its broad base extends far into the country, that the ascent of this mountain, though steep, is computed to be six miles. Ptarmigans, and other heath fowls, frequent its upper regions: its lower are the haunts of the roebuck; and herds of cattle feed in the irriguous valleys at its base. From this lofty mountain are seen Loch Lomond, the Clyde, the Forth, Edinburgh, the eastern coast as far as the Cheviot Fells, the isles of Bute and Arran, the rock of Aila, Ireland, the mountain of Plynlimmon in Wales, the Skiddaw in Cumberland, and the hills far beyond it.

LON, or **LUNE**, a river which rises in Westmoreland, and flowing by Kirby Lonsdale in that county, falls into the Irish Sea, below Lancaster. Its banks are beautiful and romantic.

LONATO, a town of Italy, in the Bresciano, 12 miles E.S.E. of Brescia. Long. 10. 11. E. Lat. 45. 24. N.

LONDON, New, a sea-port in the state of Connecticut, and county of New London. Its harbour is the best in Connecticut, and as good as any in the United States. It is defended by two forts, and seated on the Thames, near its entrance into the Sound, 80 miles N.E. of New York. Long. 72. 45. W. Lat. 41. 15. N.

LONDON, New, a town of the United States, in Virginia, on James River, 135 miles west by fourth of Richmond.

LONG ISLAND SOUND, a kind of inland sea in North America, 25 miles broad and 140 long, extending the whole length of Long Island, and dividing it from Connecticut. It communicates with the Atlantic at both ends of the island.

LONGARA, a town of Naples, in Calabria Ulteriore, 20 miles W.N.W. of St. Severino.

LONGEVITY (*Encycl.*). The following "*Hints on Longevity*," were drawn up by Sir John Sinclair, baronet, with the view of being inserted in the Analysis of the Statistical Account of Scotland; and printed in a fugitive form for the purpose of obtaining additional facts and observations on that interesting subject. They contain, however, so much truly valuable matter, and the object of them is so important to society, that we are tempted to give them further publicity, by adding them to the information we have already furnished on the subject.

1. *On the healthiness of Scotland.*—Perhaps there is no country in Europe, where, in proportion to its population, a greater number of individuals reach to sixty, and thence to eighty, and even ninety years of age, in full possession of all their faculties, both personal and mental, than in Scotland; and such a circumstance, is a stronger proof of the healthiness of a climate, than a few remarkable instances of extraordinary longevity. At the same time, North Britain is not a little distinguished, for having given birth to a number of persons, who have lived beyond the usual period of human existence *. In a work containing a collection of instances of longevity, for no less a period than 1733 years; namely, from A.D. 66 to 1799, in which there is given the name, age, place of residence, &c. of 1712 persons, from all parts of the world, who had attained to a century and upwards, 170 are stated to have been natives of Scotland, and the two most remarkable in the whole list, are Kentigern, a native of Scotland †, and Peter Torton of Temeswar, in Hungary, both of whom attained the great age of 185 years ‡.

"II. *Tables of longevity.*—But before we proceed to discuss the subject of longevity in general, it may not be improper, to lay before the reader the following table, drawn up by an eminent author (Hufeland), which explains the shortness of human life, and points out how few there are, in proportion to the number born, who reach even the period of sixty years §.

"Of a hundred men who are born, there die, according to Hufeland,

Under	10	-	-	50
Between 10 and 20	-	-	-	20
20 and 30	-	-	-	10
30 and 40	-	-	-	5
40 and 50	-	-	-	5
50 and 60	-	-	-	3
				94

"Hence only six remain, out of a hundred, who stand a chance of living beyond sixty years.

"Of persons who have lived above a hundred years, the industrious Haller has collected 1113 instances, and gives the following statement of the duration of their lives ||.

"Of those who lived from 100 to 110 years, the instances have been above

From 110 to 120	about	-	1000
120 to 130	-	-	62
130 to 140	-	-	29
140 to 150	-	-	15
152 (Parr)	-	-	5
169 (Jenkins)	-	-	1
			1113

"But in a recent publication, the following table is given, as the result of a more extensive collection of instances of longevity.

"Of males and females, who lived from 100 to 110 years, both inclusive, the instances have been

Above 110 to 120	-	-	277
120 to 130	-	-	84
130 to 140	-	-	26
140 to 150	-	-	7
150 to 160	-	-	3
160 to 170	-	-	2
170 to 185	-	-	3
			1712

"III. *Circumstances tending to promote longevity.*—As the means of attaining great age, is a subject respecting which it is natural to entertain a considerable degree of anxiety, and as many interesting facts regarding it, are scattered throughout the Statistical Volumes, I shall proceed to state the circumstances on which longevity seems principally to depend.

"In the first place, climate seems to be of considerable importance; and it may be laid down as a general rule, that the moderate, or even the coldest climates, are the most favourable to long life. Heat seems to relax and enfeeble, cold to strengthen and brace, the human frame. The diet also of hot countries is not so nourishing, as that of cold **; and there is in general a greater disposition, and greater opportunities, to indulge in various excesses, in the former, than in the latter. But if the climate be cool, a rainy atmosphere seems to be less unfavourable to longevity than could well be

* "Buffon places the mountainous districts of Scotland, at the head of a list containing those parts of Europe the most distinguished for longevity. *Hist. Nat. de l'Homme.* edit. 1752, tom. IV. p. 358. The celebrated Pallas, in the second volume of his *Travels*, states, that the inhabitants of the mountainous districts of the province of Jersk, in the northern parts of Siberia, live to a great age; people of 100 years are very common; and he saw an invalid soldier aged 120. The inhabitants of the plains in their neighbourhood, are by no means so healthy or so long lived."

† "Kentigern, known also under the name of St. Mungo, was the founder of the bishopric of Glasgow. The following verses were made on his extraordinary age and place of interment:

"Cum octogenos centum quoque quinque vir annos
Complerat, Sanctus est Glasgow funere functus."

Spotiswood's *Hist. of the Church of Scotland*, p. 11 and 12.

If we should not be willing to give credit to the extraordinary age which Kentigern and Torton are said to have reached, in which there is nothing impossible, as Parr and Jenkins approached to it so nearly, the first being 152, and the second 169 years of age; yet they may certainly be cited as examples of long life, greatly beyond the usual extent."

‡ "See *Human Longevity*, by James Eafon. Printed at Salisbury, in one vol. 8vo. anno 1799. There is a portrait of Torton in England, which it would be desirable to have engraved."

§ "On the Art of prolonging Human Life; a work written by Professor Hufeland of Jena, in Germany, which merits to be translated. The original may be had at Geisweiller's, Parliament-street."

|| "Haller's *Elementa Physiologiae Corporis Humani*, vol. III. lib. xxx. sect. 3. p. 103."

** "In cold countries they live more upon animal, in hot countries upon vegetable, food, and fruits. A judicious mixture of both is the best plan to pursue, but of the two, animal food is the most nourishing."

imagined; for Ireland, which is a wet country, boasts of a great number of old people. And a very large proportion of the aged who have lived in England and Scotland, have resided in the western, and consequently the rainiest, counties in the island*.

"The next circumstance to be considered is, the form † and size of the individual. It is generally admitted, that persons of a compact shape, and of a moderate stature, are the most likely to live long. Height often originates from the disproportioned growth of some particular part of the body, which necessarily has a tendency to engender weakness and disease. Tall persons also are apt to acquire a habit of stooping, which contracts the chest, and is a great enemy to free respiration; whereas the short-sized find little difficulty in keeping themselves erect, and are naturally much more active, by which the animal functions are retained in a state of much greater perfection. The only disadvantage attending a short stature is, that it is frequently accompanied with corpulence, which is extremely unfavourable to long life.

"Being born of healthy parents, and exempted from hereditary disease, are circumstances evidently favourable to longevity. A puny frame, like Cornaro's, may, by the greatest care and anxiety, be preserved in existence, but those who inherit health and strength, and are born with robust constitutions, can alone expect not only to live long, but to enjoy the pleasures and comforts of life, while they continue to possess it.

"Longevity also, seems to depend upon good temper, mixed at the same time with a cheerfulness of disposition, or good spirits ‡. Neither the irascible, nor those who, from dependency, sink under the crosses of life, can expect to live long. Even those who suffer their strength and spirits to be exhausted by severe study, or other mental exertions, seldom reach great age. Of the long list of 1712 persons, who lived about a century, Fontenelle (who did not quite reach 100 years) is the only author of any note; and his great age is ascribed to the tranquil ease of his temper, and that liveliness of spirits, for which he was much distinguished; for he retained to the last, the *youth of old age*, as the French happily express it.

"It is commonly observed, that it is not the rich and great, nor those who depend on medicines, who become old, but such as use much exercise, are exposed to the fresh air, and whose food is plain and moderate §. And it is certain that persons of that description, in general stand the best chance of living long. At the same time, though instances of great age, in royal and in noble personages, are not often to be met with, yet they may be as many, in proportion to the smaller number of such persons, as those in the lower but more numerous classes of society. Nor is there any thing in-

consistent in sovereign power, high rank, or great wealth, being accompanied with a long period of existence, provided other circumstances are favourable to longevity.

"In the next place, it is evident, that long life must depend much on the manner in which the individual is employed. Unhealthy occupations generally become fatal. Yet Peter Pein, a glass-blower, is said to have attained the great age of 101; and John Tyler, a miner at Leadhills, in Scotland, is supposed to have reached even 132 years ||. His age, indeed, could not be proved by direct, but it rests on very strong circumstantial evidence; and a person of the most undoubted authority (Dr. Walker, professor of natural history in the university of Edinburgh) informs me, that in his muscles, joints, and in his whole conformation and aspect, he wore the appearance of more remote antiquity, than he had ever seen in any human creature. But on the whole, farmers, gardeners, and labourers in the country, are in general the longest lived. Foot soldiers also, who have survived the dangers of war, are remarkable for long life. They are generally stout and vigorous men; and the regularity to which surviving soldiers must have accustomed themselves, whilst the careles and disorderly drop off, the erect posture to which they have been trained, and being of course men well formed by nature, and habituated to march and walk well (which familiarizes them to a natural and healthy exercise), all combine in their favour.

"It is also proper to remark, that not only moderate exercise, but even labour, if not too severe, contributes to good health, and old age. In many instances, persons have worked at threshing, and other laborious occupations, exposed to a current of fresh air, after they had passed beyond the age of 100; and, if accustomed to them, they do not appear to have suffered any inconvenience from such exertions.

"Nor ought it to be omitted, that a large proportion of the long lived have preferred a married to a single state, and in general have left behind them a numerous family. Whether a life of celibacy occasions disease, or leads to irregularity, or sours the temper, or to whatever other cause it ought to be attributed, may be a subject of dispute, but it is certain, that the number of single persons who live long, bear no proportion to the married**.

"In the last place, though a greater number of males are born than of females, at least in European countries, yet there is reason to believe, that of the two sexes, women reach old age in the greatest proportion. For this various causes may be assigned, as the greater regularity and temperance of their mode of living, their being less exposed to danger and hardships, less subject to violent agitations, and generally endowed with more cheerfulness and gentleness of disposition ††.

* "Moisture, it would appear, is not prejudicial to health, if it does not affect the purity of the air. Even stagnated water, if in peat bogs or morasses, is not unwholesome, as the water, by the asfringency of the peat, is prevented from becoming putrid. Lincolnshire, also, and several of the marshy counties of England, can produce a number of instances of great age, but probably they were from the more elevated parts of these districts."

† "On the extent of the thorax, and the moderation of impulse on the heart, it has been remarked, that the endurance of animal life materially depends."

‡ "Hence the great age to which many of the French nobility lived, particularly before the regency of Orleans."

§ "See Easson on Human Longevity, Introduction, p. 11."

|| "It is said that neither of these instances ought much to be wondered at, as a glass-blower is constantly exposed to fresh and dry air, and the labour of miners under ground is not for many hours, and they generally reside in hilly districts."

** "This applies to both sexes, in particular to the male. Dr. Rush of Philadelphia asserts, that he never saw but one unmarried man exceed fourscore years."

†† "Among the symptoms of longevity, none is more striking, than when nature seems to renew itself, by producing, even in old age, new teeth, new hair, &c. but the instances of this are extremely rare."

“ IV. *Rules tending to promote long life.*—We shall conclude with shortly stating such rules as have been followed by those who have attained great age, as they may furnish some hints that may be serviceable to others.

“ The plan laid down by the celebrated Cornaro is well known, and the abstemious manner in which he lived has often been recommended to the imitation of others; but I question much, whether many would wish to lead the same life, for the sake of mere existence. Life is no longer desirable, than whilst it can be enjoyed with some degree of satisfaction, and it is of little consequence, if a person merely vegetates, whether he lives or not.

“ Without entering therefore into minute particulars, fitter for the discussions of experimental philosophy, than for real life, we shall proceed to state the rules which have been found the most effectual, and which are the most likely to be carried into practice.

“ The first rule is, to avoid excess, whether in eating, in drinking, or in mental or personal exertion of any sort, for nothing is more likely to destroy the springs of life, particularly when these become more feeble. Some instances are mentioned, of persons who have continued to commit excesses, and have lived long; but these are to be considered in no other light than exceptions from a general rule. It may indeed be reasonably contended, that if such persons lived to a great age, notwithstanding their intemperance, they would have lived much longer, had they followed a different course.

“ In the second place, any great alteration with regard to clothing, occupation, or mode of living, ought to be avoided. When once an individual has been accustomed to any particular style of life, a change must in general be dangerous, and a long period must elapse before he can accommodate himself to the alteration. Even if a person has been accustomed to live freely, and finds it necessary to become temperate, the change ought to be gradual.

“ In the third place, nothing is more conducive to longevity, than to preserve equanimity and good spirits, and not to sink under the disappointments of life, to which all, but particularly the old, are necessarily subjected. Regularity of hours, early rising, a due proportion of sleep, pure air, wholesome food, warm clothing, particularly in advanced life, and moderate exercise or labour*, are also of essential importance.

“ In the next place, good health, and consequently longevity, depends much on personal cleanliness, and a variety of minute attentions, which it is impossible here to discuss. It were much to be wished, that some author would undertake the trouble of collecting the result of general experience upon that subject, and would point out a number of habits, which taken singly, appear very trifling, yet when combined, there is every reason to believe, that much additional health and comfort would arise from their observance†.

“ It is a common saying, that every man, after the age

of forty, should be his own physician. This seems, however, to be a dangerous maxim. The greatest physicians, when they are sick, seldom venture to prescribe for themselves, but generally rely on the advice of their medical friends. Persons who pretend to be their own physicians are generally much addicted to quackery, than which nothing can be more injurious to the constitution. It is essential to health, that medicines should never be taken but when necessary, and never without the best advice, in regard to the commencement, which ought not to be too long delayed, otherwise much benefit cannot be expected from them, and also with respect to nature or sort, quantity, and continuance.

“ It is generally acknowledged, that the powers of physic are bounded. The medical art, however, is probably still in its infancy, and it is impossible yet to say, to what perfection it may reach, not only in consequence of the new improvements which chemistry daily furnishes, but also of those which may be made, by the discovery of new and valuable plants, in countries either already known or hitherto unexplored, and indeed the new uses to which old medicinal plants may be applied. Perhaps such discoveries will be much accelerated, when, instead of being left to the zeal and industry of individuals, they shall meet with that public encouragement and protection, to which they are so peculiarly well entitled.

“ It has frequently been remarked, that the greatest number of old people die in winter, and that many individuals, in a weak and consumptive state, are obliged to fly to warmer climates, as the only means of safety. It has thence occurred to Dr. Pearson, that it would be of service, both to the aged and to the consumptive, to have houses erected, of such a peculiar construction, that the air could always be preserved, not only pure, but nearly of the same, and of rather an elevated temperature, so that the invalids who resided in them, should never be affected by the vicissitudes of the seasons‡. Such an idea, it must be admitted, cannot be a general remedy, or resource, but it is well entitled to the attention of those who are in affluent circumstances, by some of whom, it is to be hoped, an hospital for the aged and consumptive will be erected, and the experiment fairly tried, both for their own sakes, and for that of human nature in general§.

“ On the whole, it is more than probable, that by proper attention and good management, persons in general might not only live longer, but might enjoy life with more relish, than is commonly the case at present; and it is to be hoped, in respect of this, as well as of many other particulars, that human nature is still in the threshold of acquirement, that it will yet obtain greater and more important acquisitions of knowledge, and may reach further improvement, both with regard to the extent of personal and mental gratifications, which our species may be found capable of enjoying, and also the means of possessing them, with more satisfaction and comfort, and for a much longer period of time.”

* “ Travelling, in moderation, from the change of air and scene, has also been found of great use.”

† “ Many people, for instance, injure their health, by neglecting their teeth, in consequence of which, the gums become first diseased, the breath becomes tainted and noxious, the teeth then rapidly decay, and the food not being properly masticated, much occasion various complaints.”

‡ “ Haller (p. 118) recommends it to old men to emigrate from a colder to a warmer region; but the proposed building will probably answer the same purposes equally well.”

§ “ An eminent surgeon (Mr. Benjamin Bell, of Edinburgh) is of opinion, that any common house might be made sufficiently warm to answer the proposed object; and he has frequently recommended the plan of keeping the house, during the colder seasons of the year, with much advantage to aged and infirm patients; but to give the idea a fair trial, a house peculiarly constructed for the purpose should be built.”

Sir John Sinclair justly observes, that it would be of importance, if some author, who had leisure to probe this enquiry to the bottom, would undertake a paper on longevity; and he annexes a list of some publications upon the subject, which might be consulted with advantage. The following observations, he adds, also, coming from so respectable a quarter as that of Dr. Fordyce, merit particular attention :

" If a man wishes to prolong life to a very long period, he must take great care to eat very moderately, and drink no wine, nor use any intoxicating liquor whatever. In all polished nations, men eat at least double the quantity of food necessary, perhaps four or five times. If men eat only the necessary quantity, they have no occasion for wine, spices, or any other stimulant to assist the digestion of their food. On the other hand, if a man be contented to live to the age of seventy, rather a greater quantity of food is useful, to support the exertions of the bodily powers; but eating in excess, always wears out the body without any advantage whatever. If a man uses more food than is necessary, it is likewise proper to use stimulants to increase the powers of digestion. This contributes also to wear out the powers of the body. Drinking large quantities of wine of any kind, beer, cyder, mead, &c. tends to produce many diseases, but at the same time defends a man intoxicated from many, such as arise from sudden exposure to cold, infection, and many others, if their cause be applied during the time of intoxication; so that many men who have been intoxicated every day, have lived to the age of eighty, ninety, or even longer, but never to any very great length beyond that time. Those who have been intoxicated by spirits distilled from these liquors have hardly ever arrived at even the age of seventy, and most of them have been cut off at an early age. This much I have to observe in general; to enter into the proofs, would require a long disquisition, which I have not time at present to enter into."

Another respectable physician observes, " that in respect of diet, no one rule is of so much importance as to avoid all sorts of compound liquors, water being the only wholesome beverage, the best solvent and diluent of the solid portions of our food; supporting the tone of the stomach, without exhausting its vigour, and furnishing the most simple, the most bland, and manifestly the most suitable supply to the secretory vessels and general humidity of the body. In a word, good water is the only fit, and salutary, liquor for the ordinary uses of man; all others are noxious, and this in the proportion as they recede in their qualities from water."

It is to be observed, however, that though water may be an effectual solvent, yet that wine, beer, and other fermented liquors, must contain more nourishment; and consequently a moderate use of them, besides acting as a stimulant, and assisting digestion, must be serviceable to persons exhausted by severe labour, whether mental or personal; and in particular must prove a strengthening and refreshing cordial to the aged and the infirm.

LONGUION, a town of France, in the department of Moselle. Here is a considerable iron-works and cannon-foundry. It is 10 miles S.W. of Longwy, and 22 W. of Thionville. Long. 5. 29. E. Lat. 49. 27. N.

LONS-LE-SAULNIER, a town of France, in the department of Jura, with a late abbey of noble Bernardines. It derives its name from the salt springs with which it abounds, and is seated on the Solvan, 30 miles S.S.W. of Dole. Long. 5. 30. E. Lat. 46. 37. N.

LOOKOUT, CAPE, a cape of North Carolina, south of Cape Hatteras, and opposite Core Sound.

LOOTS, a town of Germany, capital of a county of the

same name, in the bishopric of Liege, 16 miles west of Maëtricht. Long. 5. 19. E. Lat. 50. 52. N.

LOPATKA, CAPE, the fourth extremity of the peninsula of Kamtschatka. See KURILES.

LOPESCO, a town of Naples, in the province of Abruzzo Ulteriore, 19 miles S.W. of Aquila. Long. 13. 30. E. Lat. 45. 50. N.

LORA, a town of Spain, in Andalusia, on the river Guadalquivir, 28 miles N.E. of Seville. Long. 5. 4. W. Lat. 37. 46. N.

LORA, a town of Upper Saxony, in the county of Hohenstein, 30 miles north of Saxe-Gotha. Long. 10. 55. E. Lat. 51. 30. N.

LORE, a town of Spain, in Granada, 15 miles north of Malaga. Long. 4. 35. W. Lat. 36. 50. N.

LORBUS, a town of the kingdom of Tunis, with a castle, and fine remains of antiquity. It is seated in a plain, fertile in corn, 150 miles S.W. of Tunis. Long. 9. 0. E. Lat. 35. 35. N.

LORCA, an ancient town of Spain, in Murcia, seated on an eminence, near the river Guadalquivir, 30 miles west of Cartagena. Long. 1. 37. W. Lat. 37. 44. N.

LORCA, a town of Suabia, in the duchy of Wurtemberg. It had formerly a very rich abbey, whose revenues now belong to the university of Tubingen. It is seated on the Remms, 20 miles N.W. of Ellingen.

LORCH, a town of Germany, in the electorate of Mentz. The inhabitants subsist principally by cultivating vineyards and making wine. It is 24 miles W.N.W. of Mentz. Long. 8. 1. E. Lat. 50. 8. N.

LORCHAUSEN, a town of Germany, in the electorate of Mentz, 27 miles west of Mentz.

LORD HOWE'S GROUP, an extensive group of islands in the South Pacific Ocean, discovered, in 1791, by Captain Hunter, who distinctly discerned 32 of them, some of considerable extent. They appeared thickly covered with wood, among which the cocoa nut was very distinguishable. Nine of the natives came near the ship, in a canoe, which was about 40 feet long, badly made, and had an outrigger. They were a stout, clean, well-made people, of a dark copper colour; their hair tied in a knot on the back of the head; and they appeared as clean-shaven. They had an ornament, consisting of a number of fringes, like an artificial beard, which was fastened close under the nose; and to this beard hung a row of teeth, which gave them the appearance of having a mouth lower than their natural one. They had holes run through the sides of the nose into the passage, into which, as well as through the septum, were thrust pieces of reed or bone. The arms and thighs were tattooed, and some were painted with red and white streaks. They wore a wrapper round their middle. Long. from 159. 14. to 159. 37. E. Lat. 5. 30. S.

LORD HOWE'S ISLAND, an island of the South Pacific Ocean, discovered, in 1788, by Lieutenant King, in his voyage from Port Jackson to Norfolk Island. Many excellent turtle have been caught here on a sandy beach; and it abounds with a variety of birds, which were so unaccustomed to be disturbed, that the seamen went near enough to knock down as many as they wanted with a stick. At its south end are two high mountains, nearly perpendicular from the sea; the southernmost named Mount Gower. About 14 miles to the south is a remarkable rock, named Ball's Pyramid, which has much the appearance of a steeple at a distance. The island is three miles and a half long, and very narrow. Long. 159. 0. E. Lat. 31. 36. N.

LOREDO, a town of Italy, in Polesino di Rovigo, seated on the Adige, 20 miles east of Rovigo. Long. 12. 50. E. Lat. 45. 5. N.

LOGUES, a populous town of France, in the department of Var, seated on the Argens, five miles west by south of Draguignan, and 360 south by east of Paris. Long. 6. 27. E. Lat. 43. 30. N.

LORRACH, or **LARACH**, a town of Suabia, in the margravate of Baden, six miles N.W. of Rheinfelden, and six N.E. of Balle.

LORRIS, a town of France, in the department of Loiret. It was the residence of Philip the Long, in 1377, and of other kings of France. It is 15 miles west by south of Montargis.

LOT, a river of France, which rises in the department of Lozere, and watering Mende and Cahors, enters the Garonne, below Agen. It begins to be navigable at Cahors.

Lot, a department of France, including the late province of Quercy. It takes its name from the river Lot. Cahors is the capital.

LOT AND GARONNE, a department of France, including part of the late province of Guienne. It is so called from two rivers. Agen is the capital.

LOTZIN, a town of Prussia, with a castle, situate on a canal, which joins the Angerburg and Leventin lakes, 36 miles S.E. of Konigsberg.

LOUANS, a small town of France, in the department of Saone and Loire, situate in a kind of island between the rivers Seilles, Salle, and Solnan, 18 miles S.E. of Chalons.

LOUDEAC, a town of France, in the department of the North Coast. Here is an iron forge and a manufacture of thread. It is 20 miles south of St. Brieux, and 27 S.S.E. of Guingamp. Long. 2. 40. W. Lat. 48. 11. N.

LOUDUN, a town of France, in the department of Vienne. It is remarkable for the tragical end of its rector, Urban Grandier, who, in 1634, was burnt alive for having caused certain Ursulin nuns to be possessed with devils! It is seated on a mountain, 30 miles N.W. of Poitiers, and 155 S.W. of Paris. Long. 0. 17. E. Lat. 47. 2. N.

LOUGHREA, a town of Ireland, in the county of Galway, near a lake of the same name, 15 miles S.W. of Galway.

LOVIGNANO, a town of Naples, in Otranto, 12 miles S.S.W. of Brindisi.

LOUISA, a town of Swedish Finland, with a fortress, on a bay of the gulf of Finland. The houses are all of wood, two stories high, and painted red.

LOUISBURGH, the capital of the island of Cape Breton. It was taken by the English in 1745, restored to the French in 1745, taken by the English in 1758, and ceded to them in 1763; since which the fortifications have been destroyed. It has an excellent harbour, near four leagues in circumference. Long. 59. 48. W. Lat. 45. 54. N.

LOUISVILLE, a town of the state of Georgia, in the county of Burke, seated on the north side of the Ogeechee, 50 miles S.W. of Augusta. Long. 82. 30. W. Lat. 32. 42. N.

LOUISVILLE, a town of Kentucky, in the county of Jefferson, seated on the Ohio; at its rapids, 95 miles S.W. of Lexington. Long. 86. 30. W. Lat. 38. 3. N.

LOUI-TCHEOU-FOU, a city of China, in the province of Quang-tong. Its territory is separated, by a narrow strait only, from the life of Hai-nan. It is 315 miles S.W. of Canton.

LOUITZ, a town of Great Poland, in the palatinate of Rava, 55 miles east of Gnesna. Long. 19. 0. E. Lat. 52. 26. N.

LOULE, a town of Portugal, in Algarva, with a castle. It is surrounded with antique walls, and seated on the river Loulé, near the sea, 10 miles north of Faro, and 15 west of Tavira. Long. 8. 1. W. Lat. 37. 18. N.

LOU-NGAN-FOU, a city of China, in the province of

Chan-fi, situate near the source of the Tfo-tsang-lo, and containing eight cities of the third class in its jurisdiction. It is 375 miles S.W. of Peking.

LOUNG, Loch, a great arm of the sea, in Argyleshire, which communicates, on the south, with the frith of Clyde.

LOURDE, a town of France, in the department of the Upper Pyrenées, with an ancient castle, seated on a rock, on the Gave de Pau, 10 miles N.W. of Bagneres. Long. 0. 5. W. Lat. 43. 8. N.

LOURICAL, a town of Portugal, in Estremadura, 12 miles south of Montemor-o-Velho.

LOUSE (*Encycl.*). Reference was erroneously made, in that article, to LICE. See PEDICULUS.

LOUVESTEIN, a fortress of the United Provinces, in Holland, on the west end of an island, called Bommel Waert. In this castle, the patriotic chiefs were imprisoned by Prince Maurice; whence that party has ever since been called the Louvestein party. It is 16 miles east of Dort. Long. 5. 13. E. Lat. 50. 40. N.

LOUIERS, a fortified town of France, in the department of Eure, with a considerable manufacture of fine cloths. It is seated on the Eure, in a fertile plain, 10 miles N. of Evreux, and 55 N.W. of Paris. Long. 1. 15. E. Lat. 49. 0. N.

LOUVO, a populous town of the kingdom of Siam, with a royal palace, 50 miles north of the city of Siam. Long. 100. 50. E. Lat. 15. 8. N.

LOUVRES, a town of France in the department of Seine and Oise, 12 miles north of Paris. Long. 2. 24. E. Lat. 49. 3. N.

LOWDORE, a fine cataract in Cumberland, on the east side of the lake of Derwent-water, in the vale of Keswick. It is formed by the rushing of the waters of Watanlath through an awful chafin made by the contiguity of two vast rocks; but it falls entirely in a dry season.

LOWENSTEIN, a town of Suabia, and capital of a county. It is 20 miles N.E. of Stutgard. Long. 9. 19. E. Lat. 49. 1. N.

LOWESTOFFE, a town in Suffolk, with a market on Wednesday. It is built on a cliff, the most easterly point of Great Britain; partakes with Yarmouth in the mackerel and herring fisheries; is much frequented for sea-bathing; and has a manufacture of coarse china. It is 10 miles south of Yarmouth, and 117 N.E. of London. Long. 1. 55. E. Lat. 52. 35. N.

LOWES-WATER, a lake in Cumberland, one mile long and a quarter of a mile broad. It is of no great depth, and without char; but it abounds with pike and perch. In opposition to all the other lakes, it has its course from north to south, and, under the lofty Mellbreak, falls into Cromack-water.

LOWICZ, a populous town of Poland, in the palatinate of Rava, with a strong fortress, seated on the Bzura, 21 miles south of Plockko, and 30 north of Rava. Long. 19. 29. E. Lat. 52. 24. N.

LOW-LAYTON, a village in Essex, six miles N.E. of London. Here several foundations, with Roman bricks, and coins, have been found near the manor-house; and some urns, with ashes in them, have been dug up in the church-yard, and other parts.

LOXA, a considerable town of Spain, in Granada, seated in a fertile country, on the river Xenil, 18 miles west of Granada. Long. 3. 52. W. Lat. 37. 15. N.

Loxa, a town of Peru, in the province of Quito, 200 miles E.N.E. of Paiza. Long. 77. 10. W. Lat. 4. 50. S.

LOYTZ, a town of Pomerania, in the county of Gutz-

kow, seated on the Pene, 10 miles above the city of Gutzkow.

LOZERE, a department of France, including the late province of Gevaudan. - It is a mountainous barren country, and receives its name from one of its principal mountains, Mende is the capital.

LU, a town of Italy, in Monterrat, eight miles south of Casal, and eight west of Alexandria.

LUARCA, a town of Spain, in Asturias, near the north coast, 30 miles N.W. of Oviedo.

LUBAN, a town of the Russian government of Livonia, 70 miles east of Riga. Long. 26. 36. E. Lat. 56. 55. N.

LUBANSKEN-SEA, or **LAKE OF LUBAN**, a lake in Livonia, toward the confines of Courland and Lithuania. The river Rositta falls into this lake.

LUBBEN, a town of Germany, in Lower Lusatia, capital of a district of the same name. It has several churches, with a noble hospital, and a landhouse, or a house where the diets assemble. It is seated on the Spree, 60 miles S.E. of Berlin. Long. 14. 25. E. Lat. 52. 0. N.

LUBEC, bishopric of, a small bishopric, in the duchy of Holstein. It has been enjoyed by protestant princes of the house of Holstein, ever since 1561, when Lutheranism was established here.

LUBEC, an island of the Indian Ocean. Long. 112. 22. E. Lat. 5. 50. S.

LUBOW, a town of Poland, in the palatinate of Cracow, 50 miles S.E. of Cracow. Long. 20. 36. E. Lat. 49. 36. N.

LUBZ, or **LUBITZ**, a town of Lower Saxony, in the duchy of Mecklenburgh, 23 miles S.S.W. of Guffrow.

LUC, a town of France, in the department of Var, 25 miles N.E. of Toulon. Long. 6. 25. E. Lat. 43. 28. N.

LUC, a town of France, in the department of liere, seated on the Drome, 32 miles south of Grenoble. Long. 5. 48. E. Lat. 44. 40. N.

LUCE, a great bay in Wigtonshire, lying to the east of the promontory, called the Mull of Galloway.

LUCENA, a town of Spain, in the province of Cordova, 29 miles S.S.E. of Cordova, and 40 N.W. of Granada. Long. 3. 50. W. Lat. 37. 28. N.

LUCERA, an ancient town of Naples, in Capitanata, with a bishop's see. The town is small but populous, and has a manufacture of cloth. It is 30 miles W.S.W. of Manfredonia, and 65 N.E. of Naples. Long. 15. 34. E. Lat. 41. 28. N.

LUCERNA, a town of Italy, in Piedmont, 15 miles S.W. of Turin. Long. 7. 38. E. Lat. 44. 52. N.

LUCHEIN, a town of Spain, in Valencia, 30 miles S. of the city of that name. Long. 0. 30. E. Lat. 38. 53. N.

LUCHO, a town of Lower Saxony, in the principality of Lauenburg, situate on the Jetze, 40 miles E.S.E. of Lauenburg, and 54 N.E. of Zell.

LUCHOWICE, a town of Lithuania, in the palatinate of Novogorodeck, 40 miles S.S.E. of Novogorodeck.

LUCIANA, a town of Spain, in the province of Seville, eight miles W.N.W. of Eoya.

LUCIANO, a town of Spain, in New Castile, 19 miles W. of Ciudad Real.

LUCIGNANO, a town of Italy, in Tuscany, 10 miles S. of Sienna. Long. 11. 11. E. Lat. 43. 0. N.

LUCITO, a town of Naples, in the Molise, 11 miles N.E. of Molise.

LUCKNOW, an ancient and extensive city of Hindoostan Proper, capital of Oude. It is meanly built; the houses are chiefly mud walls, covered with thatch; many are entirely of mats and bamboos, thatched with leaves of the cocconut, palm-tree, and sometimes with straw; and very few are

built with brick: the streets are crooked, narrow, and worse than most in India. In the dry season, the dust and heat are intolerable; in the rainy season, the mire is so deep, as to be scarcely passable; and there is a great number of elephants, belonging to the nabob and the great men of his court, which are continually passing the streets, either to the palace, or to the river, to the great danger and annoyance of the foot passenger, as well as the inferior class of shopkeepers. The comforts, convenience, or property of this class of people are, indeed, little attended to, either by the great men or their servants; the elephant itself being frequently known to be infinitely more attentive to them as he passes, and to children in particular. The palace of the nabob is seated on a high bank near the Goomty, and commands an extensive view both of that river and the country on the eastern side. Lucknow is 605 miles N.W. of Calcutta. Long. 81. 25. E. Lat. 26. 35. N.

LUCKO, a town of Poland, capital of Volhynia, with a citadel, and a bishop's see, seated on the Ster, 75 miles N.E. of Lemberg, and 175 S.E. of Warlaw. Long. 25. 39. E. Lat. 51. 13. N.

LUCO, a town of Naples, in Abruzzo Citeriore, seated on the W. bank of the lake Celano, nine miles S.S.W. of Celano.

LUCON, or **LUZON**, a town of France, in the department of Vendée, and late province of Poitou, and lately an episcopal see. It is seated in an unwholesome morass, 17 miles N. of Rochelle, and 50 S. of Nantes. Long. 1. 5. W. Lat. 46. 27. N.

LUCONIA, or **LUCON**, the chief of the Philippine Islands, in the N. Pacific Ocean, 400 miles in length, and 100 in breadth. It is not so hot as may be expected, because it is well watered by large lakes and rivers, and the periodical rains, which inundate all the plains. There are several volcanoes in the mountains, which occasion earthquakes; and a variety of hot baths. The produce of this island is wax, cotton, silk, wild cinnamon, sulphur, cocoa nuts, rice, gold, hories, buffaloes, and game. Philip II. of Spain, formed a scheme of planting a colony in the Philippine Islands, which had been neglected since the discovery of them by Magellan, in 1521. Manila, in this island, was the station chosen for the capital of the new establishment. Hence an active commercial intercourse began with the Chinese, a considerable number of whom settled in the Philippine Islands, under the Spanish protection. These supplied the colony so amply with all the valuable productions and manufactures of Asia, as enabled it to open a trade with America, by a direct course of navigation, the longest from land to land on the globe. This trade, at first, was carried on with Calao, on the coast of Peru; but it was afterward removed to Acapulco, on the coast of New Spain. From this port, annually fail one or two ships, which are permitted to carry out silver to the amount of 500,000 crowns, in return for which they bring back from Manila spices, drugs, China and Japan wares, calicoes, chintz, mullins, silks, &c. The inhabitants are a mixture of several nations, beside Spaniards; and they all produce a mixed breed distinct from any of the rest. The blacks have long hair, and good features; and there is one tribe, who prick their skins, and draw figures on them, as they do in most other countries where they go naked.

LUDENSCHEIDE, or **LUNSCHEDE**, a town of Westphalia, in the county of Mark. The principal trade is in manufactures of iron. In 1723 it was almost wholly destroyed by fire, since which it has been rebuilt with stone. It is 28 miles N.E. of Cologne. Long. 7. 20. E. Lat. 51. 11. N.

LUDERSBURG, a town of Lower Saxony, in the duchy of Lauenburg, seated on the Elbe, five miles above the town of Lauenburg.

LUDGERSHALL. See **LUGGERSHALL**.

LUDWIGSBURG, a town of Suabia, in the duchy of Wurttemberg, which manufactures cloth, damask linen, and marble paper. Here is a fine hunting feat belonging to the Duke of Wurttemberg, called La Favorita. It is five miles N.N.E. of Stutgard.

LUDWIGSBURG, a town of Upper Saxony, in Anterior Pomerania, five miles E.N.E. of Griefswalde.

LUDWIGSTADT, a town of Franconia, in the principality of Culmbach, 13 miles S. of Saalfeld.

LUGA, a town of Russia, in the government of Peterburg, situate on a river of the same name, 80 miles S. of Peterburg. Long. 29. 30. E. Lat. 51. 40. N.

LUGANO, a town of Switzerland, capital of a bailiwick of the same name, which is the principal of the four transalpine bailiwicks. It is built round a gentle curve of the lake of Lugano, and backed by an amphitheatre of hills. It is the emporium of the greatest part of the merchandise, which passes from Italy over the St. Gothard, or the Bernardin. It contains 8000 inhabitants; and on an eminence above the town, is the principal church, which has a delightful prospect from its terrace. Most of the houses are built of tuff-stone; and the residence of the governor is a low building, on the walls of which are the arms of 12 cantons to which this bailiwick is subject; for the canton of Appenzel has no jurisdiction over it. It is 17 miles N.W. of Como. Long. 8. 48. E. Lat. 45. 54. N.

LUGANO, a lake of Switzerland, on the Italian side of the Alps. It is 25 miles in length, and from two to four in breadth; its form is irregular, and bending into continual sinuities. It lies about 190 feet higher than the lakes of Como and Locarno.

LUGDE, or **LUDE**, a town of Westphalia, in the bishopric of Paderborn, situate on the Emmer, 24 miles N.N.E. of Paderborn. Long. 8. 39. E. Lat. 51. 49. N.

LUGO, an ancient city of Spain, in Galicia, with a bishop's see. There are springs in this city boiling hot. It is seated on the Minho, 32 miles S.E. of Mondonnedo, and 60 S.W. of Oviedo. Long. 8. 52. W. Lat. 42. 46. N.

LUNDEN, a town of Lower Saxony, in the duchy of Holstein, seated near the Eyder, 36 miles N.N.W. of Gluckstadt. Long. 9. 20. E. Lat. 54. 26. N.

LUNEL, a town of France, in the department of Gard, near the river Ridourle. It produces excellent Muscadine wine, and is 16 miles E. of Montpellier. Long. 4. 19. E. Lat. 43. 38. N.

LUNEN, a town of Westphalia, in the county of Marche, situate at the conflux of the Zesick and Lippe, 20 miles S.S.W. of Munster. Long. 7. 49. E. Lat. 50. 40. N.

LUNERA, a mountain of Italy, between Naples and Puzzoli. It contains much sulphur, and alum; and the springs that rise from it are excellent for curing wounds.

LUNEVILLE, a considerable town of France, in the department of Meurthe, with a castle, where the dukes of Lorraine formerly kept their court, as did afterward King Stanislaus. It is now converted into barracks. The church of the late regular canons is very handsome; and here Stanislaus founded a military school, a large library, and a fine hospital. It is seated in a plain, on the rivers Vezouze and Meurte, 12 miles S.E. of Nancy, and 62 W. of Strasbourg. Long. 6. 35. E. Lat. 48. 36. N.

LUPO GLAVO, a town of Austrian Istria, seated near the mountains of Vena, 15 miles W. of St. Veit.

LURE, a town of France, in the department of Upper Saone, remarkable only for a late abbey of Benedictines, converted, in 1764, into a chapter of noble canons. It is 30 miles N.E. of Besançon. Long. 6. 33. E. Lat. 47. 38. N.

Vol. X.

LURI, an ancient town of Corsica, between Cape Corie and the towns of Bastia and St. Fiorenza.

LUSIGNAN, a town of France, in the department of Vienna, seated on the Vonne, 15 miles S.S.W. of Poitiers, and 200 of Paris. Long. 0. 10. E. Lat. 46. 25. N.

LUSO, a river of Italy, which rises in the duchy of Urbino, crosses part of Romagna, and falls into the gulf of Venice, 10 miles W. of Rimini.

LUTANGE, a town of France, in the department of Moselle, eight miles S.E. of Thionville, and 11 N.N.E. of Metz. Long. 6. 19. E. Lat. 49. 11. N.

LUTKENBURG, a town of Germany, in the duchy of Holstein, seated near the Baltic, 13 miles from Ploen.

LUTON, a town in Bedfordshire, with a market on Monday, seated among hills, 18 miles S. of Bedford, and 31 N. by W. of London. Long. 0. 25. W. Lat. 52. 27. N.

LUTSCHINEN, a river of Switzerland, in the canton of Bern. It is formed by the junction of two streams; the Weiß Lutschinen, which flows through the valley of Lauterbrunn, and the Schwartz Lutschinen, which comes from the valley of Grindelwald. In a rainy season, the river forms a torrent, which rushes impetuously through the great masses of rock that obstruct its course, and, with inconceivable violence, forces from their beds the most enormous fragments. The road to Zwey Lutschinen and Lauterbrunn is over this roaring torrent, by a kind of bridge, which is fixed against the sides of rocks, that are almost in a leaning position. A huge vertical stone, raised in the middle of the river, supports some thick planks, so badly joined, as to be neither steady nor solid; and these form the wretched bridge, over which the inhabitants daily pass, with a firm step and undaunted eyes; a passage, which the traveller, unaccustomed to such strange communications, would tremble to attempt. Hence the Lutschinen flows till it falls into the lake of Brienz.

LUTTENBURG, a town of Germany, in the duchy of Stiria, seated on the Muehr, 34 miles S.E. of Gratz. Long. 16. 10. E. Lat. 46. 46. N.

LUTTER, a town of Lower Saxony, in the duchy of Brunswick, remarkable for a battle gained over the Austrians, by the Danes, in 1626. It is eight miles N.W. of Goslar, and 13 S.E. of Hildelheim. Long. 10. 25. E. Lat. 52. 4. N.

LUTTERBERG, a town of Lower Saxony, in the electorate of Hanover. It was formerly a county, and for a long time governed by lords of its own. It is 15 miles S. of Goslar. Long. 10. 40. E. Lat. 51. 45. N.

LUTTERWORTH, a town in Leicestershire, with a market on Thursday, and a large handsome church, with a fine lofty steeple. Here Wickliffe, the first reformer, was rector, who died in 1385; but was dug up and burnt for a heretic 40 years after. Lutterworth is seated on the river Swift, 14 miles S. of Leicester, and 88 N.N.W. of London. Long. 1. 10. W. Lat. 52. 26. N.

LUTZENSTEIN, a town of France, in the department of Lower Rhine, with a strong castle, seated on a mountain, 30 miles N.W. of Strasbourg. Long. 7. 17. E. Lat. 48. 55. N.

LUXEUIL, a town of France, in the department of Upper Saone, remarkable for its mineral waters. From the number of urns, medals, and inscriptions, found here, it is supposed to have been a considerable place in the time of the Romans. It was destroyed by Atilla in 450. Near the town was a late celebrated abbey, founded by St. Columban, an Irishman. It is seated at the foot of the Voiges, 15 miles W. of Vesoul. Long. 6. 24. E. Lat. 47. 50. N.

LUZARCHES, a town of France, in the department of Seine and Oise, 15 miles N. of Paris. Long. 2. 19. E. Lat. 49. 7. N.

10 G

LUZERNE, a county of Pennsylvania, 86 miles long and 61 broad. In 1790, it contained 4,904 inhabitants. Wilkesborough is the capital.

LUZZANA, a town of Italy, in the Mantuan, 22 miles S. of Mantua; Long. 10. 48. E. Lat. 44. 50. N.

LUZZARA, a strong town of Italy, on the confines of the Duchies of Mantua and Guastalla, near the confluence of the Crostolo with the Po. Here a battle was fought between the French and Spaniards, in 1702, when each side claimed the victory. It is 10 miles S. of Mantua. Long. 10. 50. E. Lat. 45. 0. N.

LUZZI, a town of Naples, in Calabria Citeriore, near the river Craté, three miles S. of Bisignano.

LYCHAM, a town in Norfolk, whose market is dispersed. It is 24 miles W. by N. of Norwich, and 92 N.N.E. of London.

LYDSING, a village in Kent, near Gravesend. Here 600 young Normans, who came over with Alfred and Edward, the sons of Ethelred, after the death of Canute, to take possession of their father's throne, were massacred by Godwin, earl of Kent.

LYESSE, a town of France, in the department of the North, 15 miles E. of Landrecy. Long. 4. 10. E. Lat. 50. 6. N.

LYGE, a town of Norway, near a lake of the same name, 16 miles N.W. of Christianfand.

LYGUM, a town of Denmark, in the duchy of Sleswick, 14 miles W. of Apenrade.

LYING-IN CHARITIES, a kind of useful institutions, which, happily for the female poor, have multiplied greatly of late years, in the most populous districts of the united kingdom. The establishments which go by this name differ from the Lying-in Hospitals very essentially, and in fact confer greater benefits on the indigent at a smaller expence to the subscribers. One important and distinguishing feature in them, which marks them with a decided preference is, that poor women are not under the necessity of leaving their families, but have charitable aid administered to them at their own homes, where their presence cannot but be of great use in keeping an eye on their small domestic concerns, which might suffer materially during an absence of some weeks at an hospital.

The following extract from an account of a charity, for assisting the female poor, at the period of their lying-in, with *child-bed linen*, &c. is published in the Reports of the Society for bettering the Condition of the Poor, and may serve as a sufficient model for similar Institutions:

Fifteen sets of child-bed linen and clothes are distributed in parcels at Stowe, Wotton, Buckingham, and Aylesbury, in the county of Buckingham, and at Gosfield Hall in Essex, under the care of persons at those places, who receive applications and enquire into the characters of the persons applying. The sets are lent out for a fortnight, three weeks, or a month, according to circumstances, and consist of the fol-

lowing articles each;—three sheets, two blankets, one leather sheet, two bed-gowns, two night-caps, three bed shifts, three children's caps, three children's shirts, one cotton wrapper, one flannel wrapper, and a sufficient quantity of small articles.

The woman, who has the use of any set, is allowed to retain a cap, a shirt, and some flannel for the child: the rest are returned clean, and five shillings allowed her for washing them; which, as that is generally done by the kindness of her neighbours, is so far an additional charity to her.—During her confinement, broth and beer caudle, are occasionally sent her, and medical aid in particular cases.

This charity was instituted by the Marchioness of Buckingham about ten years ago.—The benefit of it has been accepted by the poor in the most grateful manner; and there occurs no instance of its having been abused, by their damaging or purloining any of the articles. Almost every article is spun, woven, and made up, at the schools for poor children, which have been of late years established at Stowe, Wotton, and Gosfield; and, when made of coarse materials, which will answer the purpose, need not cost more than 30s. a set. The annual expence of keeping them up may be about 10s. a set.

The advantage of this charity is, that it affords the poor, at a small expence, much more relief and comfort than they could provide for themselves with the same sum, even if they possessed it: for one set of articles may, in the course of a year, serve a dozen families successively, who either might not have the means of purchasing them, or, if they had, would be obliged to buy them merely for temporary use, and then to sell them again to disadvantage. Besides this there is a saving in the purchase of the articles by wholesale, and an advantage in thus furnishing work for a village school. Though what has been done, in this instance, is at the expence of one person, it is quite as well suited to be established by a subscription, and conducted by a committee of subscribers. This charity has been administered many years, at Audley End, in Essex; and has also been adopted, on a smaller scale, in some other places. Aid is also given to females during their lying-in by some of the Benefit Societies for women. See FEMALE BENEFIT SOCIETIES, *Supp.*

LYNDHURST, a village in Hants, with a seat which belongs to the Duke of Gloucester, as lord warden of the New Forest. It is seven miles N. of Lymington.

LYNN, a town of Massachusetts, with a considerable manufacture of women's silk and cloth shoes. It is nine miles N.E. of Boston. Long. 70. 55. W. Lat. 42. 33. N.

LYSE, a town of Norway, eight miles S.S.W. of Bergen.

LYSEKIL, a sea-port of Sweden, in West Gothland, 16 miles W. of Uddevalla.

LYSOBYKI, a town of Poland in the palatinate of Lublin, 20 miles N.N.W. of Lublin. Long. 22. 40. E. Lat. 51. 29. N.

M.

MABRA, a town of the kingdom of Algiers, seated on the gulf of Bona, W. of the town of Bona.

MACEDONIA, a province of Turkey in Europe, bounded on the N. by Servia and Bulgaria, on the E. by Romania and the Archipelago, on the S. by Livadia, and on the W. by that country and Albania. Salonichi is the capital.

MACERATA, a town of Naples, in Terra di Lavoro, four miles S. of Capua.

MACHECOUL, a town of France, in the department of Lower Loire, situated on the Tenu, 20 miles S.W. of Nantes. Long. 1. 11. W. Lat. 47. 2. N.

MACHERRY, a town of Hindoostan Proper, in the country of Mewat, 70 miles S.S.W. of Delhi.

MACHIA, a town of Naples, in the Molise, 12 miles S.W. of Molise.

MACHICAGO, a promontory of Spain, in the Bay of Biscay. Long. 3. 0. W. Lat. 43. 37. N.

MACKERAN, a province of Persia, bounded on the N. by Segestan and Sablestan, on the E. by Hindoostan Proper, on the S. by the Arabian Sea, and on the W. by Kerman. It is tributary to the sultan of Candahar, and the capital, of the same name, is 100 miles N. W. of Tatta. Long. 66. 0. E. Lat. 26. 0. N.

MACOCO, or **ANZICO**, a kingdom of Africa, to the E. of Congo, and S. of the equator. The Portuguese trade with the inhabitants for slaves, elephants' teeth, and copper.

MACON, or **MASCON**, an ancient town of France, in the department of Saone and Loire, and lately a bishop's see. It is remarkable for good wine, and seated on the declivity of a hill, near the Saone, 35 miles N. of Lyons, and 88 S.E. of Paris.

MACPHERSON (James), a Scotch writer of some celebrity, was born in 1738. His first work, and that which brought him mostly into notice, was a translation of poems attributed by him to Ossian. These poems, certainly possess great beauty; but after they had been published some time, their authenticity was doubted by Dr. Johnson and other writers, while they were as vigorously defended by some men of genius, the principal of whom was Dr. Blair. Mr. Macpherson was greatly irritated at Dr. Johnson's remarks, and wrote him a threatening letter, which the doctor answered in the most indignant terms. In 1773 Mr. Macpherson published a Translation of the Iliad into heroic prose, but it sunk into contempt. In 1775 Mr. Macpherson published *The History of Great Britain from the Restoration to the Accession of the House of Hanover*, in two volumes 4to.; a work in our opinion of great merit, though by one party it has been industriously, and, we are sorry to add, too successfully, decried. As an historian, our author could not indeed boast the attic elegance of a Robertson, the splendor of a Gibbon, or the philosophical profundity of a Hume; but his *style*, though it has sometimes been the avowed, was not the real, cause of the coldness with which his history was received. The writer of this sketch once saw a gentleman of rank, and of the whig interest, turn over one of Macpherson's volumes, and heard him say, upon shutting the book: "I cannot bear that work." He was asked if he thought the narrative false; and he replied, "No! It is too true; but I cannot bear it, because it gives me a bad opinion of those great men to whom I have been accustomed to look back with reverence as to the saviours of my country."

The author, however, acted with great fairness; as, together with the history, he published the proofs upon which

his facts were founded, in two quarto volumes, entitled, *Original Papers, containing the Secret History of Great Britain, from the Restoration to the Accession of the House of Hanover; to which are prefixed, Extracts from the Life of James II. as written by himself*. These papers were chiefly collected by Mr. Carte, but are not all of equal authority.

Soon after this period, the tide of fortune flowed very rapidly in Mr. Macpherson's favour, and his talents and industry were amply sufficient to avail himself of every favourable circumstance which arose. The resistance of the Colonies called for the aid of a ready writer to combat the arguments of the Americans, and to give force to the reasons which influenced the conduct of government, and he was selected for the purpose. Among other things, he wrote a pamphlet, which was circulated with much industry, entitled, *The Rights of Great Britain asserted against the Claims of the Colonies; being an Answer to the Declaration of the General Congress*, 8vo. 1776, and of which many editions were published. He also was the author of *A Short History of Opposition during the last Session of Parliament*, 8vo. 1779; a pamphlet which, on account of its merit, was by many ascribed to Mr. Gibbon.

But a more lucrative employment was conferred on him about this time. He was appointed agent to the nabob of Arcot, and in that capacity exerted his talents in several appeals to the public in behalf of his client. Among others, he published, *Letters from Mahommud Ali Cban, Nabob of Arcot, to the Court of Directors; to which is annexed, a State of Facts relative to Tanjore, with an Appendix of Original Papers*, 4to. 1777; and he was supposed to be the author of *The History and Management of the East-India Company from its Origin in 1600 to the present Times*, vol. I. containing the affairs of the Carnatic, in which the rights of the Nabob are explained, and the injustice of the Company proved, 4to. 1779.

In his capacity of agent to the nabob, it was probably thought requisite that he should have a seat in the British Parliament. He was accordingly, in 1780, chosen member for Camelford; but we do not recollect that he ever attempted to speak in the House. He was also re-chosen in 1784 and 1790.

He had purchased, we think before the year 1790, an estate in the parish in which he was born; and changing its name from *Retz* to *Belville*, built on it a large and elegant mansion, commanding a very romantic and picturesque view; and thither he retired, when his health began to fail, in expectation of receiving benefit from the change of air. He continued, however, to decline; and after lingering some time, died at his seat at Belville, in Inverness, on the 17th of February, 1796. He appears to have died in very opulent circumstances; and by his will, dated June 1793, gave various annuities and legacies to several persons to a great amount. His remains were afterwards taken from the place where he died, and buried in the Poets' Corner of Westminster church.

MACRES, a river of Africa, which crosses the kingdom of Tripoli, and falls into the Mediterranean, a little to the E. of Lebeda.

MACRI, an ancient town of Samos, in the Archipelago.

MACRO, or **MACROMISI**, an island of the Archipelago, near the coast of Livadia, 20 miles E. of Athens. Long. 24. 16. E. Lat. 37. 30. N.

MACZUA, a small island on the Red Sea, near the coast of Abex.

MADIA, or **MAGGIA**, a town, river, valley, and bailiwick

of Switzerland, in Upper Valais. The valley is long and narrow, between high mountains, watered throughout its whole length by the river; and it is the fourth transalpine ballivice. The town is 10 miles N.W. of Locarno.

MADRE DE DIOS, an island in the S. Pacific Ocean, near the coast of Patagonia, 180 miles in circumference. Long. 42. o. W. Lat. 51. o. N.

MADRID, New, a city, now building, or to be built, in a new Spanish settlement, in Louisiana, on the Mississippi, opposite the mouth of the Ohio. The settlers are to enjoy a free toleration in religion. Long. 89. 50. W. Lat. 30. 36. N.

MADRIGAL, a town of Spain, in Old Castile, seated in a plain, fertile in excellent wine, 10 miles N.E. of Medina-del-Campo. Long. 4. 19. W. Lat. 41. 25. N.

MADRIGAL, a town of Terra Firma, in the province of Popayan. Long. 75. 45. W. Lat. o. 50. N.

MADRISIO, a town of Italy, in Friuli, lately belonging to the state of Venice, 30 miles N. of Venice.

MADROGAM, the capital of Monomotapa, with a spacious royal palace. The upper part of the houses is in the shape of a bell. Long. 31. 40. E. Lat. 18. o. N.

MADURA, a town of the Carnatic, capital of a province of the same name, on the coast of Coromandel. It is 130 miles N. by E. of Cape Comorin, and 300 S.S.W. of Madras. Long. 78. 12. E. Lat. 9. 55. N.

MADURA, the capital of an island of the same name, in the Indian Ocean, situate to the N. of the E. end of the island of Java. Long. 112. 49. E. Lat. 9. 50. N.

MAELER, a lake of Sweden, between the provinces of Westmania and Sudermania. It contains several fine islands, is usually frozen during a few weeks in winter, and opens an easy communication, by sledges, between the interior parts of Sweden and the city of Stockholm.

MAERNA, a town of Germany, in the county of Tyrol, 23 miles W.S.W. of Trent.

MAESLANDSLUYS, a town of the United Provinces, in Holland, five miles S.W. of Delft. Long. 4. 18. E. Lat. 51. 57. N.

MAESYCK, a town in the bishopric of Liege, on the river Maese, eight miles S.W. of Ruremoe.

MAFFRA, a town of Portugal, in Estremadura, near which, in a sandy and barren place, King John V. erected a building of extraordinary magnificence. This was done in pursuance of a vow, made in a dangerous fit of illness, to found a convent for the use of the poorest friary in the kingdom. Upon enquiry, this poorest of convents was found at Maffra, where twelve Franciscans lived together in a hut. The king procured from Rome the design of a building far exceeding the Ecclurial. It is five miles N.W. of Lisbon.

MAGGEROE, a large island, near the coast of Norway, said to be the most northern land in Europe. Long. 25. o. E. Lat. 72. o. N.

MAGGIORE, or LOCARNO, a lake of Italy, partly in the duchy of Milan, and partly in the country of the Grisons. It is 35 miles long and six broad.

MAGHERAFELT, a town of Ireland, in the county of Londonderry, considerable for its linen manufactures, 13 miles W. of Antim, and 30 S.E. of Londonderry.

MAGLIANO, a small but populous town of Italy, in the territory of the pope, and district of Sabina, seated on a mountain, near the river Tiber, 30 miles S.W. of Spoleto, and 50 N. of Rome. Long. 12. 35. E. Lat. 42. 25. N.

MAGNAVACCA, a town of Italy, in the Ferrarese, with a fort, seated at the mouth of the lake of Comacchio, in the gulf of Venice, 18 miles N. of Ravenna. Long. 12. 4. E. Lat. 44. 52. N.

MAGNY, a town of France, in the department of Seine and Oise, 32 miles N.W. of Paris. Long. 1. 54. E. Lat. 49. 10. N.

MAGRA, a river of Italy, which rises in the Appennines, in the valley of Magra, washes Pont-Remoli and Sarzana, below which it falls into the Mediterranean.

MAËRA, a valley in the duchy of Tuscany, 27 miles long and 15 broad.

MAGUELONE, a lake of France, in the department of Herault, near a town of the same name, which is seated on the coast of the Mediterranean, into which the lake enters by a canal, the beginning of the famous canal of Languedoc.

MAHALEU, a town of Egypt, capital of Garbia. It carries on a considerable trade in linen, cottons, and sal-ammoniac; and the inhabitants have ovens to hatch chickens. Long. 30. 31. E. Lat. 31. 30. N.

MAHANUDDY, or MAHANADY, a river of Hindoostan, which rises in the N.W. part of Berar, and falls by several mouths into the bay of Bengal, at Cattach. These mouths form an assemblage of low woody islands; and at the mouth of the principal channel, near Falie Point, is a fortified island, named Cajung or Conjung.

MAHMUDPOUR, a town of Hindoostan Proper, in Bengal, 80 miles N.E. of Calcutta, and 84 S.E. of Moorhedabad.

MAHOMDY, a town of Hindoostan Proper, in the country of Oude, 70 miles N.W. of Lucknow, and 150 E.S.E. of Delhi. Long. 80. 32. E. Lat. 27. 54. N.

MAIDA, a town of Naples, in Calabria Ulteriore, nine miles W.N.W. of Squillace.

MAILLEZAIS, a town of France, in the department of Vendée, seated in an island formed by the Seure and Autize, 22 miles N.E. of Rochelle, and 210 S.W. of Paris. Long. o. 40. W. Lat. 46. 27. N.

MAIN, a district of Massachusetts, 300 miles long and 104 broad; bounded on the N.W. by the high lands, which separate the rivers that fall into the St. Lawrence, and those that fall into the Atlantic; on the east by the river St. Croix, and a line drawn due north from its source to the said high lands, which divides this territory from Nova Scotia; on the S.E. by the Atlantic; and on the west by New Hampshire. It is divided into three counties. The heat in summer is intense, and the cold in winter extreme: all the lakes and rivers are usually passable on ice, from Christmas till the middle of March. Portland is the capital.

MAINA, a country of Turkey in Europe, in the Morea, according to tradition, derives its name from the Greek word *Mania*, signifying *rage* or *fury*, and intended to express the ardor with which those people fought against the Turks. That tract of territory, though rough with rocks and mountains, contains a population of about forty-five thousand souls. It reckons three hundred and sixty villages, of which Vitulo is the most considerable.

Its principal productions are wheat, barley, and lupines, which are each year grown in rotation, so as never to let the land lie uncultivated. Here, as every-where else, agriculture is the mother of the principal domestic resources. It is not attended with great difficulty in Maina, in consequence of the great population, and the proximity of the villages. The labours of the plough are performed by oxen: the crops are not abundant; but the deficiency of corn is compensated by a prodigious quantity of oil, and by the produce of the silk-worm.

The lands of Maina, like its inhabitants, are unacquainted with rest. They annually yield their produce, without the aid of manure, except such as they derive from the natural deposits of the cattle, which remain constantly in the fields, as there are no fables in the country. Besides, the soil is dotted with little rocks which prevent the waters from washing away the mould; and the rain, being stopped by those rocks, deposits around them a kind of mud, which probably contributes to the fertility of the land.

No vineyards are seen in Maina. It is not that the soil is

tinist for the cultivation of the grape; for there are parts of it well adapted for the propagation of the vine; but the Mainots give the preference to Ceres over Bacchus. They can very well dispense with wine, they say, but not with corn. Besides, they can easily procure grapes and wine from any other part of the Morea.

The Mainots are equally unacquainted with extreme poverty and great opulence. During the summer, they imitate the ant, and carefully lay up for winter a sufficient store of provisions of prime necessity. The inhabitants of Cape Matapan are alone destitute of that advantage: their territory being less fertile than the other parts of the district of Maina, numbers of them go in the harvest season to work in the Morea, and thus procure supplies of wheat and barley for the whole year.

Since the fall of the Greek empire, the Mainots have ever considered courage as the virtue which was the most necessary to them for the preservation of their liberty. Their bodily exercises give them agility; and their temperance renders them robust. Having neither tribunals nor judges, they have acquired the habit of personally avenging themselves for every kind of injury. To pardon an outrage is deemed the conduct of a coward: to punish it, is frequently to kindle the flames of war between the families of the parties: but even this kind of family hostilities is advantageous to them, inasmuch as it inures them to martial toils.

Their economy constitutes their wealth. Equally sparing of their time and their money, they have sufficient dependence on each other's word, to supersede the necessity of binding themselves by written agreement. Neither notaries nor lawyers are to be found among them: all their engagements are made verbally, but are not on that account the less faithfully observed.

At Maina, nothing is more sacred than the honour of the fair sex. To deceive a woman is accounted an act of baseness; an outrage offered to her is, in the eyes of her family, a stain which cannot be washed out except in blood. The women, it is true; shew in the first instance a proper respect for themselves. The conduct of the mothers is the best lesson for their daughters. They seldom go abroad from their houses, and then on family business alone. Accustomed to labour, they neither experience the irksome *ennui* of our polite circles, nor are exposed to the dangers of our public places, nor frequent balls, where every thing is masked, except debauchery. Accordingly they are safe from those dark intrigues in which virtue too often falls a sacrifice. It is not that their hearts are proof against the shafts of love, or that the young men view them with the eyes of indifference; but both sexes are equally attentive to preserve their moral and physical powers for the purpose of more effectually securing their liberty.

All the inhabitants of the same village live together like children of the same family: they mutually lend to each whatever is necessary, and take pleasure in relieving each other's wants. If any one of them, burthened with a numerous family, is reduced to distress, the priests or principal inhabitants of the place make for him a collection without naming him, and cause it to be privately conveyed to his hands.

Hospitality is the favourite virtue of the Mainots. Does a hapless victim of Turkish cruelty come to them from any other part of the Morea in quest of an asylum? he is received with all the attention due to misfortune and to friendship: he

is provided with lodging, food, raiment, every thing. If they do not observe the same conduct toward foreigners, it is because the Mainots are afraid of feeling corruption introduced among them. To insure himself a good reception, a foreigner must come recommended by some person who is well known to the inhabitants, or bring with him the means of supplying all his wants until his demeanour have gained him respect, and he have learned in some measure to speak the language of the country. His character once established, he is thenceforward treated as if he were a native Mainot.

In no other part of the globe is so great affection and friendship seen to reign among relatives as in Maina. The glory of a noble deed, or the disgrace of an act of baseness, reflects on the whole kindred. Each family regards its seniors as its guides. Is there question of a marriage, or of any other important undertaking? The old men are consulted before a single step be taken in the business.

There is no corporal punishment for theft; but the deprecator is obliged to make seven-fold reparation. His crime is never expiated by the penalty of death: for "all the wealth in the world," say the Mainots, "is not equal in value to the life of a man." Indeed, what is stolen among them is of no great moment: it is only fruits or garden produce. The most effectual check upon persons who might be inclined to thievery, is the sentence of excommunication pronounced against them by the priest at mass.

The Mainots profess the Christian religion according to the rites and tenets of the Eastern church, which acknowledges for its chief the patriarch of Constantinople. They scrupulously observe the commandments of their church, which have been handed down to them without innovation. They consider the head of the Roman church as a schismatic, on account of the changes introduced into the Romish religion: changes, in consequence of which it is no longer recognisable. In particular, they cannot pardon the popes for having forbidden married men to exercise the ecclesiastic functions, and having sold indulgences which were pretended to possess the virtue of releasing souls from purgatory.

In Maina there is a bishop, residing at Vitulo, but who has neither salary nor house. He lodges in a little convent with a small number of monks, where he lives on the fruit of his personal labour, and the produce of his masses, for each of which he receives a stated price, amounting to four times the sum paid for a mass said by a common priest. The priests are in general married, and obliged to work for their subsistence, having no other income than the casual fees arising from the exercise of their functions. The custom of paying to the church either tithes or any other stated contribution, is equally unknown to the Mainots as to the rest of the Greeks.

It rarely happens that the priests accompany their masses with sermons; they supply the place of the latter by their exemplary lives. Their modesty, their mildness, their simplicity, gain for them the unbounded confidence of the people, whom they inspire with equal attachment to their religion as to their native country. Hence that axiom, common to all the Greeks, "Fight for your religion and country"—an axiom so scrupulously respected at Maina, that the priests are ever among the foremost in flying to arms for the defence of the country, and that they never take up arms except in her cause.

In the Greek churches* there is but a single altar; at that

* Different in this respect from the Romish churches; the latter containing numerous altars, at each of which, numerous masses are each day said. In the *ci-devant* cathedral of *Notre Dame*, at Paris, not a single minute elapsed, between the hours of six in the morning and twelve at noon, without the appearance of a priest passing or repassing, between the vestry and some

altar no more than one, mass can be celebrated on the same day; and the celebration usually takes place only on Saturdays and Sundays. On those days, therefore, and on the festivals, not an individual is to be seen in the villages during the hour of divine service, all the inhabitants being at church. At Maina there is no parochial rector: if there happen to be several priests in one village, each in rotation exercises his functions during a week; whence he is, for the time being, called the hebdomadary.—At church, the wives of the priests hold the foremost rank among the women.

When a Mainot woman is on the verge of puerperal labour, a midwife is called in, together with some of the female relatives or neighbours, who prepare every thing necessary for the occasion. The woman places herself upright in the arms of her husband, who also holds himself in a standing position, but with his back leaning against the bed, that he may have more strength. Nothing can be better calculated to facilitate the delivery than that posture. The midwife attends for no other purpose than that of receiving the infant; her skill extending no further than to encourage the patient by her discourse. If the child presents itself in a wrong direction, the mother is laid on a sheet, and rocked to and fro until that inconvenience be remedied.

As soon as the infant is come into the world, the midwife handles all his limbs, puts them into proper shape, carefully forms the nipples of the breast, and sprinkles the babe from head to foot with finely powdered salt. After the expiration of three days she washes him with a tepid decoction of aromatic plants, which preserves him from all eruption either in the head or in any other part of the body. When the child is swathed, he is sprinkled, particularly on the joints, with fine powder of myrtle-leaves.—With respect to the lying-in woman, she is bound beneath with a girdle, and supplied with a bowl of good broth.

The birth of a son is announced by a musket-shot fired by the father. At that signal, all his male relatives and friends testify their joy by a discharge of their fire-arms. During the first eight days from her delivery, the mother is visited by her female relatives, who bring her presents of food suited to her condition. So long as she keeps her bed, she takes the best of nourishment, and drinks nothing but wine, being expressly prohibited to use water. Hence she acquires an abundance of milk.

Every mother suckles her own child; and, if a mother happen to die, each of her female neighbours is eager to supply, toward the orphan, the place not only of a nurse but also of a mother. The babe receives baptism and confirmation together. The priest takes a small bit of wax from each of the two candles used at the ceremony, cuts, on four sides, some hairs from the child's head, fastens them to the wax, and, together with it, throws them into the water in which he has been baptised.

The cradle used in Maina proves the simple and natural genius of the people. It is made of a sheep-skin well tanned, and dyed with any colour, according to the fancy of the maker. It is three feet in length: its breadth at the head is three feet and half, at the foot only two. To each side is fastened a stick, having at each end a ring, through which passes a cord. The child's head rests on a pillow, which prevents the sticks from meeting, and thus leaves a free access to the air. At home, the mother hangs the cradle from a nail fastened in the wall. Whenever she goes abroad, she slings it over her shoulder, and carries it as a soldier carries his car-

touch-box. Nothing is more common than to see a Mainot woman returning from the fields with a faggot of wood on her back, and, on top of the faggot, her child in its cradle; the whole burthen so well adjusted, that she has her hands at liberty to spin cotton as she walks along.

The male child continues till the age of seven years under the direction of his mother. She carefully instils into him a love for his country, respect for old age, discretion, fidelity to his friends, and, above all things, hospitality to the poor and the stranger.—After the expiration of the seven years, the father takes charge of his son's education, teaches him to read and write, accustoms him to agricultural labours for the purpose of strengthening his limbs, trains him to the handling of arms until he becomes capable of participating the exercises of youth, which consist in wrestling, lifting a weight and placing it on his shoulders, hurling stones of a certain size, leaping, and swimming.

The daughters are left to the care of the mother, who trains them to the labours of the household. Their principal instruction has for its objects the spinning of cotton, and the rearing of silk-worms. Each woman has her loom in the house, and can weave cotton and silk stuffs, which serve for the raiment of both sexes. The girls, constantly employed under the inspection of their mother, never think of the sports and amusements suited to their age. It is only on holidays that they are allowed to quit the house, for the purpose of going to church, and to the dances, which are held only in the public market-places, and by day:—there is no dancing by night.

At Maina the young men are robust; and though, at the age of eighteen, their bodies are hardened by laborious exercises, they do not, however, marry till five-and-twenty. That age is deemed necessary for the procreation of well-constituted children. Till that period their chief desire is to signalise their prowess in combat; and they find frequent opportunities of gratifying their wishes in that respect. There never comes a new pacha to the Morea, who is not ambitious to announce his arrival by an attack on the Mainots. These, on the other hand, are all up in arms in an instant. The young men are the foremost in falling forth to meet the enemy. The only recompense which they covet is the approbation of the fair sex. Nothing is more efficacious to fire their courage than encomiums from the lips of young heroines, who are ever ready to partake their dangers. Accordingly, notwithstanding the enormous superiority of the Ottoman force, the Mainots continue unsubdued.

Their gunpowder is excellent. Each man prepares it in his own family. This is one of the principal occupations of the young men. They take care, in the first instance, to reduce the saltpetre, the sulphur, and the charcoal, separately, to fine powder in wooden mortars; after which they blend the ingredients together, and work them to a proper consistency. There are some spots of land in Maina which produce saltpetre in abundance; but the inhabitants are unacquainted with the art of extracting it.

If the Mainots have preserved their innocence and their liberty, they are indebted for the enjoyment of those blessings to the care with which they have retained that austerity of manners which characterised their progenitors. Even in the age of infancy they breathe the pure air of virtue: in years of adolescence they triumph over the allurements of libertinism. Their parents are aware, that, in adding a new member to society, they have done no more than acquit themselves

one of the many altars. And as many of those gentlemen could expedite their masses in fifteen or twenty minutes, the reader may judge what a number were said at each altar, and what sums were paid for that commodity, even at a shilling per mass, which was the very lowest and poorest price.

of a debt which they owed to it: they know that they have a more important duty to fulfil—that of directing the first affections of their children, and as it were the first pulsations of their hearts, until they have taken their bent toward wedlock.

In Maine those intrigues are unknown, which elsewhere serve as an introduction to the conjugal union, and which frequently prove favourable to love at the expense of matrimony. So soon as a young man has made the choice of a partner, he communicates the matter to his kindred, who then apply to hers, and ask of them her hand in marriage: nor do the latter hesitate to grant the request, if they approve the young man. The girl is next made acquainted with the choice of her future husband, which she sanctions by her silence. Not having before laid her heart open to love, this first object presented to her becomes the sole possessor of her entire affection for the remainder of her life.

That affection is increased by an obstacle which is not known in any other country. From the moment when the marriage has been decreed, the young man is expressly prohibited from entering the abode of his intended bride, or even speaking to her, until the marriage have taken place. If he should happen to transgress that prohibition, the spousal contract would be broken. This privation tends to fan the soft flame in the bosoms of the young betrothed, and adds a new stimulus to their desire of seeing themselves bound in the hymeneal chain.

The wedding-day being arrived, the relatives of the party assemble—those of the bride in her dwelling, where they remain—the others in the abode of the bridegroom, whence they set out with him, to go to the house of his betrothed wife. The young man presenting himself at the door, one of her kindred stops him, and asks what is the object of his visit.

"My promised bride," he replies, "that I may go and be married to her according to the established forms."

"Have you sufficient means to support the partner whom you desire?"

"Would her family have consented to give her to me, if I had not the ability to maintain her?"

Immediately the girl's father is called, and informed that his future son-in-law is at the door. The father advances to the youth, and salutes him in these terms—"Welcome, my son-in-law! May God grant thee happy days, peace and concord with thy partner, and every thing that thy heart desires!" So saying, he embraces him.

After the father, comes the brothers of the bride, who hail the youth with the same prayer, make him a present in money proportioned to their faculties, and, having embraced him, deposit their offering in the hands of a female appointed to receive it; for which office the bridegroom's sister or cousin is always chosen.

The brothers are succeeded by the male relatives, who each in turn present similar gifts, and in like manner embrace him. After them, come the females, preceded by the bride's mother and sisters.

The salutations and embraces which they bestow are accompanied by presents of a different nature; each of them places a handkerchief on the bridegroom's shoulders, where the sisters it to remain.

This ceremony concluded, a little boy, brother or cousin-german to the bride, and not above six years old, takes the young man by the hand, and conducts him to the apartment which contains his destined wife. The betrothed pair salute each other, and remain together with the relatives of the bride. Immediately those of the bridegroom being introduced, both parties unite, divert themselves, eat some dried fruits, drink, and sing hymns suited to the occasion. After about an hour spent in this manner, the whole company walk

forth; which is generally done at the setting-in of night. Foremost advance the relatives of the bridegroom, at whose side marches the bridegroom, appointed to the office of exchanging the rings and chaplets. Next follows the bride, attended by all the females.

In this order the procession arrives at the church, in the middle of which rises an altar erected for the occasion, and displaying a cross surrounded by six candles. The priest, arrayed in his ceremonial robes, assigns their stations to the young couple, placing the bride to the right of the bridegroom. Near to them stands the bridegroom and a young woman, who is attentive to wipe the perspired moisture from their faces with a white handkerchief.

The priest alternately asks the youthful votaries of hymen whether they be satisfied to unite with each other according to the rules prescribed by the church. Having received their several answers in the affirmative, he bestows on them his benediction; and taking their right hands, puts them together, saying—"These hearts, which God has united, let no man disunite." He then blesses the two rings, and places one on the fourth finger of the right hand of each of the parties, saying, "God's faithful servant *AB* is united with God's faithful handmaid *CD*;" after which he turns to the altar, and blesses the chaplets, which are composed of vine-twigs ornamented with branches of lemon-tree and laurel.

During this time, the bridegroom exchanges the rings three times, finally leaving the ring of each party on the finger of the other. The priest now takes the chaplets, which he places on the heads of the new-married pair, saying, as he crowns the bridegroom, "I crown God's faithful servant *AB*, in uniting him with God's faithful hand-maid *CD*," and repeating a similar formula as he places the garland on the head of the bride: after which ceremony he wishes them a life of peace. The garlands being exchanged in the same manner as the rings, he directs the young couple to take from the same glass a morsel of bread and a few drops of wine: finally he walks forward with the bride and bridegroom, leads them three times round the altar, conducts them back to their former station, bestows on them a new benediction, and thus terminates the functions of his ministry.

The company retire from the church in the same order as they had repaired to it, firing musket and pistol-shots. While the new-married pair proceed along the streets, the women, from the windows, sprinkle the ground before their steps with wheat and millet, symbolic of fecundity. The procession returns amid the sounds of musical instruments, to the bridegroom's dwelling, which the bride cannot enter with her attendant until she have answered the same questions at the door as had been put to him when he presented himself for admission into her abode. Here also a little child is employed to introduce her into the house of her husband. On her entrance, her mother-in-law, having disrobed her of her veil, conducts her into an apartment, where she seats her on a cushion placed upon a sack of flour. By her side stands another sack full of nuts, almonds, and other dry fruits, which she distributes to the relatives who successively approach and wish her every kind of prosperity.

The bridegroom's mother takes her station at the window, whence she throws fruits, and sometimes money, to those persons who have followed the hymeneal train without invitation. The bride, having finished her distribution, is conducted to the hall where the wedding-feast is prepared. The remainder of the evening is spent at table; the night is devoted to dancing; and—what will no doubt be considered as the most singular circumstance in the whole business—the new-married pair are, by the traditionary usage handed down from their ancestors, debarred from all opportunity of *à-la-à-la* interview during this night.

Three days after the marriage, and it is always on a Wednesday, the bridegroom, accompanied by his bride, and preceded by a boy of the age of seven years, repairs to the house of his father-in-law, where he dines—having, however, taken care to bring with him every thing necessary for the meal. When they are preparing to return home, the mother presents her daughter with a distaff and spindle, emblems of the kind of occupation for which she is destined. The husband is presented with agricultural implements, which he accepts. Mutual embraces being exchanged, the new-married pair retire, and pass eight days without attending to any domestic business.

In the evening of the seventh day, the nearest relatives of the husband invite the kindred of both families to escort the young couple to church on the morrow, and to re-conduct them to the house of the husband's father-in-law. They all attend the summons: after having saluted the bride and bridegroom, they sing and dance until the moment of their departure for the church.

During that interval, the young man's father presents the father of the young woman with bread, cheese, wine, and other provisions, such as almonds, nuts, and figs, in sufficient quantity to supply a breakfast for the whole company.

After the celebration of divine service, the party go to the house of the bride's family, where the same kind of distribution is made as had taken place on the wedding-night. They dine, they dance, they sing. After dinner, the husband receives from his father-in-law his wife's portion, consisting of clothes and furniture, of which an inventory is drawn up, and signed by both parties. If perchance the woman die without issue, the marriage-portion is punctually restored to her family; on the other hand, if the husband happens so to die, his realty enjoys his property during her widowhood. No law-suit ever occurs on these occasions: any difficulty arising relative to such matters is immediately removed by the decision of arbitrators, whose judgment admits of no appeal.

The Mainots have a particular mode of dress for the marriage ceremony. The bridegroom wears on his head a small close-fitting red cap, from the top of which depends a silken tassel. His vest is scarlet, having all the seams covered with twist of the same colour; it has no collar, and is edged round with three rows of similar twist: its sleeves are open as far as the middle of the fore-arm. His jacket is of the same stuff: it is open in the fore part, and, from the neck to the bottom, is ornamented with five rows of gold or silk twist: a sixth serves, on the left side, to furnish loops, and on the right, to fasten twenty-four small round buttons, which lie close to each other. The vest and jacket are both fashioned to a point in front. The breeches are very wide, and defend six inches below the knee. He wears no stockings: his shoes are fastened with silken strings ascending half way up the leg, and are bordered before and behind with an edging to prevent the strings from hurting the foot.

The bride wears a veil of white gauze, two yards in length, which goes round the upper part of her head, passes under her chin, and falls behind, hanging down as low as her mid-leg. It is fastened on each side of the head with a pin. This veil is ornamented with fringes of the same stuff. Under it she wears a bonnet of scarlet cloth or of silk. From her ears hang two pendants of curious workmanship. Her under garment is of silk, without sleeves, and has three edgings, one red at the bottom, another of white lace, at a small distance above the former, and a third, blue or yellow, at equal distance from the second. Her breast is bound with an elegant girdle. Over the inner garment she wears an ample scarlet robe with very wide sleeves. Her shoes are flat, and she has no stockings.

Divorce is allowed at Maina, but that indulgence is rarely

used. A separation seldom takes place, except in consequence of a notorious incompatibility of dispositions in the married pair, or of the husband's continuing seven years absent without sending any intelligence to his wife. No legal process is necessary: no expence is incurred: the parties simply present themselves before the bishop, who, after having ascertained the fact, pronounces their separation, and declares them at liberty to form new engagements. If there be any children from their union, they remain with the father.

At Maina there are no school-masters, in the proper acceptance of the term. It is by the priests that the children are taught to read and write: which two acquisitions constitute nearly all the knowledge possessed by the teachers themselves. They however form the heart at the same time that they instruct the mind. Their morality consists much less in precept than in good example.

The best policy of the Mainots is, that they are totally unacquainted with what we call policy. Justice is their guide, and jealous vigilance their safeguard. They are strangers to the art of printing, that art which enables designing impostors to deceive millions of men at once. They have scarcely any books, and exclusively devote their attention to agriculture, fishing, hunting, and practising with the weapons of war. Their martial exercises are considered as an object of prime importance. Hence it is common to see a boy running from school, and a priest from the altar, to oppose the enemy.

The Mainots have not among them either surgeons, or physicians, or apothecaries. To the purity of the air they breathe, and more especially to their temperate mode of life, they are indebted for the preservation of their health. Their blood is not tainted with maladies imported from foreign lands. Fevers, indeed, of the putrid and intermittent classes, are not unknown in the country; but these prevail only on the frontier, toward Monenbassa, where low lands and marshes abound.

During the period of a continuous fever, the patient is surrounded by his relatives, who are attentive to afford him every aid which their knowledge or experience can suggest. They do not administer to him any internal medicines, through an apprehension of counteracting nature in her crisis, but suffer the disease to take its natural course. If the sick person have lost his appetite, they present him no food: but if he have retained an inclination to eat, they give him such aliment, of the lighter kinds, as he prefers; thus endeavouring to support his strength. Hence he frequently recovers.

It is from long experience that the Mainots have learned to distinguish the critical days in violent diseases. They then employ diet-drinks and gentle medicines internal and external, calculated to facilitate a perfect crisis. By the application of external medicaments they remove accidental pains, such as head-ach, nephritic colic, stitch in the side.

At Maina the physicians of the soul have also the additional advantage of acting as physicians for the body. A priest is stationed near the sick person, having one hand placed on his forehead, and holding in the other a book, from which he continually reads prayers with a loud voice, until he have procured him some relief. He sometimes passes whole nights thus exorcising the fever.—The recovery of a patient is a triumph for religion, since the superstitious credulity of those good folks never fails to attribute the cure to the efficacy of the holy man's prayers.

Every Mainot acts as surgeon in his own family. They have learned by routine how to apply the first dressings, and to follow up the process by the use of medicaments suited to determine the suppuration. In cases of gun-shot wounds, they successively employ detensive and cicatrizing applications, which are usually derived from plants. For wounds from

edged weapons, when there is no loss of substance, they content themselves with the aid of decorative plants, to prevent suppuration; by which method they speedily cure them. With respect to luxations and fractures, there are particular men at Maina who are noted for their skill in treating them; and these are called in on such occasions.

The Mainots are not so rashly hasty in drawing blood from sick persons, as people are in those countries which are subject to the despotism of medicine. Before they have recourse to that operation, the relatives, and particularly the old men, assemble, consult the great book of experience, examine whether, under a similar malady, phlebotomy has proved beneficial or injurious, and conformable to the result of their examination, adopt or reject the expedient. The Mainots are almost universally expert in opening a vein.

None of the nation has ever yet attempted to establish a public pharmacy. Each individual possesses one at home, or carries it as it were in his head. They have a number of remedies generally adopted as specifics for certain complaints. They pursue an equally singular and efficacious mode of treating fevers arising from a vitiated state of the humours; they apply to them the leaves of a detestive plant, adding, every four-and-twenty hours, a new leaf, without removing the former, or doing more than gently to press the fore with the hand, for the purpose of squeezing out the purulent matter by the sides. That matter becoming each day thicker, because also, in our faculty phrase, more "*laudable*," and, when the fore is cicatrised, the leaves are dried by the heat of the flesh, and detach themselves from the part on being gently rubbed.

When a Mainot has expired his last breath, his decease is announced by the lamentations of all around him. He is enwrapped in a sheet, and placed in the middle of the house, under a white coverlet, with his face exposed. The near relatives of the female sex, their cheeks bedewed with the drops of sorrow, and their hair dishevelled, stand round the corse, singing mournful airs so tenderly affecting as to call forth sympathetic tears from all who are present. The male relatives or friends who come to the mournful scene, so soon as they have reached the threshold of the door, pronounce three times, in conformity to a very ancient custom, the words, "Brother! ah! sweet brother!" To these lamentations they generally add questions analogous to the connections which had existed between them and the defunct.—The widow, after having given a loose rein to her grief, rehearses all the good qualities of her deceased husband. She pours forth in extemporaneous poetry the most pathetic speeches, suited to the melancholy occasion.

When the priests are come, attended by almost the entire population of the village, the wailings and tears are redoubled at the moment when the dead body is placed in the coffin; but, when the funeral procession has commenced its march, they cease. The priests advance singing, in front; the men follow the coffin; and the woman close the rear.

After their arrival at the church, when the clergyman in the course of the funeral-service pronounces the words "Friends and brethren! weep my separation!" the nearest relatives of the deceased walk successively in pairs, one on each side of the coffin, with their faces turned toward the altar, and, bowing in adoration, respectfully kiss the image of Christ on his breast, and then his forehead. The interment being concluded, the company all return to the house of the defunct, testify their regret, and retire.

As ancient custom hath forbidden the lighting of any fire in the house of a deceased person, on the day of his death, each of the relatives and friends carries from home a ready-cooked dish to go and dine with the family of the defunct.

The men first take their repast, seated on the floor or carpets, before a cloth which covers the whole length of the hall. At the head sit the priests, next to them the old men, and after these the others in the order of seniority. This custom of assigning the places according to age is so regularly observed at Maina, that no confusion ever takes place in that respect. On beginning the meal, at the first morsel which they are preparing to eat, each of the company successively exclaims, "God have mercy on his soul, and grant him a place among the just!" After the men have dined, the women come and take their places in the same order. The visitors invite the near relatives of the deceased to take some food, and in the most affectionate language endeavour to console them. The whole company remain with them till dark: as soon as night has commenced, each of them embraces the family, and retires.

All the Mainot women wear trimmings at the bottom of their petticoats or gowns. Widows are known by the want of these, which they cannot replace until married again.

If a widow is burdened with children, her relatives and friends choose a holiday to cultivate her lands, but not without having previously obtained the bishop's permission for that purpose. A single day is sufficient for sowing her field, or gathering in her harvest.

MAINBURG, a town of Bavaria, situate on the Ambs, 18 miles S.E. of Ingolstadt, and 32 N.N.E. of Munich. Long. 11. 21. E. Lat. 48. 40. N.

MAINEVILLE, a town of France, in the department of Eure, 24 miles S.E. of Rouen. Long. 1. 26. E. Lat. 49. 20. N.

MAINLAND, the principal of the Shetland Isles, 60 miles long, but its breadth seldom exceeds six. The face of the country exhibits a prospect of black craggy mountains, and marshy plains, interspersed with some verdant spots, which appear smooth and fertile. Neither tree nor shrub is to be seen, except the juniper and the heath. The mountains abound with various kinds of game. Lofly cliffs, impending over the ocean, are the haunts of eagles, falcons, and ravens. The deep caverns underneath shelter seals and otters; and to the winding bays resort swans, geese, scarfs, and other aquatic birds. The seas abound with cod, turbot, and haddock; and, at certain seasons, with shoals of herrings of incredible extent. They are visited, at the same time, by whales, and other voracious fishes. Lobsters, oysters, mussels, &c. are also plentiful. The hills are covered with sheep of a small breed; the horses are also of a diminutive size, but remarkably strong and handsome, and are well known by the name of Shelties, from the name of the country. The rivulets and lakes abound with salmon, trout, &c. A mine of copper, and one of iron, near the fourth extremity of the island, are said to be extremely productive. There is an inexhaustible store of peat, but no coal. Lerwick is the capital.

MAINLAND, or POMONA, the principal of the Orkney Islands, 24 miles long and nine broad. The general appearance of the country is not very different from the Mainland of Shetland. The soil, however, is more fertile, and in some parts better cultivated. Kirkwall is the capital. See ORKADES.

MAINTENON, a town of France, in the department of Eure and Loire, with a castle, a late collegiate church, and a late priory. It is seated between two mountains, on the river Eure, five miles N. by E. of Chartres. Long. 1. 36. E. Lat. 48. 31. N.

MAINUNGEN, a town of Franconia, capital of a small district belonging to the house of Saxe-Gotha. It is eight miles N. of Henneberg. Long. 10. 39. E. Lat. 50. 46. N.

MAISY, a town of France, in the department of Calvados, five miles N. of Ifigni, and 27 W.N.W. of Caen. Long. 1. 2. W. Lat. 49. 24. N.

MAIXANT, Sr. an ancient town of France, in the department of Two Sevres. It had lately a Benedictine abbey, and is one of the new bishoprics created since the revolution of 1789. It carries on a trade in corn, stockings, and woollen stuffs; and is seated on the Sevre, 26 miles S.W. of Poitiers. Long. 0. 7. W. Lat. 46. 24. N.

MAIZE, or **INDIAN CORN** (see *ZEAL*); when properly cooked, a most excellent article of human sustenance, happily introduced into Britain during the late scarcity. To be thoroughly acquainted with this valuable grain, and the means of making its use general among the poor, it is necessary to consult Count Rumford's *Essays*, vol. I. See also the article *CORN*, *Supp.*

MAKAREV, a town of Russia, in the government of Niznei Novogorod, situate on the Volga, 24 miles E.N.E. of Niznei Novogorod. Long. 44. 46. E. Lat. 56. 25. N.

MAKARIEF, or **MAKAREU**, a town of Russia, in the government of Kostrom. It is the capital of the province of Unzha, and situate on the river Unzha, 80 miles east of Kostrom. Long. 44. 14. E. Lat. 58. 50. N.

MAKOONDA, a town of Hindoostan Proper, in the country of Allahabad, 66 miles S. of Allahabad, and 110 N.N.E. Gurrab. Long. 84. 37. E. Lat. 24. 33. N.

MALAMOCCO, a small island and town in the Lagoon of Venice, five miles south of Venice.

MALATHIA, an ancient town of Turkey in Asia, capital of Lesser Armenia, seated on the Arzu, with an archbishop's see. Long. 43. 25. E. Lat. 39. 8. N.

MALCHIN, a town of Lower Saxony, in the duchy of Mecklenburg, seated on the river Peene, where it falls into the lake Camrow, 10 miles N. of Wahren. Long. 13. 12. E. Lat. 53. 0. N.

MALDEN, a village in Surrey, two miles S.E. of Kingston. Here are some gunpowder mills, on the stream that flows from Ewel to Kingston.

MALESHERBES, a town of France, in the department of Loiret; 11 miles N.E. of Pluviers. Long. 2. 6. E. Lat. 48. 20. N.

MALESTROIT, a town of France, in the department of Morbihan, seated on the Oust, 37 miles E. of Port l'Orient. Long. 2. 23. W. Lat. 47. 45. N.

MALIO, **CAPE**, or **ST. ANGELO**, a cape of the Morea, at the fourth entrance of the gulf of Napoli, 15 miles E. of Malvasia.

MALKAR, a town of the Deccan of Hindoostan, in the country of Golconda, 22 miles S.E. of Calberga, and 54 W. of Hydrabad. Long. 77. 36. E. Lat. 17. 12. N.

MALLEVILLE, a town of France, in the department of Lower Loire, 15 miles N.W. of Nantes.

MALLING, **WEST**, a town in Kent, with a market on Saturday, 6x miles W. of Maidstone, and 30 E. by S. of London. Long. 0. 33. E. Lat. 51. 20. N.

MALMEDY, a town of the Netherlands, in the bishopric of Liege, with an abbey. It was taken by the French in 1794. It is seated on the Recht, nine miles S. of Limburg. Long. 6. 2. E. Lat. 50. 18. N.

MALMISTRA, an ancient town of Natolia, with an archbishop's see; seated at the mouth of a river of the same name, which divides it into the Old and New town. It is 30 miles S.E. of Teraflo. Long. 36. 15. E. Lat. 36. 50. N.

MALMOE, a sea-port of Sweden, in the province of Schonen, with a large harbour and a strong citadel. It is

seated on the Sound, 15 miles S.E. of Copenhagen. Long. 13. 7. E. Lat. 53. 38. N.

MALMSAS, a town of Sweden, in the province of Sudermania, 23 miles W.N.W. of Nikoping.

MALORIA, a small island of Italy, on the coast of Tuscany, 10 miles W. of Leghorn. Long. 10. 4. E. Lat. 43. 34. N.

MALPARTIDO, a town of Spain, in Estramadura, 14 miles S. of Placentia. Long. 5. 30. W. Lat. 39. 36. N.

MALSESENA, a town of Italy, in the Veronese, 13 miles N.N.W. of Verona.

MALT-KILN. Under the article *KILN* we have given an account of the improved construction of malt-kilns. We here present the reader with the description of a Malt and Corn Kiln invented by Mr. Joseph Coppinger, of Harbour View, near Cove, Ireland, which was communicated by him to the editors of the *Repertory of Arts*, &c.

"The enclosed plan of a malt and corn kiln," says Mr. Coppinger, "for which I have been favoured with the thanks of the Bath Society, at a general meeting, held in September last, is particularly adapted to the use of farmers, who, in wet seasons, often lose quantities of grain for want of such convenience. The advantages it appears to me to possess above the kiln now in common use are many; *first*, it may be erected for one-tenth of the expence, if you take in the value of the separate buildings which are now almost invariably allotted for this purpose. *Secondly*, any kind of fuel may be used without prejudice to the malt or corn to be dried in it. *Thirdly*, the heat (by the construction of the flues) will be more regularly and evenly distributed without any waste, as at present. *Fourthly*, the health of the people attending will not, as at present, be exposed to certain injury, by always breathing and sleeping in heated and unwholesome atmospheres, as their beds will be placed in a shed on the outside of the building. This, in my mind, is the most important part of the plan, and highly worthy the attention of every humane and considerate employer in this way. *Fifthly*, this construction of a kiln may be erected on a loft or ground floor. If in the latter situation, sufficient elevation should be given the fire-place, so as not to impede the draught. These are the principal advantages that occur to me. If the experience of others confirm them, I shall be highly gratified.

In Plate 34: A, shews the main walls. B, the flues. C, the chimneys; in each of which may be placed a metal damper, to regulate the heat. It is recommended, in the case of a new building, to carry up the flues of the chimneys in the thickness of the walls. In a house already built, they may be carried up either inside or outside the building. D, the fire-place, which may be divided, or in one, just as desired; by which the half or the whole may be heated.

"Kiln tiles, eighteen inches square, and two inches thick in the solid, with a lapping of half an inch broad and one inch deep quite round the edge of each tile, are proposed for covering the flues, which, if fairly cast, may be laid dry, without mortar. If it should be difficult, or too expensive, to procure tiles of eighteen inches, nine inches can be made to answer. The flues are proposed to be divided by a brick, on edge, so as that every eighteen-inch tile will cover two flues. The breadth of the flues may be six inches and a half, and ten inches high. This proportion, it is hoped, will be found to answer in most cases; but it may be varied according to the better judgment of the party erecting. The sides and bottoms of the flues should be plastered. The platform of this kiln should, in all cases, be well rammed with earth, and made perfectly level before laying out the flues."

Iron grate doors are intended to be hung on hinges, in a

reefs, at the mouth of each flue, to prevent them being choked with large pieces of cinder, or other substances. It is proposed that these doors should shut and open at pleasure, as may be found necessary.

MALTA, MELITA, or CITTA VECCHIA, an ancient and strongly fortified city of the island of Malta. It is the residence of the bishop, and the cathedral is a very fine structure. Near this city are the catacombs, which are said to extend 15 miles under ground; and a small church, dedicated to St. Paul, adjoining to which is a statue of the saint, with a viper in his hand, said to be placed on the spot where he shook the viper off, without having been hurt; and close to it is the grotto in which he was imprisoned. Malta is seated on a hill in the centre of the island, and was formerly twice as large as at present; for the new city, Valetta, being more conveniently situate, has drawn away the greater number of its inhabitants.

MALTOY, a town of the Decan of Hindoostan, in the country of Berar, 58 miles N.W. of Nagpore.

MALVASIA, a small island of Turkey in Europe, on the east coast of the Morea, remarkable for its rich wine, called Malmsey. The capital is Napoli-di-Malvasia.

MALUNG, a town of Sweden, in the province of Dalecarlia, 55 miles W. of Fahlun. Long. 15. 20. E. Lat. 60. 30. N.

MALWA, a province of Hindoostan Proper, bounded on the W. by Guzerat, on the N. by Agimere, on the E. by Allahabad and Orissa, and on the S. by Candia. It is one of the most extensive, elevated, and diversified tracts in Hindoostan; and is divided among the chiefs of the Poonah Mahrattas. Ougein and Indore are the principal towns.

MALZIEU, a town of France, in the department of Lotzere, 20 miles N.N.W. of Mende.

MAMARS, an ancient town of France, in the department of Sarthe, seated on the Dive, 14 miles W. of Belleme. Long. o. 16. E. Lat. 48. 22. N.

MANACHIA, or MAGNISA, the ancient Magnesia, a town of Natolia Proper, with a bishop's see, and a castle. It was formerly the capital of the Ottoman empire, and is seated at the foot of a mountain, on the river Sarabat, 22 miles N. of Smyrna. Long. 27. 25. E. Lat. 38. 45. N.

MANAR, an island of the East Indies, on the east coast of the island of Ceylon. The Portuguese got possession of it in 1560; the Dutch took it from them in 1658; and the English took it from the Dutch in 1795. Long. 80. 45. E. Lat. 9. o. N.

MANATOULIN, a chain of islands on the N. side of Lake Huron, in N. America, extending about 100 miles in length and eight in breadth. The name signifies a Place of Spirits; and they are held sacred by the Indians.

MANBED, a town of Persia, in the province of Irak, 150 miles E.S.E. of Ispahan.

MANBOBE, the capital of the kingdom of Sabia, situate on the sea-coast, at the entrance of the channel of Mosambique. Long. 32. 19. E. Lat. 20. 55. N.

MANCHESTER, a village in Warwickshire, near Atherstone and the river Anker. It was a Roman station on the Watling-street, and here several coins have been dug up.

MANCHE, or CHANNEL, a department of France, including part of the late province of Normandy. It is almost surrounded by the English Channel, and Coutances is the capital.

MANCHESTER, a town of Virginia, on James River, opposite to Richmond, with which it is connected by a bridge.

MANCIET, a town of France, in the department of

Gers, 17 miles S.W. of Condom. Long. o. 5. W. Lat. 43. 38. N.

MANDAL, a sea-port of Norway, in the province of Christiansand, at the mouth of a river of the same name, 19 miles W.S.W. of Christiansand. Long. 7. 42. E. Lat. 58. 2. N.

MANDRIA, a small desert island, in the Archipelago, between Samos and Langos. It gives name to the sea near it.

MANGALORE, a sea-port of Canara, on the coast of Malabar, with an excellent road for ships. It is inhabited by Gentoos and Mahometans. The former, on their festival days, carry their idols in triumph, placed in a waggon, adorned on all sides with flowers; and on the wheels are several sharp crooked iron hooks, upon which the mad devotees throw themselves, and are crushed to pieces. It is a place of great trade, and the Portuguese have a factory here for rice, and a large church frequented by black converts. The adjoining fields bear two crops of corn in a year; and the higher grounds produce pepper, betel-nuts, sandal-wood, iron, and steel. It is seated on a rising ground, 100 miles N. by W. of Tellicherry. Long. 75. 24. E. Lat. 13. 8. N.

MANGANESE (*Encycl.*). The following remarks on the decomposition of the sulphate of iron and copper by means of the natural calx of manganese, by Mr. Fischer, of Berlin, appears in Scherer's Chemical Journal.

"Accident," says the author, "led me to these experiments. I had, for a different purpose, let a solution of sulphate of iron, to which I had added two parts of calx of manganese and half a part of muriate of natron, to one part of the crystallised salt of iron, stand for several days in a moderate temperature. After the mixture had stood for this space of time, I found it considerably tinged with a reddish yellow colour, and a considerable quantity of calx of iron had separated itself in a completely oxydized state. My first idea was, that it had acquired oxygen from the calx of manganese, in consequence of which it had been separated in an insoluble form. However, upon adding a quantity of carbonate of lime to the liquid, a precipitate was formed, which might almost have been mistaken for a pure calx of iron; but, upon a more accurate examination, it was found to consist, for the greater part, of imperfect calx of manganese, and a small quantity of a perfect calx of iron. This unexpected phenomenon induced me to make the following experiments.

"One part of the vitriol of iron of commerce, containing copper, which had also been employed in the first case, with two parts of natural calx of manganese, and half a part of muriate of natron, were exposed in a glass retort to a red heat. An extremely small quantity of muriatic acid gas was extricated. After the extrication of gas had ceased, the retort was cooled and broken, and the mass that had been melted together was boiled out with hot distilled water. The residuum was found to be calx of copper, iron, and magnesia; but the filtrated fluid, on the contrary, which was perfectly colourless, contained no calx of iron, as appeared by proving it with the solution of prussiate of kali, for a precipitate of a light red colour was formed, which was completely dissolved by the addition of more water. It therefore contained pure calx of manganese, partly combined with sulphuric acid, but for the greater part with muriatic acid, besides which the solution contained sulphate of natron.

"These carbonates of kali and natron precipitated from this solution a perfectly white carbonated calx of manganese, which, however, in the course of time assumed a brownish yellow colour. Carbonate of ammonia added to the fluid produced also the same effects.

"I became doubtful whether the calx of manganese, thus obtained, was entirely free from iron, as it appeared to become coloured by the contact of the air, which might easily proceed from the presence of iron; however, I found, when the alkali was not added in excessive quantity, but in such proportion as not to be able to precipitate the whole of the calx of manganese, that the precipitate, after having been adulcerated and dried, retained its white colour without alteration.

"I am much inclined to account for the first appearance, by supposing a complete oxydation of the calx of manganese, which perhaps obtained oxygen from the superabundant addition of alkali; for that the alkalies really contain oxygen, seems to me to be proved by various facts, amongst which I also reckon the great change which siliceous earths undergo in being heated with the alkalies.

"I further mixed one part of pure sulphate of iron with four parts of calx of manganese, and exposed this mixture, for the space of half an hour, to a strong red heat. A portion of the sulphuric acid was, by this means, volatilized, but that which remained was found, after boiling out the torrefied pulverulent mass, to be combined with calx of manganese, completely free from iron, in which the prussiate of kali produced a clean, light red, and easily soluble precipitate. The undissolved residuum was perfect calx of iron and manganese.

"Sulphate of copper, in the same proportion with calx of manganese, and treated in the same manner, afforded the same results. The residuum contained calx of copper, undecomposed calx of manganese, and, in the latter, always an admixture of calx of iron.

"Possibly these experiments may procure us the advantage of being able to exhibit the calx of manganese free from iron, in an extremely cheap manner, and to employ it as a cheap and agreeable glass-flux for earthen-ware and china.

"By the method first mentioned, the sulphate of iron is never completely decomposed by the calx of manganese; for, by constant boiling for four hours, and afterwards digesting for twelve days, I could effect no complete separation of the iron; though, after this treatment, it is contained in the solution as completely oxydized iron. I have found, by repeated experiments upon this subject, that the decomposition may be completely effected in the dry way, by the application of a red heat for the space of fifteen minutes."

MANGEEA, an island in the South Pacific Ocean, five leagues in circumference. In the interior parts it rises into small hills, and Captain Cook represents it as a fine island; but the hostile appearance of its inhabitants obliged him to leave it soon. Long. 158. 16. W. Lat. 21. 27. S.

MANGLE, a valuable domestic machine, employed for the purpose of smoothing such linen as cannot be conveniently ironed.

Various patents have been granted for improvements in this machinery: but, as they are not expired, and too complicated to be understood without very tedious details, we have annexed the figure in Pl. 35, representing an improved mangle contrived by Mr. Jee, of Rotterdam; to whom the Society for the Encouragement of Arts, &c. in 1798, voted their silver medal, for the ingenuity displayed on that occasion.

The following is a description of Mr. Jee's improved mangle:

A, points out the great wheel, which, in machines of a full size, is 15 inches in diameter. B, the arbor, on which the nut, C, is fixed. D, the handle of the wheel. E, the crank, 21 inches in length. F, the rod of the crank. G, G, represents the hollow studs, by which the ends of the bed are lifted up. H, H, the levers. I, I, I, the four pulleys fixed on the moveable bed K. L, L, the ends of the rollers.

Fig. 2, represents a front view of one of the hollow studs G, to shew its form, when standing at the end of the bed; and into which the levers enter alternately, as often as it becomes necessary to elevate the bed, in order to put in, or take out, the rollers.

Mr. Jee's mangle is so constructed, that the handle requires to be turned one way only, in consequence of which the machine moves with greater facility, and with incomparably less injury to the linen, than by varying the turnings, and in a manner cutting the different folds. Besides, it possesses the great advantage, that a woman and one boy are sufficient to work it, and can perform as much labour in the same period of time, as three or four persons with mangles of the common construction.

MANGUSHLAK, a town of Turcomania, on the east coast of the Caspian Sea. Its commerce is considerable; the neighbouring Tartars bringing thither the productions of their own country, and even of Bokharia, such as cotton, yarn, fluffs, furs, skins, and rhubarb. It is 37 miles S.W. of Astracan. Long. 48. 20. E. Lat. 44. 45. N.

MANHARTZBERG, the northern part of Lower Austria, separated from the southern by the river Danube, and bounded on the west by Upper Austria, on the north by Bohemia and Moravia, and on the east by Hungary.

MANICA, or CHICANGA, an inland kingdom of Africa, bounded on the north by Monomatapa, on the east by Sofala and Sabia, and on the south and west by unknown regions. It is said to abound with mines of gold, and to have a great number of elephants; but it is little known to the Europeans.

MANICKDURG, a town of the Deccan of Hindoostan, in the country of Berar, five miles S.E. of Chanda.

MANICKPOUR, a town of Hindoostan Proper, in the country of Oude, 30 miles N.W. of Allahabad, and 68 S.S.E. of Lucknow. Long. 81. 45. E. Lat. 37. 26. N.

MANIEL, a mountain of St. Domingo, 20 miles in circumference, and so high and craggy, that it is almost inaccessible.

MANNINGTREE, a town in Essex, with a market on Tuesday; seated on the river Stour, which is here called Manningtree-water, 11 miles W. of Harwich, and 60 E.N.E. of London. Long. 1. 12. E. Lat. 52. 0. N.

MANOSQUE, a populous town of France, in the department of the Lower Alps, with a castle. It is seated on the Durance, 10 miles S. of Forcalquier, and 350 S. by E. of Paris. Long. 5. 55. E. Lat. 43. 51. N.

MANPURRY, a town of Hindoostan Proper, in the country of Doab, 54 miles E. of Agra. Long. 77. 40. E. Lat. 27. 5. N.

MANRESA, an ancient town of Spain, in Catalonia, seated at the confluence of the Cardenero and Llobregat, 15 miles S.E. of Cardona, and 20 N.W. of Barcelona. Long. 1. 56. E. Lat. 41. 36. N.

MANSAROAR, a lake of Thibet, from which the southernmost head of the Ganges is supposed to issue. It is 115 miles in circumference, and lies about 79° E. long. and 34° N. lat.

MANSILLA, a town of Spain, in Leon, 15 miles S.W. of the city of Leon. Long. 4. 55. W. Lat. 42. 30. N.

MANSOURA, a town of Egypt, which has a considerable trade in rice and sal-ammoniac. Here are likewise vast chicken ovens. It is seated on the east side of the Nile, 24 miles S.S.W. of Damietta, and 60 N. of Cairo. Long. 31. 36. E. Lat. 31. 10. N.

MANSURA, a town of Turkey in Asia, in Trac Arabia, situate on the Euphrates, where it is joined by a branch of the Tigris, 110 miles W.N.W. of Bassora.

MANTCHEW TARTARS, a branch of the Mogul Tartars, whose ancestors conquered China in the 13th century, but were expelled by the Chinese in 1368. They inhabit the three departments of east Chinese Tartary, called Lea tong, Kirin, and Teiticar. They retain the customs they brought from China.

MAOUNA, one of the Navigators Islands, in the South Pacific Ocean. Here, in 1787, M. de la Pérouse, commander of the French ships the *Bouffole* and *Astrolabe*, met with his first fatal accident; M. de Langle, captain of the *Astrolabe*, with 11 officers and sailors, being massacred by the natives. Long. 169. o. W. Lat. 14. 19. S.

MARAGAL, a town of Persia, in the province of Aderbeizan, 42 miles south of Tauris. Long. 47. 52. E. Lat. 37. 36. N.

MARANS, a town of France, in the department of Lower Charente. The inhabitants carry on a considerable trade in falt, malt, corn, and meal. It is situate in the midst of falt marshes, 12 miles N.N.E. of Rochelle, and 21 west of Niort. Long. 1. 5. W. Lat. 46. 18. N.

MARANT, or **AMARANT**, a town of Persia, in the province of Adirbeizan, containing 2500 houses, each with a garden, situate near a river, and watered by canals. Cochineal is found in the neighbourhood. The inhabitants say that Noah was buried here. It is 50 miles north of Tauris. Long. 47. 46. E. Lat. 39. 7. N.

MARASCH, a populous town of Natolia, encompassed by the mountains of Taurus and Anti-taurus, and the river Euphrates. Long. 38. 25. E. Lat. 38. 15. N.

MARAWINA, a river of Guiana, which separates Surinam from the French colony of Cayenne. It is noted for a curious pebble, known by the name of the Marawina diamond; which, when polished, is often set in rings, &c. It falls into the Atlantic in long. 53. 48. W. Lat. 5. 58. N.

MARBACH, a town of Suabia, in the duchy of Wirtemberg, seated on the Neckar. It was burnt by the French in 1693. It is 12 miles south of Hailbron, and 13 north of Stuttgart. Long. 9. 25. E. Lat. 48. 59. N.

MARCA, a small island in the gulf of Venice, five miles from Ragusa, on which it depends. It had formerly a bishop's see; but the town is now in ruins.

MARCELLIN, St. a town of France, in the department of Isere, seated on the Isere, at the foot of a hill, in a country that produces excellent wine. It is five miles from St. Antoine, and 253 south by east of Paris. Long. 5. 32. E. Lat. 45. 14. N.

MARCELLINO, a small river of Sicily, in Val-di-Noto, which falls into the sea, two miles from Augusta.

MARCHIENNES, a town of the Austrian Netherlands, in the county of Namur, seated on both sides of the Sambre, four miles west of Charleroy, and 22 south-west of Namur. Long. 4. 22. E. Lat. 50. 20. N.

MARCHIENNES, a village of France, in the department of the North, with a late abbey; seated in a morass, on the river Scarpe, between Douay and St. Amand.

MARCHPURG, a town of Germany, in the duchy of Stiria, with a strong castle, seated on the Drave, 18 miles west of Pettaw, and 25 S.S.W. of Gratz. Long. 15. 19. E. Lat. 46. 44. N.

MARCIGLIANO, a town of Naples, in Terra di Lavoro, seven miles east of Naples, between Nola and Acerra. Long. 14. 30. E. Lat. 40. 51. N.

MARCK, a territory of Germany, in the circle of Westphalia, bounded on the north by the bishopric of Munster, on the east by the duchy of Westphalia, and on the south and west by that of Berg. It is pretty fertile, and belongs to the King of Prussia. Ham is the capital.

Vol. X.

MARCKECK, a town of the archduchy of Austria, situate on the Marfch, 14 miles north-west of Presburg, and 24 E.N.E. of Vienna. Long. 16. 58. E. Lat. 48. 17. N.

MARCKOLSHEIM, a town of France, in the department of Lower Rhine, 26 miles south of Strasburg. Long. 7. 27. E. Lat. 48. 10. N.

MARCO, St. a town of Naples, in Calabria Citeriore, with a bishop's see, seated on the Senito, 22 miles north of Cosenza. Long. 16. 20. E. Lat. 39. 41. N.

MARCOU St. two islands in the English channel, near the coast of France, about seven miles south-east of La Hogue. Long. 1. 17. W. Lat. 49. 31. N.

MARDIKE, a village of France, in the department of the North, seated on a canal, to which it gives name, four miles west by south of Dunkirk.

MAREB, a town of Arabia, capital of a district, in the province of Yemen. It is 88 miles east of Sanaa. Long. 27. 30. E. Lat. 15. 44. N.

MAREB, Loch, a fresh-water lake in Ross-shire, 18 miles long, and in some parts, four broad. It contains many small islands, and abounds with salmon, char, and trout.

MARENNES, a town of France, in the department of Lower Charente, remarkable for the green-finned oysters found near the coast, and its salt. It is seated near the Atlantic, 32 miles north-west of Saintes, and 270 south-west of Paris. Long. o. 49. W. Lat. 45. 15. N.

MARETIMO, an island of Italy, on the west coast of Sicily. It is 10 miles in circumference, has a castle, with a few farm-houses, and produces much honey. Long. 12. 35. E. Lat. 38. 5. N.

MARGARETTA, an island near Terra Firma, 40 miles long and 15 broad, discovered by Columbus in 1498. The continual verdure renders it pleasant; but it is not considerable since the Spaniards retired thence to Terra Firma. The present inhabitants are mulattoes, and the original natives. It was taken in 1626 by the Dutch, who demolished the castle. Long. 63. 12. E. Lat. 10. 46. N.

MARGOZZA, a town of Italy, in the Milanese, situate near a small lake, to which it gives name, 40 miles N.W. of Milan.

MARICELLO, a town of Naples, in the province of Bari, six miles N.W. of Gravina.

MARIE-AUX-MINES, a town of France, in the department of the Vosges, divided into two parts by the river Leber. It is famous for its silver mines, and 25 miles N.W. of New Brisch. Long. 7. 24. E. Lat. 48. 16. N.

MARIENBURG, a town of Upper Saxony, in Mifnia, remarkable for its rich silver mines. It is seated among the mountains, on the confines of Bohemia, 28 miles S.S.W. of Dresden. Long. 13. 35. E. Lat. 50. 49. N.

MARIENBURG, an ancient and strong town of Western Prussia, capital of a palatinate of the same name, with a castle. It is seated on a branch of the Vistula, 30 miles S.W. of Elbing, and 30 S.E. of Dantzic. Long. 19. 15. E. Lat. 54. 9. N.

MARIENSTADT, a town of Sweden, in West Gothland, seated on the lake Wenner, 35 miles S.E. of Carlstadt, and 162 S.W. of Stockholm. Long. 14. 25. E. Lat. 58. 28. N.

MARIENWERDER, a town of Western Prussia, with a castle. The cathedral is the largest church in the kingdom of Prussia, being 320 feet long; and by its strong breast-works seems to have formerly served as a fortress. The palace here is spacious, and built in the old Gothic taste. Marienwerder is seated on the Vistula, 20 miles S.S.W. of Marienburg. Long. 19. 5. E. Lat. 53. 49. N.

10 K

MARGINANO, a town of Italy, in the duchy of Milan, remarkable for the defeat of the Swifs, by the French, in 1515. It is feated on the Lambro, 10 miles S.E. of Milan.

MARINO, Sr. a town of Italy, in Campagna di Roma, with a caſtle, 10 miles E. of Rome. Long. 12. 46. E. Lat. 41. 54. N.

MARK, Sr. a ſea-port on the W. ſide of St. Domingo. The houſes are built of free-ftone, which is abundant in the neighbouring country. It was taken by the Engliſh and royaliſts in 1794, and is 45 miles N.W. of Port-au-Prince. Long. 72. 40. W. Lat. 19. 20. N.

MARKDORF, or **MARCHDORF**, a town of Suabia, in the biſhopric of Conſtance, nine miles N.E. of Conſtance, and 11 S.W. of Ravensburg. Long. 9. 14. E. Lat. 47. 43. N.

MARKET-RASEN, a town of England, in the county of Lincoln, with a weekly market on Tueſday: ſixteen miles and a half N.N.E. Lincoln, and 151 N. of London.

MARMORA, a ſea between Europe and Aſia, which communicates with the Archipelago, by the ſtrait of Gallipoli on the S.W. and with the Black Sea, by the ſtrait of Conſtantinople, on the N.E. It is 120 miles in length, and 50 in breadth, and was anciently called the Propontis.

MARMORA, a celebrated caſcade of Italy, in the duchy of Spoletto, three miles from Terni.

MARMORA, a town of Naples, in Calabria Ulteriore, 16 miles W. of St. Severino.

MARNE, a department of France, including part of the late province of Champagne. It takes its name from a river which riles near Langres, and flowing N.W. joins the Seine, a little above Paris. Rheims is the archiepiſcopal ſee, but Chalons is the capital.

MARNE, UPPER, a department of France, including part of the late province of Champagne. Chaumont is the capital.

MARNE, a town of Perſia, in the province of Choraſan, 200 miles N. of Herat.

MARNHULL, a village in Dorſetſhire, on the Stour, five miles S.W. of Shaftbury. The church is an ancient lofty building; the tower of which fell in 1710, in time of divine ſervice, but was handſomely rebuilt.

MARO, a town of Italy, on the coaſt of Genoa, in a valley of the ſame name, eight miles N.W. of Oneglia, and 48 W.S.W. of Genoa. Long. 7. 41. E. Lat. 44. 55. N.

MAROGNA, a town of Rumania, with a Greek arch-biſhop's ſee, feated near the Mediterranean, 70 miles S.W. of Adrianople. Long. 25. 41. E. Lat. 40. 59. N.

MAROTIER, a town of France, in the department of Lower Rhine, with a late Benedictine abbey, 18 miles N.W. of Straßburg. Long. 7. 33. E. Lat. 48. 38. N.

MARPACH, a town of Suabia, in the duchy of Wirtemberg, ſituate on the Neckar, eight miles N.N.E. of Stuttgart, and 30 E.N.E. of Wildbad. Long. 9. 7. E. Lat. 48. 51. N.

MAR-FOREST, a diſtrict in Aberdeeniſhire, conſiſting of vaſt woodland mountains, which occupy the weſtern angle of the country. The river Dee riles among theſe mountains.

MARSICO NUOVO, a town of Naples, in Principato Citeriore, with a biſhop's ſee; feated on the foot of the Appennines, near the river Agri, 73 miles S.E. of Naples. Long. 15. 40. E. Lat. 40. 28. N.

MARSILLY, a town of France, in the department of Marne, 10 miles S. of Suzanne.

MARSTRAND, a rocky iſland of Sweden, in the Cate-gate, lying N.W. of the mouth of the Götha. It is two miles in circumference; and, on account of its ſtrength, is

called the Gibraltar of Sweden. The town, which lies on the E. ſide, contains about 1200 inhabitants; and the harbour is ſecure and commodious, but of difficult entrance. Since the peace of 1783, its trade has declined; and the inhabitants ſubſiſt chiefly by the herring fiſhery, by the number of ſhips which in bad weather take refuge in the harbour, and by a contraband trade. It is 23 miles N.W. of Gotheborg. Long. 11. 30. E. Lat. 57. 59. N.

MARTA, a town in Italy, in the patrimony of St. Peter, and duchy of Castro; feated on a lake of the ſame name, called alſo Belena, 35 miles N. of Rome. Long. 12. 40. E. Lat. 42. 26. N.

MARTAGO, a town of Spain, in Leon, 10 miles S.S.E. of Ciudad Rodrigo.

MARTEL, a town of France, in the department of Lot, feated near the Dordogne, 18 miles E. of Sarlat. Long. 1. 44. E. Lat. 44. 51. N.

MARTHALEN, a conſiderable town of Switzerland, in that part of the county of Kyburg, ſubject to Zurich. It is feated near the Rhine, fix miles S. of Scaffhaufen.

MARTIGAO, a town of Portugal, in the Beira, 22 miles N.E. of Coimbra.

MARTIGNANA, a town of Piedmont, in the marquiſate of Saluzzo, feated near the Po, five miles W. of Saluzzo.

MARTIGNI, a town of Switzerland, and the ſeat of a government, in the Valais. It is 11 miles W. of Sion, and 58 E. of Geneva. Long. 71. E. Lat. 46. 5. N.

MARTORANO, a town of Naples, in Calabria Citeriore, with a biſhop's ſee, eight miles from the ſea, and 15 S. of Cofenza. Long. 16. 20. E. Lat. 39. 6. N.

MARTOREL, a town of Naples, in Catalonia, feated at the confluence of the Noya and Llobregal, 18 miles N.W. of Barcelona. Long. 1. 56. E. Lat. 41. 36. N.

MARTOS, a town of Spain, in Andalucia, with a fortrefs on a rock, eight miles S. of Anduxar.

MARU, a town of Perſia, in Choraſan, celebrated for its ſalt-works; 150 miles E.N.E. of Meſched, and 190 N.N.E. of Herat.

MARVAO, a town of Portugal, in Alentejo, ſeven miles S.E. of Valença de Alcantara. Long. 6. 14. W. Lat. 44. 33. N.

MARVEJOLS, a commercial town of France, in the department of Lozere, feated in a valley, on the river Colange, 10 miles N.W. of Mende, and 300 S. of Paris. Long. 2. 23. E. Lat. 44. 36. N.

MARVILLE, a town of France, in the department of Meufe, feated on the Othein, three miles N. of Jametz.

MARY'S RIVER, Sr. a river of the United States, in Georgia. It is navigable for veſſels of conſiderable burthen for ninety miles; and its banks afford immenſe quantities of fine timber ſuited to the Weſt-India markets. It forms a part of the ſouthern boundary of the United States, and enters Amelia Sound, in lat. 30. 44. N.

MARY'S STRAIT, Sr. a ſtrait in North America, which forms the communication between Lake Superior and Lake Huron. It is about 40 miles long; and at the upper end is a rapid fall, which, when conducted by careful pilots, may be defended without danger.

MARZA SIROCCO, a gulf on the ſouth ſide of the iſle of Malta. The Turks landed here in 1565, when they went to beſiege Valetta; for which reaſon the grand maſter ordered three forts to be built, two at the entrance of the gulf, and one on the point of land that advances into the middle of it.

MARZILLA, a town of Spain, in the province of Navarre, feated near the river Arragon, 30 miles S. of Pampe-luna.

MASBATE, one of the Philippine Iſlands, almoſt in the

centre of the reef. It is 75 miles in circumference, and the natives are tributary to the Spaniards. Long. 122. 25. E. Lat. 11. 36. N.

MASBROUGH, a village in Yorkshire, on the river Don, adjoining the bridge of Rotherham. Here are considerable iron works, where all sorts of hammered and cast-iron goods are made, from the most trifling article to a large cannon, of which great quantities are exported.

MASCATE, a town of Arabia Felix, in the province of Oman. It has a castle on a rock, and is very strong both by nature and art, though the buildings are mean. It was fortified, in 1650, by the Portuguese; but afterwards taken by the Arabs, who put all the garrison to the sword, except 13, who turned Mahometans. The cathedral, built by the Portuguese, is now the king's palace. There are neither trees, shrubs, nor grass, to be seen on the sea-coast near it, and only a few date-trees in a valley at the back of the town, though they have all things in plenty. The weather is so hot from May to September, that no people are to be seen in the streets from ten in the morning till four in the afternoon. The bazars or market places are covered with the leaves of date-trees, laid on beams which reach from the house tops on one side to those on the other. The religion of the inhabitants is Mahometanism, and yet, contrary to the custom of the Turks, they suffer any one to go into their mosques. The products of the country are horses, dates, fine brimstone, coffee, and ruins, a root that dyes red. Mascate is seated at the bottom of a small bay, of the Arabian Sea, 68 miles S.E. of Oman. Long. 57. 26. E. Lat. 24. 0. N.

MAS-DASIL, a town of France, in the department of Arriège, with a late rich Benedictine abbey; seated on the rivulet Rife, eight miles S.W. of Pamiers.

MASHANGUR, a town of Hindoostan Proper, in the province of Cabul, situate on the Seward, 48 miles N. of Attock, and 130 E.S.E. of Cabul. Long. 71. 7. E. Lat. 33. 54. N.

MASKELYNE'S ISLES, a group of small beautiful islands, in the South Pacific Ocean, lying off the S.E. point of Malicollo, one of the New Hebrides.

MASON (William), an eminent poet and distinguished scholar, was born at Hull, where his father possessed the vicarage of St. Trinity. Where he received his school education we have not been able to learn. At the proper time he was admitted into St. John's College, Cambridge; where he took the degree of B.A. and M.A. and in 1747 he obtained a fellowship in Pembroke-hall. It was there that he contracted an intimate friendship with Gray the poet, and with Mr. Hurd, now Bishop of Worcester. When the former of these gentlemen died, Mr. Mason took upon himself the office of editor of his works and guardian of his fame; and upon the promotion of the latter to the see of Lichfield and Coventry, he expressed his satisfaction in some beautiful verses.

In 1754 he entered into holy orders, and was patronised by the then Earl of Holderness, who obtained for him the appointment of chaplain to the king, and presented him with the valuable rectory of Aston in Yorkshire. He was some time afterwards made preacher of York Cathedral, when he published a small volume of church music, which has alternately met with opposition and applause. In our opinion some of his anthems are unrivalled.

It was natural for the precentor of a cathedral church, who was likewise a poet, to turn his attention to sacred music; and Mason had been a poet from his early years. His *Elfrida* and *Caractacus*, two tragedies on the Grecian model, were both published before the year 1757. These two dramas, in the opinion of Dr. Hurd, do honour to modern poetry, and are, according to him, a sufficient proof of the propriety of re-

viving the choros on the British stage. In this sentiment few critics, we believe, will agree with his lordship; but the tragedies have certainly great merit, and transcend perhaps every poem of the same cast in our own or any other modern tongue. In the first, the language is elegant and sweet; in the latter, it is daring and sublime. The author himself always considered the former as the most perfect; and Johnson, whose critical judgment will not be rationally questioned, seems to have been of the same opinion.

Besides his two tragedies, Mr. Mason published many other poems. His English Garden is universally read and admired, being unquestionably the finest poem of the kind that has appeared since the days of Thomson; though some have affected to consider it as treating the subject rather with professional skill than with poetical genius. That there are in it a few prosaic expressions we shall not controvert; for such seem inseparable from didactic poetry: but, taken as a whole, where shall we find its equal? His elegies, particularly that on the death of his wife, and that on the demise of Lady Coventry, have been generally read and extolled, though not more than they deserve, as superior in classical elegance to any thing of the kind in the English tongue, and expressing a manliness and tenderness of the pathetic, rarely found in the most polished elegies of Roman writers. The splendor of genius, and accuracy of judgment, conspicuous in his dramas, are equally displayed in his character as a lyric writer. His quarry was bold and impetuous, and he never swept the ground with an ignominious flight. In his Sappho and Phaon he has happily imitated the style of Dryden and Metastasio; and at his death he was employed on a poem in which he proposed to measure his strength with Dryden.

It is said, we know not how truly, that this ingenious man was the inventor of the fashionable instrument the Piano-forte.

Poetry and music, and the duties of his office, might be supposed to have employed all his time; but, unfortunately, he caught the alarm which in 1769 was spread over the nation by the expulsion of Mr. Wilkes from the House of Commons, and immediately enrolled himself among the supporters of the *Bill of Rights*.

Being leagued with the opposition, he joined in some violent clamours for a parliamentary reform. In the year 1779, when the city of London, and some other commercial towns, agreed to present their petition to parliament for a more economical expenditure of the public money, and a more equal representation of the people, Mr. Mason came forward, and took an active part in promoting these designs, as one who was convinced of their importance and necessity. Yet he shewed, by his subsequent conduct, that however earnestly he might wish for what he doubtless considered as an expedient reform in the commons-house of Parliament, he was firmly attached to the British constitution. He was indeed a whig; but he was a whig of the old school. In the beginning of 1794, when the reformers had betrayed the principles of French democrats, he deserted them, and ranged himself under the banners of the servants of the crown; and for this conduct, which was certainly consistent, he has been plentifully traduced by our Jacobin journalists as an alarmist, who not only deserted his old friends, but ascribed to them a certain degree of guilt and political depravity.

The death of this great and good-man, which happened in April 1797, was occasioned neither by age nor by inveterate disease. As he was stepping into his chariot, his foot slipped, and his shin grazed against the step. This accident had taken place several days before he paid the proper attention to it; and on April the 3d a mortification ensued, which in the space of 48 hours put a period to his life.

That he was a scholar and a poet of high eminence is universally acknowledged; and we are assured, that his posthumous works, when published, will not detract from his living fame. In private life, though he affected perhaps too much the fastidious manners of Mr. Gray, whose genius he estimated with a degree of enthusiasm amounting almost to idolatry, his character was distinguished by philanthropy and the most fervid friendships; and he may be considered as a man who merits to be ranked with the ablest supporters of British liberty and British morals.

MASOVIA, a province of Poland, containing the two palatinates of Czerk, or Malovia Proper, and Polotk. By the last dismemberment of the kingdom, it is annexed to the territories of Prussia. Warfaw is the chief city.

MASSA, a town of Italy, in the Siennese, with a bishop's see; seated on a mountain near the sea, 25 miles S.W. of Sienna. Long. 10. 48. E. Lat. 42. 40. N.

MASSACHUSETTS BAY, a bay of North America, which spreads eastward of Bolton, and is comprehended between Cape Ann on the north, and Cape Cod on the south. It is so named, as well as the whole state of Massachusetts, from a tribe of Indians of the same name, that formerly lived round this bay.

MASSAFRA, a strong town of Naples, in Terra d'Otranto, with a bishop's see; seated at the foot of the Appennines, 16 miles N.N.W. of Tarento. Long. 17. 20. E. Lat. 40. 50. N.

MASSEERANO, a town of Piedmont, capital of a small principality of the same name, held by its prince as a fief of the church. It is seated on a mountain, 40 miles N.E. of Turin. Long. 8. 14. E. Lat. 45. 38. N.

MASSEUBE, a town of France, in the department of Gers, 14 miles south of Auch. Long. 0. 28. E. Lat. 43. 25. N.

MASTICO, or CAPO MASTICO, a cape on the south side Scio, one of the islands of the Archipelago.

MASUAH, a town of Abyssinia, situate on an island on the coast of the Red Sea. The houses, in general, are built of poles and bent grass, as in the towns in Arabia; and a few are of stone, some of them two stories high. Long. 39. 36. E. Lat. 15. 35. N.

MATAGORDA, a fortress of Spain, at the entrance of the harbour of Cadiz.

MATALA, a town and cape of the S. coast of the island of Candia, 30 miles S. of Candia. Long. 24. 58. E. Lat. 34. 46. N.

MATALONA, a town of Naples, in Terri di Lavoro, eight miles N.W. of Capua, and 19 W. by S. of Benevento. Long. 14. 14. E. Lat. 41. 12. N.

MATCOWITZ, a strong town of Upper Hungary, in the county of Scepus, seated on a mountain, 185 miles N.E. of Presburg.

MATELICA, an ancient town of Italy, in the marquisate of Ancona, 15 miles S. of Jesi.

MATTHEW, St. an island of Africa, 420 miles S. by W. of Cape Palmas on the coast of Guinea. It was planted by the Portuguese, but is now deserted. Long. 6. 10. W. Lat. 1. 24. S.

MATTHEW, St. a small island in the Indian Ocean. Long. 123. 51. E. Lat. 52. 2. S.

MATZSEE, a town of Bavaria, in the archbishopric of Salzburg, 12 miles N. of Salzburg. Long. 13. 3. E. Lat. 47. 50. N.

MATUMAY, a sea-port in the island of Jesso, capital of a province of the same name, tributary to Japan. Long. 138. 55. E. Lat. 42. 0. N.

MATURA, a town of Hindoostan Proper, in the province

of Agra, 22 miles N.E. of Agra, and 70 S.S.E. of Delhi. Long. 78. 41. E. Lat. 27. 11. N.

MAUBAL, a town of Hindoostan Proper, in the country of Candahar, 70 miles N.N.E. of Candahar.

MAULDAH, a city of Hindoostan Proper, in Bengal, situate on a river that communicates with the Ganges. It arose out of the ruins of Gour, which are in its neighbourhood; and is a place of trade, particularly in silk, 190 miles N. of Calcutta. Long. 88. 28. E. Lat. 25. 10. N.

MAULEON, a town of France, in the department of the Lower Pyrenées, situate on the frontiers of Spain, 20 miles S.W. of Pau, and 40 S.E. of Dax. Long. 0. 31. W. Lat. 43. 10. N.

MAULEON, a town of France, in the department of Vendée, with a late famous Augustine abbey. It is seated near the river Oint, 52 miles N.E. of Rochelle, and 52 N.W. of Poitiers. Long. 0. 36. W. Lat. 46. 54. N.

MAURA, St. an island of the Mediterranean, near the coast of Albania, 15 miles N.E. of the island of Cephalonin. Long. 20. 46. E. Lat. 39. 2. N.

MAURE, St. a town of France, in the department of Indre and Loire, 17 miles S. of Tours, and 148 S.W. of Paris. Long. 0. 42. E. Lat. 47. 9. N.

MAURIAC, a trading town of France, in the department of Cantal, famous for excellent horses. It is seated near the Dordogne, 27 miles S.E. of Talles. Long. 2. 16. E. Lat. 45. 15. N.

MAURICE, St. a town of Switzerland, in the Valais, situate on the Rhone, between two high mountains, 16 miles N.W. of Martigny. It guards the entrance into the Lower Valais.

MAURIENNE, a valley of Savoy, 50 miles in length, extending to Mount Cenis, which separates it from Piedmont. St. John is the capital town.

MAXEN, a town of the electorate of Saxony, celebrated for a victory obtained by the Austrians, commanded by Count Daun, over the Prussians, in 1759, when 20,000 Prussians surrendered prisoners of war. It is eight miles S.W. of Pirna, and 10 S. of Dresden.

MAXIMIN, St. a town of France, in the department of Var. Before the revolution, here was a convent for Dominicans, who pretended to preserve in it the body of Mary Magdalen, which brought them great riches by the resort of superstitious visitors. It is seated on the Argens, 20 miles N. of Toulon. Long. 5. 57. E. Lat. 43. 30. M.

MAY, or MAYO, one of the Cape de Verd Islands, 17 miles in circumference. The N.E. end is extremely low, and the land rises gradually till it arrives at a volcanic mountain, to the S.W. of which is irregular ground, soon followed by a high disorderly peak, much more lofty than the volcanic cone. The soil in general is very barren, and water scarce; but there are plenty of beeves, goats, and asses; as also some corn, yams, potatoes, plantains, figs, and water-melons. The chief commodity is salt, with which many English ships are freighted in the summer time. Pinofa is the principal town, and has two churches. The inhabitants are negroes; who speak the Portuguese language, and many of them go naked. Long. 23. 5. W. Lat. 15. 10. N.

MAY, CAPE, a cape of North America, on the North side of the mouth of the Delaware. Long. 75. 4. W. Lat. 39. 0. N.

MAYAMBA, a town of the kingdom of Loango, capital of a district of the same name. Long. 13. 6. E. Lat. 3. 20. S.

MAYENCE. See MENTZ.

MAYENNE. See MAINE.

MAYORGA, a town of Portugal, in Estramadura, near

the Atlantic, 15 miles S.W. of Leria, and 51 N. of Lisbon.
Long. 9 7. W. Lat. 39. 33. N.

MAZANDERAN, a province of Persia, bounded on the north by the Caspian Sea, on the west by Gilan, on the south by Irac Agemi, and on the east by Astrabad. Ferabad is the capital.

MEACU, or **KIO**, a city of the island of Nippon, in Japan, of which it was formerly the capital. It is the great magazine of all the manufactures in Japan, and the principal place for trade. The inhabitants are said to be 600,000.
Long. 134. 25. E. Lat. 35. 30. N.

MEADIA, a town of Hungary, in the bannat of Temeswar, seated on the north side of the Danube, 15 miles east of Belgrade. It was dismantled by the Turks in 1738. Long. 12. 0. E. Lat. 45. 0. N.

MEAO, a small island, one of the Moluccas, in the Indian Ocean, with a good harbour. Long. 127. 5. E. Lat. 1. 12. N.

MEASURES (*Encycl.*). The following is an account of the present French weights and measures:

Measures of length.	English inches.
Millimetre	0.3937
Centimetre	3.9370
Decimetre	3.93702
Metre	39.37023
Decametre	393.70226
Hecatometre	3937.02260
Chiliometre	39370.22601
Myriometre	393702.26014

	M.	F.	I.	Ft.	In.
A decametre is	0	0	10	2	9.7
A hecatometre	0	0	109	1	1
A chiliometre	0	4	213	1	10.2
A myriometre	6	1	150	0	6

8 chiliometres are nearly 5 miles.

Measures of capacity.	Cubic inch. E.
Millilitre	0.06102
Centilitre	0.61024
Decilitre	6.10244
Litre	61.02443
Decalitre	610.24429
Hecalitre	6102.44288
Chilolitre	61024.42878
Myriolitre	610244.28778

A litre is nearly 2½ wine-pints.

12 decilitres are nearly 3 wine-pints.

A chilolitre is 1 tun, 12.75 wine-gallons.

Weights.	E. grains.
Milligramme	0.0154
Centigramme	0.1544
Decigramme	1.5444
Gramme	15.4440
Decagramme	154.4402
Hecagramme	1544.4023
Chilogramme	15444.0234
Myriogramme	154440.2344

A decagramme is 6 dwts. 10.44 gr. tr.; dr. iii.
gr. 4.44 apoth.; or 5.65 dr. avoird.

A hecatogramme is 3 oz. 8.5 dr. av.

A chilogramme is 2 lbs. 3 oz. 5 dr. av.

A myriogramme is 22 lbs. 1.15 oz. av.

100 myriogrammes are 1 ton wanting 32.8 lbs.

Agvrian measures.

Are, 1 square decametre, - - - 3.95 perches.

Hectare, - - 2 acres, 1 rood, 38.1 perches.

Vol. X.

For Fire-wood.

Decistre, $\frac{1}{2}$ fere, - - - 3.5315 cub. f. E.

Stere, 1 cubic metre, - - - 35.3150 cub. f.

MECAN, a large river, which rises in Thibet, and flowing S.E. through Laos and Cambodia, falls by two mountains into the China sea, forming an island below the city of Cambodia, which here gives name to the eastern branch.

MECHADEB, a town of Arabia Felix, in the province of Yemen, 72 miles S. of Sanaa. Long. 44. 15. E. Lat. 14. 7. N.

MECHLIN, a city of the Austrian Netherlands, capital of a district of the same name, with an archbishop's see. It consists of several small islands made by artificial canals, over which are a great many bridges; and its cathedral is a superb structure, with a very high steeple. Here is a great foundry for ordnance of all kinds; and it is famous for fine lace, and a fort of beer, which is sent into the neighbouring provinces. The territory of this town is a lordship, which comprehends two small districts containing nine towns of little consequence, and some villages. It submitted to the Duke of Marlborough in 1706, and was taken by the French in 1746, but restored in 1748. In 1792 the French again took it, evacuated it the next year, and re-entered it in 1794. It is seated on the Dender, 10 miles N.E. of Brussels, and 15 S.E. of Antwerp. Long. 4. 34. E. Lat. 51. 2. N.

MECHOACHAN, or **VALLADOLID**, a considerable town of New Spain, capital of the province of Mechoachan, with a bishop's see. It is seated near a great lake, 110 miles W. of Mexico. Long. 102. 28. W. Lat. 20. 5. N.

MECKENHEIM, a town of Germany, in the archbishopric of Cologne, situate on the Erft, seven miles S.S.W. of Bonn, and 18. S. of Cologne. Long. 6. 43. E. Lat. 51. 40. N.

MECKLEY, a province of Asia, bounded on the N. by Affam, on the E. by China, on the W. by Bengal, and on the S. by Rodhaan and Burmah, to which last it is subject.

MECRAN, a province of Persia, bounded on the N. by Segeftan and Candahar, on the E. by Hindooftan, on the S. by the Indian Ocean, and on the W. by Kerman. The southern part is dry, and little more than a desert; the northern is less so; but animals are rare, and the soil far from fertile.

MECRINHOS, a town of Portugal, in Tra los Montes, 15 miles N.N.E. of Torre de Moncove, and 24 S.E. of Miranda. Long. 6. 3. W. Lat. 41. 8. N.

MEDEBACH, a town of Westphalia, 32 miles W. of Cassel. Long. 10. 1. E. Lat. 51. 4. N.

MEDELIN, a town of Spain, in Estramadura, remarkable for being the birth-place of Fernando Cortes. It is seated in a fertile country, on the river Guadiana, 22 miles E. of Merida. Long. 5. 38. W. Lat. 38. 41. N.

MEDELPADIA, a maritime province of Sweden, in Norland, on the gulf of Bothnia. It is full of mountains and forests. Sundwall is the capital.

MEDEMBLICK, a town of the United Provinces, in North Holland, seated on the Zuider-Zee, with a good harbour. It is nine miles N. of Hoor, and 22 N.E. of Amsterdam. Long. 5. 0. E. Lat. 52. 47. N.

MEDICINE (*Encycl.*). There is no art or science in which a greater degree of penetration and of accuracy appears to be required than in medicine; for, involved in difficulty and uncertainty as it must, in general, be, its possessors ought, in order to combat them, to possess no small share of capacity and discernment. This, perhaps, the reason that where the professions have been separate, physic has been generally esteemed more respectable than surgery; although, in point of utility, it may justly be doubted whether a preference may

not be due to surgery. The almost inextricable obscurity in which the nature of the animal functions, and the operations of medicines, are at present involved, are the more to be lamented, as the ignorant and impatient are, in general, more disposed to commit themselves to the care of pretenders, who do not deserve the name even of empirics, than to be contented with the moderate degree of relief that can be promised them by the honourable practitioner; who, from the supposed depth and extent of his acquaintance with nature and its laws in general, has been denominated a physician;—an appellation once as usual in France and Germany as it is still in England.

Whether any great advances will ever be made in rendering the animal processes as intelligible as those of inanimate nature, is very much to be doubted; and indeed, to judge from general inferences, can scarcely ever be hoped: although the rapid advances which have been made within our recollection, and which are daily making, in many kindred sciences, render it hazardous to pronounce an absolute negative. Hitherto very little progress can be said to have been made in the immediate subjects of medical speculation; and the grand advantage of modern practice appears to consist in a partial return to nature and simplicity. It is no longer the fashion to irritate every wound by hot and stimulating balsams, nor to deprive it of the protection and assistance of the blood which coagulates round it: a fever is not oppressed with a miliary eruption, nor the small-pox made confluent, by a forced accumulation of heat; and the natural inclination for cold liquids has been followed with the most salutary effects: a patient in a dropy is not tormented with hunger and thirst to produce the temporary relief of a symptom; and the support of the whole system is not prodigally wasted by unnecessary venesection. But all this has required time for its attainment; however natural and easy it might have seemed to compare at least those cases in which nature had been uninterrupted and successful, with others where art had been mischievously active.

It may be enquired, then, how far the writings of the Greek physicians, so much extolled by medical writers of no ancient date, really deserve their commendations: and if a man who has taken the pains to make himself master of their contents would be candid enough to divest himself of partiality for his pursuits, he would be obliged to confess, that he would in no case think himself justified in following in his practice an aphorism of Hippocrates, unsupported by modern experience, if it came in competition with a single observation of a country apothecary, published in any medical journal of the present century. This being granted, it is difficult to conceive on what ground the most prejudiced can maintain the propriety of a man's spending a considerable portion of his time in endeavouring to deduce practical information from sources so precarious. That the form of examining candidates for medical honours in the ancient medical writers should be retained, is exceedingly necessary for the support of the good education and literary respectability of the profession. And it must also be allowed, that pathological studies may be assisted, and, perhaps, hints for experiments may often be derived from their works; but for every single fact of practical importance known to the Greeks and Romans, it is probable that ten were discovered in the last century, and twenty in the present: and yet, for the mortification of human vanity, it must be confessed that the average period of human life does not appear to be perceptibly longer now than at the time of the oldest calculations. In physiology, the discovery of the nature of the circulation of the blood, of the change which this fluid undergoes in the lungs, of the process of its coagulation, of the cause of the pleuritic coat, of the existence and

functions of the absorbents, of the nature of the placenta; the explosion of the notion of the origin of animal heat from friction, and of the exaggerated doctrines of the human pathology; all these improvements are of such vast magnitude, that it is almost astonishing that they have not produced more conspicuous effects on the practical treatment of all possible diseases. Of the most powerful articles of our materia medica, opium and cantharides alone were known to the ancients; antimony, bark, ipecacuan, and mercurials, are entirely of modern invention; and, perhaps, the application of electricity may, in time, deserve to be reckoned among the most efficacious, when its highly interesting chemical properties and its effect in the animal economy shall have been more fully investigated. On the other hand, we have to combat with many diseases unknown to the ancients; it is singular enough, that almost all of these are curable with tolerable certainty, and yet sometimes not without the greatest risk. The small-pox, although in great measure deprived of its terrors by the practice of inoculation, is still so formidable a disorder, as to create a doubt whether more individuals do not annually die of it than before the introduction of that practice; and a more complete protection from its effects, which there is every reason to hope from the vaccine contagion, must still be reckoned an invaluable addition to the expedients for the preservation of the public health, and such as will fairly entitle the man who first introduced inoculation for the cow-pox, both to honorary and to substantial tokens of public gratitude.

Supposing a preference to be decidedly granted to modern, beyond ancient medicine, it will be of consequence to enquire into what countries of Europe the most rational practice in general prevails. And here, without being accused of partiality, we may be allowed by the concurring testimony of the majority, to give the preference to Great Britain, and, perhaps, in particular to that of the metropolis of England. One of the few who have disputed the superiority of the English practice, Dr. Fischer of Brunswick, begins with accusing his countrymen in general of a servile adoption of foreign innovations, and in particular of the medical anglo-mania. Undoubtedly the former part of the accusation is well founded, and it is with reason that he asserts that they spend their whole time in amassing materials, without taking sufficient pains to methodise, to digest, and to appropriate them; so that where this is the case we cannot expect to find a high degree of practical perfection: and the truth of the second part of the charge is so well known, as to constitute a well-grounded compliment to this country; for if the Germans, who are so diligent compilers, are usually in the habit of giving a decided preference to the English practice of physic, this is by no means the slightest recommendation that can be produced in its favour. The specific objections that he makes to the practice in London are principally four; that it is too simple, too inappropriate, too bold, and too impatient; nor will our physicians have any objection to confessing that these characters may, in comparison with continental medicine, be in some degree allowed to be just; and especially in that limited kind of practice which a stranger can see in a few months in an hospital. The German practice would here, on the contrary, he called old womanish and fanciful; their inciding medicines, their decoction of grafts-root, their horrors of the rheumatic matter contained in a boiled potatoe and a pork chop, and of the inflammatory and antiseptic powers of a cup of coffee, would here excite a smile. On the whole it may be fair to conclude, that the German physicians compile well, the Scotch reason well, and the English describe well, and that the liberal and diligent student may derive from each of the schools information and instruction enough to repay him for his application.

MEDINA-SIDONIA, an ancient town of Spain, in Andalusia, with a castle, 36 miles N.N.W. of Gibraltar, and 20 N.E. of Cadiz. Long. 5. 36. E. Lat. 36. 40. N.

MEDNIKI, a town of Poland, in the province of Samogitia, with a bishop's see; seated on the Warwitz, 40 miles E. of Memel. Long. 22. 49. E. Lat. 55. 42. N.

MEDUA, a town of the kingdom of Algiers, seated in a country abounding in corn, fruits, and flocks of sheep, 175 miles S.W. of Algiers. Long. o. 13. E. Lat. 34. 45. N.

MEDUSA (*Encycl.*). The animal now known among naturalists by the name of *medusa*, was called by the ancients the *sea nettle*, on account of its producing a sensation on the skin similar to that which is excited by the plant, called a *nettle*. This animal was peculiarly called the *sea nettle*, to distinguish it from another of the same species, which adheres to rocks. Linnæus, desirous of avoiding these compound and equivocal denominations, assigned to the animal the name of *medusa*: there is no obvious reason for this preference; except that, in many cases, it is fortunate to find a name which distinguishes the given object, without exciting any other idea. See Pl. 1, Vol. VI, and Pl. 38 in this SUPPLEMENT.

The medusa lives in the waves of the sea, and swims with considerable swiftness. The body forms a segment of a sphere, similar to the head of a mushroom. Though no muscular fibre can be perceived, it possesses the faculty of contracting and dilating itself at will, either in parts, or in the whole. By increasing or diminishing the concavity of its upper surface, it strikes the water with sufficient force to rise to the surface; its own weight enables it, without exertion, to sink to the bottom: and when desirous of making an horizontal progress, the animal strikes the water with a part of its edge, and thus proceeds with a rotatory motion.

Under the centre of the plane of the segment of a sphere according to the species of the animal, representing, in a manner, the stalk of the mushroom, supporting the body to represent the head of the plant. In some kind of medusas this excrecence is terminated by a large opening, which is the mouth of the animal; but that which is here described has no mouth, or, to speak more correctly, hundreds of mouths.

Although this species of the medusa is most common on the coast of France, it has not been accurately described and delineated till the present time, except by Réaumur. At the ebb of the tide they are left in large quantities, motionless, on the sand. They are of all sizes, from about four fifths of an inch to eight or nine inches diameter; transparent, with a bluish reflection, producing an agreeable effect. Their substance is about the consistency of the jelly of veal; and when they are suspended for a short time, they become reduced almost to nothing, as the water, which swells out their parenchyma, drops out, and nothing remains but their thin and fragile membranes.

The delicacy of their conformation has hitherto prevented all attempts to ascertain their interior structure by dissection. It was also peculiarly difficult to inject them with success. No heated substance, such as melted wax, could be used, because it would parch them up in an instant. Mercury, by its weight, tore all their vessels; and liquids, as ink and coloured oil, escaped at the minutest aperture. At length Cuvier had the good fortune to succeed in displaying the vascular system of the medusa, and even to preserve the injected animal for a long time in spirits of wine, by the use of a very fluid matter, which could be consolidated at pleasure, without changing its temperature. He injected the animal with milk, and, the moment the vessels were sufficiently distended,

coagulated the milk, by pouring on a quantity of very strong vinegar.

From this experiment, the following information was obtained:

Under the excrecence above mentioned are eight leaves of flesh, of considerable size, triangular, and indented at the edges. At each of the indentations of these leaves is a small hole, which is only visible when the animal is dilated by means of the injected liquor. Through these small holes the medusa imbibes the portion of fluid by which it is nourished. These small orifices give birth to an equal number of minute vessels, which, after uniting to the number of two or three, terminate in one greater vessel, which occupies the centre of each leaf of flesh.

These eight vessels also unite themselves, two by two, in four large trunks, which descend into a cavity, the only one in the body, and which may be denominated either the heart or the stomach.

This cavity is situated in the base of the cylindrical excrecence, before compared to the stalk of the mushroom: this base, increasing in size, extends itself between four pillars of flesh, which terminate in the body, or part already compared to the head of the mushroom. It is in the midst of these four pillars that the cavity of the stomach is situated. The interstices of the pillars would be so many orifices to this cavity; but they are closed by a thin folded membrane, the use of which, undoubtedly, is to extend itself in proportion as the stomach is filled: however this may be, sixteen vessels branch out from the stomach, which direct themselves immediately to the circumference of the body, dividing its area into sixteen equal partitions.

Four of these vessels correspond with the four pillars of flesh; and there is, on the internal surface of each pillar, a groove which establishes a direct communication between the corresponding vessels, and one of the four grand vessels of the stalk. The remaining twelve are distributed in divisions of three in the interstices of those four, and terminate in those parts of the stomach which are closed by the folded membranes.

The sixteen vessels in the body all communicate with each other by a circular vessel, exactly concentric to the periphery of the animal.

The space, or fillet, situate between this circular vessel and the edge, is filled with an innumerable multitude of small vessels, which form a common net-work, exactly resembling the most beautiful lace.

On the side opposite to the circular vessel, that is to say, on the concave of the body, are sixteen vessels, forming a semicircle, one for each division; they communicate with the greater vessel, not only at their two extremities, but also by means of two or three short vessels, which go directly from the one to the other.

These sixteen semicircles appear to supply with nourishment those parts of the body which are situate between the circular vessel and the stalk; but this fact could not be demonstratively ascertained, as the injection could not be sufficiently projected.

The following facts could, however, be safely inferred:—
1. That the nutritive juices reach the inside by a multitude of small apertures, and not through a single mouth: this is an instance of approximation in this animal to the vegetable species never before intimated by the naturalists.

2. That the nutritive juices do not pass into the vessels until they have been deposited in the great interior cavity: this circumstance restores the medusa to the order of animals.

3. That the vessels which conduct these juices to all parts of the body branch out immediately from this great cavity.

This would also be a singularity, if these vessels are to be considered as real arteries; but if they are supposed to be only elongations of the intestinal cavity, a kind of *cæca*, then the *medusa* may, in this respect, be classed between the star-fish and the polypus; for the star-fish also produces *cæca* disposed in rays, but floating in the cavity of the body, and not connected with it in a common mass; and in the polypus the stomach produces no *cæcum*, but adheres to and incorporates with the rest of the animal.

The *medusa*, uniting in itself both these singularities, is also connected with both the species to which it appertains. If these inferences are correct, Cuvier, in his Elements of Zoology, and Lamarck, in the tables annexed to his Lectures on Helminthology, have rightly placed it between the star-fish and the polypus. In that case, the remarkable characteristic of this animal will consist only in the multitude of its little mouths.

If, on the other hand, the interior cavity be considered as a heart, and the vessels branching from it as arteries, the small vessels leading to it must be considered as veins, or as lymphatic vessels, and we may say that the sea serves it for a stomach, as the earth does to plants.

But the former is the more reasonable supposition, considering that, in the animal scale, the heart disappears much more early than the stomach.

This *medusa* has no nerves, nor any particular organs of sensation; nor could Cuvier discover any organs of generation, or by what particular means the species was multiplied. The thin folded membranes surrounding the stomach, in the interstices between the pillars of flesh, may be considered as adapted for respiration, since the ambient element can pervade their substance to act on the nutritive fluid.

Such is the result of observations hitherto made on this extraordinary animal, whose singularity consists in its having apparently no mouth, but nourishing itself like a plant, by means of ramified suckers, and in the circumstance of its stomach fulfilling the office of the heart.

MEDWI, a town of Sweden, in E. Gothland, called the Swedish Spa, on account of its waters, which are vitriolic and sulphureous. The lodging-houses form one street of uniform wooden buildings painted red. The walks and rides are delightful, particularly on the banks of the Wetter. It is three miles from Wadstena.

MEDZIBOZ, a town of Poland, in the palatinate of Volhonia, seated on the river Bog, 20 miles S. of Constantinow.

MEGEN, a town of Dutch Brabant, seated on the Maese, 15 miles S.W. of Nimeguen. Long. 5. 26. E. Lat. 51. 49. N.

MEGESVAR, a town of Transylvania, capital of a county of the same name, remarkable for its good wines. It is seated on the river Koter. Long. 25. 20. E. Lat. 46. 50. N.

MEGIERS, a town of Transylvania, 28 miles N. of Hermanstadt. Long. 24. 41. E. Lat. 46. 53. N.

MEHRAN, the principal of the channels into which the river Indus divides itself, near Tatta, in Hindooistan Proper.

MEHUN-SUR-YEVRE, an ancient town of France, in the department of Cher. Here are ruins of a castle built by Charles VII. as a place of retirement; and here he starved himself, in the dread of being poisoned by his son, afterward Lewis XI. It is seated in a fertile plain, on the river Yevre, 10 miles N.W. of Bourges, and 105 S. of Paris. Long. 2. 17. E. Lat. 47. 10. N.

MEHUN-SUR-LOIRE, a town of France, in the department of Loiret, seated on the Loire, 10 miles S.W. of Orleans. Long. 1. 48. E. Lat. 47. 50. N.

MEILLERIE, a village of Savoy, in Chablais. It is seated on the S. side of the lake of Geneva, in the recess of a small bay; and at the foot of impending mountains, which in some parts are gently sloping, and clothed to the edge of the water with dark forests, and in others are naked and perpendicular. These dark and gloomy rocks lie S.W. of Clarens, which place and Meillerie are both interesting scenes in the Eloisa of Rousseau.

MEINAU, an island in the bay of the Bodmer Sea, or middle lake of Constance, one mile in circumference. It belongs to the knights of the Teutonic order, and produces excellent wine, which forms the chief revenue of the commander. It is five miles N. of Constance.

MEINUNGEN, a town of Franconia, situate amid mountains, on the river Werra, 14 miles N.W. of Hilburgshausen, and 21 N. of Schweinfurt. Long. 10. 26. E. Lat. 50. 36. N.

MEISSAU, a town of the archduchy of Austria, 14 miles S.S.W. of Znaim, and 34 N.W. of Vienna. Long. 16. 7. E. Lat. 48. 30. N.

MEISSEN, or MISNIA, a margravate of Germany, in the electorate of Saxony, 100 miles long and 80 broad; bounded on the N. by the duchy of Saxony, on the E. by Lusatia, on the S. by Bohemia, and on the W. by Thuringia. It is a very fine country, producing corn, wine, metals, and all the conveniences of life. The inhabitants speak the purest language in Germany. The capital is Dresden.

MEISSENHEIM, a town of Germany, in the duchy of Deux Ponts, situate on the Glan, 28 miles N. of Deux Ponts, and 30 W.S.W. of Mentz. Long. 7. 22. E. Lat. 49. 42. N.

MELAZZO, an ancient town of Natolia, with a bishop's see, and some curious monuments of antiquity. It is seated on a bay of the Archipelago, 60 miles S. of Smyrna. Long. 27. 25. E. Lat. 37. 28. N.

MELCK, a small fortified town of Lower Austria, with a celebrated Benedictine abbey, seated on a hill, 47 miles W. of Vienna. Long. 15. 26. E. Lat. 48. 11. N.

MELDELA, a town of Italy, in Romagna, belonging to its own prince, eight miles S.W. of Ravenna. Long. 11. 48. E. Lat. 44. 22. N.

MELDERT, a town of Austrian Brabant, 10 miles S.E. of Louvain. Long. 4. 41. E. Lat. 50. 45. N.

MELDORP, a town of Lower Saxony, in the duchy of Holstein, seated near the Elbe, 15 miles S. of Tonnigen, and 45. W. of Hamburg. Long. 9. 6. E. Lat. 54. 10. N.

MELFI, a town of Naples, in Basilicata, with a bishop's see, and an ancient castle, seated on a rock, 16 miles N.E. of Conza, and 72 of Naples. Long. 15. 52. E. Lat. 41. 2. N.

MELIDA, an island of Dalmatia, in the gulf of Venice, and in the republic of Ragusa. It is 25 miles in length, and abounds in oranges, citrons, wine, and fish. It has a Benedictine abbey, six villages, and several harbours.

MELILLITHUS, in toxicology, the honey-stone. The celebrated chemist, Mr. Klaproth, of Berlin, has enriched chemistry with a discovery of a new acid, which he obtained by the analysis of this stone. It is not a simple mineral acid; but rather of the nature of a vegetable acid; and according to the properties it shews, it must be considered as a peculiar modification of those elements which constitute vegetable acids, and consequently as a specific vegetable acid, and an acid of its own. The properties it possesses are the following:

1. It crystallises in small fibrous and glomerated masses, and sometimes in small and short columns. It does not appear to be able to crystallise at first, but gets the power

Medusa

Patent Horse-Shoe Nail Machine.

Ox-Harness.
Fig. 1.

Fig. 2.

Fumigator for the Teeth.

of crystallizing by degrees, by imbibing more oxygen from the air.

2. Its taste is sweetish-four at first, but becomes afterwards a little bitter.

3. Poured upon a heated potsherd it quickly evaporates, spreading a dark grey smoke, which, however, does but little affect the smell; a small quantity of yellowish light ashes is left, which, moistened with water, are quite tasteless, and cause no change at all in blue colours.

4. Neutralized with kali, it forms a crystalline mass of a fibrous, radiant texture.

5. Saturated with natron, or soda, it produces cubic crystallizations, partly diagonal single prisms, partly concrete in a flattened manner.

6. The neutral salt which it produces with ammonia, exhibits small hexagonal prisms, that lose their transparency when exposed to the air, and get a silver-white appearance.

7. Dissolved in water, and dropped into lime-water, into a solution of burned barytes in water, it causes a white precipitation, which disappears again by dropping to it some nitric acid.

8. A similar precipitation takes place when it is dropped into a solution of acetated barytes (acetate de baryte), that also dissolves again in nitric acid.

9. No precipitation followed with muriated barytes; but, soon after, some small needle-like crystals became visible in the mixture.

10. A solution of silver in nitric acid remained clear in mixing it with the acid of the honey-stone.

11. A solution of nitrate of mercury mixed with it, let fall a frequent precipitation of a white colour, which was dissolved again by putting more nitric acid to the solution.

12. Iron dissolved in nitric acid, formed a yellow precipitation with it, and was made soluble by the addition of muriatic acid.

13. A solution of the acetate of lead is much precipitated by it, but clearly dissolved again by nitric acid.

14. With a solution of the acetate of copper, a verdigrise precipitation followed.

15. A solution of nitrate of copper suffered no change by it.

These experiments shew, that this acid enters into a combination with several metallic calces, and that its affinity to them is greater than that of the acetic acid, though inferior to mineral acids. Similar effects are produced by its neutral salts, and the precipitation caused by them is in a great degree soluble.

As this acid is constituted by the carbon, oxygen, and hydrogen, and easily destroyed by fire; and as, at the same time, it agrees with none of the known acids in its properties and relations; it deserves to be placed among the vegetable acids, as an acid of its own, to which the name of *Mellitic Acid* may be given.

The honey-stone, or Mellithus, from which it is obtained, is a fossil found in Saxony amongst the strata of bovey-coal (braunkohle), and was first described by Mr. Werner. It is of a honey-yellow colour, sometimes darker, sometimes lighter, and is always found in a crystallized octædrous form, but seldom in a perfect state. Its surface is generally smooth and shining, but sometimes rough and eaten. It rarely is quite clear, but generally half transparent only, and it is soft, brittle, and easily reduced to a yellow grey powder. Its specific weight is, according to Klaproth, 1550. Mr. Klaproth was induced to subject this mineral to a new analysis, in consequence of the different opinions of chemists and mineralogists about its nature and constituent particles. Some of

them took it for a kind of amber, as Mr. Born; others, for a sort of gypsum impregnated with petroleum. The chief particles are now, according to Mr. Klaproth, a peculiar acid combined with aluminous earth; and the proportion in 100 parts of it is, 16 parts of aluminous earth and 46 of acid, besides the water of crystallization.

Prof. Lampadius, of Freyberg, in Saxony, found in 100

85½ carbon
3¼ petroleum
1 siliceous earth
5 water of crystallization

96

Mr. Abick relates its constituent particles as follow:

40 carbonic acid
28 water of crystallization
16 carbonic aluminous earth
5 benzoic aluminous earth
5½ benzoic acid
5 calx of iron
2½ refin

100

MELINDA, the capital of a kingdom of the same name, on the coast of Zanguebar. Here the Portuguese have 17 churches, nine convents, and warehouses well provided with European goods. It is surrounded by fine gardens, and has a good harbour, defended by a fort; but the entrance is dangerous, on account of the great number of shoals, and rocks under water. The inhabitants are Christians and Negroes, which last have their own king and religion; and the number of both is said to amount to 200,000. It is seated at the mouth of the Quilmanci. Long. 39. 38. E. Lat. 2. 15. S.

MELIPILLA, a town of Chili, in a jurisdiction of the same name, 200 miles N. of Concepcion. Long. 71. 39. W. Lat. 33. 28. S.

MELISSAU, a town of Naples, in Calabria Citeriore, four miles N. of Strongoli.

MELITELLO, a town of Sicily, in Valdi Noto, eight miles W. of Leontini.

MELITO, a town of Naples, in Calabria Ulteriore, with a bishop's see, 40 miles N. of Reggio. Long. 16. 30. E. Lat. 38. 40. N.

MELITOPOL, a town of Russia, in the province of Tauris, about 12 miles from the sea of Azoph, and 108 S. of Catharinensklaf. Long. 83. 10. E. Lat. 46. 22. N.

MELLDORF, a sea-port of Lower Saxony, in the duchy of Holstein, on the German Sea, 48 miles N.W. of Hamburg. Long. 9. 4. E. Lat. 54. 10. N.

MELLE, a town of Westphalia, in the bishopric of Osnaburg, 10 miles E. of Osnaburg. Long. 8. 35. E. Lat. 52. 25. N.

MELLE, a town of France, in the département of the Two Sevres, 13 miles S. of St. Maixent.

MELLINGEN, a town of Switzerland, in the bailiwick of Baden, which, since 1712, depends on the cantons of Zurich and Bern. It is seated in a fertile country, on the river Reufs, five miles S. by W. of Baden.

MELNICK, a town of Bohemia, seated at the confluence of the Elbe and Muldaw, 18 miles N. of Prague. Long. 14. 50. E. Lat. 50. 22. N.

MELOUE, a town of Upper Egypt, seated on the Nile, with a remarkable mosque. Long. 31. 55. E. Lat. 27. 30. N.

MELRICHTADT, a town of Franconia, in the bishoprick of Wurzburg, remarkable for a battle fought near it,

10 M

between the emperor Henry IV. and Rodolph duke of Suabia. It is located on the Strät, 20 miles N. of Schweinfurt.

MELUN, an ancient town of France, in the department of Seine and Marne, located on the Seine 25 miles S.E. of Paris. Long. 2. 55. E. Lat. 48. 30. N.

MEMBRILLO, a town of Spain, in Extremadura, 14 miles S. of Alcantara. Long. 6. 0. W. Lat. 39. 12. N.

MEMMINGEN, a strong town of Suabia, near which, in 1795, the French republicans defeated the emigrants under the Prince of Condé. It is located in a fertile plain, 24 miles S.E. of Ulm, and 35 S.W. of Augsburg. Long. 10. 16. E. Lat. 48. 3. N.

MENAN, a large river of the kingdom of Siam, which runs through it from N. to S. passes by the city of Siam, and falls into the gulf of Siam, below Bangkok. There are several singular fishes in it, beside crocodiles, which are common in these parts.

MENANCABO, the capital of a small kingdom of the same name, in the island of Sumatra; located on the S. coast, opposite the isle of Nias, 250 miles from the strait of Sunda.

MENDE, an ancient town of France, capital of the department of Lozere, with a bishop's see. The fountains, and one of the steeples of the cathedral, are remarkable. It is very populous; has manufactures of serges and other woollen stuffs; and is located on the Lot, 35 miles S.W. of Puy, and 210 S. by E. of Paris. Long. 3. 35. E. Lat. 44. 31. N.

MENDICITY, that state in which paupers frequently are; especially in crowded cities, where the pursuit of pleasure too much engrosses *their natural guardians, the rich*, to attend duly to the charge which Providence has assigned them.

It is certainly a disgrace to the metropolis of Britain, that, with all our charitable establishments, no adequate provision has yet been made to prevent mendicity in London; but that our funds of charity are to be wasted on the indolent and drunken beggar, while modest indigence is often neglected and forgotten.—When the means of occupation, and the inducement to industry and exertion, are provided in London, there will be no further occasion for *vagrant passes, and for orders of removal*. The idle and the profligate beggars will soon find that the air of the metropolis does not suit them; and will retire, as they have done from Edinburgh, to other more congenial climates, where liberal encouragement continues to be offered to idleness and profligacy.

It is no small merit in the Edinburgh establishment (see *EDINBURGH, Supp.*), that they have adopted the principle, so strongly recommended by Count Rumford, of giving the poor the **WHOLE** ENTIRE of their earnings, and **ALL** the benefit of their industry. Those earnings, it is true, are considerable, and at the present period inadequate to their support; and, indeed, whenever an establishment of this kind shall be formed in London, it is probable that the produce of the industry of the poor, in the commencement at least, will be comparatively small. But if we could suppose only one half of the beggars of London to be usefully employed (the other half having retired to other cities, where *speculative idleness is not perfected*), the gain to the public in the positive produce* of labour, in the examples of industry, and in the comparative improvement of morals, would be of an importance beyond all calculation.

"I am aware," says Mr. Bernard, in the Reports of the Society for bettering the Condition of the Poor, "that I shall

be told that the situation, the magnitude, and the circumstances, of Edinburgh and London are very different. In like manner if I urge the example of Munich, I am answered, that "the scale is small,—the difficulty less;—with the military under his orders, and the springs of government at command, the favourite minister of a despotic prince might do much."

—So, if I cite what Mr. Voght has done at Hamburg;—Mr. Venn, at Clapham;—what Lord Winchelsea, at Burley;—Mr. Conyers, at Epping;—Mr. Eitcourt, at Shipton Moyne;—or Mr. Gilpin, at Boldre;—still I am told, there are all peculiar cases, exempt from those circumstances, which are every ready to prevent any thing of that kind being attempted by the projector.—I admit that the magnitude of Edinburgh is less, the education and domestic habits of the poor are better, and that they are free from the embarrassments attending our complicated system of poor laws: but I must observe, that those circumstances in London, which enhance the difficulty, do all increase the necessity of the measure; and that if we are innumerable by poor laws, we may receive from them funds more than adequate to the perfecting and continuing of such a reform; as there can be little doubt that half the money which is now applied in our metropolis in making the poor helpless and idle, would be sufficient for the encouragement of industry, and for the relief of poverty, to the extent that political wisdom and general philanthropy would require; even if we can suppose that the benevolence of individuals would not afford any pecuniary supplies; and that Bridewell, and some other charities, originally intended to have been subversive to this general object, shall remain for ever in their present condition.

"In short, when we consider the degree of distress which such an establishment may alleviate, the comfort it may bestow, the industry it may promote, the productive labour it may create, the bad habits it may amend, the good habits it may form, the improvement in skill and dexterity of working it may produce, the benefit to be done to the metropolis by diminishing the number of beggars at the present, and by keeping down the poor rates in future, and the probable advantages to the country from such an example leading to the erection of similar establishments in other parts of the kingdom,—I flatter myself we shall all speedily unite in measures, for forming an institution to PROVIDE FOR THE BEGGARS OF LONDON, upon principles similar to those which have been adopted with such success and effect at Edinburgh."

After this account of what *ought* to be done to check the growing disposition to mendicity among the poor, especially in the metropolis, we may very properly state what has been done. The following is extracted from an account of an attempt to ascertain the circumstances of the beggars of London, with observations on the best mode of relieving them, by Thomas Bernard, *esq.*

In order to inform himself on this subject, Mr. Martin has, from the beginning of the year 1797, distributed tickets in London, to appoint such of the beggars there, as seemed to merit and wish enquiry into their circumstances, to come to him for that purpose. Of these as many as 120 have attended in consequence;—21 men and 99 women.

Of the men the greater part were maimed, or disabled by age or sickness; and only two of them belonged to any place of legal settlement in London.

Of the women there were 48 widows; seven of them the

* Few persons are fully aware of the extent of the loss to the public by a certain number of persons being unemployed.—The following paper was very lately distributed with good effect among the riotous colliers at Bristol.—"Kingwood, April 11, 1801.—The loss to every **IDLE MAN**, for one day's work, is 2s; one week's ditto, 12s; and if five hundred men do not work for a week, their wives and children will be deprived of the enormous sum of **THREE HUNDRED POUNDS!**"

widows of soldiers; only one of them of a seaman. About a third of these consisted of aged women; some were crippled, and some distressed from want of work: many of them embarrassed by ignorance of the mode of obtaining parochial assistance, or by the fear of applying for it.

Of the wives, in most cases, the difficulty was the want of work, or the incapability of doing it on account of a child in arms. These were cases of very great distress. Above half of them had two or more children, who were some of them infants, and the greater part of the residue of an helpless age, too young for work.

With regard to the settlements of the women, twenty-four referred him to parishes in London and Westminster; thirty-three to parishes in different parts of England; twenty-two belonged to Scotland and Ireland; and the remaining twenty said they could not give, or at least declined giving, him any account of their place of settlement.

By application, in most cases to their parishes, and in some to their friends, he was enabled to obtain effectual relief for several of them: for others he is now using his endeavours. To all of them, the gift of a little food, and the hearing of their melancholy story, afforded some comfort.

Upon this paper, extracted from Mr. Martin's account, Mr. Bernard adds the following observations:—As the parochial poor of the metropolis," says he, "though they are in general treated with kindness and attention, yet the overseers in London have more room allowed for the operations of favour and prejudice, than in country parishes. The magistrates, in the city of Westminster and its suburbs, interfere very little in questions of parochial relief; and the poor are, in consequence, left almost entirely to the *discretion or caprice* of the parish officers; and frequently, by the want of relief, or by their not understanding the mode of applying for it, are induced to increase the number of beggars in London.

"In many of the instances, where persons of this description beg in the streets, a neglect of duty is, in a certain degree, imputable to some of the parish officers of London.—But there is, in the metropolis, a more numerous class of mendicants, who belong to parishes in the country. By the preceding account it will appear, that, of the 120 beggars whose cases have been enquired into, one third of the women, and the greater part of the men, belonged to country parishes; which, in some cases, there is too much reason to believe, their parish officers, either by menaces or promises, had prevailed upon them to quit, in order to set up the trade of a London beggar. In this manner the poor and the helpless, by harsh treatment, or by a trifling present, are sometimes separated from their own connections, where they might live cheaper and earn something, and where by law they are entitled to support and protection, and are, in a degree, compelled to increase the mass of vice and misery in the metropolis.

"This is an abuse which *ought* to be corrected.—Left, however, I should be misunderstood, I must state what has always been my sentiment; that, in policy and justice, every individual should be at liberty, while he can work, to carry his industry to that parish, in which he can exert it with most benefit to himself and the community; and I should add that, in point of kindness and humanity, the aged and infirm, who want parochial aid, should not be removed to a distant parish, that may have been their place of settlement, though not of residence; much less that they should be driven, at the close of a useful life, into a parish work-house, while they have friends and connections, with whom they may continue upon a parochial allowance, not more, and probably less, than they would cost in a work-

house. But the case of London beggars, with country settlements, is very different. Their connections are not in London. They have wandered from their parishes, from their friends, and from those who are by law directed to maintain them, to a place new and unknown to them; where, by a display of misery, too frequently the genuine, though uncredited, representation of real sufferings, they draw *compassionately* and *ingenuously* relief from the compassion of individuals, instead of receiving at home that parochial protection and support, to which by law they are entitled.

"To these two classes is to be added a third, consisting chiefly of casual poor, who are occasionally out of employment, and either are not, or pretend not to be able to procure work. Of these some are ready and desirous to be employed; and the greater part would work, if it were as easy for them to obtain employment, as it is to ask alms. For the relief of them, we have only to follow the example of Count Rumford, in his great and excellent establishment at Munich; or that of Lord Winchelsea, in his school at Oakham, admirable in its simplicity and facility of execution: we have only to establish work-rooms in different parts of the metropolis, where the poor shall have the option of attending or not, where they shall receive inviolably every penny of their earnings, and where they may, *if they prefer it*, partake of a comfortable and good meal at a cheap rate.

"I have described the three classes, of which the beggars of London do principally consist:—1st. of aged and infirm persons, belonging to parishes in or about the metropolis; parishes, which ought, and, with proper assistance, would pay more attention to them: 2d. of a similar description of persons from country parishes, where they should be received and maintained; something being done, if an extraordinary case occurred, to prevent their sending away their parochial poor: and 3d. of persons who cannot procure employment, and of other casual poor, for whose resort and relief work-rooms ought to be opened.

"What is proposed would have the merit of being capable of execution with little or no addition to the statute book; as it would hardly require more than the enforcement of our present laws, in instances where the neglect of them has been attended with serious evils to the community. If, therefore, by the enforcement of those laws, and by the aid of individuals, these three objects are attained;—the relieving of the aged and impotent of London parishes;—the assisting of the country poor to return to their own parishes;—and the finding of employment for the casual poor, who either cannot find work, or do not wish to find it;—begging will soon become, in London, an unnecessary and unprofitable trade.

"A question, however, may arise, whether this object, so far as it calls for the aid of the magistrate, can be attained by the present police offices; or whether it will not require a new and original office of its own.—Most of the police offices are already pretty fully employed; but even if they were not, yet a regular system of relief, that is to pervade the whole of the metropolis—to provide work, and the means of maintenance for all who *can* labour, and for the aged and infirm (who *cannot*) comfort and relief, in the mode best for them, and least burthen some to society;—a measure like this, I am persuaded, could never be completed, and properly carried into effect in this great town, but by one office. It would otherwise be devoid of that singleness and uniformity of plan, which would be essential to its success:—not that it seems necessary that any new appointment should be made for the purpose; as a weekly board held at one of the now existing offices, or, which perhaps would be better, at a separate office, by some of the most active and intelligent

magistrates, selected from the other offices, might be fully adequate to these important objects.

"Such an office, established in the metropolis for the sole purpose of attending to the poor, and forming and promoting plans for their employment and protection, if conducted with zeal, industry, temper, and discretion, would be attended with the most beneficial effects; not merely in the relief of the distressed and impotent poor, but in the reform of the idle and profligate. Whether the execution of the measure should be conducted by the Society, the expenses being defrayed from funds to be furnished by public contribution, or by any other mode, is matter for serious consideration. In any event, it would produce an important diminution in the amount of misery and vice in London; and it would be the means of assisting and encouraging virtue and industry, and converting the benevolence of individuals into its proper and legitimate channel.

MENDIP-HILLS, a lofty tract, in the N.E. of Somersetshire, abounding in coal, calamine, and lead; the latter said to be of a harder quality than that of other countries. Copper, manganese, bole, and red ochre, are also found in these hills. On their summits are large swampy flats, dangerous to crofs.

MENDLESHAM, a town in Suffolk, with a market on Friday, 18 miles E. of Bury St. Edmunds, and 82 N.E. of London. Long. 1. 12. E. Lat. 52. 24. N.

MENDRAH, a province of the kingdom of Fezzan, much of which is a continued level of hard and barren soil; but the quantity of trona, a species of fossil alkali, that floats on the surface, or settles on the banks of its numerous smoking lakes, has given it a higher importance than that of the most fertile districts. It has a town of the same name, 60 miles S. of Mourzook.

MENDRISIO, a town of Switzerland, the capital of an Italian bailiwick, containing about 16,000 inhabitants. It is seven miles W. of Como. Long. 8. 59. E. Lat. 25. 45. N.

MENEHOULD, fr. an ancient and considerable town of France, in the department of Marne, with a castle advantageously situate; but its other fortifications have been demolished. It was almost totally destroyed by a conflagration in 1710. It was here, in 1792, that the French gave the first check to the progress of the victorious Prussians, which in the end compelled them to a retreat. St. Menehould is seated in a morass, on the river Aisne, between two rocks, 20 miles N.E. of Chalons, and 110 E. of Paris. Long. 4. 59. E. Lat. 49. 2. N.

MENGEN, a town of Germany, in Austrian Suabia, 33 miles S.W. of Ulm, and 45. S. of Stuttgart. Long. 9. 13. E. Lat. 48. 1. N.

MENIN, a town of Austrian Flanders, seated on the Lis. In 1585 it was almost entirely destroyed by fire. It is considered as the key of the country; and in every war, from the middle of the 17th century, the possession of it has been deemed of the utmost consequence. It has, therefore, been often taken and retaken; the last time by the French in 1794, when the garrison (in order to save the unhappy emigrants) bravely forced their way through the enemy. It is eight miles S.E. of Ypres, and 10 N. of Lille. Long. 3. 9. E. Lat. 50. 48. N.

MENTON, a city of Italy, in the principality of Monaco, with a castle. It has a considerable trade in fruit and oil; and is seated near the sea, five miles E.N.E. of Monaco, and eight W.S.W. of Ventimiglia. Long. 7. 35. E. Lat. 43. 46. N.

MENZALA, a town of Egypt, situate near a great lake to which it gives name, 20 miles S.S.E. of Damietta, and 73 N.N.E. of Cairo. Long. 32. 2. E. Lat. 31. 3. N.

MEPHITIS (*Enceyl.*) The following communication on a method of preventing and destroying the mephitic taint with which walls become impregnated where a number of persons, particularly sick, are collected together, is inserted in the *Décade Philologique*, &c.

"In my Memoir," says the author, "on milk-painting (see *PAINTING*, *Supp.*), I had considered it only as an object of domestic economy, so that I neglected to treat of the useful application of this method of painting to the demephitization of walls. Let me therefore supply the omission.

"Wherever a great number of persons, either healthy or sick, are collected together, the walls are penetrated, and become intensely furcharged with infectious effluvia; which they again exhale in consequence of the motions of the atmospheric air; so that actual inhalation and exhalation take place in them. The currents of air which are conducted through such places serve very well to renovate the atmosphere, but they do not carry away with them the miasmata that lurk in the pores of the walls, and which are retained there by the infectious moisture proceeding from the perspiration of the bodies, and which condenses itself upon their surface.

"I have mentioned inhalation and exhalation: in fact, in the southern climates, and particularly in Italy, where the phthisis assumes a character of energy that renders it very contagious, experience has shewn that it is necessary, not only to burn all the clothes and furniture that have been in contact with the phthisical person, but likewise to remove the superficial layer of the walls and floors, in order to prevent the contagious miasmata, which is concealed in them, and which they re-exhale, from taking effect. In my opinion, quick-lime might be substituted in the place of these means, and prove a sufficient preventive of the contagion, as it has powerful demephitizing properties.

"By washing with water and lime I entirely deprived a dead body, in a state of putrefaction, which I was charged, by a decree of the parliament, to have dug out of the ground, of its smell, on account of the dangers that might arise from digging it out of ground.

"This mephitism is so inherent, that even time cannot dissipate it, as was proved by the example of the Donjon of Vincennes, when it ceased to be a state prison, under the administration of Maleherbes. Curiosity attracted a great concourse of people to the dungeon; and those who had formerly inhabited the prison being particularly curious to see it, they recognised the same smell in it with which they had been struck upon entering it the first time: and yet the doors and windows had been removed, and the elevation of the building exposed it to the free action of the air.

"Workshops, manufactories, infirmaries, hospitals, prisons, and all such buildings, have an atmosphere peculiar to themselves, an atmosphere which shortens the lives of the individuals, or often becomes the source of epidemic, and sometimes pestilential maladies, as the hospital or prison fever, &c. Plants, when deprived of air, languish and lose their colour; the effects of this privation must be still more powerful upon animals, whose lungs consume so large a quantity of air.

"Citizen Guyton-de-Morveau has discovered a method, by means of muriatic, or preferably oxygenated muriatic gas, of purifying any atmosphere impregnated with contagious and pestilential miasmata. It washes such an atmosphere, and deprives it of its miasmata, which it seizes upon and destroys. This important discovery gives Citizen Morveau a claim to the title of one of the benefactors of humanity, and a right to the civic crown.

"This means, however, though it subdues the mephitism of the air, would, perhaps, not act with equal efficacy upon walls, which conceal, deep within their pores, the miasmata

with which they are infected. The activity of time is sufficient for the purpose.

"I find in my notes the result of an experiment which I shall relate. Wishing to ascertain the power of lime as a means of demephitisation, I had layers, to the thickness of nine lines, taken away from a wall, before I arrived at a layer that was not yet altered. The other portion of the same wall, which I reserved for the comparative experiment, was completely deprived of its mephitic impregnation by three successive applications of common white-wash (pure water and quick-lime). See WHITE-WASH, *Supp.*

"Now lime enters into the composition of the milk-paint, and it may be made the base of it by substituting it instead of the Spanish white, or whitening.

"The painting will become still cheaper by this substitution, on account of the cheapness of the lime, so that the toils of the painting will cost only five centimes: as to the labour, there can be no want of hands in buildings where great numbers of individuals are collected together, and where every thing ought to be conducted as economically as possible.

"To be able to destroy the mephitism of the walls in the asylums of industry, indigence, and misfortune, is certainly a great point gained; but the means of preventing the evil, so that there may be none that requires to be remedied, is a no less valuable acquisition. Now milk-painting, with the base of lime, is the means of preventing the walls from becoming impregnated with infectious miasmata.

"But of what advantage, it may be objected, is the addition of milk and of oil? It is not by a chemist that this objection will be made; however this is our answer to it. The addition is made because lime has no adhesion to the walls: it cannot be applied in a thick layer; and the slightest contact causes it to come off; on which account walls white-washed in the common way soil the clothes that come into contact with them. The caesous part of milk, the addition of the oil, which forms a saponaceous substance with the lime, afford, on the contrary, after the evaporation of the moisture, a layer that possesses density and cohesion, and is capable of receiving thickness; it is a coating, in some measure varnished, which annihilates the porosity of the stone, plaster, brick, or wood, and from which we may wipe off the dust, without laying bare the place which has been painted.

"Milk painting affords another advantage, which I have not mentioned in my memoir, namely, that of checking the nitrification of the walls, which is accelerated by painting in distemper.

"In fact, glue is an animal substance, of which one of the constituent principles is azot; now the decomposition of the glue extricates this azot, which is also one of the constituent principles of the nitric acid, and enables it to combine with the oxygen, with which it forms this acid.

"As milk painting produces no extrication of azot, one of the aliments of the nitrification is removed; not that the caesous part of milk does not also contain azot, but that it does not become decomposed, nor give this principle the freedom requisite to enable it to enter into a new combination. Moreover, this painting stops up the pores of the stone, and intercepts itself between the walls and the nitrifying action.

"Supported by the theory which I have just explained, by the authority of two of our first chemists, Citizens Fourcroy and Deyeux, to whom I have submitted my opinion, and, lastly, by my own experience, I think myself justified in recommending to the administrators of hospitals, to adopt the *resinous milk painting* (always substituting lime in the place of Spanish white) as the most efficacious, and at the same time the most economical means of destroying the mephitisation of the walls, and preventing it for the future."

MEPPEN, a town of Westphalia, which depends on the Bishop of Munster. It is seated on the Embs, 15 miles N. of Lingen, and 50 N.W. of Munster. Long. 7. 36. E. Lat. 52. 45. N.

MEQUINENZA, an ancient town of Spain, in Arragon, with a castle; seated at the confluence of the Lbro and Segra, in a fertile country, 39 miles N.W. of Tortosa, and 180 N.E. of Madrid. Long. 0. 29. E. Lat. 41. 36. N.

MER, a town of France, in the department of Loir and Cher, 10 miles N.E. of Blois.

MERAN, a trading town of Germany, in the Tyrol, capital of Erieland. It is seated on the Adige, 12 miles N.W. of Bolzano. Long. 11. 18. E. Lat. 46. 44. N.

MERAZION, or MARKET JEW, a sea-port in Cornwall, with a market on Thursday; seated on an arm of the sea, called Mountbay, three miles E. of Penzance, and 283 W. by S. of London. Long. 5. 30. W. Lat. 50. 12. N.

MERCURY (*Encycl.*). The following experimental enquiry concerning the solution and oxydation of mercury, by Mr. Schmidt, apothecary at Sondeburg, appears in Scherer's Chemical Journal.

"In preparing," says the author, "the red oxyd of mercury (red precipitate of mercury), the idea had frequently occurred to me, whether the nitrous acid that passes over might not still be employed for other similar purposes, or more mercury employed for solution. Time and circumstances did not at first permit me to enter upon the investigation of this subject, which afterwards ceased to engage my attention, till the observations of Van Mons upon the oxydation of mercury, in this Journal, vol. II. p. 712, which so entirely coincided with what I had formerly suspected, recalled my thoughts to it, and I now felt a more urgent impulse to institute a more accurate enquiry into the subject.

"I therefore first subjected, according to the old method commonly in use, one part of mercury, and two parts of the common aquafortis of the shops, to distillation, in order to examine, whether the acid, which is carried over, might not still be employed once more, or perhaps oftener, for the same purpose. After the distillation, I found that the loss of aquafortis amounted to no more than four scruples in the ounce. To this I added three drachms more of fresh mercury, and my expectations were completely fulfilled; the mercury was completely dissolved, and the fluid that was carried over amounted to six drachms all but one scruple, which, as the acid did not yet seem to have entirely lost its powers, I mixed still with three drachms of mercury, in order to carry my experiments to this ultimate point. Here, however, my expectations failed: scarcely two drachms were dissolved, and amongst this salt I found globules of liquid mercury, which, being accurately weighed, amounted to sixty-six grains; and the fluid that had passed over no longer exhibited any traces of predominant acidity.

"After having repeated these experiments several times, and always with the same result, I took equal parts of mercury and common aquafortis, as the former experiments clearly proved that this completely dissolved, and consequently oxydated the mercury, put both together into a retort, and subjected them to distillation. I again obtained a perfect nitrate of mercury, but the nitrous acid that was carried over was far less in weight than before, which was to be attributed to the greater quantity of mercury that had been employed. I then mixed the acid that had passed over once more with half the quantity of mercury; but now nine scruples remained undissolved in the retort out of one ounce of mercury.

"These experiments sufficiently convinced me, that the common aquafortis of the shops is able to dissolve only a little more than an equal quantity of mercury: I therefore thought

proper to try the *double aquafortis* (*aquafortis duplex*), and the concentrated fuming nitrous acid (*Acidum nitri concentratum*). But all the experiments which I made with those afforded me little more dissolved mercury than the common single aquafortis had done: a drachm of fuming nitrous acid dissolved only four scruples of mercury, all of which, under the extrication of a large quantity of nitrous gas, was converted into a dry saline mass, to which no artificial heat could be applied. Double aquafortis was more convenient for my experiments, as it produced no constant extrication of vapours; however it dissolved and oxydized no larger a quantity of mercury than had been done in the former processes.

"It now therefore only remained for me to try the purified acid of nitre; and it was necessary for me to make the experiment also with this, in order that I might be able to draw certain inferences from my experiments. I therefore purified good common single aquafortis again over dry saltpetre, put the fluid which first passed over apart, and employed only that which followed for my experiments. Their result was as follows:

"1. Equal parts of mercury and purified acid of nitre, immediately dissolved in the cold, under an extrication of nitrous gas, in a glass vessel, and yielded a white salt, over which fell one scruple of fluid flood; this I poured anew upon half a drachm of mercury, which likewise was entirely converted into a saline mass.

"2. Half an ounce of purified aquafortis, and an ounce of mercury, were likewise completely dissolved, without the application of artificial heat.

"3. I then poured half an ounce more of this aquafortis, and two ounces of mercury, into a small retort, in which I let them remain inclosed over night, and, on the following morning, I found that six drachms were dissolved. I then fixed a receiver to the retort, and applied a gentle heat; however, no more mercury was dissolved; I therefore poured the remaining crude mercury into the fluid that had passed over into the receiver, in which, upon the application of heat, two drachms were again dissolved, so that in all an ounce of mercury remained undissolved*.

"After having made these experiments, I endeavoured to avail myself of the hints which Van Mons gives in the above-mentioned article in Scherer's Journal, namely, "To perform the solution and oxydation of the mercury in an open vessel, which enables us to stir the mass, and divide the mercury." An evaporating dish of porcelain was chosen for this purpose: I began the solution at a low temperature, and gradually increased the heat, at the same time keeping the mass in constant motion by stirring it; however, all my labour was in vain. I obtained nothing more than what the preceding experiments had already exhibited, and the supposition of Van Mons, "That, by proceeding in this manner, it might be possible to oxydize at least fifty parts of mercury with twenty parts of moderately concentrated nitrous acid," was proved to be groundless. I obtained, indeed, a very good oxyd; but the mercury that was not dissolved had escaped in increasing the temperature.

"However, if we take the proper proportions of acid and mercury, and manage the fuel properly, this mode of proceeding is the most convenient, easy, and advantageous. By con-

stant stirring, every part of the mercury is exposed to the action of the acid; the whole process is completed in a few hours, and a considerable saving of fuel is made.

"From all the experiments hitherto mentioned, I deduce the following inferences:

1. "That the common, not purified, aquafortis of the shops, both single and double, can dissolve and oxydize well only equal quantities of mercury; but that one part of purified aquafortis can dissolve and oxydize two parts of mercury.

2. "That consequently purified aquafortis, free from all admixture of muriate and sulphuric acid, is the best adapted for the solution of mercury.

3. That the solution or oxydation of mercury, performed in open vessels, effects nothing more than that which is performed in close vessels; but that, for the reasons already adduced, it is more advantageous to perform the operation in open vessels†.

4. "That it is advantageous, when this operation is performed in close vessels, to reserve the acid that passes over from the mercurial oxyd, for new solutions of mercury; or also to make use of this fluid in preparing the white precipitate of mercury, as always a portion of dissolved mercury passes over together with it, which affords a white precipitate with muriate of ammonia and carbonate of kali.

5. "When too much mercury was employed, I did not observe that it passed over into the receiver in the metallic salt; but it was always at first covered by the mercurial salt; and upon increasing the temperature, it was raised indeed, but it deposited itself in a half-calcined state upon the upper part of the retort, in the form of a greyish-white sublimate. The very trifling quantity of metallic mercurial globules that passed over was immediately dissolved by the distilled acid contained in the receiver.

MERDIN, a town of Turkey, in Diarbeck, with a castle, and an archbishop's see. The country about it produces a great deal of cotton. It is 45 miles S.E. of Diarbekar. Long. 39. 59. E. Lat. 36. 50. N.

MERE, a town in Wiltshire, with a market on Tuesday, 28 miles W. of Salisbury, and 100 W. by S. of London. Long. 2. 25. W. Lat. 51. 6. N.

MERECZ, a town of Lithuania, seated at the confluence of the Perezino and Merez, 30 miles N. of Grodno. Long. 24. 10. E. Lat. 50. 0. N.

MERGENTHEIM, a town of Franconia, subject to the grand master of the Teutonic order; and seated on the Tauber, 16 miles S.W. of Wurtzburg. Long. 8. 50. E. Lat. 49. 30. N.

MERGUL, the capital of a province of the kingdom of Siam, situate on an island near the coast, with an harbour, which is said to be one of the best in the East Indies. Long. 98. 28. E. Lat. 12. 6. N.

MERINDOL, a village of France, in the department of the Mouths of the Rhone, whose inhabitants were massacred on account of their religion, in 1545, by virtue of an arrest of the parliament of Aix. It is nine miles E. of Cavallion.

MERITZ, MERITCH, or MERRICH, an important fortress and city of the Decan of Hindoostan. It was taken by Hyder Ally, in 1778; and is situate near the N. bank of the river Kistna, 70 miles S.W. of Viliapour.

* "It is not yet entirely clear to me (says Mr. Schmidt in a note), from whence it proceeded, that the whole of the nitrous acid did not at first saturate itself with mercury, and that the fluid that passed over still dissolved a portion of mercury, as was the case in all the processes before mentioned. Perhaps the nitrous salt of mercury that had separated itself from, and covered, the metallic mercury, prevented the nitrous acid, that was now left in a weak state, from acting upon it."

† Note of Prof. Scherer. "In the same manner I also dissolve the sulphate of mercury, complete the operation in a few hours, which, when performed in close vessels, occupies several days, on account of the difficulty with which the concentrated sulphuric acid passes over, and nevertheless obtain Turpeth mineral of the finest yellow colour."

MERK, a river of Austrian Brabant, which running N. by Breda, afterward turns W. and falls into one of the mouths of the river Maese, opposite the island of Overflackee, in Holland.

MERO, a strong town of the kingdom of Pegu, 140 miles S.W. of the town of Pegu. Long. 98. 36. E. Lat. 16. 6. N.

MEROU, a town of Persia, in Chorasan, seated in a fertile country, which produces salt, 112 miles S.W. of Bokhara. Long. 64. 25. E. Lat. 37. 40. N.

MERRIMACK, a town of the United States, in New Hampshire, situate on a river of the same name, 35 miles N.W. of Boston.

MERSEBURG, a town of the electorate of Saxony, in Misnia, with a bishop's see; seated on the Sala, 10 miles S. of Halle, and 56 N.W. of Dresden. Long. 12. 6. E. Lat. 51. 28. N.

MERSPURG, a town of Suabia, in the bishopric of Constance, and the bishop's usual place of residence. It is seated on the N. side of the lake of Constance, 11 miles from the town of that name. Long. 9. 26. E. Lat. 47. 45. N.

MERTOLA, a strong town of Portugal, in Alentejo, seated near the Guadiana, 60 miles S. of Evora, and 100 S.E. of Lisbon. Long. 7. 40. W. Lat. 37. 30. N.

MERTON, a village near Oxford, situate near two military ways. There were intrenchments in the neighbouring woods, supposed to be thrown up by King Ethelred, or the Danes, whom he defeated in 871.

MERTON, a village in Surrey, seated on the Wandle, seven miles S.W. of London. It had a celebrated abbey, founded in the reign of Henry I. in which several important transactions took place; particularly, at a parliament held here, in 1236, were enacted the provisions of Merton (the most ancient body of laws after Magna Charta), and the barons gave that celebrated answer to the clergy, *Nolumus leges Anglie mutari*—We will not change the laws of England. Nothing remains of this abbey, but the E. window of a chapel; and the walls that surround the premises, which are built of flint, are nearly entire, and include about 60 acres. Upon the site of this abbey are two calico manufactures, and a copper-mill; and about 1000 persons are now employed on a spot, once the abode of monastic indolence.

MERVE, the north branch of the river Maese, in Holland, on which the city of Rotterdam is seated.

MERVILLE, a town of France, in the department of the North, seated on the Lis, 10 miles S.E. of Cassel, and 24 S.W. of Menin. Long. 2. 43. E. Lat. 50. 57. N.

MESEN, a sea-port of Russia, in the government of Archangel, capital of a district of the same name. It is seated on the river Mefen, on the E. coast of the White Sea, 160 miles N. of Archangel. Long. 44. 45. E. Lat. 65. 50. N.

MESKIRK, a town of Suabia, in the county of Furstenturg, 15 miles N. of Ueberlingen.

MESSA, a town of Morocco, on the river Sus, not far from the Atlantic, at the foot of Mount Atlas. Near it is a mosque, in which are the bones of a whale, which the inhabitants consider as the bones of the whale that swallowed Jonah. It is 165 miles S.W. of Morocco. Long. 10. 46. W. Lat. 29. 58. N.

MESSING, a town of Franconia, in the bishopric of Aichstatt, 14 miles N.N.E. of Aichstatt.

MESTRE, a town of Italy, in the dogado of Venice, 16 miles N.E. of Padua. Long. 12. 2. E. Lat. 45. 26. N.

MESURATA, a sea-port of Tripoli, and the residence of a governor. Caravans travel hence to Fezzan and other interior parts of Africa, with which they carry on a great trade. It

is 100 miles E.S.E. of Tripoli. Long. 15. 2. E. Lat. 37. 55. N.

METELN, a town of Westphalia, in the bishopric of Munster, 19 miles N.W. of Munster. Long. 6. 59. E. Lat. 52. 18. N.

METERISCH, a town of Moravia, in the circle of Iglau, 17 miles E. of Iglau, and 76 S.E. of Prague. Long. 15. 58. E. Lat. 49. 6. N.

METHODISTS (*Encycl.*). We have already given a general account of this religious body, but it may not be disagreeable to the reader to have their present state in England more particularly described. The most trivial causes have oftentimes effected the greatest changes in society. Systems have been overturned by casual incidents, apparently of no significance; and widely-extended corruptions have been purged away, by means the most inadequate, and through the instrumentality of persons from whom different designs might have been expected. The reformation of the church, and the ultimate destruction of the papal power, may be attributed to the preference given by Leo X. to the Dominicans, and the consequent resentment of the Augustine monks, who encouraged their brother Luther to a spirited opposition of the papal indulgences.

The great change which has evidently taken place in the protestant churches within the present century, and the spread of religious knowledge in various parts of the earth, not long since obscured with ignorance and superstition, may be traced to the chambers of a private fellow of a college in Oxford. The sentiments of John Wesley, upon the necessity of a living Christianity, seated in the hearts and commanding the practice of men, in opposition to a mere formal profession, led him to associate with others of the same serious disposition. The remark made to him by a good man, whom he went many miles to see, affected him not a little: "Sir (said he), you wish to serve God and to go to heaven. Remember, you cannot serve him alone. You must, therefore, find companions, or make them: the Bible knows nothing of a solitary religion." Soon after this, which was about the year 1729, Mr. Wesley formed a small society at Oxford, of serious students, as his brother Charles, a Mr. Morgan, the exemplary Mr. Harvey, the celebrated George Whitfield, and others. These pious young men met together, to promote one another's studies, and to read the scriptures for mutual edification. Finding the benefit of this course, they proceeded, in the next place, to render themselves more conspicuous in a work of love; namely, to visit the prisoners in the castle, and the sick poor in the town. Being increased to the number of fifteen, they were strengthened in their minds, and encouraged in their pious labours. At this time, when prejudice is so much softened down, and religious intolerance has been driven away by a spirit of liberality, the man of enlarged mind, whatever may be his principles, cannot see any thing to discommend in this conduct: it was, on the contrary, such as highly became persons defined for the most sacred professions, and ought to be held up as an example to all candidates for the ministry. Thus far, candour must approve the rise of what is called *Methodism*, which term was applied to these serious young men by a fellow of Merton college, in allusion to an ancient sect of physicians at Rome, who were remarkable for putting their patients under regimen, and were therefore called *Methodists*. But religious zeal is a delicate thing, and requires to be tempered with much discretion. Messrs. Wesley and Whitfield were fired with the spirit to such a degree, that no limits could contain them. Though ordained in an episcopal church, the canons of which are very severe against all irregularities, they ventured to break the barriers, and went forth as missionaries to convert the world.

The churches being soon shut against them, they adopted the novel method of field-preaching, which produced much disorder, and, it must also be confessed, much good. The next irregular step of these good men, for such they undoubtedly were, was the authorizing laymen, and those in general of the lowest occupations, to preach the gospel. Nothing can prove the tenderness of our national establishment more effectually than the indulgence which was shewn to these clergymen: no ecclesiastical censure was ever passed upon their conduct, although suspension might naturally have been expected. The churches, it is true, were in general shut against them; but this was the private act of individuals, with which the bishops could have no concern. But to return: the societies of methodists increased rapidly, and were multiplied throughout the kingdom. At length the two great leaders, John Wesley and George Whitfield, separated from each other, and a grand breach was made between their followers. The former held universal redemption and free will, while the others strenuously adhered to absolute election and free grace. The heats occasioned by this difference subsisted for many years, and produced much violent and indecent controversy: at present there is more unity between them, and they appear to be ashamed of the intemperance which disgraced their once favourite disputants. Mr. Wesley preserved an admirable economy in his numerous societies, which were held together, during his life-time, by a simple, but firm, discipline. Since his death, they have suffered considerably from a spirit of dissension. Mr. Wesley always preserved a great regard for the church of England; and never suffered his societies to have religious worship in the hours of church service, or the sacrament to be administered by lay-preachers. Since his death, both these restrictions have been broken, and most of his societies have become complete dissenters. Many, however, from their veneration for Mr. Wesley, disapprove these measures, and refuse to hold communion with their brethren—calling themselves, with an honest pride, *Church Methodists*. Mr. Wesley, it is said, about the year 1765, was so imprudent as to accept of consecration from a person calling himself a Greek bishop, who also ordained several of the lay-preachers. This was a scandalous violation of the canons, and a pitiful subterfuge at the very best. It is generally concluded that the man was an impostor. Mr. Wesley afterwards took upon him, with the assistance of some other presbyters, to ordain preachers, and even consecrated, after a manner, Dr. Coke to be a superintendant, or bishop, of the methodists in North America. This gentleman is now at the head of the Wesleyan, or Arminian methodists, and is indefatigable in following the steps of his great leader. He has made several voyages to America and the West-Indies, where the societies are very numerous; and it is said that their labours among the negroes have been exceedingly successful. No less than ten thousand are regular members of classes in the West-India islands, where there are also many black preachers. The methodists of Mr. Wesley's establishment are more numerous than those of the Calvinistic persuasion, and appear to be better subjects of the government.

METHVEN, a town of Scotland in Perthshire, with an ancient castle. It has manufactures of broad and narrow linen; with two paper and some other mills. King Robert Bruce, soon after his coronation in 1306, was defeated here by the English troops under the earl of Pembroke, and found himself forsaken by the greater part of his army. It is five miles W.N.W. of Perth.

METHWOLD, a town in Norfolk, with a market on Tuesday, 15 miles N.W. of Thetford, and 86 N.N.E. of London. Long. 0. 40. E. Lat. 52. 34. N.

METLING, a strong town and castle of Germany, in the

duchy of Carniola, seated on the Kulp, 40 miles S.E. of Laubach. Long. 15. 10. E. Lat. 46. 2. N.

METRO, a river of Italy, which rises in the territory of the church, runs into the duchy of Urbino, and falls into the gulf of Venice, near Fano.

MEUDON, a village of France, where was a magnificent royal palace on the Seine, six miles S.E. of Paris.

MEULAN, an ancient town of France, in the department of Seine and Oise. It is built in the form of an amphitheatre, on the river Seine, over which are two bridges, 20 miles N.W. of Paris. Long. 1. 57. E. Lat. 49. 1. N.

MEURS, a town of Germany, in the duchy of Cleves, seated on the Rhine, 15 miles N.W. of Dusseldorf. Long. 6. 41. E. Lat. 51. 25. N.

MEURTHER, a department of France, including part of the late province of Lorraine. It is so called from a river that rises in the department of the Voges, and watering Lunéville and Nancy, falls into the Moselle. Nancy is the principal see of this department.

MEUSE, a department in France, including the late duchy of Bar. It takes its name from the river Meuse, or Maëse. Bar-le-Duc is the capital. See **MAËSE**.

MEWARI, a considerable town of Japan, in the island of Niphon, with a royal palace. It is seated on a hill, at the foot of which are vast fields of wheat and rice, with fine orchards, full of excellent plums.

MEWAT, a hilly and woody tract of Hindoostan Proper, lying on the S.W. of Delhi, confining the low country, along the W. bank of the Jumna, to a comparatively narrow strip, and extending westward 130 miles. From N. to S. it is 90 miles. Although situate in the heart of Hindoostan, within 25 miles of its former capital (Delhi), its inhabitants, the Mewatis, have been ever characterized as the most savage and brutal; and their chief employment has been robbery and plunder. In 1265, 100,000 of these wretches were put to the sword; but they are still so noted as thieves and robbers, that parties of them are taken into pay by the chiefs of Upper Hindoostan, in order to distress the countries that are the seat of warfare. Mewat contains some strong fortresses on steep or inaccessible hills, and was almost entirely subject to the late Madajee Sindia, a Mahratta chief.

MEWAT-ALI, a town of Persia, in Irac-Arabia, not so considerable as formerly, but famous for the superb and rich mosque of Ali, to which the Persians go in pilgrimage from all parts. It is 100 miles S.W. of Bagdad. Long. 42. 57. E. Lat. 32. 0. N.

MEXAT-OCREM, a considerable town of Persia, which takes its name from a mosque dedicated to Ocem, the son of Ali. It is seated in a fertile country, on the river Euphrates, 70 miles N. of Mexat-Ali. Long. 42. 57. E. Lat. 33. 0. N.

MEXICANO, or **ADAYES**, a river of Louisiana, which empties itself into the gulf of Mexico.

MEXICO, the capital of the province of Mexico Proper, of the audience of Mexico, and of all New Spain. It was a flourishing place before the Spaniards entered the country, and was seated on several islands, in a salt-water lake, to which there was no entrance, but by three causeways, two miles in length each. It contained about 80,000 houses, with several large temples, full of rich idols, and three palaces where the emperor of Mexico resided. The abbé Clavigero says, that when the Mexicans were subjected to the Colhuau and Tepanecan nations, and confined to the miserable little islands on the lake of Mexico, they ceased for some years to cultivate the land, because they had none, until necessity taught them to form moveable fields and gardens, which floated on the waters of the lake. The method which they pursued to make these, and which they still practise, is extremely simple. They

plait and twist willows and roots of marsh plants or other materials together, which are light, but capable of supporting the earth of the garden firmly united. Upon this foundation they lay the light bushes which float on the lake; and over all, the mud and dirt which they draw from the bottom of the same lake. Their regular figure is quadrangular; their length and breadth various; but generally they are about eight perches long, and not more than three in breadth, and have less than a foot of elevation above the surface of the water. These were the first fields which the Mexicans owned after the foundation of Mexico; and there they first cultivated the maize, great pepper, and other plants necessary for their support. In progress of time, as these fields grew numerous from the industry of the people, there were among them gardens of flowers and odoriferous plants. Every day, at sunrise, innumerable vessels, loaded with various kinds of flowers and herbs cultivated in these gardens, are seen arriving by the canal, at the great market-place of the capital. The mud of the lake is an extremely fertile soil, and requires no water from the clouds. In the largest gardens there is commonly a little tree, and even a hut, to shelter the cultivator and defend him from rain or the sun. When the owner of a garden wishes to change his situation, he gets into his little vessel, and by his own strength alone, if the garden is small, or with the assistance of others, if it is large, he tows it after him, and conducts it wherever he pleases. Mexico was taken by Cortez, in 1519, after a siege of three months. As the Mexicans defended themselves from street to street, it was almost ruined, but afterward rebuilt by the Spaniards. The streets are straight, and so exactly disposed, that in point of regularity it is the finest city in the world; and the great causeways leading to it, with the want of walls, gates, and artillery, render Mexico extremely remarkable. The great square in the centre of the city, and the public buildings, are magnificent. There are 20 cathedrals and churches, and 22 convents; of the riches of which an idea may be formed from the revenues of the grand cathedral, amounting to 80,000*l.* a year, of which the archbishop has 15,000*l.* There is also a tribunal of the inquisition, a mint, and an university. This city contains above 200,000 inhabitants. The goldsmiths here are immensely rich, and it carries on a great trade to Europe by St. Juan de Ulhua, and to Asia by Acapulco. This place was overthrown by an inundation in 1629, in which 40,000 persons were drowned. This obliged the Spaniards to make a great conduit through a mountain, in order to empty the lake; which being done, part of the town became seated on dry land. Mexico is supplied with fresh water by an aqueduct three miles long. It is 200 miles E.N.E. of St. Juan de Ulhua, and 250 N.E. of Acapulco. Long. 100. 34. W. Lat. 20. 2. N.

MEXICO, GULF OF, that part of the Atlantic Ocean, on the coast of N. America, bounded on the S. and W. by Mexico, and on the N. by W. and E. Florida; the entrance lying to the E. between the S. coast of E. Florida, and the N.E. point of Yucatan.

MEYENBERG, a town of Upper Saxony, in the marche of Prenzitz, 21 miles N.E. of Perleberg, and 60 N.N.W. of Berlin. Long. 12. 19. E. Lat. 53. 20. N.

MEYENFELDT, a town in the country of the Grifons, seated on the Rhine, in a pleasant country, fertile in excellent wine, 15 miles N.E. of Coire. Long. 9. 36. E. Lat. 47. 2. N.

MEYRVEIS, a town of France, in the department of Lozère, 23 miles S. of Mende, and 27 W. of Alais. Long. 3. 18. E. Lat. 44. 10. N.

MEZANA, a town of Naples, in Basilicata, 17 miles S.S.W. of Turin.

Vol. X

MEZEMNA, a sea-port of Fez, on the coast of the Mediterranean, 80 miles E. of Tetuan. Long. 4. 1. W. Lat. 35. 22. N.

MEZEN, a sea-port of Russia, in the government of Archangel, near the White Sea, at the mouth of a river of the same name, 128 miles N.N.E. of Archangel. Long. 43. 34. E. Lat. 66. 30. N.

MEZIN, a town of France, in the department of Lot and Garonne: seated in a country that abounds in wheat, with vines, from which is principally made brandy; and with the cork-tree, which is sold both in its natural state, and in corks. It is nine miles N.W. of Condom.

MIA, or MIJAH, a large town of Japan, seated on the S. coast of the island of Niphon, with a fortified palace. Long. 130. 40. E. Lat. 35. 50. N.

MIANA, a town of Persia, in the province of Aderbeizan. Here the celebrated traveller M. Thevenot died, on his return from Ispahan. It is 57 miles S.E. of Tauris.

MICHA, a cape of Dalmatia, which advances into the gulf of Venice, near the town of Zara.

MICHAEL, St. the most fertile and populous of the Azores or Western Islands. Its two principal harbours are Ponta Guda and Villa Franca: the former is the capital of the island. Long. 25. 42. W. Lat. 37. 47. N.

MICHAEL, St. a town of France, in the department of Meuse, remarkable for its hospital, and the rich library of a late Benedictine abbey. It is seated on the Meuse, 20 miles N.E. of Bar-le-Duc, and 165 E. of Paris. Long. 5. 38. E. Lat. 48. 51. N.

MICHAEL, St. a sea-port of New Spain, in the province of Guatemala, seated on a small river, 130 miles S.E. of New Guatemala. Long. 87. 45. W. Lat. 12. 25. N.

MICHAEL, St. a town of Peru, in the province of Quito. It was the first Spanish colony in Peru, and is seated near the mouth of the Piura, 225 miles S. by W. of Quito. Long. 80. 50. W. Lat. 5. 0. S.

MICHAEL DE IBARRA, St. a town of Peru, in the province of Quito, 60 miles N.E. of Quito.

MICHAEL, GULF OF St. to the E. of Panama, that part of the Pacific Ocean, which was first discovered by the Spaniards, after their march across the isthmus of Darien.

MICHELONA, a country of Prussia, which is part of the circle of Culm, and separated from the other part by the river Dribeats. It takes its name from the castle of Michelow.

MICHIGAN, a considerable lake of N. America, whose N.E. extremity communicates with the N.W. end of Lake Huron, by the strait of Michillimackinac.

MICHELLIMACKINAC, a strait of N. America, which unites the lakes Michigan and Huron, and lies in 85° W. long. and 46° N. lat.

MIDDLEBURG, a large and strong commercial city of the United Provinces, capital of the island of Walcheren, and of all Zealand. The squares and public buildings are magnificent. The Dutch took it from the Spaniards, in 1574, after a siege of 22 months. The inhabitants are computed at 26,000. The harbour is large and commodious, and has a communication with the sea by a canal, which will bear the largest vessels. It is 20 miles N.E. of Broges, 30 N.W. of Ghent, and 72 S.W. of Amsterdam. Long. 3. 39. E. Lat. 51. 32. N.

MIDDLEBURG, a town of Dutch Flanders, which belongs to the prince of Hensgenin. It is five miles S.E. of Sluys. Long. 3. 26. E. Lat. 51. 15. N.

MIDDLESEX, a county of the state of Massachusetts. Charlestown, Cambridge, and Concord, are the chief towns.

MIDDLESEX, a county of the state of Connecticut, which,

with the county of Tolland, has been recently formed from that of Hartford. Middletown and Haddam are the county towns.

MIDDLESEX, a county of the state of New Jersey. New Brunswick is the chief town.

MIDDLETON, a commercial town of the state of Connecticut, seated on the river Connecticut, 15 miles S. of Hartford. It is one of the county-towns of Middlesex.

MIDDLETOWN, a town of the state of New Jersey, and adjoining Shrewsbury, in the county of Monmouth. Sandy Hook (so called from its shape and soil) is included in this township. On the point of the Hook stands the light-house, 100 feet high, built by the city of New York. Middletown is 30 miles S.W. of New York, and 50 E. by N. of Trenton.

MIDWIFE (*Encycl.*). The following extract from an account of the mode of supplying a country parish with a midwife, by the Rev. Mr. Dolling, late Vicar of Aldenham, Herts, appears in the Reports of the Society for bettering the Condition of the Poor.

"Fifteen years ago (says Mr. Dolling), there being then no midwife living in the parish of Aldenham, I selected a poor widow, who had three children supported by the parish, and sent her up for instruction, to the Lying-in Hospital in Store-street, near Tottenham court-road; where Dr. Osborn permitted her to continue for three months, at a very small expence. Though without any preparatory education, she returned so well instructed, as to exercise her calling in the parish ever since, without a single accident, or ever having occasion to call in medical assistance*. She has been enabled thereby to support herself and her children comfortably: and is now living, and in the enjoyment of the confidence due to her skill. She attends all the day-labourers' wives, at the stipulated sum of half-a-crown.

"The expence of her instruction and setting up, was collected in the parish by subscription; part of which paid for her board in the hospital; and the rest of the money was applied for her journey and incidental expences.—She has been the cause of a considerable saving in the medical bills of the parish, besides being a very great comfort + and relief to the poor."

The expence and trouble of the above was trifling; its benefit, both to the poor and to the parish, considerable: whenever, therefore, a parish is distant from medical aid, and unprovided with a midwife of its own, the above may be recommended to its consideration.

MIECHAU, or **MIEZAWA**, a town of Poland, in Cujavia, seated on the Vistula, 10 miles S. by E. of Thorn. Long. 18. 46. E. Lat. 52. 58. N.

MIGLIANO, a town of Naples, in Principato Ulteriore, 15 miles N.N.E. of Conza.

MIKALIDI, a town of Turkey in Asia, in Natolia, with

a fort, situate on a river, which runs into the sea of Marmora, 35 miles W. of Bursa. Long. 28. 24. E. Lat. 40. 10. N.

MILAZZO, a strong sea-port of Sicily, in Val-di-Demona. It is divided into the upper and lower town; the upper is very strong, and the lower has a fine square, with a superb fountain. It is seated on a rock, on the W. side of a bay of the same name, 13 miles W. of Messina. Long. 15. 34. E. Lat. 38. 12. N.

MILETO, an ancient town of Naples, in Calabria Ulteriore, with a bishop's see, five miles from Nicotera.

MILETS, anciently **MILETUS**, a town of Turkey, in Asia, in Natolia, 64 miles S. of Smyrna. Long. 27. 14. E. Lat. 38. 22. N.

MILFORD, a town of the state of Delaware, in the county of Sussex, seated at the source of a small river, 15 miles from the bay of Delaware, and 150 S. of Philadelphia.

MILHAUD, a town of France, in the department of Aveyron. It was dismantled in 1629, and is seated on the Tarn, 50 miles N.W. of Montpellier, and 142 S. of Paris. Long. 3. 11. E. Lat. 44. 3. N.

MILANE, a town of the state of Algiers in Tremesen, with a castle. It is seated in a country fertile in oranges, citrons, and other fruits, the best in all Barbary. Long. 2. 35. E. Lat. 35. 15. N.

MILK (*Encycl.*). In the village of Barton-under-Needwood, Staffordshire, the principal number of the poorer inhabitants were destitute of all means of procuring this most useful species of food for their families. The benefit which would result, if they could be furnished with that article of food, appeared of so much importance, that, nearly three years since, a specific plan for providing a supply was adopted. A respectable tradesman in the parish expressed his readiness to take a quantity of his land into his own hands, and to employ it in keeping cows, for the purpose of selling their milk to the poor. He mentioned, however, two obstacles, as necessary to be removed. He stated the impracticability of distributing the milk at his own house; as the crowd, which would frequent it for a considerable time every morning and evening, together with the consequent noise and trouble, would be equally unpleasant and inconvenient. And he apprehended that he should receive from the purchasers a quantity of copper coin, larger than he should be capable of circulating again, either in the way of change to them, or in his own business. It was therefore settled, that the milk should be regularly carried from the field to the house of another inhabitant of the village, and sold there: and a friend of the undertaking engaged to pay this person annually for his trouble. The tradesman had also an assurance, that copper coin, to the amount of some guineas annually, should be taken off his hands, if he thought proper. These points being adjusted, the measure was carried into effect at Candlemas, 1795; and it has been continued without interruption to the present

* In the Manchester Infirmary, upon the suggestion of Mr. Simmons, a surgeon of eminence there, a plan for the relief of poor lying-in women has been adopted, which may deserve the attention of other medical hospitals. Upon notice of any difficult case of delivery, the infirmary surgeon of the district, or in his absence the one next in rotation, immediately attends gratis, and assists the poor woman at home; and the Infirmary provides medicines if wanted. The cases that have occurred have been very few, but they were cases of difficulty, and most of them would have been of extreme danger without such medical aid.

+ It seems much better for the wives of the poor, that they should be attended at home, and receive a little pecuniary or other assistance, than that they should be moved into a lying-in hospital; in which case the woman is usually absent from home for a month, her family neglected during her absence, some parochial charge incurred, and she returns home with habits of life not suitable to her situation. If she is attended at home she is generally capable of managing and assisting in her family in a very few days, and the relief is given her at about a tenth part of the expence that would have attended her lying-in at an hospital.

time. The advantages which have accrued from it to the poor, have completely answered the expectations previously formed.

The following brief statement will sufficiently shew the detail of the scheme.

Nineteen acres of land, which might be let to good tenants at 2l. 10s. per acre, are wholly employed in furnishing grafs and hay for the cows, and in rearing two or three calves. The flock of cows constantly kept is seven. Four of them calve at different periods in the spring and summer, and three in the autumn and winter—The price, at which the milk is sold, is three halfpence per quart, from the beginning of August until the time of turning out to grafs in the spring; and one penny, during the remainder of the year. It is always paid in ready money.

The quantity furnished to each poor family is regulated by the number of children in the family, and by other similar circumstances. Some of the purchasers generally attend to see the milk carried from the field to the place of sale: and they are all satisfied that the quality is unadulterated, and the measure ample.

If the milk had been sold at two pence a quart, during the three winter months, and at three halfpence the rest of the year, the account would have been in profit: but, at a penny a quart for the summer half year, there was a deficiency of about 5l. * as will appear by the following statement, made by the tradesman who sells the milk, of the receipts and expences, for one year, ending the 17th of September, 1797.

RECEIPTS.

£. s. d.

One year's receipts for milk	-	-	70	8	5
Milk kept for the tradesman's family	-	-	12	5	9
Sale of young calves	-	-	3	6	0

To the foregoing, which appear in the Reports of the Society for bettering the Condition of the Poor, Mr. Bernard annexes the following observations: he says, "I do not mean to intimate that this plan is preferable to others which have been adopted elsewhere; that object, universally most desirable, may in different places be best attained in different ways; and in some places it may be attainable by that method only which has been described. When this mode is selected, to provide for the permanence of the measure, will generally prove more beneficial, than to require *extreme* cheapness in the price of the article. To be able daily to purchase milk, though at its full value, is a very important advantage to the poor †. A local subscription, however, for the purpose of reducing the price, will frequently be an eligible mode of charity. But, if the seller be urged to dispose of the milk at a rate †, that will not allow him to draw from

* There are many parts of England, in which milk may be had at less cost, than in this part of Staffordshire. Mr. Manfell, of Lathbury Hall, near Newport Pagnell, asserts, that in his neighbourhood, cows may be kept with more advantage and less expence, than in that of Mr. Gifborne. This information is of importance, as it shews that Mr. Gifborne's example may be imitated with great advantage in other parts of England. Mr. Manfell thinks that the lattermath should be kept; and that, where the supply of milk is the object, calves should not be reared; as they consume the richest milk, which should be mixed with the other: he conceives that, in his own neighbourhood, the cutting of hedges will pay the expence of fences; and that nothing need be allowed for changing cows; as an intelligent farmer would make some benefit by buying and selling.

† It would be a great benefit and comfort to the poor, if farmers would generally, or even occasionally, sell them, for ready money, small quantities (as half a bushel) of corn, and single cheeses. The trouble of small dealings, which is the objection alleged, would be trifling, if one or two stated hours, on a fixed day in each week, were assigned for the purpose. By being thus rescued from the impositions too prevalent among millers, bakers, and hucksters, the poor would save, perhaps, two pence in every shilling, not to mention other important benefits.

‡ Milk is an article of very great importance to the poor; it is essential to the nourishment of children, and extremely useful to the economy of families. Where the cottager can be supplied with the means of keeping his cow, his benefit will be very considerable: where he cannot, the mode adopted by Mr. Gifborne is very deserving of attention and imitation. There may, however, be parts of England (particularly where a good deal of butter, or rich cheese, is made) in which the poor cannot in general have new milk: but, in those places, if they could be supplied, either as a gift or by purchase, with skim-milk, even that would be of great use to them; especially as it would come at a very cheap rate. Where the poor can purchase skim-milk, they get it very cheap; it costs them about a halfpenny a quart. To ascertain its utility to a cottager, who has children, try the following ingredients:

Two quarts of skim-milk	-	-	-	-	1d.
Half a pound of rice	-	-	-	-	1d.
Two ounces of treacle	-	-	-	-	0 ½
					2 ½d

These,

his fields a profit equal to the rent for which he could let them, or to the common returns from other modes of husbandry in the neighbourhood, he will probably continue the plan with reluctance, or will ultimately abandon it. In Barton, the price was originally fixed at one penny per quart, from Lady-day to Michaelmas; and at three halfpence, during the rest of the year. But experience proved it to be too low; and the more so, as of late the prime cost of cattle has been very high, and the advantage resulting from raising Butchers' meat, cheese, and butter, proportionally large.

"The tradesman has not had occasion to apply to be relieved from a superabundance of copper coin; a circumstance which suggests the hope that in other places, where the plan now detailed may be instituted, difficulties, apprehended at first, may be found on trial to be of little moment."

The following is extracted from an account of a supply of milk for the poor at Stockton, in the county of Durham, by Robert Clarke, esq. published in the same work.

In October, 1800, upon a farm at Stockton, of 173 acres, belonging to the episcopal demesne of Durham, the bishop, in order to relieve the distress of the poor in that place, on account of the want of milk, especially in the winter season, gave directions for the farm being let upon the old-rent, provided that (in addition to the usual stipulations applicable to a farm, consisting partly of arable land, and partly of dairy land) it should be held upon the following terms: that the tenant, Mr. John Robson, should undertake to keep upon the farm, during his lease, fifteen cows of the best breed and size in the country, over and above the number necessary for his own family; not less than twelve of which should be at one time in milk, and the remainder in calf. The tenant was to sell the milk, unadulterated, and without any cream being taken from it, to the poor of Stockton indiscriminately, whether parishioners or not, at one halfpenny per pint, beer measure in summer, and wine measure in winter. The tenant has engaged to produce for sale in Stockton, and in clean and proper vessels, the milk of these 15 cows twice a-day in summer, and once a-day in winter; every poor person applying, being to be entitled, without any preference, except that which is due to the aged and infirm, to one quart of milk in summer, and one pint of milk in winter; and as to the residue not so disposed of, a preference to be given to cottagers having families of young children.

The mode of selling the milk may be varied by the bishop or his agent; and to prevent any doubts as to the fair disposal of the milk, the tenant is not to sell any milk whatever, except to the poor; nor to sell any butter or cheese to any one; nor is he to make more butter or cheese than may be wanted for the supply of his own family.—In consideration of the preceding stipulations on the part of the tenant, it has been agreed on the bishop's part, that upon the punctual performance of the tenant's agreement to the satisfaction of the bishop's steward, the annual sum of 30*l.* shall be discounted and allowed the tenant out of his rent.

In letting this farm, a particular attention has been paid to

the character of the tenant, in respect of integrity, industry, and regularity. In consequence of what the bishop has done, and in order to incorporate upon his charity a gratuitous supply of milk for those families which cannot earn the means of purchasing it for themselves, the town of Stockton has been since divided into nine districts; in each of which five or six of the most respectable inhabitants have undertaken the office of visitors, and to attend the houses of the poor, so as to ascertain their situations and characters, and their means of livelihood. The consequence is, that upon any application for parochial relief, or for private charity, in the town of Stockton, the visitors may be referred to, and the relief to be granted may be proportioned in manner, and in degree, to the industry, the necessity, and the character of the object. By these means, coals also have been delivered to the poor, with a great attention to justice, as well as to effect; and milk is distributing, at present, to the most necessitous and deserving, by means of tickets issued by the inspectors of the district; so as, in some degree, to confine the benefit of the bishop's charity to those for whom it is peculiarly intended.

In order to give a similar accommodation to the tradesmen, and other inhabitants of Stockton *, and thereby to promote the effect and success of this plan for the benefit of the poor, the bishop has applied a further part of his estate, in providing a cow pasture, and inclosed fields, for the other inhabitants. Four fields, containing together twenty-four acres, have been laid together as a summer pasture; and a number of inclosures are to be subdivided and fenced, and to have cow-houses built in them at his lordship's expence; each of these subdivisions will contain from two acres and a half to three acres, and will be sufficient for hay and winter pasturage for two cows.

It will often come within our notice, that the country poor are more thankful for employment kindly offered, with the occasional aid of a little *skim milk* or spare vegetables for their family, than for any thing that benevolence can give in the way of alms. There is, indeed, hardly any circumstance which does more essential prejudice to the cottager's domestic system of economy, and to the health and well-being of his children, than the difficulty under which he labours, in his endeavours to procure a supply of milk. With that variety of information upon this subject, that has for some time engaged the attention of the Society for bettering the Condition of the Poor, and with the zeal which its president possesses on this and on every other object of the society, it is not to be wondered that he should have given an early and beneficial example, of the means by which this inconvenience may be removed. For the subsistence of children, there is perhaps nothing so exclusively useful as milk; no other food which assimilates and co-operates with every kind of grain of this, and of every other country, and with almost every species of vegetable and animal food; so as to correct and ameliorate our general means of life.

Until the cottager can be supplied with milk, it can hardly

These, either boiled or baked, will produce four pounds of pudding; and, at the expence of hardly more than a halfpenny each, will give a plentiful and wholesome dinner to four children. But it is not unusual for persons in many parts of England, instead of giving or even selling their refuse skim-milk to their poorer neighbours, to throw it to their dogs.

* This town has been fortunate in the attention not only of the bishop, but of Mr. Burdon, one of the members for the county, who has the merit of establishing another milk farm at Stockton for a similar purpose, and with the following covenants:—that the lessors should keep upon the ground ten milch cows, and take all the milk (except what shall be used in their own families) pure, unmixed, and unadulterated, and without having any cream taken from the same, to the inhabitants of the town of Stockton, for the time being, at or under the price of one halfpenny per pint, and in quantities not exceeding three gallons per day to any one person or family; and on performance of this covenant, Mr. Burdon agrees that the annual sum of twenty pounds shall be allowed out of the rents.

be expected that his present thrifless and comfortable table of diet of dry bread, should be changed for a more healthful and economical system of food. But with the full advantage of such a supply as is provided for the poor of Stockton, it is hardly possible but that the cottager will eventually become sensible of the advantages of milk dressed with rice, as a nourishing and palatable food for his children. And whatever prejudices may have existed against rice as a food for the labouring man (prejudices which will not, however, bear the test of experience), no one can doubt of rice, prepared with milk, being a pleasant, nutritious, and economical food for children.

Charity is meritorious, not merely in respect of its motive and principle, but in proportion as it is extensive in its influence, and unexceptionable in its effect; particularly in that of not diminishing or prejudicing the virtue, or energy, of the persons for whose benefit it is applied. As to the sums annually devoted in this instance by the founders of the milk charities at Stockton, it is not easy to say how they could have been otherwise directed with any proportionable advantage; or how any funds can be applied with less risk of impairing the industry and the prudence of those, who come within the scope of its influence.

For an account of the benefit of the arrangement of districts, and of the division of attention in the care and conduct of the interests of the poor, we must refer the reader to the Bishop of Durham's narrative and observations, in the beginning of the second volume of the Reports of the society. With regard to the latter plan, for encouraging the keeping of cows by the tradesmen and other inhabitants of the place, we have only to observe, that it removes every possible degree of odium or jealousy, to which, in some minds, the poor might have been subjected, by the extensive benefits provided for them; and that the additional number of cows thereby kept in the neighbourhood of the town, increases considerably the general supply of milk for that place; thereby diminishing the price, and leaving a surplus to be disposed of among their dependents and poorer neighbours.

MILK-HOUSE, a building designed for the reception and preservation of milk, previously to its undergoing the various processes of the dairy. In Pl. 35, we have given a representation of a milk-house, upon an improved plan, by Dr. Anderson, of Aberdeen.—Fig. 1, represents a plan of the whole structure. A, the dairy in the centre, surrounded by an open passage; B, the entry to the dairy from the north; C, the ice-house; D, the scullery, or wash-house, with the door or entrance from the south, and benches placed beneath; f, a door, which communicates with the milk-house, &c.; h, the fire-place.—Fig. 2, is an elevation of the milk-house A. In this, B B, shew the passages round it; c, the interior window; d, the ventilator or air-pipe; g, the exterior window.—Fig. 3, is a delineation of the ventilator; i, represents the valve at the top; k, another valve at the bottom, which communicates with the milk-house; n, a similar valve, with the passage. The whole of this structure ought to consist of a range of narrow buildings, as in the section first delineated, where the middle division marked A, represents the *milk-house*, properly so called. Dr. Anderson directs it to be built with a double wall, so that a current of air may continually pass, for the purpose of preserving a regular, cool temperature; the inner wall being constructed with lath or bricks, doubly plastered on both sides; and the outer one, consisting of plastered lath: both being carefully worked, so as to render them perfectly air-tight.

The entrance to the dairy ought to be on the north-side B; but it will be requisite, for greater convenience, to make another communication through the door f, into the front-
VOL. X.

room, especially during the winter, when the outer door, E, should be kept continually shut. The external roof ought to be constructed with tiles, or slate, while the inner one should be made of plaster, *slightly applied*. Between both, it will be necessary to leave a vacant space, at least four feet wide, for the free passage of air, as delineated in the elevation above given; in which the letter A represents the inside of the *milk-house*. The letters B B designate the area between the two walls, that gradually diminishes towards the top, till it terminates in the ventilator or wooden chimney d; which ought to be constructed, on three sides, with planks or boards lined with plaster; the fourth, or south front, should consist wholly of glass, carefully closed with putty, so as to render it completely air-tight. Its dimensions may vary at pleasure, from one to two feet in diameter, internally; but it should be elevated at least six or eight feet above the roof; as its effects will be more or less powerful, according to its length.

This tube is furnished at the top with a valve i, placed immediately beneath the air-holes, which may be closed when required; and at the bottom is a similar valve k. The lower pipe, which communicates with the milk-house, is considerably smaller than the upper tube just described. The opening m, is closed on one side; and at n is a valve, which, when shut, prevents any communication between this pipe and the external area. Further, the top of the ventilator is covered with boards, placed in the form of a roof, so that the rain may be thrown off, without impeding the current of air; while, by means of the valves above mentioned, the air, heated by the action of the sun through the outer wall, will immediately escape, thus constantly preserving a due temperature; and, by the same means, all damp and confined air, which is extremely pernicious in dairies, will be constantly expelled.

The building is furnished with a window placed along the slanting interior roof at e, and which is closed down with putty, to prevent it from being opened. Another window, g, is fixed over it in a similar manner on the external roof, so as to transmit the light, without impeding the current of air between the two glasses.

The passage round the milk-house ought to communicate with the external air below, only at the threshold of the door B. But it will be necessary to make a small aperture on every side, about one foot in height from the floor, in order that such area may be occasionally ventilated. Each of these apertures should be secured with a piece of thin wire-work, in order to prevent the approach of insects, or other vermin; and ought likewise to be furnished with a door, or cover, by which it may be opened, or closed, according to circumstances. Further, if this passage be furnished with shelves, and lighted by a glazed window from the inner apartment, so as to admit *light only*, it may be advantageously converted into a pantry for keeping butter, cheese, &c. perfectly cool, independently of its use for preserving the temperature of the milk-room.

The whole of the interior apartment should be finished with hard plaster neatly smoothed, and totally devoid of ornament, so that it may be cleaned as often as becomes necessary. In its centre, Dr. Anderson directs a large stone table to be placed, being about 2½ feet high, 3 feet wide at the least, and of a breadth proportioned to the length of the room. Beneath the table is to be fixed a stone trough, corresponding to the length and breadth of the former, and being about one foot deep, that is, six inches above and below the floor of the milk-house. From the bottom of the trough, a pipe is to be conducted, for the purpose of carrying off the water; and, in case it be supplied by a running stream, it will be requisite to make one side of such trough somewhat lower, that the water may run over, and thus be carried out

of the house. The floor of the building should be constructed with stones neatly laid; and, if these be easily attainable, the shelves, delineated in the elevation above given, should be ~~have~~ ^{be} ~~of~~ ^{made} of the same materials: otherwise, they may consist of wooden planks.

If the mill-house be situated near a large town, where ice could be vended during the summer, Dr. Anderson is of opinion, it would be very beneficial to the owner, to erect an ice-house contiguous to this dairy, as represented at the letter C, in the plan, fig. 1, in the plate. He recommends it to be surrounded by a double wall on three sides, with a passage or area intervening, as in the dairy. The receptacle for the ice ought to be formed of upright posts, lined with wattled-work of wands, or with clove rail-work, but so as to leave a walk two feet and a half wide every way; round which a gutter should be made to carry off such water as may drain from the ice. This is, in his opinion, the cheapest method of building an ice-house in any situation; and is far preferable to the usual mode of making vaults, which are not only more liable to be damp, and become mouldy, but are also far more expensive, and by no means so well calculated to preserve a gentle coolness, and an equal temperature, at every season.

The apartment, marked with the letter D, is designed as a repository for the utensils of the dairy, in which they may be cleaned and arranged. For this purpose, it will be advisable to place shelves round the walls, together with tables, and such other articles as may be found necessary. Its entrance should be from the south, where the roof projects about two feet over the wall, as at f, which door communicates immediately with the milk-house, and may be occasionally opened in the summer; but which alone ought to be used during the winter, when the chief entrance, B, should be constantly shut. At one end of this apartment is a fire-place, on which a cauldron, proportioned to the size of the dairy, ought to be fixed; in order that there may be a continual supply of warm or hot water.

Such is the outline of Dr. Anderson's ingenious plan, which appears to be well calculated to enable attentive dairy-men to keep their milk of an equal temperature at all seasons, while they may, at the same time, carry on the necessary operations with little trouble or expence. Those of our readers who wish to become more intimately acquainted with the whole economy of the milk-house, will not without instruction peruse Dr. Anderson's *Practical Remarks on the Management of the Dairy*, which were originally published in the 5th vol. of the *Letters and Papers of the Bath Society*; but which have been considerably enlarged in the 3d vol. of the new series of his valuable miscellany, entitled *Recreations in Agriculture*, &c.

MILL (*Encycl.*) The following account of a family-mill, invented by Mr. Thomas Ruffall, was presented to the Society for the Encouragement of Arts, &c. who voted him a premium of forty guineas, in 1800.

In Pl. 35, fig. 1, A, is the handle of the mill; B, one of the mill-stones, which is about 30 inches in diameter, and 5 inches in thickness, moving with its axis C; D, is the other mill-stone, which, when in use, is stationary; but which may be placed nearer to, or at a distance from, the moveable stone B, by means of three screws passing through the wooden block E, that supports one end of the axis C; after it has been put through a hole or perforation in the bed-stone. The grain likewise passes through this perforation from the hopper F, into the mill; F, represents the hopper, which is agitated by two iron pins on the axis C, that alternately raise the vessel containing the grain, which again sinks by its own weight. In consequence of this motion, the corn is conveyed through a spout, that passes from such hopper into the centre of the mill behind, and through the bed-stone D. G, a paddle, re-

gulating the quantity of corn to be delivered to the mill; and, by raising or lowering which, a larger or smaller proportion of grain may be furnished: H, the receptacle for the flour, into which it falls from the mill-stones, when ground: I, represents one of the two wooden supporters on which the bed-stone, D, rests. These are screwed to the block E, and likewise mortised into the lower frame-work of the mill at K, which is connected by means of the pins or wedges L, L, that admit the whole mill to be easily taken to-pieces: M, a fly-wheel, placed at the furthest extremity of the axis C, and on which another handle may be occasionally fixed; N, a small rail, serving to keep the hopper in its place; the furthest part of such hopper resting on a small pin, which admits of sufficient motion for that vessel, to shake forward the corn: O, a spur-rail, for strengthening the frame-work of the mill; P, the front upright, that is mortised into the frame-work, and serves as a rest for the end of the iron axis C, which is next to the handle. On each extremity of such axis, there is a shoulder, which keeps it steady in its place. Lastly, there is a cloth-hood fixed to a broad wooden hoop, and which is placed over the stones while working, to prevent the finer particles of flour from escaping.

Fig. 2, represents the bolter, with its front removed, in order to display its interior structure; the machine being 3 feet 10 inches in length, 19½ inches in breadth, and 18 inches in depth. A, is a moveable partition, sliding about four feet backwards or forwards, from the centre of the box, upon two wooden ribs, which are fixed to the back and front of the box, and one of which is delineated at the letter B; C, the lid of the bolter represented open; D, a slider, which is moveable in a groove made in the lid, by means of two handles on the back of such lid; E, a forked iron, fixed in the slider D, and which, when the lid is shut, takes hold of the edge of the sieve F, and moves it backwards and forwards on the wooden ribs B, according to the agitation of the slider; G, represents a fixed partition in the lower centre of the box, which it divides into two parts, in order to separate the fine from the coarse flour; from this partition, the slider A moves each way about four inches; and thus affords room for working the sieve: H, a board that is parallel to the bottom of the bolter, and forms part of the slider A; this board serves to prevent any of the sifted matter from falling into the other partition: I, represents two of the back feet, which support the bolter.

Fig. 3, of the plate above mentioned, is a view of the top, or upper part of the lid of the bolter; K, the slider that moves the lengthwise of the bolter; L, L, the handles by which the slider is worked; M, a screw, serving to hold the fork, which imparts motion to the sieve.

Fig. 4, represents the forked iron, E, separately from the lid. Both the mill and bolter may be constructed at a moderate expence, and they occupy only a small space of ground. The former may even be worked in a public kitchen, or within a room in a farm-house, without occasioning any great incumbrance.

The particular excellence of the mill consists in this circumstance, that, from the vertical position of its stones, it may be put in action without the intervention of cogs or wheels. It may be employed in the grinding of malt, the bruising of oats for horses, and for making flour, or for all these purposes: it may likewise be easily altered, so as to grind either of those articles to a greater or less degree of fineness.

Another advantage peculiar to Mr. Ruffall's contrivance is, that one man is sufficient to work it; though, if two persons, namely, a man and a boy, be employed, they will be able to produce, in the course of two hours, a quantity of flour sufficient to serve a family, consisting of six or eight persons, for a whole week:—repeated satisfactory trials have proved, that

this mill grinds the corn completely, and at the rate of one bushel of wheat within the hour. Besides, the industrious farmer will thus be enabled to make comparative experiments on the quality of his grain, and may furnish himself, at a trifling expence, with flour from his own wheat; without apprehending any adulteration; or without being exposed to the impositions, or caprice, of fraudulent and avaricious millers.

Lastly, though Mr. R.'s bolter be more particularly calculated for sifting flour, it may also be applied to various other useful purposes, and especially with a view to obviate the inconveniences necessarily attendant on the levigation of noxious substances, and to prevent the waste of their finer particles.

The original mill may be inspected in the Repository of the Society for the Encouragement of Arts, &c. Adelphi; and we understand from Mr. Taylor, the secretary to this patriotic association, that the inventor of the machinery, Mr. Thomas Rustall, wheelwright, of Purbrook-heath, near Portsmouth, engages to furnish the whole apparatus, and to deliver it free of carriage, in London, for the moderate price of *twenty guineas*.

MILL-REEK, a dreadful disease, caused by the poisonous fumes of melted lead, which affect not only those who are employed in the smelting or preparing of that metal, but likewise all who reside near the mines whence it is dug, or contiguous to the furnaces, &c. where it is worked.

On the first attack of this disease, the patient feels a weight and uneasiness in the region of the stomach, and a slight degree of colic in the bowels: the pulse is low; the appetite impaired; the legs become feeble, and the whole body is debilitated. Sometimes these symptoms abate in consequence of a slight diarrhoea; though, if the latter continue for some time, it is always attended with danger.

At first, however, the patient is not prevented from following his usual occupations; but, if the disorder progressively increase, and he neglect to apply for relief, the next symptoms will be, obstinate costiveness, violent pain in the intestines; a troublesome giddiness, insensibility, and delirium. The extremities become convulsed; the pulse intermits; and, at length, the highest degree of palsy, or apoplexy, closes the distressing scene.

The *mill-reck* is of a similar nature and origin with the *Devonshire-colic*, of which we have already treated. We cannot, however, conclude this article, without recommending the following precautions, which the editor of the Domestic Encyclopedia takes from the first vol. of the *Edinburgh Essays and Observations, physical and literary*, &c. It is certainly a duty incumbent on all those persons who are in any manner connected with the manufacture of lead, or who reside in the vicinity of lead mines, to spread and inculcate the means of rescuing many industrious members of society from a most painful death; or, if a person be attacked by this terrible disease, to contribute their share towards preserving them from feeling its extensive horrors.

1. No labourer should be suffered to repair to his work, *sifting*; his food ought to be fat and oily; and it would be very beneficial, if he were to drink a glass of sweet oil, either pure, or mixed with a little brandy, every morning.

2. It will be advisable to take some aperient physic, not only in the spring and in autumn, but likewise, as often as any symptoms of the mill-reck, however slight, are perceived.

3. No spirituous liquors should be allowed, or, at least, be very sparingly used, especially while the labourer is at work, or immediately after it.

4. No workman in a state of perspiration must expose himself to the cold air; but he should retire to his home, as

speedily as possible; and, after having changed his clothes, cool himself gradually.

5. Immediately after the labourer returns from his work, he ought to take some nourishing aliment, which should principally consist of fat broths, or similar liquids.

6. The diet should be wholesome and nourishing; because scanty or poor food disposes such persons to be more frequently affected, and renders them too feeble to undergo a complete cure.

Lastly, as often as their employment will permit, they ought to visit an open country, where they may breathe an untainted air, and find provisions free from the noxious fumes of lead. Particular care must, however, be taken not to venture upon long journeys; because such persons will be more fatigued, and reduced; by travelling one day, than by labouring two days in the lead-mines.

MILTENBERG, a town of Franconia, in the electorate of Mentz, seated on the Maine, 20 miles S.E. of Alschaffenburg. Long. 9. 19. E. Lat. 49. 46. N.

MILTON ABBEY, a town in Dorsetshire, with a market on Tuesday. It is famous for a ruinous abbey, built by king Athelstan, and for a magnificent Gothic church. It is 14 miles N.E. of Dorchester, and 112 W. by S. of London. Long. 2. 32. W. Lat. 50. 50. N.

MINCIO, a river of Italy, which rises in the lake Garda, and passing by Pelfchiera, forms the lake which surrounds the city of Mantua, and afterward runs into the Po.

MINCKENDORF, a town of the archduchy of Austria, situate on the Triesting, six miles E.N.E. of Baden.

MINEHEAD, a borough in Somersetshire, with a market on Wednesday. It has a good harbour on the Bristol Channel, for ships of large burthen; and carries on a trade in wool, coal, and herrings. It sends two members to parliament, and is 31 miles N. of Exeter, and 161 W. by S. of London. Long. 3. 34. W. Lat. 51. 12. N.

MINER, a workman or labourer in the mines. The following general view of the situation of the miners, compared with that of some other classes of the poor, by the Reverend Thomas Gisborne, is published by the Society for bettering the Condition of the Poor, with the hope of awakening the attention of the higher orders of the community to the abject state of this useful class of men. He very justly observes, that the respective occupations of the different classes, into which the poor of this country may be divided, are found to produce important effects, not only on the habits of life, but also on the moral character of each class. To state with brevity the principal of these effects, as they severally appear exemplified in two or three of the most numerous classes, together with some practical remarks, may not be useless; since, from such a statement, persons who are solicitous to benefit and improve the poor in their vicinity, may derive occasional suggestions as to the particular channels, in which their exertions are likely to be the most needed, and most beneficial.

It would be desirable to speak successively of the situation of miners, of fishermen, and of manufacturers; illustrating each by incidental references to that of labourers in husbandry. The present paper will be confined to the case of miners.

Miners are commonly exempted, by the nature of their work, from the superintending inspection of their employer. The latter, in consequence, finds the mode of paying them a certain sum per day unadvisable. He sets them their task by the great, trusting the mode to prevailing custom and other local circumstances. In Derbyshire, the workmen frequently take a mine, or bargain for a determinate period, as three months, on the terms of receiving a settled price for each measure of ore which they shall produce; or occasionally, on the condition of being themselves allowed to purchase all the

ore at a stipulated rate. In Cornwall, the established course of proceeding is not substantially different. Hence there is a fundamental diversity between the gains of the miner and those of the husbandman. The husbandman, in general, earns a fixed sum per week. If he sometimes undertakes task-work, the amount of his earnings may still be foreseen with tolerable accuracy; and it has a known limit in the strength of his body, and in his skill in the particular sort of work. But the pay of the miner depends upon chance. The working miner is almost always in some measure a gambler, and embarks in the adventure of the mine. The ore may be found deposited in ample or in scanty veins; may be with ease, or with great difficulty, detached from its bed; it may stretch far and wide in an unbroken range, or it may be suddenly removed many yards to a higher or a lower level. Even in breaking up ground which does not contain veins of ore, the miner is still a gambler. The work is put up to a kind of auction; and the person who will undertake it on the cheapest terms is preferred. His bargain proves good or bad, according to circumstances. He may find himself engaged upon a mass of soil, which yields readily to his spade, and pick-axe; or retarded in his progress by rocky strata, whose stubborn opposition must be overcome by gunpowder.

The earnings, however, of the miner, though precarious, are on an average great; and in many instances very far exceed all prospects of gain which a labourer in husbandry can propose to himself. Those miners who are industrious, and at the same time frugal, often make a conspicuous use of the opportunities which they possess, of improving their situation. With the surplus of their gains they purchase little spots of property (in Cornwall, chiefly on leasehold tenures), and cultivate them in their hours of leisure.

But, in common, the miner is not disposed to adjust the scale of his expenses to the *average* of his earnings. Being accustomed to the occasional receipt of considerable sums of money; money too which has flowed in suddenly upon him, rather from good fortune than from proportionate exertions; he often raises his expenditure and mode of living to a pitch, to which the labourer in agriculture ventures not to aspire. He feeds on better diet, and wears clothes of finer materials, than the husbandman. And, in general, he perishes in this manner of life, in spite of a change of circumstances. He is buoyed up with the sanguine hopes of a gamester; and, for what he cannot pay to-day, draws on the favourable luck of to-morrow. This natural propensity is cherished and aggravated by the ease with which he obtains credit, in comparison of those classes of labourers, whose gains, though steady, are limited. If he happens to be unsuccessful, he is trusted nevertheless at shops, and permitted to run up long scores at public-houses; through the hopes entertained by the shopkeeper and the publican, that a day will come, when fortune will smile on the debtor. Thus the habits of the miner are seldom interrupted by any rubs and difficulties, which may teach him caution. He has less occasion than most other men to dread the immediate inconveniences of poverty; and does not willingly learn the necessity of frugality and fore-cast.

Miners very frequently work and live in large companies. Hence naturally arises the communication and the encouragement of vice. In Derbyshire it is observed, and the case is probably the same elsewhere, that, when only two or three miners work together, they are frequently much more sober and orderly than the rest of their class. Among the vices of miners, those are naturally prominent, which are usually associated with rudeness of character; as riotous dispositions, impatience of supposed grievances, and discontent inflamed by

the contagion of turbulence and clamour, and filling with just alarm the adjacent country.

Drunkenness is a vice, to which particular classes of workmen are allured, in an especial manner, by the nature of their employments. Blacksmiths, glass-makers, and they who labour in other ways at the forge and the furnace, are led, by intense thirst and exhaustion of strength, first to the use, and then to the abuse, of strong liquors. The cold and dampness of subterranean situations, and in some measure the powerful exertions of subterranean labour, produce a similar effect on the miner. Several other causes concur; numerous and unprincipled society, large gains, and, in many cases, much vacant time. In Derbyshire and Cornwall, the miners frequently do not work above six hours—and, in the former county, sometimes even but four hours—in a day. The ease, too, with which a miner has obtained credit, often proves a temptation to excess. He who has met with a friend in the time of need, in the keeper of an alehouse or of a brandy shop, will feel inclined, when he has money, to spend it freely at the house of his friend, partly from gratitude, and partly from the hope of obtaining credit hereafter. Another inducement to drunkenness remains to be mentioned; namely, the custom which prevails in some few places, of paying the miners, on Saturday evening, by a bill, for a sum which is to be divided among them. These men, however disposed to depart home with their wages entire in their pockets, are absolutely forced to go for change to the neighbouring public-house: the master of which is known regularly to provide himself with cash, to answer the demand. During the division something must be spent. From this custom many miners, once sober and well disposed, have probably had to date the commencement of habits of ebriety.

The labourer in industry is commonly attached to some particular family, either of a private gentleman, or of a farmer. In the former case, it generally happens that he receives from his employer many little favours. In the latter, he is perhaps furnished with corn at a price lower than that of the neighbouring market, or enjoys some similar advantage. Hence the master acquires an influence over the conduct of his workmen; and is often seen to exert it in promoting their comfort, and guarding them from extravagant and profligate courses. The connection, which subsists between the proprietor of a mine and the working miner, is comparatively slight. The latter considers himself as independent; frequently shifts his quarters; and is little under the control of authority, or of persuasion.

Another circumstance in the situation of miners, which is unfavourable to domestic frugality and good management, is to be traced in the sort of women which they often choose for wives. At almost every mine, there is a number of women, daughters in general of the mining poor, who earn their livelihood by picking and washing the ore, and performing other operations of the same nature. In these employments they have been busied from their childhood. A young mining labourer takes a hasty liking to one of these young women, and marries her, without thinking about consequences. This is the history of a multitude of marriages among miners; and, circumstanced as the parties are, it is natural that the case should be so. The wife, however, is not likely to have found the mine an excellent school, either of virtue, or of economy. Nor is it, in consequence, very surprising that waste, profligacy, and dram-drinking, should be almost among the ordinary habits of a miner's family. The daughters of the husbandman are commonly brought up much more under the eye of their mother. They help her in nursing and spinning, and other occupations at home; and when they go out

to work in the field, it is frequently in her company. They stand, therefore, a better chance of being trained in morality and religion, and the arts of female industry; and become habituated to that economy, and those various contrivances, which actual necessity forces on the wife of a day labourer. They of course will, in general, make more virtuous and more prudent wives, than young women who have been accustomed, from an early age, to the company and example of the mixed crowd of their own sex and of the other, which is usually assembled at the mine and the stamping mill.

The colliers in the vicinity of the Tyne form so large a body of men, and shew so strongly marked a character, that some distinct account of them seems proper to be subjoined.

Few undertakings open the door so soon to the employment of the young, and few operate so powerfully to impress durable habits on the mind of youth, as the coal trade.

Boys enter the subterranean workings at the age of six or seven, in the character of *trap-door keepers*, an employment suited to their years; the labour being little more than to open and shut doors, fixed for conducting air round the various works, when the coals are passing through them from the workmen to the shaft.

In this situation they remain four or five years, with little intercourse during the hours of labour (which are from 12 to 18 out of the 24), either with their equals in years, or with their superiors; and hear little that can influence their minds, except the noise of imprecations spreading through the works, from the pitman contending with his overseer, down to the half-grown youth, employed in leading the coals from the workmen, and imposing upon his younger partner in the labour, a disproportionate share of the work, to procure ease to himself. When they reach the age of ten or twelve years, a more laborious station is allotted to them.

They then become what are termed *lads* or *foals*; supplying the inferior place at a machine called a tram, where two are employed in drawing the coals from the workmen to the shaft. In this situation they are subject to the most harsh usage from their superior in the work, who frequently forces upon them, with profane and abusive language, followed by blows, a greater share of the labour than they are able to perform. Hence, in order to avoid punishment, they soon learn habits of deceit and evasion; and scruple not to practise them, whenever they seem expedient, at the expense of truth and honesty. And when the period arrives, which places them in the station from which they have received so much abuse, they seldom fail to retaliate on those, whom progressive advancement from the trap-door to the tram brings into their power.

In every subsequent step towards manhood, they consider it as a merit to deceive and over-reach. In their next stage of occupation they are employed, during one half of their time, in *putting* and *drawing* the coals: and, during the other half, in raising the coal from its bed. Here a wider field opens itself to the display of their ingenuity in the art of evasion; and new incentives impel them to the exercise of it. Let loose from even that small degree of restraint, under which they considered themselves as held by the authority of their parents (for at this period they generally become their own masters, having the full disposal of the product of their labour), and inflamed with the growing passions of youth, they indulge themselves, with the most vicious emulation, in the scenes of intemperance and profligacy. If they are, at any time, without the means necessary to procure those indulgences, they study to avail themselves, in their respective departments, of every artifice (however injurious to the interest of their employer) to complete their purpose. Thus, by

slow but perceptible degrees, the mind becomes poisoned with wicked principles and guilty habits.

The hours devoted to what they term their amusement, are not less prejudicial to the moral character. At a very early period in life they attend the haunts of their fathers at public-houses; where their growing fondness for strong liquors is encouraged, rather than checked, by their parents; and the child soon becomes a man in the frequency of intoxication. To gratify this passion for intemperance, which is a leading characteristic of pitmen, they endeavour to enhance the price of their labour by every art in their power; and in this, as well as in every other transaction with their employers, easily sacrifice the principles of rectitude, to promote their selfish designs.

The early age, at which the child is separated from the parent, and the little communication which they have with each other afterwards, visibly impair those affectionate feelings, which constitute parental happiness.

They seem to consider their children chiefly in the light of servants and dependents, from whose labour they expect to reap advantage; and are little solicitous to impress on their minds, habits of sobriety, honesty, and truth; and thus to train them in the paths of religion.

For the purpose of inculcating Christian principles, Sunday schools have been established. While the institution was novel, they were numerously attended. As soon as that impression lost its influence, they became far less frequented. And no representations of the good effects of such institutions, have been sufficient to prevail upon the parents to enforce attendance by their authority. Even where daily schools have been established by some of the opulent coal-owners, the pitmen frequently do not give their children the advantage of that little education, which might there be obtained, antecedently to the period when they enter the pit.

When the principles are thus habitually depraved, it is not to be expected that much attention will be paid to the duties of religion. By most, even external forms are disregarded; and the time, which ought to be spent in attendance on divine worship, is generally dissipated in frivolous pursuits, vulgar athletic exercises, or in drinking at public-houses. Where attention to religion prevails, the good effects are manifest. Colliers of that character are usually sober, industrious, honest, and frugal, both in themselves and in their families.

Another trait in the character of a collier, is his predilection to change of situation. Whatever may be the comfort and conveniences resulting from his connection with any particular employ, he sacrifices them all to his love of variety, and the hope of superior advantage; so that annual changes are almost as common with the pitman, as the return of the seasons; and, not unfrequently, the succeeding year finds him in the same situation, which he quitted twelve months before. And whatever favours he may have received, he is disposed to consider them as all cancelled by the refusal of a single request.

It is to high wages, that many of the criminal habits, so often attached to the character of a collier, may in part be ascribed. He is furnished with the power of obtaining more than the necessities of life; and being destitute of the principles, which would teach him to apply the surplus to proper purposes, he squanders it in the gratification of gross sensuality. To economy he is, in general, an utter stranger. It is no unusual thing to see a man and his family, during the first week after they receive their wages (which are commonly paid to them once a fortnight) indulging themselves in the use of animal food three times a-day; and in the succeeding week living on a little rye bread, with oatmeal and

water, until the next receipt of their wages enables them to return to a course of luxury. The contrast between the pitman and the labourer in husbandry is very striking. The latter, with 9s. a-week, is seen keeping himself, his wife, and several children, from whose labour he reaps little advantage, with all the appearance of decency and frugality; and even allowing out of his wages something for the education of his children: while the former with 16s. a-week, and often more, together with the labour of his family (which, if it consist of three or four boys, brings him in from 20 to 30s. a-week in addition to his own gains), passes half of his time in luxury and riot, and the remainder in filth and poverty. The manners of the pitman are said evidently to have altered, within a few years, materially for the worse.

"As the preceding account of the colliers (says Mr. Gifford), does not represent them in an attractive light, it is the more incumbent on me to say, that I speak from concurrent information, derived from different sources, each of high authority. Many exceptions to the general description undoubtedly exist.

"The preceding statement contains facts of such a nature, that the perusal of it will probably suggest to the reader several practical remarks. There are, however, some points, on which it may be useful to add a few words.

"The first evil, in the situation of miners, which ought to be remedied, is the very little education and religious instruction, which their children in general receive. How are these children, when they compose in their turn the next generation of the mining poor, to discharge their duty to God and man, if they are not impressed early with the principles, from which the sense of religious and moral obligation flows? The institution of Sunday-schools is one excellent mean for the attainment of the object in question. Every possible encouragement ought to be given to them, and persuasion and little premiums and all other fit inducements should be employed, to secure the regular and cheerful attendance of the scholars. Another method of improving the parents, as well as the children, has been recently and deservedly recommended by an eminent prelate; namely, the erection of additional chapels in populous districts. Let it here be generally observed, that, in every plan for improving the character of the mining poor, the proprietor of the mine and the clergyman of the place ought cordially and actively to co-operate. Each has it in his power to contribute to that improvement; and, in proportion to his power, each is responsible.

"The predominant vice of drunkennells calls for the most vigilant counteraction.—Let the number of public-houses be reduced within as narrow limits as convenience will permit: and the conduct of publicans be carefully observed by the gentlemen and magistrates of the country. Let the very pernicious custom, of paying miners by a bill to be changed at the public-house, be immediately abolished. The temporal distresses, which result from ebriety, afford arguments proper to be urged to individuals, in proportion to their intrinsic force. But I know no method of recalling guilt to the paths of rectitude, either in public or in private life, likely to be durably efficacious, except this: first to impress the mind with a conviction of the truth and awful import of Christianity; and then, to point out the bearings of Christian commands and prohibitions on the particular subject, with respect to which you wish to accomplish a reformation. He who, under the impulse of brutish appetite, disregards all considerations of injured health, wasted property, a heart-broken wife, and starving children, may pause, tremble, and be reclaimed, when he sees that the "drunkard" has his place in the dark catalogue of those, who "shall not inherit the kingdom of God!"

"The use of profane language may be in a great degree repressed by care, on the part of the proprietor, to appoint conscientious agents and superintendants over his works. I could name more than one instance of captains of men-of-war, who, by suitable penalties and personal exertions, have almost eradicated that vice from their ships. Why should it be more difficult to be subdued in a coal-mine?

"Deceit appears to be among the general faults of miners. It is stated as one of the characteristics of the Newcastle colliers: and a similar reproach is applied to the miners in Derbyshire, who are said by practice to have attained great adroitness in disfiguring the sides of a mine, when the time, for which they have taken it, is expiring, that the owner may be entrapped into a new bargain advantageous to the workmen. By a due choice of agents, let the tyranny of the elder partner over his colleague at the tram, one principal source of deceit, be prevented. And, universally, let the love of truth be habitually encouraged, and traced up to Christian motives.

"In opposition to the spirit of mutiny and discontent, it may easily be shewn, and it ought to be inculcated, that no principles are, on the one hand, more adverse to turbulence and anarchy, nor, on the other, more favourable to genuine freedom, than those of the religion which we profess; and that corresponding praise belongs to those of the constitution under which we live.

"The propensity to change of situation, which prevails among miners, to the detriment of themselves and their employers, will be best encountered, by solicitude, on the part of the proprietor, to attach his workmen to himself, by rendering their condition comfortable. Let him make their cottages neat, and moderately commodious; adding to them ample gardens, and affording to each family an opportunity, as far as may be practicable, of keeping a cow, or of purchasing milk: let him study to allure them to habitual cleanliness, when above ground. Let him invite them to foreswear, by encouraging the establishment of friendly societies; the advantage of which to miners is the greater, on account of the frequent accidents to which they are exposed; and let him promote similar institutions for the benefit of widows and orphans. Let him set up schools, where the girls may be instructed in sewing, knitting, and spinning, and those little domestic arts, which will be of the utmost utility, when they become wives and mothers. By abundant ventilation, and other suitable contrivances, let him render the different subterranean occupations salubrious, and as free from disagreeable circumstances of every kind, as the nature of the case will admit."

From the pen of the same benevolent writer we have the following account of the provisions made for the benefit of the Duke of Bridgewater's colliers, near Manchester.

The Duke of Bridgewater pays his colliers, in the neighbourhood of Manchester, monthly. He has established shops, and a little market for them; and when his agents pay the wages, the shop-keepers bring in their monthly bills. These the agents discharge, and give to each collier his surplus. Thus the collier always has credit for necessaries and reasonable comforts; and, at the same time, is not able to squander the mass of his gains, to the injury of himself and his family. Debts at public-houses are not allowed to be brought in. The butchers and other tradesmen, being the duke's tenants, dare not be exorbitant in their charges, or fraudulent as to the weight of their commodities. The duke lets to his colliers their houses at a low rent, and nearly at a price. To the best and pleasiest of these houses, he prefers those colliers, who have been the longest time in his service, if they have behaved well. They are, however, all tenants at will. These

circumstances operate as ties and encouragement to good conduct. All the workmen are bound to contribute to a general sick-club. The duke's colliers are stationary with him: a neighbouring magistrate informs me, that he hears few complaints from either side; and that the colliers there are more moral than the weavers who are spread over the adjacent country. Some of the duke's agents are men of a religious cast; and have established Sunday schools for the instruction of the children.

What has been done in this instance is worthy of attention and imitation, as tending to diminish the evils and inconveniences, to which the class of men under consideration is peculiarly exposed. Colliers and miners, however, are so numerous in some parts of England, and are subject to so many and so great disadvantages, that they merit more attention than they have yet received. No persons stand more in need of the advantages of a religious education, and none are so little favoured in that respect, or possess so few means of correcting the vices and infirmities to which they are peculiarly liable.

Of miners and colliers it is to be observed, that living in large companies, without favourable examples of conduct before them, and being, through the circumstances and mode of their employment, little subject to the control or influence of their employers, they are naturally turbulent, passionate, and rude in manners and character.—Their gains are large and *uncertain*; and their employment is a species of task-work, the profit of which can very rarely be previously ascertained. This circumstance gives them the wasteful habits of a gamester, leading them to trust, without forethought or apprehension, to the extraordinary success of to-morrow, for the support of their families. Their labour being under ground, liable to subterraneous damps, and attended with strong exertions, they are, almost of necessity, led to the use, in a certain degree, of strong liquors; and thence by a natural progress, too often proceed to habitual drunkenness.

The first and best corrective of these evils, would be a religious education. It is obvious to every one, who visits the counties where colliers and miners abound, that their children have not the fair and ordinary advantages of instruction: that, placed in a situation of life in which they can have very little hope of improving by domestic example, they are so disunited from the other classes of the community, as to be, in a great degree, though living in a Christian and civilised country, excluded from the common benefits of religion and civilisation.

This observation applies to a numerous class of our fellow-subjects: a class, to which education and early habits of religion are particularly necessary; as nothing can have so efficacious a tendency to improve the conduct of men thus circumstanced, as a just sense of revealed religion, and of the rewards and punishments of a future state.

It is likewise of great importance, that colliers and miners, particularly, should be habituated to the desire of acquiring permanent property; and, with the surplus of their profits, be enabled and induced to purchase little spots of ground, as objects of cultivation, and employment for their leisure hours. Those miners, who do this in Cornwall (and there are many who in that county, with the surplus of their gains, purchase little spots of ground, chiefly on a leasehold tenure), are in every respect a better class of men.—They are kept from ale-houses, by finding, in their own little property, amusement and occupation for their vacant time; they acquire habits of fore-thought, because they enjoy the benefit of it; and become orderly and civilised in some measure, because they derive an additional motive to behave aright, and consider

their conduct as more subject to observation, in consequence of their being possessed of property.

MINERALOGY (*Encycl.*). As the pleasing and instructive science of mineralogy, after having made such rapid strides upon the continent, for these ten years, is daily making more and more progress in this island, where our gentlemen farmers, and manufacturers, begin to think it a shame to be ignorant of substances under their eyes, of which a proper knowledge may often turn to good account; we have little doubt but that the following directions for the mineralogical traveller, by the celebrated Saussure, author of the *Journey to the Alps*, in 4 vols 4to. will be acceptable to our readers.

1. The most necessary instrument to take with you, is a miners' hammer. You must have it of at least two sizes: one small, to break the little pieces, and the pebbles, holding them in your left hand, while you strike them with your right; the weight ought to be, including the handle, about 10 oz.: the other, to strike fragments out of the rocks, and to break large pieces, ought to be four times the size of the former. When I travel on horseback I have these two hammers put in my fiddle-bows.

2. Two chisels used by stone-cutters: one small, about a line or a line and a half broad at the point, to detach little crystals, or other minute objects; the second should be about seven or eight lines, that is, three quarters of an inch, in breadth.

3. To try the hardness of fossils, you must have a *steel* briquet; a triangular file, rather fine; and a strong point or needle of tempered steel.

4. Nitrous acid, and the boxes with re-actives (*boîtes à réactifs*) of M. de Morveau.

5. An artificial magnet in a case, with a pivot of steel, upon which it is placed, to try the magnetism of fossils.

6. A magnifying glass of three inches focus, in order to form a general idea of a fossil; another of one inch, to study its separate parts; and one of five or six lines, for a more accurate examination. These three magnifiers ought always to be in the pocket of the traveller; but, besides these, for the cabinet, and any lasting residence, he ought to have a microscope with a micrometer.

7. Perspective glasses to observe the inaccessible heights, and the distant mountains.

8. A pocket-book with leaves of prepared paper, on which to write with a pencil of tin-fool (soudure d'étain, *gr. etain*?) which one is not obliged to be always mending, and the writing is not so easily effaced as of black-lead. In this pocket-book must be entered, on the very spots, the sketch of one's journals, and notes of any observations that may arise; but every evening these notes should be copied with the pen, preserving, nevertheless, the originals, which have always a character of truth, to which one is glad to recur.

9. Some quires of brown paper, of which some sheets should be carried in the pocket, to wrap up, and mark, one by one, and on the spot, the pieces of stone which are collected; they must afterwards be packed with hay in a bag for this purpose, till there be enough to fill a packing case, to be sent home by the carriers as occasion may serve. But in the midst of the journey, as it is fatiguing to load one's pockets, and as the guides often lose them on purpose to get rid of the trouble, I have behind my saddle two leather bags, in which I put them till I come to a resting-place, where I have time to wrap them in hay, and put them into my canvas bag. M. Besson recommends to voyagers to write the tickets with China ink, if the minerals be to be sent from afar, because many accidents may discolour common ink.

10. The blow-pipe and its accompaniments. As I make much use of it, which is fatiguing, though I know very well

to use my cheeks only, without blowing from the bottom of my breast, I make use of portative bellows, *a deux vents*, each side being sixty-two square inches in surface. These bellows may be hung on the side of any table; and I put them in motion by pressing the handles between my knees, which again separate by a spring. This apparatus is easily carried, and very convenient.

11. A femicircle, traced, and graduated, upon a thin plate of copper, of a form exactly rectangular, with a plummet hung in the centre of the femicircle. This is the most commodious instrument to measure the inclination of beds, veins, and slopes; and may easily be carried in the pocket-book.

12. A compass, with an *alidade*, to take the direction of mountains, chains, and beds of fossils.

13. A pocket-barometer, with two thermometers, both mercurial; one fixed to the barometer, to measure the temperature of its mercury, the other with a naked bowl, to measure the temperature of the air. Those who are studious of meteorology should also have a hygrometer, and an electrometer; those who understand geometry ought to be provided with a sextant, with its artificial horizon, and a chain to measure a base, and then take the height of an inaccessible peak, of the breadth of a river, &c. With the sextant, latitudes may be taken; but the longitude requires much practice and acquaintance with astronomy.

14. It is necessary to have some tools to repair an instrument, in case it be deranged; as pincers, files, vice, compasses, gimlets, wire, needles, thread, packthread.

15. Some good map, pasted on canvas, of the country proposed to be examined; which must be often compared with the itinerary, and the situation assigned by the compass. The other observations of M. Saussure, relate solely to the clothing and food, &c. &c. necessary in visiting the highest Alps.

MINERAL WATERS (*Encycl.*). The following account of the facitious mineral waters of Citizen Goldschmidt is extracted from the '*Recueil Periodique de la Societe de Medecine de Paris, of Ventose; An. vii. February, 1799*;' translated in the Medical and Philosophical Journal.

Citizens Bouillon La Grange, and Chausfier, reported to the Medical Society of Paris, that they examined three distinct species of artificial mineral waters; namely, those of Seltz, Spa, and Sedlitz.

Their first care was to ascertain the physical properties; they found them very clear and transparent, having a strong acid flavour; and that they gave the tincture of turnsol a deep red colour. By putting them in contact with different re-agents, they obtained, first, by caustic alkalies, neutral salts; secondly, by lime water, an abundant carbonate of lime; thirdly, poured on filings of very pure iron, the artificial waters, in a short time, acquired a ferruginous taste, which, after the properties already discovered, confirmed the presence of the carbonic acid and its action on the iron.

They then proceeded to examine the nature of the salts employed, and the quantity of carbonic acid which each bottle might contain. The methods followed to ascertain the composition of these waters, afford no novelty; the saline substances, however, employed, were similar to those described by Bergmann. Upon the whole it appeared that the author had completely succeeded, and produced an exact imitation of nature.

As to the carbonic acid which these waters possess in solution, experience shews, they have a greater quantity than the natural waters. But in order to ascertain this quantity with the greatest exactness, Citizen Goldschmidt has invented a very ingenious apparatus. (See Pl. 39.) By this apparatus (which may serve to obtain any other gas, and ascertain with the

most scrupulous exactness, the quantity of gas held in a liquid in solution) it was discovered, that the waters contained twice and a half their volume of carbonic acid. The author even went so far as to assert, that he could separate three times their volume. But this superabundant quantity easily disengages itself, not only by being agitated, but by an elevation of temperature. Such an excess of acid is therefore useless, especially in medical practice.

The Medical Society also desired the Citizens Bouillon La Grange, and Chausfier, to examine the differences which existed between the artificial mineral waters of Goldschmidt, and those of Citizen Goffe, of Geneva; but from the impossibility of procuring those of the latter as recently prepared as those of the former, they were unable to make a fair trial. It is certainly very easy to conceive, that water which has been agitated by travelling, or which has been prepared any length of time, whether in a cellar or any other place, will not bear a comparison with water which has been saturated only a few days. The two commissioners, therefore, had recourse to the report made by their colleague, Deyeux, to the School of Medicine, who had carefully examined the artificial water of Citizen Goffe.

"Two pounds," says that chemist, "of this water, placed under mercury, afforded twice and a half their volume of carbonic acid, the half of which was separated spontaneously, and the other half by plunging the bottle into hot water."

It is evident from this, that there exists a great analogy in the result of the two experiments, since each of the waters contain twice and a half their volume of carbonic acid; and it is also evident, that there is no difference between the mineral waters of Goldschmidt and those of Goffe; for, besides the equal quantity of carbonic acid, the chemical examination of the salts in dissolution, afforded the same results as those mentioned in the report of Citizen Deyeux.

This comparison must nevertheless be of great advantage to those who prescribe or make use of these artificial mineral waters, as it will enable them to obtain them of a proper degree of acidity; for it is evident from the experiments of Citizen Goldschmidt, that it is possible to supersaturate the water with the acid.

It appears that these artificial waters have been employed with great success in different maladies by several French physicians; and Bouillon La Grange, and Chausfier, conclude their report by recommending the establishment of a manufactory for them in Paris, in order to insure their being accurately and faithfully prepared, and also by declaring Citizen Goldschmidt deserving both of attention and encouragement.

To this account is annexed the following explanation of the *Gasolitre*, by Citizen Goldschmidt.

"The method hitherto used," says he, "to ascertain the quantity of carbonic acid gas by lime water, appeared to me very troublesome, not only because it at the same time precipitates the iron, the magnesia, and other earthy substances, which we are afterwards forced to separate, and because the operation of filtering always occasions a certain waste, but because the access of atmospheric air contributes, in a great degree, to form carbonate of lime.

"The pneumatic chemical apparatus with mercury, which is at present in use, has the disadvantage of being always in equilibrium with the pressure of the atmospheric air; and is consequently obedient to the laws of the barometer.

"These several difficulties urged me to an endeavour at avoiding those obstacles, which I have overcome by the invention of the *Gasolitre*: this apparatus being fully adapted to calculate with accuracy, and in a short time, the gaseous

parts contained in any body whatever, and to shew the pressure.

"Fig. P is a glass measure containing two centilitres, or two drachms fifty grains: in fitting it with its cock for a double current of air, to the tube G, the cylinder C being full of mercury, the cock B shut, and the apparatus deprived of all possibility of admitting the atmospheric air, we shall find, in opening the cock H, that no vacuum is occasioned in the cylinder C besides that which is formed of the bubbles of air between the glass and the mercury, in filling the cylinder under the pressure of the atmosphere of seventy-five centimetres, or about twenty-eight inches, and that which the difference of the column of mercury in the cylinder C and the volume of air in the measure P under a pressure of seventy-five centimetres, reduced to zero, can produce.

"We shall find this statement accurate in opening the cock Q to communicate the pressure of the atmospheric air into the measure P: in then shutting it opposite Z it will not produce a greater vacuum in the cylinder C than the pressure of the volume of air in P has been able to effect.

"The little pump O, placed on the stand F, serves to graduate the cylinder C. We fill the bladder of gas, which we intend to measure, and open the cock S and T to draw a volume of gas, at all times equal, into the pump; we open the cock T opposite U, shutting it at the same time opposite S, and push forward the piston to introduce the gas into the cylinder C filled with mercury, and shut by the cock B: when the cock H does not supply more mercury, we continue in this manner to introduce at intervals the same volume of gas into the cylinder C, in order to graduate it.

"We shall obtain the first time a greater vacuum on account of the pressure of seventy-five centimetres, where the mercury meets; this pressure ceases the second and following times, when it will be of an equal volume.

"The operation will never be attended with success, if the external air can penetrate: it is, however, easy to ascertain this by the cock H, which, when the hole is well adjusted and shut, does not furnish more mercury, after the effort of the pressure before explained.

"To know the quantity of gas which the gaseous waters contain, we thus dispose the apparatus:

"We shut the cock H and fill the cylinder C with mercury; we shut the cocks B and K, and open the cock A, to ascertain the state of the apparatus; if the apparatus be in proper order, it will not make a vacuum in the cylinder C, further than the first mark; we fill the matsrafs up to the neck with the water we intend to analyse, and carefully fit the matsrafs to the cock K, by a screw provided with a little shield of leather: the whole being well secured, we open the cocks K and H, and heat the water to the boiling point."

The following is an explanation of the figures in the plate:

A is a glass funnel to pour in the mercury; B, iron cock; C, glass cylinder, graduated, shut by the cock, and cemented on the plate D; D, delft plate; E, wooden stand; F, stand to support the apparatus; G, glass tube, the cavity of which is of the diameter of one millimetre, about half a line, and which communicates with the cylinder C; H, tube, of the same diameter, communicating with the cylinder C, and returning into the bottle J by an iron cock; J, bottle and funnel to receive the mercury; K, cock for a double current of air; L, matsrafs containing about twelve centilitres of water (four ounces), secured to the cock by a screw; M, sand bath; N, furnace; O, pump, the cylinder of which is glass, secured by two screws to the stand F; P, glass measure of two centilitres, or six drachms twenty-eight grains; Q, cock for

a double current of air; R, bladder to contain the gas; S, cock; T, cock for a double current of air; U, glass pipe coming from the cock T to K; X, pump; Y, stand on which to fix the pump; Z, index of the second current of air.

MINFELD, a town of Germany, in the duchy of Deux Pouts, eight miles S. of Landau.

MINIATO, Sr. an episcopal town of Tuscany, seated on the Arno, 20 miles S.W. of Florence. Long. 10. 45. E. Lat. 43. 40. N.

MINORBINO, a town of Naples, in Terra di Bari, with a bishop's see, 26 miles N. of Cirenza. Long. 16. 19. E. Lat. 41. 8. N.

MINORI, a town of Naples, in Principato Citeriore, with a bishop's see. It is seated on the gulf of Salerno, between the town of that name and Amalfi.

MINSFELDEN, or **MENSFELDEN**, a town of Germany, in the archbishopric of Treves, 25 miles E. of Coblenz. Long. 7. 57. E. Lat. 50. 26. N.

MINSINGEN, a town of Suabia, in the duchy of Wirtemberg, with a castle. Long. 9. 35. E. Lat. 48. 32. N.

MINSKI, a town of Lithuania, capital of a palatinate of the same name, with two citadels. The country is pretty fertile, and has forests containing vast numbers of bees, whose honey makes part of its riches. Minski is 65 miles N. of Sluck, and 160 S.E. of Wilna. Long. 26. 48. E. Lat. 54. 11. N.

MIOLANS, a fortress of France, in the department of the Lower Alps, seated on a craggy rock, in the valley of Barcelonetta, six miles N.E. of Montmelian. Long. 6. 20. E. Lat. 45. 35. N.

MIOSSE, a lake of Norway, in the province of Hordaland, 80 miles in circumference. It is divided by a large peninsula, and contains a fertile island 10 miles in circumference.

MIRA, a town of Portugal, in Beira, 16 miles N.W. of Coimbra. Long. 8. 25. W. Lat. 40. 20. N.

MIRANDELA, a town of Portugal, in Tra-os-Montes, 30 miles S.W. of Braganza, and 28 N.E. of Lamego. Long. 6. 9. W. Lat. 41. 25. N.

MIRABEAU, a town of France, in the department of Vienne, famous for the beauty and strength of the assés which its environs produce. It is 16 miles N. of Poitiers, and 175 S.W. of Paris.

MIRECOURT, a town of France, in the department of the Vosges, famous for its violins and fine lace. It is seated on the river Madon, 27 miles S. of Nanci, and 30 S.E. of Toul. Long. 6. 4. E. Lat. 48. 15. N.

MIREMONT, a town of France, in the department of Dordogne. Near it is a remarkable cavern, called Cluseau. It is seated near the Vézère, 15 miles E. of Bergerac.

MIREPOIX, a town of France, in the department of the Upper Pyrenées. It was lately an episcopal town, and is seated on the Gers, 15 miles N. of Foix.

MISAGNO, a town of Naples, in Otranto, nine miles S.S.E. of Ostuni.

MISENO, a cape of Italy, W. of the bay of Naples, between Puzzoli and Cuma. On it are the ruins of the ancient Misenum.

MISERDEN, a village in Gloucestershire, six miles N.W. of Cirencester. Here is a park, seven miles in circumference, in a valley of which is a mount of a circular form, now overgrown with trees. This was the site of an ancient castle, built in the reign of King John; and part of the moat, which encompassed the building, is still to be seen.

MISITRA, a celebrated town of Greece, capital of the

Morea, with a Greek archbishop's see, and a castle. It is divided into four parts, the castle, the town, and two large suburbs. The church is one of the finest in the world, and the Turks have turned it into a mosque, near which is a magnificent hospital. There is a great number of Christians, and so many Jews, that they have three synagogues. It was taken by the Venetians in 1687; but the Turks retook it. It is seated on the Vasilipotamo, 100 miles S.W. of Athens, and 90 N. by E. of Lepanto. Long. 22. 30. E. Lat. 37. 6. N.

MISSOURI, a river of North America, whose source is unknown. It joins the Mississippi in lat 39° E. but is a longer, broader, and deeper river, and is, in fact, the principal stream. It has been ascended by the French traders upwards of 1200 miles, and from its depth and breadth at that distance, appeared to be navigable much higher.

MISTRETTA, a town of Sicily, in Val di Demona, with a bishop's see, 50 miles E.S.E. of Palermo, and 64 W. of Messina. Long. 24. 22. E. Lat. 38. 55. N.

MITCHAM, a village in Surrey, eight miles S.W. of London. It is seated on the Wandle, on which are some saw-mills, and two calico-printing manufactures.

MITTENWALDE, a town of Upper Saxony, in the Middle March of Brandenburg, 12 miles S. of Berlin. Long. 13. 28. E. Lat. 52. 19. N.

MITTERBURG, a town of Austrian Istria, the capital of a county, with a castle situate on a rock, 15 miles W. of Fiume, and 30 S.E. of Trieste. Long. 14. 19. E. Lat. 45. 41. N.

MOCAUMPOUR, a town of Hindoostan Proper, in Napaui, situate on the east side of the Nepal, 40 miles S.S.E. of Catmandu, and 120 N. of Patna. Long. 85. 27. E. Lat. 27. 35. N.

MODBURY, a town in Devonshire, with a market on Thursday. It is seated in a bottom, between two hills, 36 miles S.S.W. of Exeter, and 208 W.S.W. of London. Long. 3. 54. W. Lat. 50. 23. N.

MODICA, a town of Sicily, in Val-di-Noto, on a river of the same name, 25 miles S.W. of Syracuse. Long. 15. 9. E. Lat. 36. 48. N.

MODON, a strong town of the Morea, with a safe harbour, and a bishop's see. It is seated on a promontory, projecting into the sea of Spianza, 15 miles E. of Coron, and 95 S.W. of Napoli-di-Romania. Long. 21. 35. E. Lat. 36. 56. N.

MODZIR, a town of Lithuania, capital of a district of the same name. It is seated on the river Prypec, in a fertile country, 85 miles S.E. of Sluzck. Long. 29. 10. E. Lat. 52. 5. N.

MOESKIRCH, a town of Suabia, belonging to the princes of Furstenberg, 18 miles N. of Constance, and 52 S. of Stutgard. Long. 9. 11. E. Lat. 47. 56. N.

MOFFATT HILLS, the highest mountains in the S. of Scotland. They occupy the N. part of Annandale; and from these descend, in different directions, the Tweed, Clyde, and Annan, whose sources are but little distant from each other.

MOGADOR, an island and castle of Africa, in the kingdom of Morocco, near Cape Ozem. There are mines of gold and silver in one of the mountains. Long. 9. 55. W. Lat. 31. 38. N.

MOHATZ, a town of Lower Hungary, in the county of Baraniwar. Here Louis, the last king of Hungary, in 1526, was defeated by the Turks under Soliman II. with the loss of 22,000 men, and after the battle suffocated by the fall of his horse in a muddy brook. In 1687, another battle was fought here, between the Christians commanded by Prince Charles of

Lorain, and the Turks, who were defeated with the loss of 10,000 men, their cannon and baggage. It is seated at the confluence of the Danube and Comite, 17 miles N.W. of Eteck. Long. 19. 56. E. Lat. 45. 46. N.

MOHAWK RIVER, a river of the state of New York, which rises to the north of Fort Stanwix, passes by that fort and Schenectady, and empties itself by two mouths, into Hudson's River, eight miles above Albany. About two miles above its junction with that river it has a cataract, where the stream, 100 yards wide, falls perpendicularly about seventy feet.

MOHILEV, or MOGILEV, a government of the Russian empire, part of Lithuania, dismembered from Poland in 1772.

MOHRUNGEN, a town of Prussia, in the province of Oberland, situate on a lake of the same name, which almost surrounds it. Here is an old castle, formerly a convent, belonging to the knights of the Teutonic order, in consequence of whose wars the town has frequently suffered. It is 56 miles S.S.W. of Konigsberg, and 56 S.E. of Dantzic.

MOISSAC, an ancient town of France, in the department of Lot. It has a great trade in corn and flour, and is seated on the Tarn, near the Garonne, 13 miles N.W. of Montauban. Long. 1. 17. E. Lat. 44. 6. N.

MOLA DI BARI, a town of Naples, in Terra di Bari, on the coast of the gulf of Venice, 12 miles E. of Bari.

MOLA DI GAETA, an ancient town of Naples, in Terra di Bari, seated on the gulf of Venice, 14 miles E. of Bari.

MOLD, a town in Flintshire, where the assizes are held. It is five miles S. of Flint.

MOLE, a mountain of Savoy, which, from its height and fine sloping peak, is an object of great beauty, when seen from the lake of Geneva. At its foot is the town of Bonneville, 20 miles S. of Geneva.

MOLFETTA, a town of Naples, in Terra di Bari, with a bishop's see, seated on the gulf of Venice, 10 miles N.W. of Bari. Long. 16. 52. E. Lat. 41. 28. N.

MOLIERES, a town of France, in the department of Lot, 11 miles N. of Montauban, and 16 S. of Cahors. Long. 1. 30. E. Lat. 44. 10. N.

MOLINA, a strong town of Spain, in New Castile, seated on the Gallo, in a territory abounding in pastures, 35 miles S.E. of Sigüenza, and 88 E.N.E. of Madrid. Long. 1. 53. W. Lat. 40. 50. N.

MOLISE, a territory of Naples, in the form of a triangle, whose sides are 39 miles long, lying between Terra di Lavoro, Abruzzo Citeriore, Capitaneta, and Principato Ulteriore. It is a mountainous country, but fertile in corn, wine, saffron, and silk.

MOLISE, a town of Naples, capital of a territory of the same name, but not populous. It is 50 miles N. of Naples. Long. 14. 43. E. Lat. 41. 36. N.

MOLSHEIM, a town of France, in the department of Lower Rhine, seated on the Bruch, 10 miles W. by S. of Strasbourg, and 228 E. of Paris. Long. 7. 35. E. Lat. 48. 32. N.

MONASTER, an ancient town of the kingdom of Tunis, seated near the sea, 70 miles S.E. of Tunis. Long. 11. 6. E. Lat. 35. 50. N.

MONCALLIER, a town of Piedmont, seated on the Po, five miles S.E. of Turin. Long. 7. 48. E. Lat. 45. 2. N.

MONCALVO, a strong town of Italy, in Monterrat, seated on a mountain, 12 miles S.W. of Caffel. Long. 7. 19. E. Lat. 45. 10. N.

MONCHABOU, a city of the kingdom of Burma, which, in 1755, was the residence of the king. It is 39 miles N. of Ava, the present capital.

MONCONTOUR, a town of France, in the department of Ille and Vilaine, 39 miles S.W. of St. Malo. Long. 2. 36. E. Lat. 48. 15. N.

MONDEGO, a river of Portugal, which has its source near Guarda, and crossing Beira, passes by Coimbra, and falls into the Atlantic, near a cape of the same name.

MONDIDIER, a town of France, in the department of Somme, where the kings of France formerly had a palace. It is seated on a mountain, 24 miles S.E. of Amiens, and 57 N. of Paris. Long. 2. 34. W. Lat. 49. 39. N.

MONDONEDO, a town of Spain, in Galicia, with a bishop's see; seated in a fertile country, on a small river, 60 miles N.E. of Compostella. Long. 7. 10. W. Lat. 43. 30. N.

MONDOUBLEAU, a town of France, in the department of Loir and Cher, with a castle, 13 miles N. of Vendôme.

MONDRAGON, a town of Spain, in Guipuscoa, in the neighbourhood of which are some medicinal springs, and a mine of iron of superior quality. It is 24 miles S.S.W. of St. Sebastian. Long. 2. 4. W. Lat. 43. 9. N.

MONDRAGON, a town of France, in the department of Tarn, 12 miles N.N.W. of Castres.

MONDRAGONE, a town of Naples, in Terra di Lavoro, celebrated for its medicinal waters. It is near the sea, 13 miles N.W. of Capua.

MONFORTE, a town of Portugal, in Beira, 30 miles N. by E. of Portalegra. Long. 7. 21. W. Lat. 39. 32. N.

MONFORTE, a town of Portugal, in Alentejo, 20 miles S. of Portalegra. Long. 7. 31. W. Lat. 38. 47. N.

MONGEARTS, a people of Africa, of whom, and the Mouslemines, we have the following account in Saugnier's travels to the coast of Africa, Morocco, Senegal, Goree, Galam, &c.

The travels of Sparrmann, Gordon, Vaillant, Maffon, Bruce, and Mungo Park, in different parts of Africa, have made us acquainted with only a small portion of the immense kingdoms of that continent; and it may be truly averred, that, though nearest to Europe, the anterior is as yet almost entirely unknown. To become completely acquainted with it, two great journeys must be undertaken: the first to Tombuet, in Abyssinia, either by traversing the Bildulgerid, or by ascending to the source of the Niger; the second would be from Tombuet to the Mosambique, thus traversing the whole interior of Africa. No doubt the society established in London will have intrepidity enough to vanquish all the obstacles which may present themselves either in the climate, or the inhabitants; and from their indefatigable observations, will be derived an acquaintance with countries hitherto only known by incorrect maps, and peopled by nations whose names are uncertain as their existence is doubtful.

The narrative before us is rather an account of Saugnier's misfortunes than a display of discoveries, which he might have made in traversing at large a country entirely new to the observer: he being unfortunately a slave to the Moors, on whose coast his vessel was wrecked, he expected nothing but death, and had to contend with infinite difficulties. Yet his narrative contains many particulars relative to the manners, customs, and character, of the various Arabian hordes among whom he resided.

The horde of Mongearts, who alone were on the coast when he was cast away, did not obtain undivided possession of the wreck: they were obliged to share it with the Moors of the Bildulgerid, a warlike nation, known by the name of Mouslemines. One of these Arabs obtained Saugnier in his partition of the spoil: he made his escape, but fell into the

hands of other Moors, who brought him, after a march of thirty days across the desert, to their camp; for these people are all wanderers. Content in their poverty, and unacquainted with want, they live in a state of perfect tranquillity. The men are occupied in hunting or tending flocks; the women in spinning or cookery; both sexes cover themselves with the skins of goats, or with pieces of cotton when they are able to obtain them from Guinea. The finery of the men consists in carrying handsome arms, such as daggers, sabres, firelocks, and in a wreath of large white crystals: that of the women is in necklaces of amber, coral, and all kinds of glass beads; in ear-rings either of gold or silver, according to the wealth of the individuals; and in a very ample cotton covering, one half of which is red.

Saugnier was employed in supplying the tent with wood, and in keeping the flocks of goats and camels, and saw no probable end of his misfortunes. He was successively sold to different Arabs, and inferred from his own sufferings that the more men are civilised the more cruel they become: every new master treated him with increased severity, and every day brought him nearer to the states of Morocco.

By the course of successive transfers he arrived at Cape Nun, where the French and English merchants at Mogador, having learned the misfortunes of these shipwrecked people, directed a purchase to be made of all who survived that event. Saugnier was among the number. Being brought to Mogador, he fondly hoped that all his sufferings were at end, and that he should be restored to liberty, when the emperor, enraged that the Christians had been more speedily obeyed than himself in his own dominions, broke out in threats, ordered the ransom to be restored to the merchants, and Saugnier and his companions were again made slaves, but they were slaves to the emperor, which entitled them to high consideration among his subjects. On their arrival at Morocco they were well treated, dressed in the French fashion, and discharged from all labour. The emperor, to whom they were presented, received them graciously; he promised they should speedily be sent to France, and in a few days restored them to that liberty which they had not hoped to speedily to enjoy. At Tangiers, by the help of the French vice-consul, they obtained a passage in a Spanish ship, and arrived in safety at Cadiz.

In the journeys which Saugnier made with his various masters in the interior of Africa, he saw all the wandering nations which inhabit the great desert *Saara*, to the Niger; they are indifferently called Nars, Moors, or Arabs. They are divided among themselves: the most considerable tribes are the Mongearts, Trassarts, Bracnarts, and Mouslemines: the last, accustomed to murder and pillage, are the scourge of the neighbouring people. It is impossible but that a people always wandering, always fugitive, and composed of a collection of various nations, should imbibed some of the customs and superstitions of their neighbours; they are Mahometans only in appearance and name. They display in their customs, the principles of natural law; it is imprinted on almost all their actions. The simple impulse of unassisted nature and the effects of example are the only education they receive.

In the *Saara*, hospitality is exercised without restraint; every traveller, on his arrival, is conducted to the tent of the chief, and treated with all the complaisance and attention which can be expected from a half-savage race. The Jew alone must not venture on the territory of the Mongearts; all religions are tolerated except his, but he would be burned alive. The Jews are easily recognised, not only by their features, but by the distinguishing dress they are compelled to

wear in all parts of Barbary, where they form a numerous nation. Among the Arabs, the old are respected in an equal degree with the priests, and with those who have been at Mecca. The aged, like the heads of hordes, are the judges of the people. They are only restrained from pronouncing the punishment of death; several chiefs must be assembled to decide on the nature of a crime and its penalty. War is less terrible, and less sanguinary, among them than predatory attempts, which are, in a certain degree, sanctioned by law. To succeed with impunity depends on the care which is taken not to be caught in the fact: the theft is only a crime if committed by day, in the night the law authorises it, intending, no doubt, to excite a greater degree of vigilance in tending the flocks.

The only mechanics employed among the Mongearts, are farriers and gold-smiths; the people are too indolent to apply to these occupations. The workmen who travel through the Saara, come from the Biledulgerid, and find ample employment. The Mongearts go in search of things absolutely necessary to the Tassarts, who inhabit the northern shore of the Niger. These people are entirely occupied with the care of their cattle; they live on the produce of the dairy, and on grain which they obtain from their neighbours; they are strangers to agriculture, and so indolent, that they do not get their virginals ready till nature requires it, by which means they are often unprovided. The women are engaged in household concerns; the negro slaves and children take care of the flocks; the men go to the places of assembly of the hordes, to market, or to the chase. The wives of the Mongearts are held in a greater degree of consideration than those of their neighbours; yet they are kept in a state of subjection bordering on slavery. Household affairs, spinning the hair of the camels and goats, the providing of wood, and the preparation of virginals, are their concerns: those who have negro-women for slaves have no trouble but that of issuing orders.

Although polygamy is allowed by their religion, few Arabs have more than one wife; when the no longer pleases her husband, or is displeased with him, they separate; the woman retires to her parents: if she resists the solicitations of her husband to return, he is free, and may marry any one else; but if she has a child, especially a boy, she cannot remain separated from her husband more than eight days upon pain of death. When a man beats his wife, it is an unequivocal proof of his affection, and that he does not wish to be separated from her; but if he only reproaches, without beating her, she thinks herself contemned, and retires to her parents. These proofs of friendship, and even of love, though still in use among the lower classes in Russia, would not accord with the taste of females in civilised nations. The fidelity of the Arab women is inviolable; they hope for an equal immortality with their husbands, but expect to attain it by constancy alone; in this they differ widely from the Mahometans. They make frequent visits to each other, and the mode of shewing respect is to permit the guest to do all the work in the tent: she prepares the food, churns the butter, while her friend or relation talks to her on private or public affairs. The cordiality of the reception is estimated according to the quantity of occupations the visitor is permitted to fill.

All these customs are pretty generally prevalent among the inhabitants of the northern bank of the Niger, the variations are so few and trifling as to claim very little notice. The Mouslemine, who are a mixture of real Arabs and fugitive Moors from the empire of Morocco, occupy one part of the Biledulgerid. Their government is republican: more civilised than the other Moors, they are united in societies, and inhabit small towns; more industrious and laborious than their neighbours, they employ themselves in agriculture, and

treasure their grain, half-winnowed, in large holes made in the earth, in the shape of obtuse cones, which they prepare by filling them with wood, and burning it. When they have deposited their grain in these excavations, they cover them with strong planks laid close together, and cover the planks with earth.

This country is very populous, and would be still more so but for the continual wars in which they are engaged with the Emperor of Morocco. The liberty they enjoy encourages them to endure the greatest fatigues; they look upon it as their greatest good, and will fight, even to death, to preserve it. They are rich, because they alone carry on all the commerce of Barbary with the Saara. The women are not more enslaved than in the interior; every man has as many as he can maintain: those are most respected who have the good fortune to bear male children, who are educated with the greatest care.

These people have a general head of their religion, who is respected even to adoration: he is the most powerful individual in Africa; his authority is unlimited; he declares war, makes peace, and though he has no territory of his own, enjoys a most extensive power. He does not, like the Emperor of Morocco, fancy himself inspired by the prophet, nor does he impose such a belief on his people; on the contrary, he avowedly forms his judgment from consultations with wife and experienced men. His authority extends over all the inhabitants of the Biledulgerid and the Saara; and the emperor, powerful as he is, has never dared to attempt a diminution of his influence.

The country of the Mouslemine is very fertile; it produces all the necessities of life, almost without cultivation; it abounds in palm-trees, dates, fig and almond trees, and produces great quantities of oil, wax, and tobacco, which are carried to Mogador. This plenty occasions the people to be better fed than those in the desert, but the inhabitants of the country are often reduced to a state of rigid frugality.

The subjects of the emperor of Morocco are much more unhappy even than those who want the necessities of life. The prejudices and despotic power of their princes, the plunder to which they are incessantly exposed, the necessity they are under of concealing their property that it may not be forcibly taken from them, these circumstances render them unhappy and barbarous. They plunder and pilfer wherever they have an opportunity; and so subject is their submission to the will of a despotic sovereign, that they dare not even utter a complaint. This Moorish nation, which occupies one of the finest spots on the globe, is always miserable, and often in want of the necessities of life. So great is their slavery, that they have no characteristic manners, the caprice of their prince is their only law; they are acquainted with no other.

Plurality of wives is allowed among the Moors; they may have four who bear that name, the rest are called slaves. These women are closely flung up, and have no enjoyment but at the caprice of their lords. When a barbarous husband is displeased with his wives, he maltreats them according to the prevalence of his brutal passion, and they are without hope of redress; often, after a long series of ill usage, he kills them to save the expence of their maintenance: the more humane get rid of them by exchange or sale: the lot of these unhappy persons admits of no solace, unless they are so fortunate as to bear male children.

All Moors are by birth equal; they are distinguished only by offices: when out of place, they return to the ordinary rank. The education of children is very much neglected till they are seven or eight years old: it is not till after circum-

cision that they are fixed either in the study of the Alcoran, in arts, or in arms: the military are favoured by the emperor; they are placed in the horse or foot according to their expertness, and they continue in the corps where they were first admitted, till the emperor is pleased to dismiss them. The sovereign dispenses justice in person, but no one is admitted to an audience unless he comes with a present proportioned to his fortune: the smallest gifts, even two eggs, are not refused. The Moors speak boldly to their sovereign; bashfulness is considered as a symptom of guilt, and the person shewing it would be sure to lose his cause.

The emperor of Morocco, as a defendant of Mahomet, by his pretended relationship with the family of the Sherifs, is the interpreter of the law. The priests, called *Talbes*, are always friendly to him; and his subjects believe him to be inspired by the prophet, and infallible. The respect with which he is regarded is so great, that his people consider it a happiness to die by his hand; it is a favour done to a religious Moor; he is sure to go immediately to Mahomet's bosom, and there enjoy everlasting felicity. Hospitality is partially exercised: the traveller is obliged to pay for his food, but if resorted to as an asylum, the house of a Moor is inviolable.

It is a general belief, that the souls of good men, and zealous observers of the law, are immortal; others suffer for a limited period, and are then annihilated: they consider the doctrine of eternal punishments repugnant to the divine goodness. As to the women, those only are immortal who have been inviolably faithful to their husbands; the others utterly perish. According to their principles, man is not a free agent, every thing having been predestined from all eternity; therefore, if any one commits a crime, he is not the less esteemed: when a Moor is in adversity, he bears it with an heroic courage.

The present reigning prince, according to Saugnier's account, might be taken for one of the Mouflemine nation, for his love of money is equally ardent with theirs. Commerce is an object of his exclusive attention, and procures him immense sums; all nations have liberty to establish commercial houses in his states, but he takes one twelfth part of their cargoes as his right. He often levies immense sums on the merchants, which they are forced to pay or relinquish their trade: the Jews are not spared; the industry of that wandering race is one of the chief resources of the emperor; he gives them every facility in trading, and even advances them a capital, but he knows how to resume it with usury. The Arabs, acquainted with the morality of this sovereign, will not deliver up their prisoners on his word, and the Christians are sufferers by it. The merchants dare not treat for a ransom, till they have purchased the emperor's permission; but on the simple word of these merchants, the inhabitants of the Biledulgerid part with their slaves; they have no fear of losing the stipulated ransom, for there is no example of a Christian at the head of a commercial house breaking his engagement; this makes the Moors observe, that the Christians never lie, because it is forbidden by their religion.

All the dangers which Saugnier had incurred, and all the evils he had undergone, did not discourage him; he ventured to undertake a second voyage, to try whether fortune would be more favourable; he arrived at Senegal without accident. This island is a mere bank of sand in the middle of the river, at three miles distance from its discharge into the sea; sterility is its smallest inconvenience; the air is extremely impregnated with salt, the heat excessive, and increased by the reflection of the sand. Insects abound in such a degree that it is impossible to defend one's self against their stings; the water is bad, meat soon becomes tainted, and fish has a bad flavour. A more dreadful situation cannot be found, nor a place where

it is more difficult to procure the first requisites of life; yet this country has been described by Medieurs Adanson and Dumanet as the abode of enjoyment and delight. These writers, Saugnier observes, "have given the rein to their imagination; but I, who have traversed the greatest part of it, found it in every particular more or less detestable. But when one is heartily tired, it is easy to find a termination of existence without suicide; it is enough either to remain there, or, if the sufferer is not endowed with sufficient patience, let him make a voyage to Galam."

This voyage Saugnier himself undertook, not apprised perhaps of the ills he thus announces, or, perhaps, confiding in the strength of his constitution. Galam is the place known as the depot of African commerce, so far as it consists in articles of exchange. To arrive there he was obliged to ascend 325 leagues up the Niger, and to brave the dangers of a most laborious navigation, the ill effects of a most destructive climate, the hostilities of a most inhospitable race who inhabit the banks of the river, the oppressions of numerous petty sovereigns who govern these people, and finally the insubordination and the robberies of the crew he was obliged to employ. Nothing but the avidity of gain, and an insatiable thirst after riches, can induce a man to face and conquer all the hazards of such a voyage: it requires that gold should be preferred to life.

It is necessary to read the work itself to learn in the detail all the dangers of this perilous commerce. The articles of exchange are guns, gun-powder, coarse cloth manufactured for the purpose, salt, iron, pistols, fables, woollen and linen cloth, small silver bells, coral, crystals, and all kinds of glass; these are bartered for slaves, gold, ivory, and elephant's teeth. The hardy traveller has given a precise and circumstantial account of the articles used in these negotiations, but an extract which must necessarily be mutilated, would be of little use.

At length, after a voyage of five months, constantly annoyed with fatigue and illness, and harassed with a multiplicity of accidents, Saugnier returned from Senegal, having completed only one half of the purpose which cupidity had induced him to undertake. Cheated by white men, cheated by the blacks, exhausted by mental and bodily infirmities, he resolved to return to his country. He notices Goree only to say, that it is merely a melancholy rock, which can produce nothing, and is destitute of water. The air is more wholesome than at Senegal; the inhabitants are a colony of the same nation, called Yofé; there are more inhabitants than the trade of the place requires, for there are not above a hundred negroes sold in a year, and it is necessary to search a space of thirty or forty leagues to obtain even those.

Notwithstanding all the difficulties which Saugnier has encountered, the injuries he has received from men, and the insalubrity of the climate; the knowledge he has acquired, and the sacred character of slave of the emperor, which is equally respected among his numerous subjects at a remote distance as by those near the capital, have influenced him to propose to the French government to undertake, at a very small expence, one of the most extensive journeys ever yet made by land. Seven obstacles of considerable importance present themselves, but he feels in himself sufficient resources to surmount them all.

MONGHIR, a town of Hindoostan Proper, in Bahar, with a fort. It is generally made a station for part of the English troops, and is seated on the Ganges, 110 miles E. by S. of Patna, and 275 N.W. of Calcutta. Long. 86. 30. E. Lat. 25. 20. N.

MONHEIM, a town of Germany, in Bavaria, eight miles N. of Donawert. Long. 11. 12. E. Lat. 48. 53. N.

MONICKEDAM, a sea-port of the United Provinces, in North Holland. In 1515, the whole town (the church of St.

Nicholas excepted) was destroyed by fire. It is seated at the entrance of the Monick into the Zuider Zee, eight miles N.E. of Amsterdam. Long. 4. 56. E. Lat. 52. 29. N.

MONJOY, a town of Westphalia, in the duchy of Juliers, 19 miles S. of Juliers. Long. 6. 7. E. Lat. 50. 39. N.

MONISTROL, a town of France, in the department of Upper Loire, 14 miles S.W. of St. Etienne. Long. 4. 6. E. Lat. 43. 17. N.

MONOMUGI, a region of Africa, lying near the equator, between Abyssinia on the N. Zanguebar on the E. Monomotapa on the S. and Congo on the W. This country is very little known to the Europeans.

MONONGAHELA, a river of North America, which rises in Virginia, and running N. into Pennsylvania, meets the Allegany at Fort Pitt, where their united streams assume the name of Ohio. It is deep and gentle, and navigable for barges 50 miles from its mouth.

MONOPOLI, an episcopal town of Naples, in Terra di Bari, seated on the gulf of Venice, 28 miles S.E. of Bari. Long. 17. 37. E. Lat. 41. 29. N.

MONPAZIER, a town of France, in the department of Dordogne, 18 miles S.W. of Sarlat. Long. 0. 47. E. Lat. 44. 46. N.

MONREALE, a town of Sicily, in Val di Mazara. It was erected into a bishopric in 1183; which has been suppressed, and the revenues appropriated to the marine, and the defence of the island against corsairs. It is three miles W.S.W. of Palermo.

MONSANTO, a strong frontier town of Spain, in Etramadura. Long. 5. 50. W. Lat. 39. 40. N.

MONSARAZ, a town of Portugal, in Alentejo, seated on the Guadiana, 25 miles S.W. of Elvas. Long. 7. 32. W. Lat. 38. 26. N.

MONSTERBERG, or MUNSTERBERG, a town of Silesia, in a province of the same name, 20 miles N.E. of Glatz, and 27 S. of Breslau. Long. 17. 16. E. Lat. 50. 37. N.

MONTABOUR, a fortified town of Germany, in the electorate of Treves, between Coblenz and Limbourg. Long. 7. 50. E. Lat. 50. 30. N.

MONTAGNIAC, or MUDANIA, a town of Natolia, on the sea of Marmora. It carries on a great trade, especially in fruits, and is seated on a bay of the same name, 70 miles S.S.E. of Constantinople. Long. 29. 10. E. Lat. 40. 0. N.

MONTAGUE ISLAND, one of the New Hebrides, in the South Pacific Ocean, near Sandwich Island. Long. 168. 31. E. Lat. 17. 26. S.

MONTAGUE (Mrs. Elizabeth), a lady highly esteemed in the circles of fashion, and of considerable celebrity in the republic of letters, was daughter of Matthew Robinson, esq. of West-Layton, in the county of York, and of Horton in Kent; descended of an ancient and respectable family, nearly allied to Richard, first Lord Rokeby, which title, for default of male issue in the original possessor, devolved to Matthew Robinson, esq. Mrs. Montague's brother. Her mother was Elizabeth, daughter of Robert Drakes, of the town of Cambridge, esq.

The care of Miss Robinson's education was assumed by Dr. Conyers Middleton, the celebrated author of the life of Cicero, and several philosophical and theological works. The pupil was worthy the attention of so great a master, as she joined to an ardent love of literature, and a zealous desire of instruction, a perseverance which alone can insure extensive information, or permanent acquisition; of this quality she is said to have given a remarkable instance by transcribing, before she had completed her eighth year, all the Spectators; there are many reasons to doubt the truth of this story in its utmost extent; but granting the copied those papers which were best

worth the labour, namely, Addison's Contributions, the effort is entitled to applause and admiration.

About the year 1742, she married Edward Montague of Allertorpe, in the county of York, esq. son of Charles, fifth son of Edward; first earl of Sandwich. By him she had one son, who was born in 1743, and died before he had completed his second year. Mrs. Montague was early left a widow, with an ample fortune, and extensive and honourable connections.

When the celebrated Pultney, earl of Bath, and his lady, made a tour in Germany and other parts of Europe, Mrs. Montague was of the party: she maintained an epistolary correspondence with some of the most eminent literary characters of the country, and particularly with the late Dr. Monfey, physician of Chelsea College. Her letters are praised by those who have seen them, as abounding in wit, observation, judgment, and learning; and in those respects are said to excel the letters of her celebrated name-fake Lady Mary Wortley Montague.

George, lord Littleton, was a warm admirer of Mrs. Montague; he was assisted by her in the composition of his *Dialogues of the Dead*, some of the best of which, according to his acknowledgment, were her productions.

In 1769, Mrs. Montague published her only avowed literary composition, *An Essay on the Writings and Genius of Shakspeare*, compared with the Greek and French dramatic Poets; with some Remarks on the Mifrepresentations of M. de Voltaire. This work obtained a great reputation: it was well received in the first literary circles, and passed through several editions. Voltaire's talent in decrying whatever is great, admirable, or venerable, was never shackled by the restraints of truth or morality; his arrogant pretension to triumph over the unrivalled bard of Avon merited reprehension, and his fallacies were completely detected and exposed by Mrs. Montague. Yet, as an essay on the genius and writings of Shakspeare in the most extended sense of the term, her production was not satisfactory: as an apology it was complete, because it demonstrated the futility of the critic; but as an authentic homage to the bard, it was not sufficiently copious or forcible to obviate the attacks of future cavillers, or to prove the claims of her favourite author to universal superiority. Dr. Johnson, who, with great force and inimitable precision, appreciated the extent, and marked the failings of Shakspeare's genius, was not satisfied with Mrs. Montague's essay, of which he always spoke with disrespect, and expressed surprise that Sir Joshua Reynolds honoured it with his admiration. Dr. Johnson conceived that Mrs. Montague's acquaintance with the ancients was not sufficiently profound or extensive to justify the pretensions of her title-page; but, whatever faults may, in this respect, be discovered in her essay, it had at least the good effect of discrediting the presumptuous gabble of the foreign critic and his inane and ignorant echoes. The style is remarkably elegant, and characteristic of a pen formed in the school of Addison.

Mrs. Montague was in habits of friendship with the first wits and scholars of the age, and was the reputed founder of a society known by the name of the *Blue Stocking Club*. This association was founded on the liberal and meritorious principle of substituting the rational delights of conversation for the absurd and vapid frivolities of the card table. No particular attention or respect was paid to her, but the conversation was general, cheerful, and unrestrained: far different from what is insinuated respecting the company by a satirist who accuses them of going

“To barter praise for soup with Montague.”

The name of this club is said to be derived from the follow-

ing circumstance. One of their most distinguishing characters in the early days of the society was Mr. Stillingfleet, who always wore *blue stockings*: his conversation was distinguished for brilliancy and vivacity, inasmuch that when, in his absence, the flock of general amusement appeared deficient, it was a common exclamation, *we can do nothing without the blue stockings*: thus was the appellative acquired which is now become frequently in use for a learned and witty lady, even though the never drank tea in Portman-square.

Mrs. Montague was noticed for another peculiarity; that of giving an annual dinner to the chimney-sweepers of the metropolis. This innocent exercise of charity had not escaped animadversion from those who atone for giving nothing themselves by affecting to prove that the donations of others are not so wise and benevolent as they ought to be. Yet, if the festive treat is now discontinued, the footy sons of labour will undoubtedly look forward with less delight than usual to the calends of May.

This excellent lady died at her house in Upper Berkeley-street, Portman-square, London, on the 25th of August, 1801. In private life, she is said to have been an example of liberal discretion and rational benevolence. Her hand was always extended to the protection of genius and the relief of distress; but she was careful to distinguish the objects, and not to lavish her bounty upon false pretensions. Her magnificent mansion was the resort of the most distinguished characters of her time; and all were emulous to testify their esteem, and pay homage to the endowments of her mind and the amiable qualities of her heart.

MONTAIGU, a town of France, in the department of Vendée, 24 miles west of Mauleon. Long. 1. 30. W. Lat. 47. 0. N.

MONTALVAS, a town of Portugal, in Alentejo, on the borders of Spain, 32 miles N.E. of Lisbon. Long. 6. 24. W. Lat. 39. 30. N.

MONTARGIL, a town of Portugal, in Estremadura, 28 miles S.E. of Santarém, and 33 N.N.W. of Évora. Long. 8. 11. W. Lat. 38. 48. N.

MONTARORO, a town of Naples, in Principato Citeriore, nine miles north of Salerno.

MONTAUPHIN, a town of France, in the department of the Upper Alps, seated on a craggy mountain, almost surrounded by the Durance, eight miles N.E. of Embrun. Long. 6. 45. E. Lat. 44. 40. N.

MONT-DE-MARSAN, a town of France, capital of the department of Landes, seated on the Midoufe, 30 miles N.E. of Dax. Long. 0. 30. W. Lat. 43. 55. N.

MONTIE-CASINO, a mountain of Naples, in Terra di Lavoro, on the top of which is a Benedictine abbey. Long. 43. 44. E. Lat. 41. 39. N.

MONTI-LEONE, a town of Naples, in Calabria Ulteriore. It was ruined by an earthquake in 1638, and is 12 miles N.E. of Nicotera.

MONTILMAR, a commercial town of France, in the department of Drome, with an ancient citadel. The inhabitants, in the 16th century, were the first to embrace the reformed religion. It is seated in a fertile plain, 25 miles south of Valence, and 325 S. by E. of Paris. Long. 4. 55. E. Lat. 44. 33. N.

MONTI-SANTO, a town of Portugal, in Beira, six miles north of Idanha a Velha.

MONTI-VELINO, a mountain of Italy, supposed to be the most lofty part of the Apennines, and 8307 feet above the level of the Mediterranean. It is 46 miles N.E. of Rome.

MONTESQUEIEU, a town of France, in the department of Upper Garonne, 15 miles S.S.E. of Toulouse.

MONTESQUIOU, a town of France, in the department of Gers, 11 miles W.S.W. of Auch.

MONTGOMERY, a county of Pennsylvania, 33 miles long, and 16 broad. In 1790, it contained 22,929 inhabitants. Norristown is the capital.

MONTGOMERYSHIRE, a county of North Wales, 36 miles long, and nearly the same broad; bounded on the north by Merionethshire and Denbighshire, on the N.E. and E. by Shropshire, on the S. by Radnorshire, on the S.W. by Cardiganhire, and on the W. by Merionethshire. It contains five market-towns and 47 parishes, and sends two members to parliament. Though barren and mountainous in many parts, it has a greater mixture of fertile vale and plain, than several of the Welsh counties. Its riches proceed from its sheep and wool; the hilly tracts being almost entirely sheep-walks; and the flocks, like those of Spain, are driven from distant parts to feed on them during the summer. This county also affords mineral treasures, particularly lead; and it abounds with slate and lime; but there is no coal. Its principal rivers are the Severn, Yrnew, and Taunat, which are remarkable for salmon.

MONTIEL, a town of Spain, in New Castile, formerly the see of a bishop. It is 18 miles W.S.W. of Alcazar.

MONTILLA, a town of Spain, in Cordova, 18 miles S.S.E. of Cordova, and 51 N. of Granada. Long. 3. 28. W. Lat. 37. 48. N.

MONTJOY, a town of France, in the department of Lot and Garonne, eight miles S.S.W. of Agen. Long. 0. 49. E. Lat. 44. 11. N.

MONTIVILLIERS, a town of France, in the department of Lower Seine, 95 miles N.W. of Paris. Long. 0. 20. W. Lat. 49. 35. N.

MONTLOUIS, a town of France, in the department of the Eastern Pyrénées. It is the capital of the French part of Cerdagna, and has a regular fortress, on a rock, at the foot of the Pyrénées, built in 1680, by Lewis XIV. for the protection of the frontiers. It is 40 miles W.S.W. of Perpignan, and 430 south of Paris. Long. 2. 5. E. Lat. 42. 30. N.

MONTLUET, a town of France, in the department of Ain, seated on the Seraine, 12 miles N.E. of Lyons, and 205 S.E. of Paris. Long. 5. 8. E. Lat. 45. 49. N.

MONTLUCON, a town of France, in the department of Allier, seated on the Cher, 35 miles S.W. of Moulins, and 150 south of Paris. Long. 2. 45. E. Lat. 46. 22. N.

MONTMELIAN, a town of Savoy, with a castle; taken by the French, in 1705, who demolished the fortifications. It is eight miles S.E. of Chambery, and 27 N.E. of Grenoble. Long. 6. 15. E. Lat. 45. 30. N.

MONTMORILLON, a town of France, in the department of Vienna, seated on the Gartempe, over which is a bridge, 24 miles S.E. of Poitiers.

MONTPENSIER, a town of France, in the department of Puy de Dome, seated on a hill, 20 miles N.E. of Clermont, and 210 S.E. of Paris. Long. 3. 14. E. Lat. 46. 4. N.

MONTREUIL, a strong town of France, in the department of the Straits of Calais, with a castle; seated on a hill, near the river Canche, 10 miles N.W. of Hesdin, and 117 north of Paris. Long. 1. 52. E. Lat. 50. 27. N.

MONTREUIL-BELLAY, a town of France, in the department of Maine and Loire, seated on the Thouet, 12 miles S.S.W. of Saumur, and 155 S.W. of Paris. Long. 0. 9. W. Lat. 47. 6. N.

MONT-RICHARD, a town of France, in the department of Loir and Cher, and late province of Blaisois, with a castle. It is seated near the Cher, 12 miles S.E. of Amboise, and 112 S. W. of Paris. Long. 1. 22. E. Lat. 47. 22. N.

a rivulet, which glides with gentle murmurs amid the valley. On its banks about 100 cottages are built, irregularly, and environed with potatoe-gardens and corn-fields. The population amounts to about 500.

In this remote society, the manners to the ancient Irish are said to have been preserved to the present day, and present to the reflecting mind an interesting portraiture of rustic simplicity.

The glen is about two miles long from east to west, and nearly a mile wide: it produces sufficient potatoes, flax, and corn, for the inhabitants; and their black cattle, sheep, and goats, are fed on the adjacent mountains. The villagers yearly sell a considerable number of sheep and cows in the fairs of Dundalk and Newry, which, with the profits arising from the manufacture of coarse linen, and the sale of butter and poultry, enables them to pay their rents and live in their own plain way. Their houses are small, and, like the Scotch shieltries, very durable. They are chiefly employed in carrying their linen, butter, &c. to market in panniers; for their rugged, steep, and almost impassable paths prevent the use of carriages of any kind. Indeed even their agriculture is mostly effected by the spade, for the soil is so stony that in many places they cannot use the plough.

With respect to the appearance of Glenmore, the village consists of cabins, the walls of which are commonly about ten feet high, built with stone cemented by tough clay, which the rains having washed from between the stones, you would think, on approaching, that the walls were ready to fall, being apparently formed of loose stones; but they are found by experience to be strong enough to resist the winter's storms. The windows are small, being mostly only apertures in the walls, which are occasionally filled with straw to resist the weather, or opened to admit the light and air. A framed glass window moveable in a groove is considered as a mark of elegance in Glenmore, and a few of the richest peasants have white-washed their cabins as a mark of distinction. The roofs of those cottages are composed of rafters interwoven with hazle boughs or branches of the plant willow. They are very neatly thatched with straw, similar to the barns in England.

Their fuel is peat, or, as they call it, *turf*, which is cut into small oblong squares on the summits of the mountains, dried in the sun, and conveyed home on their horses in panniers.

This fuel gives a strong and durable heat, but from the unskilfulness of the peasants in the construction of their chimneys, or rather the action of the wind from the circumjacent hills, the cabins are mostly infested with smoke, which is condensed on the inside of the roof into soot, and sometimes, in wet weather, is dissolved and falls in what the peasants call *soot-drops*, which stain their clothes and utensils.

The furniture of a cabin is commonly one or more bedssteads of fir, containing a bed of chaff with coarse sheets and blankets; two or three old chests and boxes; a few wicker or straw chairs, and low stools. Their utensils are an iron pot, cups of earthen ware, three or four crocks, half a dozen trenchers, the same number of noggins, a clumsy knife, a few horn spoons, a griddle, or circular plate of cast-iron, on which they bake their oat-cakes over the fire, and lastly the ancient and ever-venerated *mather*. This curious vessel is made of wood, its form is an oblong square, it has four handles, and contains two quarts. When a person drinks out of the *mather* he takes it up by two of the handles, and he must be a very thirsty mortal indeed who cannot be satisfied with the contents. The *mather* has been used by the Irish mountaineers time

immemorial, before the introduction of metal or earthen utensils.

Such are the elegances of an Irish mountain-cottage, and indeed many of them are not so well furnished. It is only the more opulent that can boast of such accommodations; for in several of the wretched huts, the beds of the inhabitants are merely straw spread out on the earthen floor, with scarcely any bed-clothes.

Let it be remembered, however, that this faithful picture of almost savage rusticity is not to be confounded with the comfortable habitations of the Irish who live in the fertile plains, where every necessary that contentment can desire is abundantly supplied by the hand of industry, and the polite arts of civilisation polish and adorn a happy people.

This sketch will be principally confined to the mountain villages, and the reasons will be given why their inhabitants have continued so long in a state of indigent but contented ignorance.

The cabins are mostly divided into two apartments; a kitchen, where the women spin, nurse their children, and dress the provisions, and a room appropriated to repose.

Let us enter one of these lowly dwellings. At the further side of the kitchen sit a number of lively young women busy at their spinning wheels, while they sing in concert one of the favourite love-songs of Carolan, or some other Irish ballad. How simple and affecting are those soothing sounds! which are rendered still more harmonious by the hum of the spinning wheels, that, like the bison or bass-viol, softens the clear notes of the female voices. It is now evening, and the labour of the day being finished, the peasant enters his cabin, lays down his spade, and after welcoming us, sits down at a respectful distance. Emboldened by our freedom of conversation, and our enquiries respecting the village, his awe softens into that good-natured air of frankness, which evinces that man was intended to be a social being. Proud of the honour we do him, he is desirous to amuse his visitors, and diverts us with his legendary tales of the Irish giants, and the miracles of St. Patrick. Supper is now brought forward; it consists of potatoes, bread, and milk, and we are earnestly invited to participate the homely fare.

Thus, the inhabitants of Glenmore and the other mountain villages, though a distinct and detached people, are not averse to their lowland neighbours, but seem proud of a visit from strangers. Their characteristic hospitality has remained unimpaired through the lapse of ages; and notwithstanding the pains taken by their priests to prejudice their minds against the heretical protestants as they are called, the mountaineers in general are remarkably officious to their more refined visitors, and appear good-natured and cheerful.

Indeed their contentment is the consequence of their ignorance; and though some of their young men leave their native mountains and mingle in the more active scenes of civilised society, yet by far the greater number voluntarily remain at home.

The mountaineers are somewhat lower in stature than the natives of the low-lands. The men are generally of the middle size; they are well formed, active, and hardy. Their visage is round, their hair black, sometimes long, but most inclined to curl, and their complexion brown, or rather swarthy. The women are more graceful; their complexion is brown, though a few are delicately fair; their eyes are black or brown, and their hair long; they are so plump as to border on corpulence; and their faces are mostly round, smooth, and uninteresting, being rather the image of good-nature than of sensibility. There are a few

exceptions among them—girls whose symmetry of form and beauty of countenance would induce a poet to imagine them the female deities of their native mountains. Those girls are slender, with fair complexions, light brown hair, and eyes of a most enchanting light blue, beaming with the lustre of youthful health. Yet these charming creatures are insensible of their own attractions; and though their unmeaning simplicity of air may delight for a moment, yet on a more intimate acquaintance, the man of refinement is disgusted with the vulgarity of their manners.

“ Full many a flower is born to blush unseen,
And waste its sweetness on the desert air.”

Many of the young women have an amorous archness in their looks, which probably arises from the familiar intercourse of the sexes. This is attended with no immoral effects, for they are remarkably chaste. Perhaps the simplicity of their manners, vegetable diet, and industrious habits, tend to suppress that ardor which in more civilised societies is too often productive of seduction, infamy, disease, and all the dire concomitants of licentiousness. Till within these few years the mountain villagers were unacquainted with the English language, but a circumstance happened, which, fortunately for them, was the introduction not only of that excellent vehicle of knowledge, but of a more lucrative kind of industry than they had practised.

The river of Ravensdale, which flows along in the plains near the western side of the mountains before mentioned, invited enterprising men from Ulster about thirty years ago. They built bleach mills, and by introducing the linen business into the country, they prevailed upon the neighbouring mountaineers to work for a shilling a-day, wages which to them appeared a treasure. Thus by an intercourse with the protestants, the mountaineers gradually learned to converse in English, and many of them can now communicate their ideas in that language with perspicuity.

Their ignorance is owing to the want of education, and the cunning of their priests, who have gained such an ascendancy over their superstitious minds, that they believe whatever nonsense is substituted instead of the pure precepts of Christianity.

Every spring they receive absolution from the priest. On this solemn occasion they exert their recollection to the utmost, in order to render up a faithful account of all the sins they have committed during the last year. Very young boys and girls are exempted from this farcical ceremony, but all those who are arrived at maturity, assemble with the most solemn and penitential looks before the holy father, who gravely hears the confession of each in private, and gives them absolution and his benediction for six pence or a shilling each. The cheerfulness and alacrity with which they return from confession is inexpressible. They have cleared off the old account, and may lay in a new score as soon as they please! Such opinions would have a most pernicious effect in a luxurious community, but in the quiet valleys above mentioned they rather promote the contentment of the ignorant peasant.

During Lent the mountaineers abstain from animal food, and would consider it a crying sin to let it touch their lips:

The mountaineers are accustomed to hardship from their infancy. Their children run barefoot among the tufts of heath, and the rocky mountains, even amid the rigor of winter. This gives them a callousity of nerve, and tends to stupify their mental faculties. The poets may expatiate on the efficacy of frosts in bracing the nerves and clearing the brain, but the experience of mankind proves, that mild cli-

mates, genial suns, and odorous breezes, are more conducive to genius and expansion of mind.

At a very early period, perhaps seven years of age, the boys are employed in leading horses at the plough or harrow, in weeding the potatoes and corn, and several of them are shepherds. The girls are taught to knit, sew, card, and spin. Whatever ideas the children of both sexes acquire from the traditional tales of their parents and neighbours constitute the whole of their knowledge, except the “palpable obscurity” of religion, which their priests think proper to impart. Hence their ideas, like their wants, are few: they are healthy, and the pure air of their native hills gives them a charming vivacity of spirits.

The dress of the mountaineers is coarse and plain. The men are clothed in frieze coats, waistcoats, and breeches, coarse woollen-yarn stockings, brogues (a kind of clumsy shoes), coarse linen shirts, and felt hats. Some of the young men, however, imitate their low-land neighbours by a finer dress, and the women have progressively increased their finery, inasmuch that the plain woollen hood, worn about twenty years ago, is laid aside, and cloaks of good scarlet broad cloth, or in summer of white dimity, are used in their stead. The young women are particularly partial to variegated ribbons, and the more glaring the colours the more they are prized. Their gowns are linsey-woolsey or striped linen, of home manufacture. It is a curious fact, that the fair sex among the most uncivilised nations are fond of brilliant colours, witness the tartan ribbons and petticoats of the highlanders of Scotland; and a similar predilection is shewn by the women of Russia and Tartary for the party-coloured shawls of Kishmyre and India.

Hospitality may almost be said to be instinctive among the mountaineers; and they carry this amiable virtue to so great a height, that there is always a little couch appropriated to the wandering beggars who often visit them. Indeed, the sociability and contentment of their lives have been very naturally portrayed by the poet, in the following lines:

“ Though poor the peasant’s hut, his feast though small,
He feels his little lot the lot of all.
Cheerful at morn he wakes from short repose,
Breathes the keen air, and carols as he goes;
At night returning, every labour sped,
He fits him down the monarch of a shed;
Smiles by his cheerful fire, and round surveys
His children’s looks that brighten with the blaze;
While his lov’d partner, boastful of her hoard,
Displays her cleanly platter on the board.
And haply, too, some pilgrim, thither led,
With many a tale repays the nightly bed.”

Their summer amusements consist of annual festivals, which they call *patrons*, being holidays in honour of tutelary saints. The principal meeting of these mountaineers is held on Midsummer-day. On this occasion the people first hear mass in the morning, and spend the remainder of the day in dancing, drinking, and other amusements. There are booths erected where they assemble, and a multitude of toys brought thither for sale. The young men buy ribbons and gloves, which they present to their sweethearts; and the festival resembles the English country wake.

Besides this amusement, the young people often assemble on Sunday afternoon, on some little green plain or mount, where they form a circle, around which the lads and lasses pursue each other alternately, and whoever is taken forfeits a kiss, similar to the sports of Yorkshire and other northern counties of England. In winter they amuse themselves with dancing,

in barns; or when the young women spin, the young men divert them with stories, or with the music of the flute or violin. Some of them are very expert at playing on the jews-harp, and commonly use two at a time, which they play with their little fingers. It is almost impossible to conceive the cheerfulness which illumines their faces at these social meetings. Their penury, the wintry storms that howl without, and the rumbling torrents that bear fragments of the rocks impetuously along, are unheeded by the lively train. We may well say of the Irish mountaineer, as the poet does of the Swiss—

"—Every good his native wilds impart,
Imprints the patriot passion on his heart;
And ev'n those ills that round his mansion rise,
Enhance the bliss his scanty fund supplies.
Dear is that shed to which his soul conforms,
And dear that hill which lifts him to the forms:
And as a child, when fearing sounds molest,
Clings close and closer to the mother's breast;
So the loud torrent and the whirlwind's roar,
But bind him to his native mountains more."

With respect to superstition, the mountaineers retain a belief in the existence of fairies, whose power they dread. They recount many feats performed by the fairies, or, as they call them, the *gentry*. Tradition has conveyed down the fable of the *banh shea*, an apparition like an old woman, dressed in the ancient Irish habit, with a hood on her head, bound with a kerchief; this spectre was said always to appear under the window where any person lay on the death-bed, and to express several mournful cries as a token of approaching dissolution. The existence of familiar spirits is also believed by this credulous people; and an impostor, called Roger Mulhern, who lived near Carlingford for many years, is yet mentioned by them with the greatest reverence. This man pretended, that by the aid of his invisible friend he could tell the state of the dead. Several people, anxious to know how their relatives fared in the other world, flocked to the house of this sage, who gave them a night's lodging free of expence, and by artful enquiries drew from his visitors a knowledge of such circumstances in the life of the departed friends, as enabled him to decide whether he was happy or miserable. His fame increased, and the priests became alarmed lest his imposture should circumvent theirs. They forbade their parishioners to visit Mulhern, whom they affirmed to be under the influence of the devil. But though the prohibition deterred the people from going publicly to the house of the impostor, yet they visited him, with the greatest secrecy, under the veil of night; and he, as a reward for their faithfulness, presented each person with a shilling, besides giving them the most satisfactory information respecting the deceased. This act of beneficence was so different from the practice of the priests, who always demanded money for any of their good offices, that if death had not removed Mulhern, it is not improbable but he might have produced another heresy in the holy mother-church.

As the young mountaineers approach maturity, the soft passion predominates. The nearest relations of the enamoured pair assemble, and after adjusting the portion to be given with the young woman (commonly two or three cows, and a few sheep), the marriage is solemnised. This is the most expensive festival of the mountaineers. It is common for forty

or more persons to be entertained at the expence of the bridegroom; or if the father-in-law is generous, he sometimes defrays the expence of the wedding dinner.

This feast consists of a superabundance of bread, meat, poultry, butter, and whiskey punch.

Within these few years tea in the afternoon has been introduced; but in general, only the favourite cordial, whiskey*, is circulated with joy-inspiring influence. A musician attends, and the festive party dance till midnight.

When the bride retires, a number of young people of both sexes throng into her bed-chamber, till she complies with the old custom of throwing the stocking. She throws her stocking over her right shoulder, and whoever is so happy as to be hit with it, is supposed to be the next of the company who will be married. This ceremony is accompanied with loud bursts of laughter, after which the lively party retire.

A christening is also attended with much expence in regaling friends, but as the people become more enlightened they will probably be more economical.

By frequent intermarriages in the same village, the mountaineers think that they keep their property among themselves, and are unwilling to form any connubial engagements with others.

On the decease of any person, the fire is instantly extinguished, as symbolical of the extinction of life. If this event happens in spring or summer, flowers are gathered and strewed around the body, which is laid out on a little straw. It is covered to the chin with a sheet, and the face remains bare. For two nights a large table is placed over the corpse, with ten candles upon it; this is called the night-wake, and is emblematic of immortality. A basin filled with cut tobacco, with a number of pipes, are placed for the accommodation of the neighbours, who throng to the house, fill it with the smoke of tobacco, and talk as gaily as if they were at a christening. Nay, several of the young people join in such amusements as hunt the slipper, or blind man's buff; and even courtship makes no inconsiderable progress in this house of mourning. The cheerfulness of the visitors is interrupted at intervals by the exclamations of the mourners.

A female orator begins this ceremony. She recites the former happiness of the deceased; deplores his death in a kind of song, and is joined in different parts of this monody by a chorus of mourners: those who feel least are ever the most noisy, while the nearest female relations prove, by their sighs and tears, that their sorrow is unaffected.

"Alternately they sing, alternate flow
Th' obedient tears, melodious in their woe;
While real sorrow swells in each full heart,
And nature speaks at every pause of art."

This ancient custom might excite risibility in a mind unaccustomed to reflect or feel: but most people are melted by its solemn simplicity. It is difficult to see the gestures of sorrow exhibited by those mourners, and to hear their sweet plaintive voices, without sympathising; and the writer of this account has on many such occasions felt the tear of sensibility bedew his cheek.

After these ceremonies the corpse is carried on a bier to the place of interment, where the priest prays for the repose of the departed soul, and urges his hearers to give him some money for praying the deceased out of purgatory. The credulous people

* The author cannot suppress a wish that the wisdom of the legislature may devise some other mode of taxation, and put an entire stop to the distillation of this pernicious liquor. By this chemical process, nutritious grain is changed into a liquid poison, which ruins the health, and depraves the morals, of myriads of our fellow-subjects.

have paid their clergy for this nonsensical mummerly for many ages, but some of the most intelligent among them are beginning to question its efficacy, and it probably will soon be "a tale of the times of old."

The moral character of the mountaineers has often been misrepresented by satirists, who, as Churchill says, "judged the many by the rascal few." On an impartial and philo-sophic investigation of their qualities of head and heart, it will be found that they are naturally acute; warm in their resentment and affection; hospitable, credulous, and inquisitive; passionately fond of the marvellous in description; very superstitious, and passive to their clergy; communicative and unsuspicious; indolent, till stimulated by the hope of gain or a prospect of pre-eminence; boastful and fond of praise; warmly attached to their relatives and friends, and ferocious to their enemies. Such is the Irish mountaineer in his natural state; but their priests have absolutely perverted this people by inculcating a detestation of the protestants, whom they stigmatise with the name of *heretics*. This hatred is further increased by the idea that they have been dispossessed of their heritage by the first settlers from England and Scotland. Consequently the mountaineers consider themselves as the true proprietors of the island, who have been deprived of their rights by the invasion of others. In consequence of this opinion, many of them hate the protestants; and as in their intercourse they are obliged to behave civilly, nay submissively, they are early taught the low arts of dissimulation, and can disguise their sentiments with wonderful address.

This perversion of the human heart has been productive of the most dreadful effects, witness the massacre of 1641; but as superstition is gradually declining, and a spirit of enquiry is become universal throughout Europe, it is to be hoped that even the Irish mountaineers will soon adopt the benign precepts of Christianity, which teaches us to "love our neighbours as ourselves." The idea that "faith was not to be kept with a heretic," has long prevailed among the mountaineers; hence they were prone to defraud their low-land neighbours, whenever they could do it with impunity; and in their bargains they are yet too cunning for more enlightened dealers.

One virtue of the most amiable kind they practise with un-remitting zeal—filial piety. No nation, not even the Chinese, can pay more respectful attention and implicit obedience to their parents. As there are no parish workhouses in Ireland, except in some of the principal towns, consequently the country would abound with destitute old people, were it not for the gratitude of their progeny. The Irish peasant, but especially the mountaineer, protects his parents in the decline of their years. The mothers assist in nursing, carding, or spinning; the fathers huddle about the farms, directing the young men at their work. At night, the best and easiest seat is appropriated to the ancient father and mother, and the most nutritious food in the house is served up to them. It really is an edifying and lovely sight to behold the respectful attention paid by those peasants to their aged parents, while the grand-children are taught to address them in the most endearing language, nay to crave their blessing, and supplicate the Deity for them in prayer.

Nor does the filial love of the Irish mountaineer expire with his parents. He closes their eyes, attends their remains to the tomb with grateful sorrow, and occasionally visits the grave of those who gave him being, and bedews it with his tears. From such a disposition, what excellent virtues might be produced with proper cultivation! but, alas! ignorance and superstition contract those faculties with lethargic torpor, and many an excellent mind is buried in those remote regions, like the diamond in the mine.

Let us for a moment turn our attention from these wild
Vol. X.

scenes, to another that approaches nearer to the elegance of civilised society, and conclude this account with a short description of the subsequent country.

Ravensdale is a fertile valley, about seven miles north-west of Carlingford. It lies at the bottom of the great chain of mountains whose inhabitants we have described. This lofty and majestic range shelters the vale from the north and east winds. Ravensdale lies open to the southern and western breezes, and is beautified by a large river, which runs from north to south, skirting the fields with the liveliest verdure along the western side. This river empties itself into Dundalk bay, which is about two miles distant.

An excellent road has been made along the bottom of the mountains, on the eastern side of the vale; and there are five bleach-mills on the banks of the river, with several acres around, each covered with whitening linen: here a number of bleachers at work enliven the landscape, and give an air of business to the scene, while several handsome mansions, adorned with gardens and shrubberies, exhibit a charming variety.

This cheerful scene is contrasted by the wild sublimity of the mountains, which swell in natural grandeur, empurpled by the blooming heath, and brightened by the yellow blossoms of furze. Translucent streams flow in many cascades down the sides of the mountains, and appear with peculiar beauty and lustre when the evening sun shines upon them.

Towards the north, Ravensdale park displays a beautiful assemblage of picturesque objects. A variety of trees, particularly fir, oak, and laurel, bloom along the sloping side of the highest mountain, with vistas at different intervals, which give a view of the river winding along amid the level meadows below. A cascade, which falls over a rock, is precipitated about forty feet perpendicular into a basin, where it foams and murmurs away in a stream that joins the river. Several gravel walks conduct the ramblers through the mazes of the wood; and seats painted green, placed at different distances, invite to rest and contemplation. The peak of the mountain above Ravensdale park is crowned with a vast pyramidal cairn or heap of stones, probably raised to perpetuate some great event. This cairn is discoverable at the distance of many miles, and adds greatly to the magnificence of the airy steep.

The rural grandeur of this mountain scene, and the softer features of natural beauty smiling in the sunny meadows, and sparkling on the gliding river below, is contrasted by an opposite mountain, which is so barren that it presents nothing but an irregular mass of rocks and loose stones, which appear in broken curves, with here and there a stunted thorn, vegetating on the surface of the sterile foil.

Such are the primitive manners of the Irish mountaineers of Leinster, and such the rich and picturesque country adjacent, which is inhabited by an industrious and refined race of people, as distinct from the former as if they lived in a distant region of the globe.

MOUNTMELLICK, a town of Ireland, in Queen's County. The wool combing, malting, and tanning businesses; with the cotton manufacture, and bleaching, are carried on here. It is five miles north of Maryborough, and 42 W.S.W. of Dublin.

MOUNTRATH, a town of Ireland, in Queen's County. Iron forges and furnaces have been long erected in its neighbourhood; but from the scarcity of charcoal have not been in regular use: the woollen manufacture forms the principal trade. It is six miles W.S.W. of Maryborough, and 23 north of Kilkenny. Long. 6. 54. W. Lat. 53. 2. N.

MOUNTSBAY, a bay on the south coast of Cornwall, between the Land's End and the Lizard Point. It is so named

from a lofty peninsulated rock, called Mount St. Michael, which rises within it. Among the rocks, on this part of the coast, breeds the Cornish croun, or red-legged crow, noted for stealing and carrying away whatever it finds. In Mountsbay is a considerable pilchard fishery.

MOURA, a town of Portugal, in Alentejo, with an old castle; seated at the confluence of the rivers Ardita and Guadiana, 87 miles S.E. of Lisbon. Long. 5. 59. W. Lat. 38. 0. N.

MOURZOOK, the capital of Fezzan, situate on a small river, and supplied with water from a multitude of springs and wells. The medley which it presents to the eye, of the vast ruins of ancient buildings, and the humble cottages of earth and sand that form the dwellings of its present Arab inhabitants, is singularly grotesque and strange. It is surrounded by a high wall, with three gates, at which is collected a tax on all goods (provisions excepted) that are brought for the supply of its people. A caravan arrives annually from Mesurata at this place; and hence the Fezzaners dispatch, every year, a caravan to Cahna, and another to Bornou. Mourzook is 262 miles south of Mesurata, 650 N.W. of Bornou, and 710 north by east of Cahna. Long. 15. 5. E. Lat. 27. 20. N.

MOUSELEMINCS. See *MONGEARTS, Supp.*

MOUSSY, a river of Hindoostan, which crosses the country of Golconda, and runs into the Kistnah, on the borders of the circar of Palnand.

MOUSTIERS, a town of France, in the department of Lower Alps. It is noted for a manufacture of fine porcelain, and for a once famous pilgrimage, called Our Lady of Beauvezer, seated between two lofty and craggy mountains. It is five miles N.E. of Riez, and 47 W.N.W. of Nice.

MOUTIER, or **MONSTIER**, a town of Savoy, capital of Tarentesia, with an archiepiscopal palace. It is seated on the Isere, 62 miles N.W. of Turin. Long. 6. 23. E. Lat. 45. 30. N.

MOUZON, an ancient town of France, in the department of the Ardennes, with a late rich Benedictine abbey; seated on the Meuse, eight miles S.E. of Sedan, and 110 N.E. of Paris. Long. 5. 10. E. Lat. 49. 37. N.

MOYENVIC, a town of France, in the department of Meurthe, remarkable for its salt pits. It is three miles from Vic, and 10 S.S.E. of Nancy.

MOZCISLAW, a strong town of Lithuania, capital of a palatinate of the same name. It was almost ruined by the Russians in 1660, but is rebuilt. It is seated on the Soz, 22 miles south of Smolenko. Long. 32. 32. E. Lat. 54. 28. N.

MUCHELN, a town of Upper Saxony, in Thuringia. It was burned, in 1621, by the imperialists, under the command of Count Tilly. It is six miles north of Freyburg, and eight S.W. of Merzburg. Long. 11. 39. E. Lat. 51. 15. N.

MUCHELNEY, a village in Somersetshire, two miles south by east of Langport. Here are the remains of a rich and ancient abbey, part of which is now converted into a farm-house.

MUCIDAN, a town of France, in the department of Dordogne, seated on the river Isle, 18 miles S.W. of Perigueux.

MUCKENBERG, a town of Upper Saxony, in the margrave of Meissen, 28 miles north of Dresden, and 22 N.E. of Meissen. Long. 13. 52. E. Lat. 51. 20. N.

MUEHR, a river of Germany, which rises in the archbishopric of Salzburg, crosses Stiria, passing by Judenburgh, Luben, Muchr, and Gratz, and falls into the Drave, near Kaniska, in Hungary.

MUEHR, or **MUEHRHAU**, a considerable town of Germany,

in the duchy of Stiria, on the river Muchr, 25 miles N.W. of Gratz, and 40 S.W. of Neustadt. Long. 15. 4. E. Lat. 47. 16. N.

MUGGIA, or **MUGGLIA**, a town of Italy, in Venetian Istria, with a castle, seated on a gulf of the same name, five miles S.E. of Trieste. Long. 14. 2. E. Lat. 45. 52. N.

MUHLBERG, a town of Upper Saxony, in the margrave of Meissen, with a castle, situate on the Elbe, 19 miles N.W. of Meissen, and 32 N.W. of Dresden. Long. 13. 9. E. Lat. 51. 25. N.

MUHLROSE, a town of Upper Saxony, in the middle marche of Brandenburg, situate on a navigable canal, which forms a communication by water from Hamburg to Breslaw, nine miles S.W. of Frankfurt on the Oder.

MURKIRK, a town in Ayrshire, seated on the river Ayr, and noted for a considerable iron-work.

MULDAU, or **MOLDAU**, a river of Bohemia, which rises on the confines of Moravia, and running by Budweis and Prague, falls into the Elbe, at Melnick.

MULDORF, a town of Germany in the archbishopric of Salzburg, seated on the Inn, 37 miles N.W. of Salzburg, and 40 east of Munich. Long. 12. 25. E. Lat. 48. 10. N.

MULHEIM, a town of Germany, in the electorate of Cologne, seated near the Rhine, three miles from Cologne. Here the few protestants in Cologne are obliged to go to perform divine service.

MULHEIM, a town of Westphalia, in the duchy of Berg, situate on the Ruhr, 14 miles north of Dusseldorf. Long. 6. 51. E. Lat. 51. 26. N.

MULL OF GALLOWAY, a rocky promontory, the most southerly point of Scotland, in the county of Wigton.

MUNDEN, or **GEMUNDEN**, a town of Lower Saxony, in the principality of Calenberg, situate at the confluence of the Werra and the Fulda, where they join to form the Weser. No one who is not a freeman of Munden, is to trade beyond this town, but must consign his goods to a factor here; and whatever is brought in a vessel, must, by virtue of the staple-right granted and confirmed to this town, be unladen and laden again. The Werra may be navigated by Munden and Hessian vessels, but the latter, on coming to Munden, are not to proceed, without a licence, and even then they must have a Munden master and pay a duty to the town. It is 10 miles N.N.E. of Cassel, and 13 S.W. of Gottingen. Long. 9. 47. E. Lat. 51. 40. N.

MUNDER, a town of Lower Saxony, in the principality of Calenberg, situate on the Hamme, 18 miles E.S.E. of Munden. Long. 9. 25. E. Lat. 51. 38. N.

MUNDERKINGEN, a town of Suabia, seated on the Danube, 25 miles S.W. of Ulm. Long. 9. 43. E. Lat. 48. 15. N.

MUNDU, a city of Hindoostan Proper, in the province of Malwa, of which it was anciently the capital. It was then a prodigious city, 22 miles in circuit, and contained many monuments of ancient magnificence; but it is fallen much to decay. It occupies the top of a large and lofty mountain, 46 miles south of Ougein, and 454 N.E. of Bombay. Long. 75. 47. E. Lat. 22. 50. N.

MUNGATS, or **MUNKATS**, a town of Upper Hungary, with a bishop's see, and an impregnable castle, seated on a high rock, 50 miles N.E. of Tockay. Long. 22. 0. E. Lat. 41. 30. N.

MUNGLORE, a town of Hindoostan Proper, in the county of Cabul, 125 miles west of Cashmere, and 135 east of Cabul. Long. 71. 15. E. Lat. 34. 15. N.

MUNIA, or **MEÑIE**, an ancient and considerable town of Egypt, seated on the Nile. The vessels that go down the river are obliged to stop here and pay certain duties. There

are several mosques and a great number of granite pillars. It is 140 miles south of Cairo. Long. 31. 20. E. Lat. 27. 45. N.

MUNNERSTADT, a town of Franconia, in the bishopric of Würzburg, situate on the Lauer, 28 miles N.N.E. of Würzburg, and 31 N.W. of Bamberg. Long. 10. 9. E. Lat. 50. 7. N.

MUNNYPOUR, a town of the province of Meckley, in Asia, 264 miles N.N.E. of Aracan. Long. 95. 0. E. Lat. 24. 40. N.

MUNSINGEN, a town of Suabia, in the duchy of Württemberg, 20 miles west of Ulm, and 26 S.E. of Stuttgart. Long. 9. 20. E. Lat. 48. 23. N.

MUNSTER, a town of France, in the department of Upper Rhine, with 2 late rich Benedictine abbey, 30 miles S.W. of Strasburg. Long. 7. 5. E. Lat. 48. 8. N.

MUNSTER-MEINFELD, a town of Germany, in the electorate of Treves, 12 miles S.W. of Coblenz. Long. 7. 18. E. Lat. 50. 19. N.

MURANO, an island and town of Italy, a mile from Venice, formerly a very flourishing place, and has still some palaces that bear the marks of former magnificence, though now in a state of decay. The island is said to contain 20,000 inhabitants. The great manufacture of looking-glass is the only inducement for strangers to visit this place, which formerly served all Europe with looking-glasses. Long. 12. 5. E. Lat. 45. 26. N.

MURET, a town of France, in the department of Upper Garonne, seated on the Garonne, 10 miles south of Toulouse. Long. 1. 18. E. Lat. 43. 26. N.

MURHART, a town of Suabia, in the duchy of Württemberg, with a Benedictine abbey. It is seated on the river Mur, eight miles south of Halle. Long. 9. 51. E. Lat. 40. 14. N.

MURO, an episcopal town of Naples, in Basilicata, seated at the foot of the Apennines, 12 miles S.E. of Conza. Long. 15. 45. E. Lat. 40. 46. N.

MURRAY FRITH, a considerable inlet of the sea, on the east coast of Scotland, between Tarbetness, in Ross-shire, on the north, and Brough Head, in Murrayshire, on the south.

MUSA, a town of Arabia, in the province of Yemen. It is populous, and surrounded with walls: 18 miles east of Mocha.

MUSACRA, a sea-port of Spain, in Granada, with a strong castle, seated on a mountain, 27 miles N.E. of Almeria, and 62 S.W. of Carthage. Long. 1. 36. W. Lat. 37. 11. N.

MUSIC (*Encycl.*). To what we have already offered under this head we are induced to lay before the reader, from the pen of a scientific and truly ingenious writer who assumes the title of the *LEPTOLOGIST* in the British Magazine for 1800, the following observations on music in general:

The agreeable effect of melodious sounds, not only on the human ear, but on the feelings and on the passions, is so universal and so powerful, as deservedly to excite the attention of the psychological philosopher. For what ultimate end a susceptibility for this peculiar pleasure has been implanted by nature in the mind, is not easy to be ascertained; but, setting aside the well-known pleasing sensation of a delicate titillation, wherever the nerves are possessed of great sensibility, and the affections of an interesting voice, giving expression to poetical and impassioned diction, it is probable that the taste for all complicated and scientific music is wholly acquired.

1. Music may be considered as consisting of three component parts, rhythm, melody, and harmony. Rhythm is an agreeable succession of sounds considered with respect to the time of their whole duration. Melody is an agreeable succession in respect to the pitch, or the frequency of vibrations of each

sound. Harmony is an agreeable combination of several sounds at the same time. It is evident that rhythm and melody are almost inseparable; but that harmony is by no means necessary to the existence of music. In the first place, it is easy to conceive that a love of rhythm, or of the periodical recurrence of the same or similar sensations at equal intervals of time, may be derived from the habit of a certain equality and recurrence in the motions of the body, such as walking, or, in children who cannot yet walk, from the passive motion of gestation: this predilection for the return of customary sensations appears to be an innate and fundamental tendency of the human system, to which physiologists and metaphysicians have been obliged ultimately to refer many properties both of body and mind. But be this as it may, the love of rhythm, which is, perhaps, the lowest ingredient in musical taste, is, if possible, still more universal than the love of harmony and melody. Poetry, or rather metrical composition, is distinguished from prose only by the regularity of its rhythm; and the knowledge of metre and prosody, however high it may rank in the critic's estimation, is a subordinate and comparatively insignificant branch of musical science. The natural fondness for rhythm is the principal foundation of the pleasure of dancing, an amusement intimately connected with music, and no less popular. The rhythm of a musical composition is almost always at least twofold, often three or fourfold, consisting of subordinate divisions or bars, and periodical returns of larger members, either phrases or strains, containing equal numbers of these divisions. All this is perfectly natural, but, perhaps, not so necessary to music as Mr. Walter Young, in his excellent essay, printed in the Edinburgh Transactions, appears to imagine; for those who are already experienced musicians are generally observed to delight in recitative, where the rhythm is almost entirely lost; and still more in fugues, where two or three series of rhythms, almost independent of each other, are carried on at the same time, one part beginning its subdivisions when another has made some progress, and a third is still to follow. But the pleasure derived from such compositions, is, as Kirnberger has observed, more intellectual than sensual, arising in great measure from the consciousness of being able to comprehend that which is "caviar to the general." Rhythm is generally marked in performance by a slight increase of force at the beginning of each subdivision or bar; sometimes, and in some instruments always, the change of sounds, in point of acuteness and gravity, or the interruption of the same sound, is a sufficient distinction; and sometimes, after the rhythm has already been firmly impressed on the mind, neither change of sound nor of strength is perpetually repeated; the imagination alone being sufficient to conceive the continuation of the rhythm: but this constitutes a kind of *tempo rubato*, where the perception of measure is intentionally weakened or suspended. The Æolian harp pleases indeed without rhythm, but the pleasure would soon be exhausted by repetition.

2. The next constituent part of music is melody. Melody may in some sense be said to please on the same principle as rhythm, the partiality of the mind to a regular recurrence of intervals: for though we have it not in our power to count the single vibrations of musical sounds numerically, yet we are evidently able to compare with ease such sounds as are related to each other in the simplest numerical ratios. For instance, if a treble and a tenor voice sing the same part, there is scarcely an ear so inaccurate as not to perceive their resemblance, which is produced by the recurrence of two vibrations of the treble note at the same interval of time with one of the tenor. The same love of order may easily be extended to the comparison of fifths and fourths, where the proportions are as two to three, and as three to four. This is enough to account in

some degree for the pleasure derived from melody, or the succession of sounds bearing certain proportions to each other, in respect to gravity and acuteness: besides, that the same intervals which are most melodious in succession, are found also to form the most pleasing combination of harmony when contemporary; for since the preceding sound is very frequently continued by reflection from surrounding objects, so as to become contemporary with the succeeding, and perhaps always remains fixed in the imagination, it is obvious that sounds, in order to be perfectly melodious, must also be harmonious. Add to this, the impression generally made in infancy by the more or less melodious ditties of the nurse's voice, and the connection of refined and chromatic melodies with the natural expression of the means of grief, or the exclamations of joy; and from the union of all these causes it may easily be conceived from whence the love of melody, as an acquired faculty, may, without much difficulty, be derived.

3. The pleasure arising from harmony is not so simple and universal as that which is produced by a combination of rhythm and melody. Harmony requires for its execution and perception a greater degree of cultivation both in the performer and the hearer than melody alone. Contemporary sounds may, from the due proportion of the times of their vibrations, give a similar pleasure to that of melody, when the mind, considering them in succession, finds them capable of a ready comparison. But the characteristic of harmony is the regular, and at the same time diversified, motion of the air, which arises from the combined vibrations, and which appears to be well calculated to produce the pleasure that the mind derives from the perception of symmetry. In this point of view, a concord may be considered as a single sound distinguished from a discord by a superior quality of tone; in the same manner as the tone of the harmonica is more agreeable than that of a new-man's horn, as the note of a nightingale is sweeter than that of a frog, and a smooth rich voice more pleasing than a hoarse and nasal croaking. Thus the harshness and disagreeable quality of a single sound may also, on a more nice examination, be sometimes found to consist in a want of harmonious proportion in those secondary notes which generally enter into its composition. This quality of sound, sometimes called its tone, register, colour, or *timbre*, might be considered as a fourth component part of music; it depends on the law by which the parts of the sounding body, and the particles of the air, are governed, with respect to the velocity of their progress and regresses in each vibration, or in different successive vibrations. No doubt, much of the pleasure derived from music depends on it; but as it is capable of little diversity on the same instrument, it is seldom considered in treating of the theory of music. The various combinations of the stops of the organ and harpsichord, the use of the harmonies of the harp and violin, the bowing nearer to or further from the bridge, the application of mutes of various kinds, the change of the aperture of the lips in wind instruments, the choice of vowels and consonants more or less adapted to the powers of the voice; and, in full pieces, the judicious introduction of different voices and instruments as subservient to the general effect: all this relates to the quality of sound, and whoever adequately relishes the works of the great modern masters will be fully competent to judge of its practical importance.

Be the causes what they may, natural or habitual, simple or complicated, it is certain that a very great majority of mankind experiences pleasure from music: this pleasure is a social pleasure, and, connected as it is with sentiment and passion, it is a rational pleasure. The pursuit of musical excellence, if properly conducted, amply exercises the faculties, at the same time that it forms a desirable variety when inter-

mixed with literary or professional employments. To call it an amusement only, betrays an ignorance of the nature and difficulty of the study; so far is the science of music from being of a light and superficial nature, that, in its whole extent, it is scarcely less intricate or more easily acquired than the most profound of the more regular occupations of the schools: and even practical perfection in music requires so much intense and laborious application, such a minute accuracy of perception, and so rapid an allocation of various sensitive ideas with other ideas and mechanical motions, that it is inconceivable how men who have no appearance of superior brilliancy in any other accomplishment, should be able to attain a conception and execution which seem almost to require the faculties of a superior order of beings. An intemperate and dissipated attachment to music may indeed often be productive of evils; but probably the same individuals would have been equally idle and irregular if they had been destitute of this accomplishment. A considerable share of the pleasure of practical music arises from causes perfectly distinct from the sensual perceptions: the consciousness of having overcome difficulties, the laudable satisfaction of entertaining others, and the interest and emulation produced by a concurrence of others in the same pursuits: all these entirely outweigh the temporary amusement of the ear, and wholly remove the objection which might be made to the enervating effect of a continual devotion to pleasurable sensations. The ancient philosophers, with all the manliness and dignity of character to which they aspired, were not ashamed to consider music as an indispensable part of a liberal education; and Plato devotes three of the earlier years of his young citizens entirely to the study of the lyre: nor are we without examples in modern times, of philosophers, and princes, and heroes, who have excelled as much in musical performances, as in literature and in arms.

Origin of the scale.—The first lyre, with three strings, is said to have been invented in Egypt by Hermes, under Ormus, between the years 1800 and 1500 before Christ. The second and third string were, perhaps, the octave and fifth of the first, or more probably its fifth and fourth, as it would be easy to sing the octave with the accompaniment of the primitive note only. The melody might be either always in unison with one of the strings, resembling a very simple modern bass part; or the intervals might be occasionally filled up by the voice without accompaniment. We have in modern music, a specimen of a pleasing air, by Rousseau, formed on three notes alone, the key note with its second and third; but there can be little doubt that the earliest melodies must have had a greater compass than this. The trumpet is said to have been invented about the same time: a little experience might have taught the Egyptians to produce from it the octaves, the 12th, 17th, 23d, and other harmonies of the primitive sound, which are related to it in the ratio of the integers from 1 to 9, and the same sounds might have been observed by a delicate ear among the secondary notes of a long chord; and then by descending three octaves from the 23d, and two from the 17th, they might have added to their lyre, the second and major third of the principal note. But it does not appear that this method ever occurred to the ancients: they seem rather to have attended to the intervals of the notes within the octave, than to the union of similar notes in the natural harmonics; and, besides, the series of natural harmonics would never have furnished a true fourth or sixth. It is uncertain when, or by whom, the fourth string was added; but the merit of increasing the number to seven, is attributed to Terpander, about the year 700 before Christ; two centuries after Homer; although some persons asserted that he only brought the improvement from Egypt, and that Hermes was also the inventor.

of the lyre with seven strings. Pythagoras, or Simonides, about the year 500, added an eighth, and Timotheus a ninth string: the number was afterwards extended to two octaves; and Epigonus is said to have used a lyre of forty strings, or rather a harp, as he played without a plectrum: but the theory of the ancient music soon became more intricate than interesting. The lyre of eight strings comprehended an octave, corresponding pretty accurately with the notes of our natural scale beginning with *c*: the key note was *a*, so that the melody appears to have borne usually a minor third, which has also been observed to be the case in the airs of most uncultivated nations: but there was a considerable diversity in the manner of tuning the lyre, according to the great variety of modes and genera that were introduced. These modes were of a nature totally different from the modern modulations into various keys, but they must have afforded a more copious fund of striking, if not of pleasing melodies, than we have at present. In some of the genera, intervals of about a quarter tone were employed; but this practice, on account of its difficulty, was soon abandoned: a difficulty which is not easily overcome by the most experienced of modern fingers; although some great masters have been said to introduce a progression of quarter tones, in pathetic passages, with surprising effect. The tibia of the ancients, as it appears evidently from Theophrastus, although not from the misinterpretations of his commentators and of Pliny, had a reed mouth-piece about three inches long, and therefore was more properly a clarinet than a flute; and the same performer generally played on two at once, and not in unison. Pollux, in the time of Commodus, describes, under the name of the Tyrrhene pipe, exactly such an organ as is figured by Hawkins, composed of brass tubes and blown by bellows: nor does he mention it as a new discovery: it appears from other authors, to have been often furnished with several registers of pipes; and it is scarcely possible that the performer, who is represented by Julian as having considerable execution, should have been contented without occasionally adding harmony to his melody. That the voice was accompanied by thorough bass on the lyre, is undeniably proved by a passage of Plato: and that the ancients had some knowledge of singing in three parts, is evident from Macrobius. Martini, who is one of the strongest opponents of that opinion, which attributes to the ancients a knowledge of counterpoint, observes, that "they allowed no concords but the octave, fourth, and fifth, or at most very rarely the third; yet they were not without a knowledge of concord of harmonious parts. It is known with certainty, that two parts, whether vocal or instrumental, or mixed, besides unison, performed at the same time the same melody, either always in octaves, or probably always in fifths, or always in fourths; which was called a symphony: perhaps also, they changed in the course of the performance from one interval to another, and this might be done by more than two parts at the same time." It is not improbable that this statement may be accurate: nor is it necessary to suppose a very exquisite and refined skill in the intricacies of composition, to produce all the effects that have with any probability been attributed to music. It is well known that Rousseau and others have maintained, that harmony is rather detrimental than advantageous to an interesting melody, in which true music consists; and it may easily be observed, that an absolute solo, whether a passage or a cadence, is universally received, even by cultivated hearers, with more attention and applause than the richest modulations of a powerful harmony.

The minor scale being the most commonly used by the ancients, it was natural for Pope Gregory, who in the year 600 is said to have marked the notes by the Roman letters, to begin with *A*, the key note of that scale: although if, as there

is some reason to suppose, that *B* was originally flat, *A* was not the key note, but its fifth, until the *B* natural was introduced, and denoted by a square *b* instead of a round one. By degrees the chromatic scale was filled up, and the five added intervals were denoted by the letter belonging to the note above them, with the addition of the round *b*, or by the note below, with the addition of four lines crossing each other, implying a half note, as composed of four commas. A simple cross would, however, at present, be much more convenient, as more readily distinguishable from the square *b*, which is used to signify a natural note in opposition to these flats and sharps. This is the historical account of the origin of the scale; but, according to the modern theory and practice of music, the subject may be more easily understood, by beginning with an explanation of the major scale.

Practical application of the scales.—The simplest proportions of two sounds to each other, next to unison, is when the frequency of their vibrations are related as one to two: such sounds bear to strong a resemblance to each other, that when named, they are denoted by the same letter, and are only distinguished by the appellations in alt, in altissimo, on the one side, and double double, on the other. The Germans, with great propriety, make use of small letters or capitals with one, two, or more lines over them. The note marked by tenor

cliff is called $\bar{c}$, the octaves above $\bar{c}$, $\bar{c}$, as far as six lines, which is, perhaps, the highest note used in music: the oc-

taves below $\bar{c}$, are $\bar{c}$, $\bar{c}$, $\bar{c}$, $\bar{c}$: $\bar{c}$ is probably not audible, vibrating but eight times in a second. $\bar{c}$ with six lines, would denote a sound, of which the complete vibrations should last precisely a second. The series of natural notes is thus—*A*, *B*, *C*, *D*, *E*, *F*, *G*, *A*, *B*, *C*, *a*, *b*, *c*, *d*.—The subjoined table will shew the absolute frequency and the dimensions of each vibration of the octaves of *c*, and the length of the simplest organ pipe that produces it; but according to the different temperature of the air, and the pitch of the instruments, these numbers may vary somewhat from perfect accuracy; and it must be observed, that the usual pitch of concerts in London, is higher than this standard; and in Germany, perhaps a little lower.

Sound moves in a second 1130 feet.

Any sound may be assumed at pleasure for the primitive or standard note of a piece of music, and is then denominated the key note; and the idea of this note is perpetually im-

pressed on the mind in all simple compositions, both from its frequent recurrence, and from the relation that all the other sounds bear to it. C being the key note of the scale called natural, we shall consider it as the foundation of the scale. The next in importance is the fifth, G, which for various reasons is intimately connected with the key note. The first reason is, that it constitutes the most perfect melody and harmony with C, since every other vibration of C coincides with every third of G; the second is, that an attentive ear may almost always distinguish this fifth, at least its octave, the 12th, whenever any instrument sounds C; it being one of those secondary sounds which are called natural harmonics, and which may generally be observed in the proportion of the natural numbers, as far as twenty or more, but which have not hitherto been completely explained: thirdly, a stopped pipe, if blown forcibly, springs immediately from C to g, and an open pipe first to c, and then to g, the interval between C and G, is most naturally divided by the note E, which answers to the number of 5, when C and G are represented by 4 and 6, and which is found among the natural harmonics both of chords and pipes. These three notes constitute the harmonic triad, or common accord in the major scale, which is the most perfect, or rather the only perfect harmony. But the intervals are still much too large for melody, and require a further subdivision; we now therefore take the fifth below instead of above the key, or its octave, the fourth above F, which is to C as 4 to 3: this found is no-where found among the natural harmonics of C, but C is the most distinguishable of its harmonics, and therefore the relation is nearly the same. The scale is completed by filling up the perfect triads of G and F: the fifth of G furnishing D, the second of the key, which is also the ninth natural harmonic of C; the third of G, the seventh, B, which is the fifteenth harmonic of C; and the third of F being the sixth of the key, A, which is neither among the harmonics of C, nor has c among its harmonics. Hence we have a second table, in which the proportions of the length of a chord, or pipe, producing the various sounds are detailed, and the place among the principal natural harmonics of the key annexed.

Notes.	Proportions.	N. H.
Key C	1	1, 2, 4
2d D	$\frac{8}{3}$	9,
3d E	$\frac{5}{2}$	5, 10
4th F	$\frac{4}{3}$	0, ($\frac{1}{3}$)
5th G	$\frac{3}{2}$	3, 6, 12
6th A	$\frac{8}{5}$	0,
7th B	$\frac{15}{8}$	15,
8th c	$\frac{3}{1}$	2, 4, 8, 16

Now when two or more perfectly harmonious parts are performed together, they must necessarily be found all in the same triad, C, E, G; G, B, D; or F, A, C; and the succession of these triads in various forms, is sufficient for the accompaniment of any simple melody. A regular melody always terminates by an ascent or descent of one degree to the key note: the last note but one must therefore be always B or D; and both of these being in the triad of G, G is called the governing note, or the dominant of C; and E, being in the same manner governed by C, is called its subdominant. And it is usual, in all regular compositions of any length, to depart for a short time from the principal harmony of the key note, and to modulate into the key of the dominant, then to return, and to modulate for a still shorter time into the subdominant, before the final close in the tonic or key note. It is necessary therefore, for greater variety, to complete the scale of the dominant, as well as that of every other note which may be occasionally introduced as a principal key note; but to do this

with mathematical accuracy in the same proportion as has been explained, would be practically impossible, and even theoretically inconvenient: hence arises the necessity of tempering some intervals to make the others more tolerable, without too much increasing the number of sounds. It has been found sufficient in practice, to add five notes to the seven which have been enumerated; but the best proportions of these have not yet been absolutely determined: some have made all the twelve intervals equal: others have left the whole scale of C perfect: others again have taken a middle path, and have introduced a slight imperfection into this key, in order to make the neighbouring ones the less disagreeable. The least circuitous introduction of these notes is shewn in the third table, together with the proportion that they bear to C when thus considered. They are denominated nearly in the German manner—signifying what the English call sharp, and the French *disjé*, and -es, flat, or *bémol*.

Notes.	Relations,	Proportions.
Fis	as 7th of G	$\frac{32}{27}$
Bes	as 4th of F	$\frac{16}{15}$
Cis	as 7th of D	$\frac{128}{125}$
Ees	as 4th of Es	$\frac{256}{243}$
Cis	as 3d of E	$\frac{10}{9}$

But a still greater variety being required than these major scales afford, it has been found that the interval of a fifth may be agreeably, though somewhat less harmoniously, divided, by placing the minor third below, instead of above, the major; so that C may be to E as E was to G, and consequently E to G as C was to E. The *E* thus depressed to $\frac{3}{2}$, differs but by a comma, or the ratio of 80 : 81, from the *E* found above, as the 4th of *Bes*; therefore the same string serves for both notes; and the scale becomes C, D, *Ees*, F, G, A, B, C; which is the ascending minor scale, the A and B being retained as leading best towards the key note, and the major triad of the dominant being therefore necessary to the cadence. But in descending, the triad of the sub-dominant F may conform to the character of the minor mode, and *Aes* is substituted for A; and most frequently *Bes* for B, as dividing the interval from C to *Aes* more equally and more melodiously.

Thus, we have a pretty comprehensive view of the most usual practical relations of all the notes to each other. Their use as discords is somewhat more complicated, and would lead further into the science of music than is consistent with the nature of so summary a view. But it may be remarked in general, that by far the most common discord is the note which constitutes the distinction of the scale of the key from that of its dominant; for instance, F with the triad of G, which is called the accord of the flat seventh of G; and F not being in the scale of G, is considered as a regular preparation to the final accord of C; in which that part or instrument by which the F is introduced, must necessarily descend to E, the third of the key. The second kind of discords are suspended discords, when one or more notes of any preceding accord are continued after the commencement of a different harmony in other parts of the composition. The third, which is rare, and less universally adopted, consists in an anticipation of a subordinate note of an accord which is to follow, as in the case of the added sixth of the French school. The fourth kind are passing discords, where a note forming only a melodious step between two others, is inserted without any regard to its harmonious relations.

Terms expressive of time.—The notation of music, as it has been established for more than two centuries, is in general admirably adapted for its purpose: but there is one great deficiency, which might be very easily remedied, and that is, the total omission of any character expressive of the absolute duration of each note, however accurately the relative value of

the notes may be prescribed. 'Tis true, some little allowance must be made for the execution of the performer, and for the habits of the audience; but this is no reason why time might not be much more accurately noted, than by the vague terms which are usually adopted. It would be easy to prefix to each movement a number, signifying how many bars are to be performed in a minute, which might at first be ascertained by the help of a stop-watch, and would soon become perfectly familiar both to composers and performers, even without this assistance. According to Quanz, the number which should be substituted for *Allegro assai* in common time, is about 40; for *Allegretto*, 20; for *Larghetto*, 10; and for *Adagio assai*, 5. But it is usual to perform modern music much more rapidly than this; or at least the style of composition is so changed that the terms are very differently applied. An allegro, or even an allegretto, in common time, without fermi-quavers, is often performed as fast as 60, seldom slower than 30.

A very superficial attempt to affix a determinate meaning to the words denoting musical time, may be seen in the table subjoined; which, if it were more completely and accurately filled up, might be of considerable use to young musicians; although it will appear from inspection, that composers have hitherto employed those terms in very indefinite significations. But it must be confessed, that much latitude must necessarily be left for the ear and taste of a judicious performer, and that it is impossible for human art to describe on paper every delicacy of finished execution.

Indian Music. Of the melodies called *Raugs* and *Raungees*, the primary and subordinate modes or tunes of Hindoostani, many equal in sweetness the most favourite Scotch or Italian airs. Sir William Jones derives the word *raug* from a Sanscrit root, signifying a passion, or affection of the mind. The *raugs* are six in number; to each belong five *RAUNGEES*. The most extraordinary and preternatural powers are ascribed to some of these tunes; by the Indians: one has the property of occasioning a fall of rain; another causes a conflagration, &c.; and several strange anecdotes are recorded of rash musicians who suffered the most dreadful agonies, as a punishment for having violated all musical decorum by singing a *night raug* in the day-time, or a *morning raug* in the evening.

These melodies are personified by the Hindoos; and represented in allegorical paintings, the series of which is denominated *Raungmala*: the best account we have yet seen of these personifications is given by the ingenious Mr. Gilchrist in his very excellent and useful *Grammar of the Hindoostanee Language*, p. 276; from which work, as it is unfortunately so rare in this country as not to be procured for any price, we have not hesitated to extract the following descriptions, taken by that learned orientalist from a Persian treatise, called the *Tobful al Hind*, composed by *Mirza Khan*.

I. **FIRST RAUG**, called *BHYROON*.—This must be sung at the dawn of day, in the autumnal season only; it is represented under the figure of the god *Mabadeo*, or *Jupiter Olympius*: face comely, but covered with ashes, and long lock hair; from which the river Ganges flows. The *raug* issues from the mouth of the deity, who holds a trident in his hand, and has a bull by his side, with other emblems of divinity familiar to the Hindoos.

The *raungees* belonging to *Bhyroon* are,
1. *Bhyrouwee*, represented as a beautiful damsel, dressed in scarlet and white, with a garland of *chumpia* flowers round her neck. She is seated on a hill amidst lilies, worshipping the *Mabadeo* (or symbol of Jupiter Genitor), singing a love song, and playing on the cymbal. Time; morning. Season; autumn.

2. *Eyraree*. A handsome nymph, black locks, bracelets on her arm, adorned with leaves; dallying with her lover, and fanning flies from his face. Time; evening. Season; autumn.

3. *Mudebmadd*. A nymph dressed in yellow, with streaks of saffron on various parts of her body, in dalliance with her lover. Time and season as the last.

4. *Sinaburree*. Time; evening. Season; autumn. A lovely female, clothed in red, and armed with a trident; her ears ornamented with noon-flowers. She sits complaining, and expecting her lover, while she runs over her rosary in honour of *Mabadeo*.

5. *Bangal*. Time and season as the last mentioned. A female, with a beautiful face, but obscured by ashes rubbed over it, like that of a *Jognee*, or female mendicant. Her hair coiled up. In her left hand a trident; in the right, a water-lily; her drapery saffron colour, and her body marked with stripes of sandal wood: on her forehead a line of milk.

II. **SECOND RAUG**, named *MALKOOS*, is adapted to the second winter, and the last watch of the night. It proceeds either from the mouth of *Mabadeo* or *Kanb*, the Indian Apollo. The figure is a robust, florid, stately man, in blue garments, armed with a club; his neck adorned with a string of pearls, or human skulls, and he seems in dalliance with many damsels.

The *raungees* belonging to *Malkoos* are,
1. *Tooree*. Time; forenoon. Second winter. A fair and gentle maid, clothed in violet and white; her body covered

with streaks of saffron and camphor: she plays on the *veena*, or Indian lyre, in a verdant plain, where the wild deer are captivated by her melody.

2. *Gource*. Time; late in the afternoon. Second winter. A charming brunette, dressed in white robes, singing with a voice which faulters from the juice of the grape. She has pendants and mango blossoms in her ears, and her songs are amorous.

3. *Goorkulee*. Dawn of day: second winter. A woman, who, in the absence of her lover, by grief and lamentation, has reduced herself to an emaciated state. She is weeping with dishevelled hair at the foot of a *kudum*, or *ball-flower* tree.

4. *Koumbhawatee*. After midnight: second winter. An airy, graceful nymph, sighing constantly, dancing and playing on musical instruments; clad in green and scarlet, with jewels.

5. *Kokuba*. A plump female, with wanton looks and glances, having just left her bed-fellow; her garments are partly rent, and her garland of flowers discomposed.

III. THIRD RAAG, named *HINDOOL*, is intended for the gay season of morning and spring: he is said to have emanated from the navel of *Brabma*, and seems a handsome youth of radiant hue: he is seated on a swing, with lovely nymphs, who toy and dally with him; singing songs of love, and playing on various instruments.

The *raagnes* which belong to him, are,

1. *Ramkulee*. Season; spring. Time; dawn of day. A lovely female; bright complexion, clad in blue, ornamented with jewels; her lover falling at her feet entreats forgiveness for past infidelities.

2. *Deakb*. Morning: spring. A fair Amazon, with a drawn sword; her arms and breasts covered with ashes; her lover close at her side.

3. *Lulin*. Season as above. A beautiful damsel, clad in scarlet, and richly ornamented with jewels: on her neck a garland of flowers.

4. *Bilawal*. Time; morning in spring. A jetty nymph, of slender make, and clad in crimson, decorated with jewels; she sits in expectation of her lover.

5. *Pumunjuree*. Spring: midnight. A forlorn, deserted, love-sick damsel, grieving in the absence of her lover. A garland of withering flowers hangs on her bosom.

IV. FOURTH RAAG, called *DEEPUCK**, is to be sung in the hot weather at noon exactly. He is the offspring of the sun, and of a flame or orange colour, with crimson garments, and a string of large pearls round his neck, riding upon a furious elephant, attended by many females. Others describe him as extinguishing a taper, and darkening his chamber, that the eye of curiosity may not put him to the blush on account of his amours.

The *raagnes* subordinate to him are,

1. *Delee*. Summer season: forenoon. A handsome ruddy young woman, in green robes, decorated with pre-

cious stones, &c. She amorously approaches the couch of her lover.

2. *Kanod*. Time as the last. A graceful female, clad in white above and red below, weeping in the absence of her lover.

3. *Nut*. Afternoon. Summer season. A rosy nymph adorned with jewels, mounted on a steed in a riding habit, with a drawn sword, hewing down her enemies in battle.

4. *Kidara*. Summer: midnight. A mendicant with long matted hair, in pink-coloured garments. A snake entwined in his locks, whence issues the river Ganges. His brow is adorned with a crescent, and he worships *Mahadeo* with closed eyes.

5. *Kanbra*, or *Kurntee*. Summer evening. A handsome fair man, with a sword in his right hand, the left extracts the tooth of an elephant; a bard stands before him repeating his praises: on his forehead is a line of camphor.

V. FIFTH RAAG, named *SKEERAVG*, is restricted to winter's afternoon: he proceeds from the womb of the earth, and is a florid graceful man clothed in white, or red, adorned with a necklace of amethysts and false diamonds. He holds the lotus flower in his hand, and sits on a splendid throne, before which musicians are singing to amuse him.

The *raagnes* belonging to him, are,

1. *Majjinee*. Winter season: forenoon. A rosy dame, with graceful figure, clad in yellow, with a group of damsels, under the shade of a mango grove.

2. *Marwa*. Winter; towards evening. A damsel in gorgeous apparel, with a garland of flowers round her neck, expecting the arrival of her lover.

3. *Dhunnajee*. Winter: forenoon. A love-lorn female, in red garments, weeping alone under a *Mouljee* tree.

4. *Bajunt*. Forenoon: winter. A handsome man, dressed in scarlet; crowned with peacocks' feathers; holding mango blossoms in his hand; incited with passion; a garland of flowers hangs from his neck, and he sports in a garden with singing and dancing girls; in his left hand he holds a pan of *betel*, whilst he plays on a pipe or lute, surrounded with his nymphs.

5. *Ufarworee*. Winter: forenoon. A dark-coloured, delicate damsel, in white garments, her legs and arms entwined by several large snakes. She is seated in water, on a plain at the top of a mountain: according to some, she is quite naked, or only wears an apron of leaves.

VI. SIXTH RAAG, called *MEGH*, is adapted to the wet or rainy season, and the last watch of night. He is said by some to proceed from the head of *Brabma*, and by others from the sky; he is of a dark complexion, but comely. His hand is armed with a sword, and his hair gathered into a knot, and tucked up behind.

The *raagnes* belonging to *Megh*, are,

1. *Tunk*. Midnight: rainy season. A damsel distracted by the absence of her lover; spreading a bed of lotus leaves.

* On the subject of this raag, we shall extract a curious passage from Sir William Ouseley's Essay on Indian Music (Oriental Collections, vol. I. p. 73.) "There is a tradition, that whoever shall attempt to sing the raag *Depuck*, is to be destroyed by fire. The emperor Akber ordered Naik Gopaul, a celebrated musician, to sing that raag. He endeavoured to excuse himself, but in vain; the emperor insisted on obedience; he therefore requested permission to go home, and bid farewell to his family and friends. It was winter when he returned, after an absence of six months. Before he began to sing, he placed himself in the waters of the Jumna, till they reached his neck. As soon as he had performed a strain or two, the river gradually became hot; at length began to boil, and the agonies of the unhappy musician were nearly insupportable. Suspending for a moment the melody thus cruelly extorted, he sued for mercy from the monarch, but sued in vain. Akber wished to prove more strongly the powers of this raag. Naik Gopaul renewed the fatal song. Flames burst with violence from his body, which, though immersed in the waters of the Jumna, was consumed to ashes!!!"

2. *Mular*. Same season: midnight. A lovely maid, pining in the absence of her beloved. Adorned with jessamine flowers, and playing a mournful air on the lute.

3. *Gooree*. Morning: rainy season. A beautiful damsel, slender waited, and skilled in song; the upper part of her drapery is orange coloured; the lower, scarlet; studded with jewels, &c.

4. *Bhopalee*. Evening: rainy season. A charming rosy female, in white garments; her body streaked with saffron; she has a garland of flowers round her neck, and is wholly covered with rich ornaments; she leans upon her lover, and her hands are tinged with *binna*.

5. *Defkar*. Last watch of the night: rainy season. A beautiful fair woman, with a fine mole on her face, which is oval; her breasts rival the pomegranate, and her skin the lily; she wears a string of pearls round her neck, and is adorned with jewels. She sports and amorously dallies with her lover.

Musical GAMES. The following is a specification of the patent granted to Ann Young, of the city of Edinburgh, for an apparatus consisting of an oblong square box, which, when opened, presents two faces or tables; and of various dice, pins, counters, &c. contained within the same, by means of which six different games may be played, which, besides being amusing and interesting, and such as children of eight years old may be taught to play, are at the same time an improving exercise upon, and serve to render familiar, and to impress upon the memory, the fundamental principles of music, particularly all the keys or modulations, major and minor, both with the common and uncommon signatures, musical intervals, chords, discords, with their revolutions, and the most useful rules of thorough bass. It is dated March 16, 1801.

The box is composed of two equal pieces or frames of cabinet-work, united by hinges like backgammon tables. When it is opened, or spread out, the two pieces exhibit different faces. The one presents at each end two musical staves or systems of five lines. In each line and space of these staves, a number of small holes are drilled, in which are occasionally stuck the pieces of turned ivory and wood, which are designed to represent the sharps and flats, that severally belong to the different keys or modulations of music. Under each of these staves there is a drawer, in one of which are contained the dice, pins, &c. which are used in playing with sharps; and, in the other, the corresponding dice, pins, &c. used in playing with flats. These drawers are pulled out from the ends of the frame, and, when in their places, are kept firm by brass pins running through the edge. In the middle space betwixt them are contained two dice boxes; when these are taken out and the game is to be played, this vacant space is covered by a moveable lid, which at other times rests upon one of the ends. The surface of the table is by that means rendered complete and uniform. Upon the outer part of the border round it are written the fundamental letters of all the twelve major keys, according to the order of succession by flats; and, immediately below or within each of these, the fundamentals of their relative minor keys. At each letter there is a small hole for receiving a pin. The other face or table is of one piece. At each end is a delineation of the clavier or finger touches of a piano-forte, in every one of which there is a small hole. Above these are two musical staves, on which are written in crotchets the whole scale of natural notes. In the round head of each crotchet, there is a small hole, for receiving pins or moveable notes; and also immediately below each of them, there is another small hole for receiving the pins, on the heads of which are the characters of sharp, double

sharp, double flat, and natural. Around this table there is a border similar to that which surrounds the other table, on which are marked the fundamental letters of the twelve major keys, according to the order of succession by sharps, with their relative minors below or within each. In the drawer which contains the apparatus for sharps, there is at one end in front a square compartment, in which is an uncovered box or moveable frame, divided by a partition in the middle into two cells, in one of which are contained fourteen pieces of turned ivory, and in the other, ten such pieces of a different shape; the former intended to represent single sharps, and the latter to represent double sharps, and designed to be stuck into the holes in the lines and spaces of the staves upon the table first described, for the purpose of exhibiting the signatures of all the keys of music with sharps. Behind this compartment are two small square cells, in each of which is a cylindrical box, the one containing twelve larger, and the other twelve smaller ivory counters. The remaining part of the front of the drawer is a range, divided into four small square compartments, marked 1, 2, 3, 4, in each of which are four dice, and a smaller one at the end marked 5, in which lie two ivory pins. The first pair of dice in the compartment 1, have upon their faces, the one, the capital letters G, D, A, E, B, F, being the fundamentals of six major keys with signatures in sharps; the other, the small letters c, b, f#, c#, g#, d#, being the fundamentals of six relative minor keys with signatures in sharps. The second pair in the compartment 2 have upon their faces, the one, the capitals C#, G#, D#, A#, E#, B#, being the fundamentals of the six remaining major keys, with uncommon signatures, or according to the order by sharps continued from six to twelve; the other the small letters a#, e#, b#, f#, x#, c#, g#, x, the fundamentals of the six remaining minor keys with uncommon signatures. The four dice in the compartment 3, have each upon their faces respectively in order the very same fundamentals of the keys major and minor with the former, represented in musical notes bass staves, with the signatures proper to each. In the compartment 4, there is 1st, a die having upon its faces C, the same note on a musical staff, A, the same note on a musical staff, and two bass staves without signatures; 2dly, a die having on its faces bass staves, with signatures of 1, 2, 3, 4, 5, and 6 sharps, but without any notes; 3dly, a die having upon three of its faces the letter T, and upon the other three the letter S; 4thly, a die having upon its faces the characters of treble, bass, and tenor clefs. In the 4th compartment are dice with various numeral figures. The space behind this range is divided into two compartments. In one of these, upon a raised surface, are stuck fourteen ivory pins, with small flat heads, on seven of which are marked the musical character #, or sharp, on five the character X, or double sharp, and on two, the character ♮, or natural. Upon the sunk surface beside these are stuck three ivory plates, bearing the marks of the treble, tenor, and bass clefs. In the other compartments are stuck eight black, and two white pins, with small round heads, which are used as musical notes. The other drawer, which contains the apparatus for flats, is, in its divisions and compartments, exactly similar to the one now described. The fourteen and ten pieces of turned work contained in the divided box, or moveable compartment, which represent single and double flats, are exactly of the same form with those for sharps, but for the sake of distinction are made of dark coloured wood. The counters are of ivory stained red. The first pair of dice in the compartment 1, have, the one, the capitals F, Bb, Eb, Ab, Db, Gb, the fundamentals of six major keys, according to the order by flats; and the other, the small letters d,

g, c, f, bb, cb, the fundamentals of the respective minor keys. The second pair have, the one, *Cb, Fb, Bbb, Ebb, Abb, Dbb*, the fundamentals of the other six keys with uncommon signatures, or according to the order by flats continued up to twelve; the other, *ab, db, gb, cb, bbb*, their respective minors. The four dice in the compartment 2, have the very same fundamentals, represented in musical notes upon bass staves, with the proper signatures of one, two, three, four, five, and six flats, but without notes; 2dly, a die having upon its faces one line, one line and a half, two lines, two lines and a half, three and four lines: thirdly and fourthly, a pair, having upon their faces various thorough bass cyphers, and chords upon musical staves. In the compartment 4, there is, first, a die having upon one of its faces the character $\sharp$, upon two, the character $\flat$, and upon the other three, numeral figures: secondly, a die having upon one of its faces the character $\sharp$, upon two, the character $\flat$, and upon the remaining three, numeral figures. Lastly, a pair bearing upon their faces the fundamental letters of all the keys major and minor of the first circular system.

Several games are inferred by way of illustration; but as they extend to too great a length, we must refer for further particulars to the Repository of Arts, &c. vol. XVI.

MUSICAL-INSTRUMENTS. These have been spoken of under their proper names. It is necessary however to notice the patent lately granted to Mr. Becker of Princes-street, Soho, for improvements in the construction of harps and piano-fortes.

Mr Becker says his invention consists in the following improvements in the harp and piano-forte. Of the harp, he observes as follows:—"I produce," says he, "sharps, flats, quarter notes, or any intermediate variation deviating from the natural notes, by causing (what are commonly called) the wrest pins (I mean the pins by which the strings are extended and tuned) to move partly round their centres, and thereby increase or decrease the tension of the strings, more or less, as may be required, to answer the desired change of the notes. To this purpose the said wrest pins are connected with the pedals by an apparatus hereby described, and more clearly expressed by the annexed drawing (see Pl. 39): fig. 1, *a, a*, represents the wrest pin passing through a socket *b*, with a lever *cc*, on which slides a quadrant *d*; on this quadrant are fixed the link *ee*, kept stationary by a regulating screw *f*. These links communicate with the pedals by the interposition of a crank *g*, fig. 2, where are seen all the quadrants *d*, with levers and wrest pins belonging to their respective strings of the same denomination. On the said crank *g* is also a regulating screw *f*, to adjust the whole to the motion of the pedals. Now if any one of the pedals is pressed down, all its appertaining quadrants with the wrest pins must follow, and consequently the tension of the appending strings will be increased accordingly; and as soon as the pedal is left at liberty, the strings will, by their re-action, resume their former degree of tension, and the pedal its former station; hence it follows, that a variety of changes may be effected on each string throughout the instrument by the motion of the pedals. It is obvious that to this end the quadrants and the parts of the wrest pins, round which the strings coil, must, in regard to their circumferences, be so proportioned that by the motion of the pedals each string shall have its tension altered uniformly with the rest of the strings belonging to the same pedals, so as to keep in tune together. If in case new strings are put on, perhaps differing in size or quality, any irregularity should take place, this must be corrected by the regulating screw *f*; for if by this screw the quadrant is moved towards or from the centre of the wrest pin, its motion will be

accordingly more or less. To stop the pedals at four different stations, answering to the natural note, to one quarter, to one half, and to three quarter notes, I apply a kind of rack, as seen in fig. 5; *a, b, c*, are the steps, which being so disposed, preserve the pedal in each situation in a perpendicular line, and thereby prevent them coming too close to one another. To ease the motion of the pedals, having each of them six or seven strings to act upon, I apply a spring to each pedal, to counteract the tension of the strings, and thereby render the motion of the pedals as easy as I please. As in tuning the harp it is generally attended with difficulty to find out the wrest pin belonging to its respective string in the bass, particularly for short persons, I reverse the wrest pin, and form the square for the key, by which the instrument is tuned, at the same end where the string is applied, as fig. 3. To facilitate the tuning of this instrument, I have still another contrivance, viz. instead of turning round the wrest pin in its socket, in which it must move tight, to be capable of sustaining the stress of the string, I fix it into the socket; and to receive the string I apply a separate piece *k*, fig. 4, with a notched rim, to be turned by an endless screw *ff*, which is supported by a collar firmly fixed to the pin. When the former method is made use of, it will be necessary to apply a set of springs, as shewn at fig. 2, to support the levers *c*, belonging to the smaller strings, in the act of tuning, in their proper position; for as the wrest pin in drawing up the string moves in the same direction as it is propelled by the pedals, the lever will be carried along with it if nothing is put in opposition to overcome the friction which subsists between the wrest pin and socket. This friction may be adjusted by the socket *b*, fig. 1, being slit at *b*, and an adjusting screw introduced: besides this, a lining of leather or any other elastic substance within the socket may be of some service. Instead of the spring *f*, fig. 2, several other mechanical contrivances may be made to answer the same end.

"In *piano-forte*, or other stringed instruments, played with keys, I use one or more wheels, to cause the strings to vibrate. These wheels are placed under or above the strings, and put in motion with a pedal or pedals, or any other mechanical power, and the strings are by the touch of keys inclined to the wheels. In the manner of extending and inclining the strings consists the principle of my invention. In the diagram, fig. 6, *a* represents the string fastened by a loop and pin at *b*, and extended by a moveable lever or brace, with two points or knife-edges resting against two props at *cc*: here it may be easily conceived that if the string passes through the direction of the points of motion, *cc*, of the lever, the string has no inclination to either side, but may, without materially altering its tension, be moved up or down a little way by *d*, and very little power will keep it in due bounds. The gravity of the lever, connected with a key, will be sufficient to keep in balance with the string when its direction is a little above those points of motion; hence it is easy to construct an instrument on this principle so as to make the keys with the strings move a little way up and down very freely. Secondly, if the said lever on its extremity instead of two points or knife-edges forms part of a circle, the radius of which is the length of the lever, and rests against two circular surfaces, described by the part of the string *a* to *b*, fig. 7: here it is evident, that by moving the lever at *d* up to *m*, or down to *n*, the tension of the string will not in the least be altered, and yet yield to the slightest touch. The application of this principle is not confined to these two instances, but will admit of a variety of forms and applications. If therefore the string be any-wise extended on any thing moveable, having its prop or fulcrum any-where within the extent of the string, or

its two ends higher or lower, for the purpose of inclining or moving the string to the wheels, or altering the tension of the strings to raise or lower the tone thereof, it will comprise the principle of my invention. Where hammers and dampers are used, I mean to connect both, so as to constitute one piece, by letting one or two slips, of any convenient material, pass through between the strings, which are to be fastened to the hammer below the strings, and likewise to the dampers above them; by that means the mechanism will be simplified, and their gravity is thereby united, and serves each alternately. The hammer may move on a hinge in any of the usual ways, or otherwise, and the damper form part of the said hammer."

MUSK (*Encyel.*) There has been lately discovered an *Artificial Musk*; a chemical preparation, thus denominated on account of its possessing all the essential properties of the genuine musk. It was first invented by Mageraff, and has been lately recommended to public notice by Professor Hufeland: it is prepared in the following manner:—one drachm of rectified oil of amber is first poured into a wine glass, on which a drachm and a half of the concentrated nitric acid, or smoking aquafortis, should be gradually and cautiously dropped. The mixture, on agitating it, grows hot, and emits offensive vapours, against which the nostrils must be guarded: when it has stood twenty-four hours, the compound produces a yellow resinous matter, concreting at the top, and which resembles musk in its smell, while a strong acid liquor remains at the bottom. The resin is now to be repeatedly washed, both in cold and in hot water, till it be totally divested of its four taste. Thus a substance is obtained, which is not only cheaper than the common musk, but is at the same time free from those impurities with which the latter is too frequently adulterated.

Dr. Willich says artificial musk is a more powerful medicine than the natural, and that it has been successfully prescribed by Hufeland, in the epidemic chin-cough, as well as other nervous and spasmodic affections. Nor have its effects been less salutary in cases of diabetes, and difficulty of breathing; having effected a cure when other medicines had failed of success.—As this substance is of a resinous consistence, it will be most conveniently given in emulsions: hence ten or twelve grains of it should be triturated in a mortar, together with a few blanched almonds, and diluted with five or six ounces of distilled water. Of this mixture, two tea-spoonfuls may be given every two hours, to a child between one and two years old; and in progressive doses, so that a youth from twelve to fourteen years of age, will require double, and an adult about three times, the quantity above stated. Without the aid of any other medicine, it generally produces a sudorific effect; diminishes and alleviates the fits of coughing; and often produces eruptions resembling the true nettle-rash;—thus, a favourable change takes place, and the disease speedily disappears.

MUSSELBURG, a sea-port in Edinburghshire, on the frith of Forth, at the mouth of the river Esk. Here a victory was obtained by the English over the Scots, in the reign of Edward VI. It is six miles east of Edinburgh. Long. 3. 5. W. Lat. 56. 0. N.

MUSTAGAM, a sea-port of the kingdom of Algiers,

with a castle, 140 miles west of the city of Algiers. Long. 0. 3. W. Lat. 36. 30. N.

MUSUELA, a town of Spain, in Andalusia, situate on the Guadalquivir, seven miles N.E. of Jaen, and 50 north of Granada. Long. 3. 18. W. Lat. 37. 41. N.

MUSWELL HILL, a village in Middlesex, five miles north of London. It takes its name from a famous well on the hill, which belonged to the fraternity of St. John of Jerusalem, in Clerkenwell; and as this was deemed a miraculous cure for all scrofulous and cutaneous disorders, they here built a chapel, with an image of our lady of Maswel, to which there was a great resort of patients. This well still belongs to the parish of Clerkenwell.

MUTSCHEN, a town of Upper Saxony, in the circle of Leipzig. In the neighbourhood is found a species of crystal to which is given the name of Mutsehen diamond. It is 20 miles east of Leipzig. Long. 12. 50. E. Lat. 51. 14. N.

MUYDEN, a town of Holland, situated on the Vecht, on the south coast of the Zuider-Zee, seven miles east of Amsterdam. Long. 5. 1. E. Lat. 52. 22. N.

MYCONE, an island of the Archipelago, thirty miles in circumference. The harbour is very open, and deep enough for the largest ships, where they may ride secure from the north wind. The soil is dry, and the mountains are of a great height. Water is very scarce in summer; but in the town is a large well, the only one in the island. Here are plenty of partridges, quails, woodcocks, turtle-doves, rabbits, and wheatears; also excellent grapes and figs. Almost all the inhabitants are Greeks, who have fifty churches in all; but many are chapels; and some monasteries. Long. 25. 51. E. Lat. 37. 28. N.

MYSORE, a kingdom in the peninsula of Hindoostan, formerly subject to a prince, named Tippoo Sultan, who styled himself regent of the country. His dominions comprehended, generally, the provinces of Mysore Proper, Bednore, Coimbatore, Canara, and Dindigul; beside the conquests of his father Hyder Ally (who usurped the throne) to the northward, which are Meritz, Soonda, Chittledroog, Harponelly, Sanore, Bancapour, Roydroog, Gootty, Condanore, Canoul, and Cuddapa. The extent of this territory from north to south, is 550 miles; and its breadth, in the widest place (the north part of the peninsula) 330 miles, but proceeding to the south, it diminishes, till it ends in a point. Its area has been compared to that of Great Britain. By the peace of 1762, Hyder Ally was to relinquish all but his ancient possessions. How far his successor fulfilled the terms of that treaty cannot be ascertained; but on the termination of the war in 1792, Tippoo Sultan agreed, over and above a large payment in money, to cede one half of his dominions to the English East-India-Company, and their allies, the Mahrattas and the nizams of the Decan. In 1799 a new war taking place between him and the East-India Company, his capital was taken by the English troops, on the 4th of May, and himself killed in the assault. Mysore, in general, is dry, rugged, mountainous and barren. It lies between 10 and 16° N. lat. The capital is Seringapatam.

MYSORE, a town and fortified post of the peninsula of Hindoostan, the ancient capital of the same name, eight miles south of Seringapatam, the present capital.

N.

NABAL, a town of the kingdom of Tunis, celebrated for its pottery. Near it are several remains of antiquity. It is seated near the sea, 32 miles S.E. of Tunis. Long. 10. 10. E. Lat. 53. 13. N.

NABURG, a town of Germany, in Bavaria, seated on the river Nab, 10 miles S.E. of Amberg. Long. 12. 13. E. Lat. 50. 23. N.

NAFFELS, a town of Switzerland, in the canton of Glaris. In 1388, a celebrated victory was gained near this place, by the inhabitants of this canton over the Austrians. Only about 350 troops of Glaris, assisted by fewer than 50 Schweitzers, withstood 15,000 Austrians, and, after a terrible slaughter, compelled them to retire; in memory of which glorious transaction, a chapel was built on the spot, which was rebuilt in 1779. The inhabitants are Roman-catholics. It is four miles N. of Glaris.

NAGOLD, a town of Suabia, in the duchy of Wurtemberg, with a strong castle, situate on a river of the same name, 10 miles W. of Tubingen. Long. 8. 37. E. Lat. 48. 30. N.

NAGORE, a town of Hindoostan Proper, in the country of Agimere, 40 miles N.W. of Agimere. Long. 74. 10. E. Lat. 27. 8. N.

NAGPOUR, a city of the Deccan of Hindoostan, capital of that part of Berar which is subject to a chief of the Eastern Marhattas. It is extensive and populous, but meanly built; and, excepting a small citadel, is open and defenceless. It is 560 miles W. by S. of Calcutta. Long. 79. 46. E. Lat. 21. 8. N.

NAGYBANJA, a town of Hungary, which is a metal town, and one of the royal free towns. The gold and silver mine-works are of great produce, and the money coined here is distinguished by the mark NB. It is 30 miles N.E. of Zatmar. Long. 22. 54. E. Lat. 48. 10. N.

NAHE, a river of the palatinate of the Rhine, which flows by Birkenfeld, Oberstein, Kreuzenach, and Bingen, and falls into the Rhine.

NAJERA, a town of Spain, in old Castile, 32 miles W. of Calahorra, and 36 E. of Burgos. Long. 2. 39. W. Lat. 42. 10. N.

NAIL (*Encycl.*). Among the different purposes for which nails are employed, is that of firmly securing the shoe of a horse to his hoof. Mr. Coleman, in his work on shoeing horses, recommends a nail with the head formed like a wedge, to fit a corresponding hole, struck in the shoe with a punch. Of both these he has given delineations in his publication. A person of the name of Spencer has obtained a patent for making horse-shoe nails of this form in an expeditious manner. He forms them whilst the iron is of a red heat, by means of a roller with impressions cut off it; or he fays the metal may be formed by casting, which must be varied according to the length of nails intended to be made. "This is," fays the inventor in his specification, "to be run (in forming the iron for the nails) against a plain roll; after the iron has passed these rolls, it will be left according to B (Pl. 38), which is then taken and separated by shears or any other engine for the purpose of cutting at C, which is the thinnest part, the edges of which are, if neces-

sary, thinned by hand or tilt-hammer; the piece, No. 1, is then applied to the bed D, and punch E, which are fixed in a screw press, or any other power fit for the purpose; and when the stroke is made, presses the iron out as F, which is then applied to the bed G, and separator H, in a power similar to that used for the bed and punch D, E, and which then leaves two complete horse-shoe nails I. The punch E may be formed of different shapes so as to suit any fancy, and it may also be formed to punch out only one nail instead of two if found more convenient."

NAIRNE, a borough and sea-port, the county-town of Nairnshire; seated at the entrance of the frith of Murray, 10 miles N. of Inverness, and 104 N. of Edinburgh. Long. 3. 51. W. Lat. 57. 33. N.

NAKSIVAN, a city of Armenia, capital of a province of the same name, with an archbishop's see. It is 90 miles S.E. of Erivan, and 250 E. of Erzerum. Long. 45. 30. E. Lat. 38. 40. N.

NAMARI, a mountain of Sicily, in the Val-di-Demone, between Messina, Taormina, and Melazzo.

NAMSLAW, a town of Silesia, in the principality of Breslaw, with a strong castle, situate among morasses, on the river Weyda, 23 miles S.E. of Breslaw. Long. 17. 38. E. Lat. 51. 33. N.

NANDER, a town of the Deccan of Hindoostan, in the province of Dowlatabad, 132 miles N.W. of Hyderabad.

NANGASACKI, a city of Japan, in the island of Ximofisen, with a well-frequented harbour. The inhabitants carry on a great trade with the Chinese and Dutch. The latter are never suffered to come into the city, unless when their ships arrive, and then they deliver up their guns, helms, and sails, as pledges of their good behaviour. Long. 128. 52. E. Lat. 32. 32. N.

NANGIS, a town of France, in the department of Seine and Marne, 12 miles W. of Provins, and 14 E. of Melun.

NANG-KANG-FOU, a city of China, in the province of Kiang-fi, seated on the lake Po-yang, and containing four cities of the third class in its district.

NAN-NGAN-FOU, a populous city of China, in the province of Kiangfi, containing, in its district, four cities of the third class. It is 200 miles N. by E. of Canton.

NANTUA, a town of France, in the department of Ain, situate at the extremity of a great lake of the same name, 18 miles S.E. of Bourg.

NANTUCKET, an island in the state of Massachusetts, of which it is a county. It lies to the south of Cape Cod, and had once the most considerable whale fishery on the coast; but it was almost ruined by the civil war. As the island is low, sandy, and barren, the inhabitants depend almost entirely on the watery element for subsistence. It has but one town, called Sherburne, which is 83 miles S. of Boston. Long. 70. 30. W. Lat. 41. 0. N.

NAPAU, a province of Hindoostan Proper, bounded on the S. by Bahar, on the W. by Oude, and Rohilcund, on the N.W. by Sirinagur, and on the N.E. and E. by the ridge of mountains called Himmalech, by which it is separated from Thibet. Catmandu is the capital.

NAPOLI-DI-MALVASIA, a sea-port of the Morea, capital of the island of Malvasia, seated on a rock, at the entrance of the bay of Napoli-di-Romania. It is defended by a good citadel; has a fine harbour, and a long wooden bridge, which joins it to the main land. It gives name to that excellent wine, called Malvasie; and was the ancient Epidaurus, famed for the temple of Æsculapius. It is 42 miles S.E. of Napoli-di-Romania. Long. 23. 22. E. Lat. 36. 57. N.

NAPOLI-DI-ROMANIA, a sea-port of the Morea, and an archbishop's see, seated at the bottom of a bay of the same name. It has a large harbour, with a narrow mouth, through which one ship only can enter at a time. It is inhabited by 60,000 Greeks, beside people of different nations, and very strong both by nature and art. It was taken by the Turks in 1715. It is 56 miles S.W. of Athens. Long. 23. 4. E. Lat. 37. 36. N.

NARA, a town of Japan, in the island of Nihon, with a magnificent castle, 25 miles N.W. of Meaco. Long. 134. 15. E. Lat. 35. 30. N.

NARAGANSET BAY, a bay on the coast of the United States, which contains Rhode Island, and several other islands.

NARBARTH, a town in Pembrokeshire, with an old castle, and a market on Wednesday. It is seated on a hill, 12 miles N.E. of Pembroke, and 229 W. by N. of London. Long. 4. 46. W. Lat. 51. 50. N.

NARBOROUGH, an island of South America, on the coast of Chili, where Sir John Narborough refreshed his men, when sent to the South Sea, in the reign of Charles II. Long. 74. 35. W. Lat. 45. 0. N.

NARENTA, a town of Dalmatia, with a bishop's see, seated on a gulf of the same name, 46 miles N.E. of Ragusa. Long. 18. 27. E. Lat. 43. 35. N.

NARNALLA, a town of the Deccan of Hindoostan, in the province of Berar, 33 miles W.N.W. of Ellichpore, and 52 E. of Burhanpore. Long. 77. 34. E. Lat. 21. 25. N.

NARNI, an ancient town in Italy, in Sabina, with a bishop's see. Here are the ruins of a marble bridge, built by Augustus, one of whose arches was 150 feet high, and 200 broad; as also of an aqueduct that brought water from a spring at the distance of 15 miles. It contains a great many noble families, and is seated on the Nera, 20 miles S.W. of Spoleto, and 40 N.E. of Rome.

NAROVA, a river of the Russian empire, which issues from the lake Peipus, and watering Narva, flows into the gulf of Finland, eight miles below that town. It is noted for two cataracts, pompously described by travellers, but they are far inferior to that of the Rhine, at Laufen.

NARSINGAPATAM, a town of the peninsula of Hindoostan, in the territory of Bisnagur. It was the residence formerly of a king, and is situate 400 miles S.E. of Bombay. Long. 76. 10. E. Lat. 15. 30. N.

NARWAR, or **NARWA**, a town of Hindoostan Proper, in the province of Agra, seated near the Sindu, which falls below it into the Jumna. It is 127 miles S. of Agra. Long. 79. 17. E. Lat. 25. 40. N.

NASEBY, a village in Northamptonshire, famous for the decisive victory gained by the army of the parliament over that of Charles I. in 1645. It is 12 miles N. of Northampton.

NASHVILLE, a town of the state of Tennessee, capital of the district of Mero, seated on Cumberland River, 160 miles E. of Knoxville. Long. 87. 20. W. Lat. 36. 2. N.

NASSAU, a county of Germany, in the circle of Upper Rhine; bounded on the N. by Westphalia, on the E. by the county of Solmes, on the S. by the territory of Menz, and

on the W. by the electorate of Treves. It is very fertile, and contains mines of iron, copper, and lead.

NASSAU, a town of Germany, capital of a county of the same name; the house of whose sovereign is divided into several branches. It is seated on the river Lahn, 12 miles S.E. of Coblenz. Long. 7. 42. E. Lat. 50. 18. N.

NASSAU-HADAMAR (*Encehl*), erroneously printed *HASSAU-Hadamer*.

NASSUCK, a town of Hindoostan Proper, in the province of Guzerat, 128 miles W.V. of Aurangabad, and 95 S.W. of Surat. Long. 73. 49. E. Lat. 19. 50. N.

NASTADT, a town in Germany, in the circle of Upper Rhine, 18 miles S.E. of Coblenz, and 22 N.W. of Mentz. Long. 7. 36. E. Lat. 19. 50. N.

NATANA, a sea-port of South America, in the government of Panama, seated in a fertile country, on the bay of Pirata, 70 miles S.W. of Panama. Long. 81. 15. W. Lat. 8. 10. N.

NATAL, a country on the W. coast of Africa, lying N.E. of the Cape of Good Hope, inhabited by the Bothman Hottentots.

NATCHITOCHES, a river of Louisiana, which falls into the Mississippi, at Point Coupee.

NATIONAL INSTITUTE. See *INSTITUTE*.

NATTAM, a town and fortress of the peninsula of Hindoostan, in the country of Madura, 18 miles N. of Madura, and 45 S.W. of Trichinopoly. Long. 78. 18. E. Lat. 10. 10. N.

NAVARINO, a strong and populous town of the Morea, with an excellent large harbour, defended by two forts. It is seated on a hill near the sea, eight miles N.E. of Modon, and 17 N.W. of Coron. Long. 21. 40. E. Lat. 37. 2. N.

NAVARREINS, a town of France, in the department of the lower Pyrenées, seated on the Gave d'Oleron, 26 miles S.E. of Bayonne. Long. 8. 45. W. Lat. 43. 19. N.

NAVIDAD, a sea-port of New Spain, seated on the Pacific Ocean, 350 miles W. of Mexico. Long. 106. 0. W. Lat. 19. 0. N.

NAVIGATORS ISLANDS, a cluster of islands in the South Pacific Ocean. The inhabitants are a strong and handsome race; scarcely a man to be seen among them less than six feet high, and well proportioned. The women are delicately beautiful; their canoes, houses, &c. well constructed; and they are much more advanced in internal policy, than any of the islands in this ocean. Long. 169. 0. W. Lat. 14. 19. S.

NAUEN, a town of Upper Saxony, in the Middle Marche of Brandenburg, 14 miles N. of Potsdam, and 8 W. of Berlin. Long. 12. 52. E. Lat. 52. 37. N.

NAUENHOF, a town of Upper Saxony, in the circle of Leipzig, eight miles E. of Leipzig.

NAUMBERG, a town of Germany, in the electorate of Mentz, situate on the Eder, 14 miles W.S.W. of Cassel, and 36 S. of Gottingen.

NAXKOW, a town of Denmark, in the Isle of Laland, with a harbour commodious for trade, and a plentiful fishery here. It is 60 miles S.W. of Copenhagen. Long. 11. 31. E. Lat. 54. 52. N.

NAZARETH, a town of Palestine, famous for being the residence of Jesus Christ, in the early part of his life. It is now only a village, where the monks of St. Francis have a convent. Long. 35. 20. E. Lat. 32. 30. N.

NAZARETH, a town of the United States, in Pennsylvania. It is a flourishing settlement of the Moravians, and is situate 10 miles N. of Bethlehem, and 65 of Philadelphia.

NAZE, or **CARL LINDENAS**, the most southern promontory of Norway. Long. 17. 20. E. Lat. 57. 30. N.

NEAGH, Lough, a lake of Ireland, situate in the counties of Armagh, Down, Antrim, Londonderry, and Tyrone. It is the largest in Europe, those of Ladoga and Onega in Russia, and that of Geneva in Switzerland, excepted; being 20 miles long, and 15 broad. It is remarkable for a healing virtue, and also for petrifying wood, which is not only found in the water, but in the adjacent soil, at a considerable depth.

NEATH, a corporate town in Glamorganshire, with a market on Saturday, situate on the river Neath, over which is a bridge, where small vessels come to load coal. In the neighbourhood are iron forges, smelting works for copper, and coal mines; and on the other side of the river are the ruins of a fine monastery. It is governed by a portreeve, who is sworn in by the deputy constable of the castle of Neath, and seated near the Bristol Channel, 32 miles N.W. of Landaff, and 200 W. by N. of London. Long. 3. 45. W. Lat. 51. 43. N.

NEATH, a river in Glamorganshire, which runs into the Bristol Channel, below the town of Neath.

NEB, a river in the isle of Man, which runs into the Irish Sea, at Peel Castle.

NEBRA, a town of Upper Saxony, in Thuringia, 12 miles N.W. of Naumburg. Long. 11. 26. E. Lat. 51. 13. N.

NECKAR, a river of Germany, which rises in the Black Forest, crosses the duchy of Wurtemberg, and the palatinate of the Rhine, and falls into the Rhine, at Manheim.

NECKARS-GEMUND, a town of Germany, in the palatinate of the Rhine, seated on the Neckar, 42 miles N. of Stuttgart. Long. 9. 55. E. Lat. 49. 26. N.

NECKARS-ULM, a town of Germany, in the circle of Franconia, seated on the Neckar. It belongs to the grand-march of the Teutonic order. Long. 9. 5. E. Lat. 49. 52. N.

NEDROMA, a town of the kingdom of Algiers, surrounded with magnificent ruins. It is 50 miles W.S.W. of Oran. Long. 0. 38. W. Lat. 35. 40. N.

NEDSJED, an extensive province or district of Arabia; bounded on the N. by the desert of Syria, on the E. by Nachla, on the S. by Hadramaut and Yemen, and on the W. by Hedsjas. The soil is various, in many parts very fertile. The Bedouins inhabit a great part of this province; the remainder is mountainous, and contains a great number of towns, almost every one of which has its own schiech.

NEEHHEHOW, one of the Sandwich islands, five leagues W. of Atoui. The E. coast is high, and rises abruptly from the sea; the rest of it consists of low ground, except a round bluff head on the S.E. point. It produces plenty of yams.

NEERWINDEN, a village of Austrian Brabant, a little N. by W. of Nanden. Hence the two celebrated battles of Nanden are sometimes called by the name of Neerwinden.

NEFTA, a town of the kingdom of Tunis, 250 miles S. by W. of Tunis. Long. 9. 25. E. Lat. 33. 0. N.

NEGRAIS, a sea-port on the E. side of the bay of Bengal, 240 miles W.S.W. of Pegu. Long. 94. 4. E. Lat. 15. 10. N.

NEGRO, Cape, a promontory of Africa, on the W. coast of Angola, being the most southerly country to which the Europeans usually resort to purchase slaves. Long. 10. 40. E. Lat. 15. 54. N.

NEGROES ISLAND, one of the Philippine Islands, between Panay and Zebu.

NEGROPONT, a strong city, capital of an island of the same name, and a Greek archbishop's see. It has a

good harbour, which is commonly the station of the Turkish ships. The walls of the city, in which the Turks and Jews reside, are two miles and a half in circumference; but the suburbs, where the Christians live, are much larger. It was taken in 1469, from the Venetians, who attempted to retake it in 1688, without effect. It is seated on a strait of the same name, 30 miles N.E. of Athens, and 260 S.W. of Constantinople. Long. 24. 8. N. Lat. 38. 30. N.

NEHAVAND, an ancient town of Persia, in Irac Agermi, famous for a battle fought near it, between the califf Omar and Yez Degerd, king of Persia, in 1638, when the latter lost his life and kingdom. It is 170 miles N.W. of Ispahan. Long. 47. 10. E. Lat. 34. 20. N.

NEIDENAU, a town of Germany, in the electorate of Mentz, situate on the Jaxt, nine miles N. of Heilbron, and 23 E.S.E. of Heidelberg.

NEIDENBURG, a town of Prussia, with a castle on a mountain, 75 miles E. of Culm. Long. 20. 20. E. Lat. 53. 22. S.

NEIDENSTEIN, a town of Germany, in the palatinate of Hesse, six miles E. of Naumburg, and nine S.E. of Cassel. Long. 8. 58. E. Lat. 51. 3. N.

NEIFFEN, a town of Suabia, in the duchy of Wurtemberg, 17 miles S.S.E. of Stuttgart. Long. 9. 11. E. Lat. 48. 30. N.

NEILSTON, a village in Renfrewshire, to the S. of Paisley. It is noted for a cotton manufacture.

NEITRA, a town of Hungary, the capital of a district, with a bishop's see. It is situate on a river of the same name, 34 miles N. of Gran. Long. 18. 3. E. Lat. 48. 20. N.

NELISURAM, a town of the peninsula of Hindoostan, on the W. coast, 33 miles N.E. of Mangalore, and 40 N.W. of Tellicherry. Long. 74. 57. E. Lat. 12. 20. N.

NELLENBURG, a town of Suabia, capital of a land-gravate of the same name, 20 miles N. of Constance, and 20 N.E. of Schaffhausen. Long. 9. 8. E. Lat. 47. 50. N.

NELLORE, a town and fortress of the peninsula of Hindoostan, in the Carnatic, near the Pennar river, 85 miles N. of Madras, and 98 N. of Arcot. Long. 79. 57. E. Lat. 14. 26. N.

NELSON, an English settlement in North America, on the W. side of Hudson's Bay, at the mouth of the river. Nelson, 250 miles S.E. of Churchill Fort. It belongs to the Hudson's Bay Company. Long. 92. 35. W. Lat. 57. 7. N.

NEMEA, a village of the Morea, famous for the Nemean games anciently celebrated here.

NEN, the principal river of Northamptonshire, which rises in the W. part of the county, and is made navigable at Northampton. It leaves the county at Peterborough, and crossing the isle of Ely, forms part of the W. boundary of Norfolk, and falls into the Lincolnshire Wash. It likewise communicates, by several channels, with the Great Ouse.

NEOCASTRO, a fort of Turkey in Europe, in Romania, where the Turks always keep a good garrison. It is seated in the middle of the strait of Constantinople, 12 miles from Constantinople. Long. 29. 4. E. Lat. 41. 10. N.

NEOTS, St. See **NEEDS**.

NEPEAN ISLAND, an island of the South Pacific Ocean, opposite Port Hunter, on the south coast of Norfolk Island. It consists entirely of one mass of sand, held together by the surrounding cliffs, which are a border of hard rocks. The surface was covered with a kind of coarse grass, and upwards of 200 fine pines were growing on it.

NEPI, an ancient town of Italy, in the patrimony of St. Peter, with a bishop's see, seated on the Trighia, 20 miles N. of Rome. Long. 13. 34. E. Lat. 42. 14. N.

NERAC, a town of France, in the department of Lot and Garonne, divided by the river Baïse into Great and Little Nerac. In the feudal times, this was the residence and capital of the lords of Albret. Their stupendous castle is now in ruins; but, before the abolition of royalty, no true Frenchman could visit it without sentiments of veneration; for here there once favourite Henry IV. spent part of his youth. Nerac is 20 miles S.W. of Agen, and 380 S. by W. of Paris. Long. 0. 13. E. Lat. 44. 2. N.

NERBUDDA, a river of India, which issues from a lake on the southern confines of the province of Allahabad, forms the boundary between Hindoostan Proper and the Deccan, and falls into the gulf of Cambay, below Baroch.

NERICIA, a province of Sweden Proper; bounded on the N. by Westmania, on the E. by Sudermania, on the S. by East Gothland, and on the W. by West Gothland. Orebo is the capital, and the only considerable place in it.

NERO, an island in the East Indies, the second of the Banda Islands, where the Dutch have a fort called Fort Nassau. Here are large serpents, but not venomous, and the mountains are covered with trees, in which are birds of a very singular kind. Long. 129. 45. E. Lat. 4. 40. N.

NERTCHINSK, one of the four provinces of the Russian government of Irkutsk. Its capital, of the same name, is seated on the Nercha, which falls into the Schilka. Long. 116. 44. E. Lat. 51. 12. N.

NESLE, a town of France, in the department of Somme. It is seated on the Lingon, eight miles N.E. of Royes, and 66 N. by E. of Paris. Long. 2. 59. E. Lat. 49. 51. N.

NESS, Loch, a lake in Invernesshire, 22 miles in length, and, for the most part, one in breadth. It is sheltered on the N.W. by the high mountains of Urquhart and Mealfourvoney, and edged with coppices of birch and oak.

Ness, a river of Scotland, which is the outlet of Loch Ness, and falls into the frith of Murray, below Inverness.

NESTVED, a town of Denmark, in the island of Zealand, situate on the river Nefs, 38 miles S.W. of Copenhagen. Long. 11. 51. E. Lat. 55. 15. N.

NETSCHKAU, a town of Upper Saxony, in the Voigtland, situated on the Golfch, 12 miles S.W. of Zwickau.

NETTLE RASH, in medicine a troublesome cutaneous eruption, of which D. Cullen forms the genus *URTICARIA*. This disease has its English name from the resemblance of its eruption to that made by the stinging of nettles. These little elevations upon the skin in the nettle-rash often appear instantaneously, especially if the skin be rubbed or scratched, and seldom stay many hours in the same place, and sometimes not many minutes. No part of the body is exempt from them; and where many of them rise together, and continue a hour or two, the parts are often considerably swelled; which particularly happens in the face, arms, and hands. These eruptions will continue to infect the skin, sometimes in one place and sometimes in another, for one or two hours at a time, two or three times every day, or perhaps for the greatest part of the twenty-four hours.—In some persons they last only a few days, in others many months; may sometimes the disease has lasted for years with very short intervals.

But though the eruption of the urticaria resembles, as already observed, that produced by the stinging of nettles, it is sometimes accompanied with long wheals, as if the part had been struck with a whip. Whatever be the shape of these eminences, they always appear solid, without having any cavity or head containing either water or any other liquor; and this affords an easy mark whereby this disease

may be distinguished from the itch. For it often happens that the insufferable itching with which this eruption is attended, provokes the patient to scratch the parts so violently, that a small part of the cuticle on the top of these little tumors is rubbed off; a little scab succeeds; and, when the swelling is gone down, there is left an appearance hardly to be distinguished from the itch, but by the circumstance just now mentioned. The nettle-rash also sometimes differs from the itch, in not being infectious.

Dr. Heberden is inclined to ascribe this disease to some mechanical cause outwardly applied to the skin. He observes, that most people suffer in a similar manner from the real stinging of nettles. Cowhage, a sort of *phafolus* or French bean, the pod of which is covered over with a kind of down or hair, and the effect of which upon the skin is much the same as that of nettles; and almost any hairs cut equally short, and sprinkled upon the skin, whenever they happen to stick in it, will make the part itch or smart in such a manner as to give great uneasiness; it is also a considerable time before the skin can be cleared of the finer ones, when once they are strewn upon it.

Reaumer, in the fourth memoir of his History of Insects, describes a species of caterpillar to which belong a sort of hairs almost invisible to the naked eye, which are easily detached, and frequently float in the air round their nests, though it have not been at all disturbed. The touch of these hairs has a similar effect with the cowhage; that is, they occasion intolerable itchings, with little bumps and redness, arising sometimes to a slight inflammation. These he found would continue four or five days, if the animal or the nest had been much handled; and though they had not been touched at all, yet, by only walking near their nests, the same effects would be brought on, but for a shorter time. These hairs affect the skin in this manner by sticking in it, as he could perceive with a glass of a great magnifying power; for with one of a small power they are not visible. The uneasy sensations caused by these small wounds, not only, as he says, last several days, but move from one part of the body to another; so that they will cease upon one wrist, and immediately begin on the other; from the wrist they will go to the fingers or the face, or even to the parts of the body which are covered. He supposes, that the motion of the body, when much of this fine down lies near or upon the skin, may drive it from one part or another, or change what was lying there inoffensively to a situation fit to make it penetrate into the skin. Neither cold water, nor oil, nor spirit of wine, with which the parts affected were bathed, had any effect in removing the itching. He thinks the most efficacious remedy which he tried for this complaint was, to rub the parts strongly with parsley, which instantly lessened the sensations, and after two or three hours, entirely freed the patient from them. It is also well known that many species of caterpillars, by only walking over the hands, will produce something like this effect on the parts which they touch, and undoubtedly from the same cause.

Dr. Heberden asks, Is it impossible that the nettle-rash should arise from the same causes, or from others similar, which we mis by looking too deeply for them in the blood and humours? Such (says he) may have been its origin in some instances, where it has lasted only a few days; but where this affection has continued for some years, in persons who change their linen every day, and who bathe frequently all the time, it can hardly be ascribed to such an external cause. He has observed it frequently to arise from cantharides; but though it has continued many weeks after the removal of the blister, yet it might be sur-

pected that this arose from the fine spiculae of the cantharides sticking all this time about the skin; it being customary to strew much of the dry powder of the cantharides over the blister-plaster, whence it may readily be carried to other parts of the body. But it is certain that similar effects will sometimes follow the internal use of wild valerian root, or the eating of fish not sufficiently dressed; muscles, shrimps, and even honey, and the kernels of fruits, will also sometimes produce symptoms of a similar kind. But whatever be its cause, Dr. Heberden never saw any reason to suppose that the nettle-rash had in any way vitiated the humours to such a degree as to require the use of internal remedies; and if the itching could be certainly and expeditiously allayed, there would be no occasion for any further cure. He concludes this history of the disorder with a case communicated to him by Dr. Monsey, physician of Chelsea College, and in which the disease appeared with uncommon violence.

W. A. aged near 30, of a thin spare habit, was seized with a disorder attended with symptoms of a very uncommon kind. Whenever he went into the air, if the sun shined bright, he was seized with a tickling of his flesh on those parts exposed to the sun: this tickling, by his continuing in the air, increased to a violent itching, attended with great heat and pain: the skin would then be almost as red as vermillion, and thicken like leather; and this remained till he went out of the open air, and then abated in about fifteen or twenty minutes. This happened only when the sun was above the horizon; at other times he was what he called *quite well*.—But it was not owing to the heat of the sun; for the sun in winter affected him full as much, if not more, and the heat of the fire had no such effect. Thus he was confined to the house for ten years. He tried several hospitals, and had advice from many physicians, without the least abatement of his complaints. At last it was agreed in a consultation of physicians, that he should try dipping in salt water; which he did at Yarmouth for thirteen weeks, without any visible amendment. One hot day, having pulled off his clothes and gone into the sea in the middle of the day, the heat diffused itself so violently all over his body, that, by the time he had put on his clothes his eye-sight began to fail, and he was compelled to lie down upon the ground to save himself from falling. The moment he lay down, the faintness went off: upon this he got up again; but had no sooner arisen, than he found himself in the former condition: he therefore laid down again, and immediately recovered. He continued alternately getting up and lying down, till the disorder began to be exhausted, which was in about half an hour; and he was frequently obliged to have recourse to the same expedient.

Having at last accidentally met with Dr. Monsey, this physician questioned him concerning the cause of the disorder; but nothing could be guessed at, excepting that the patient owned he had one winter lived entirely upon bullocks' liver and porter, from inability to purchase better victuals. A comrade lived with him at that time, on the same provisions; and he also was affected in a similar manner, though in a less degree, and had recovered. This patient was then first put upon a course of Dover's sweating powder without any effect, and afterwards tried a course of nitrous ones with the same bad success. At last Dr. Monsey determined to try the effect of mercury, which happily proved effectual in removing this obstinate and uncommon distemper. The patient began with taking five grains of calomel for three nights running, and a cathartic next morning. In this course he went on for near a fortnight, at the end of which he found himself very sensibly relieved. This

encouraged him to go on rather too boldly, by which means a slight salivation ensued; however, that went off soon, and in about six weeks he was quite well.—Some time after, he was threatened with a return of his disorder; but this was effectually relieved by a dose of calomel, which he had afterwards occasion to repeat for the same reason, and with the same success: but at last the disorder seemed to be radically cured, by his having no further symptoms of a relapse.

NEUBURG, a town of Suabia, in the Brisgau, subject to the house of Austria. It is seated near the Rhine, 12 miles N. of Badle, and 12 S. of Baislach. Long. 7. 35. E. Lat. 47. 47. N.

NEUBURG, a town of Lower Austria, with a famous monastery, seated on the Danube, five miles from Vienna, Long. 16. 20. E. Lat. 48. 13. N.

NEUBURG, a town of Germany, in the duchy of Wurtemberg, with a castle, seated on the Editz, 25 miles W. of Stuttgart. Long. 8. 34. E. Lat. 48. 52. N.

NEUBURG, a town of Germany, in the circle of Bavaria, capital of a duchy of the same name, subject to the elector palatine. It is 26 miles N.E. of Augsburg, and 40 S.W. of Ratibon. Long. 11. 18. E. Lat. 48. 45. N.

NEVERS, a considerable town of France, in the department of Nievre, with a bishop's see. It is built in the form of an amphitheatre, and contains several fine buildings; particularly the ancient ducal palace, in which John-Casimir, king of Poland, expired in 1672. The number of inhabitants is estimated at about 8000. It is seated on the Loire, over which is a handsome bridge, 15 miles N.W. of Moulins, and 14 S.E. of Paris. Long. 3. 14. E. Lat. 46. 59. N.

NEUCHÂTEL, a town of France, in the department of Lower Seine, noted for excellent cheese. It is seated on the Arques, 20 miles S.E. of Dieppe, and 75 N.W. of Paris. Long. 1. 30. E. Lat. 49. 46. N.

NEUHÄUS, a strong town of Bohemia, in the circle of Bœhm, with a castle. Long. 15. 13. E. Lat. 49. 8. N.

NEUMÄRS, a town of Lower Saxony, in the duchy of Bremen, situate near the mouth of the Oste. It was once a place of great trade, and had a commodious harbour; but a sand bank arising in it, at the issue of the Oste into the Elbe, it is now much less frequented. It is 19 miles N.W. of Stade. Long. 8. 27. E. Lat. 53. 52. N.

NEUHAUSEN, a strong town of Upper Hungary, seated in a marshy plain, on the river Neitra, 15 miles N.W. of Comora, and 40 S.E. of Presburgh. Long. 18. 10. E. Lat. 48. 1. N.

NEVIN, or NEWIN, a town in Carnarvonshire, with a market on Saturday. It is seated on the Irish Sea, 20 miles S. by W. of Carnarvon, and 240 W.N.W. of London. Long. 4. 25. W. Lat. 52. 52. N.

NEUKIRCHEN, a town of Germany, in the principality of Hesse, 20 miles E.N.E. of Marburg, and 28 S. of Cassel. Long. 9. 15. E. Lat. 50. 40. N.

NEUMAGEN, a town of Germany, in the electorate of Treves, on the south side of the Moselle, 11 miles E.N.E. of Treves, and 42 S.W. of Coblenz. Long. 6. 26. E. Lat. 50. 0. N.

NEUMARK, a town of Transylvania, on the river Merisch, 56 miles N. of Claufenburg. Long. 23. 35. E. Lat. 47. 19. N.

NEUMARK, a town of Bavaria, 30 miles N.N.W. of Ratibon. Long. 12. 25. E. Lat. 49. 18. N.

NEUMARK, a town of Silesia, in the principality of Breslaw, 15 miles W. by N. of Breslaw. Long. 16. 42. E. Lat. 51. 5. N.

NEUS, a river of North Carolina, which enters Pamlico Sound, below Newbern, where it is a mile and a half broad.

NEUSALTZ, a town of Silesia, in the principality of Glogau, 12 miles N.W. of Glogau.

NEUSIDLE, a town of Hungary, situate on a lake of the same name, 24 miles S.W. of Presburg.

NEUSOL, a town of Upper Hungary, with a large castle, in which is a church, covered with copper. Near it are the greatest copper-mines in all Hungary. It is seated on the Gran, 10 miles N. of Chrennitz, and 50 N.E. of Leopoldstadt. Long. 19. 29. E. Lat. 49. 9. N.

NEUSTADT, a town of Lower Saxony, in the duchy of Holstein, seated on the Baltic, 22 miles N.N.E. of Lubeck. Long. 11. 0. E. lat. 54. 10. N.

NEUSTADT, a town of Lower Saxony, in the duchy of Mecklenburg, 15 miles S. of Schwerin. Long. 11. 50. E. lat. 53. 24. N.

NEUSTADT, a town of Lower Saxony, in the duchy of Hanover-Lunenbourg, with a castle, 15 miles N.W. of Hanover. Long. 9. 55. E. Lat. 52. 34. N.

NEUSTADT, a town of Lower Austria, with a bishop's see, a castle, and an arsenal, 30 miles S. of Vienna. Long. 16. 27. E. Lat. 47. 48. N.

NEUSTADT, a town of Franconia, in the bishopric of Wurzburg, seated on the Sale, 12 miles N.E. of Schweinfurt. Long. 10. 25. E. Lat. 50. 24. N.

NEUSTADT, a town of Germany, in the duchy of Wurttemberg, seated on the Koehel, 12 miles N.N.E. of Hailbron. Long. 9. 20. E. Lat. 49. 17. N.

NEUSTADT, a town of Germany, in the palatinate of the Rhine, nine miles N. by W. of Landau. Long. 8. 7. E. Lat. 49. 20. N.

NEUVILLE, a town of Switzerland, in the bishopric of Basle. It is governed by two burghmasters and a small and great council, each consisting of twenty-four members. It is seven miles S.S.W. of Bienne, and nine N.E. of Neuchâtel.

NEUWIED, a flourishing commercial city of Germany, in the circle of Upper Rhine, capital of the principality of Wied. The number of the inhabitants is between 6 and 7000: the Calvinist is the established religion, but all others are tolerated; and the Moravians, in particular, have here a very respectable settlement. Neuwied is 10 miles N.N.W. of Coblenz. Long. 7. 25. E. Lat. 50. 32. N.

NEWARK, a flourishing town of the United States, in New Jersey, with one episcopal and two presbyterian churches. It has the reputation of making the best cider in the world, and is nine miles W. of New York.

NEWBIGGIN, a fishing town of Northumberland, situate on the N. side of a bay to which it gives name, seven miles E. of Morpeth.

NEUBURGH, a corporate town in the Isle of Anglesey, with a market on Tuesday. It is governed by a mayor, and seated on the Brant, 15 miles S.W. of Beaumaris, and 257 N.W. of London. Long. 4. 27. W. Lat. 59. 10. N.

NEWBURN, a village in Northumberland, on the west side of Newcastle, inhabited chiefly by colliers. Here, a part of the army of Charles I. under Lord Conway, was defeated by the Scotch in 1640.

NEWBURY PORT, a town of the United States, in Massachusetts, where the business of ship-building is carried on largely. It is situate on the river Merrimack, two miles from the sea, and 45 E. of Boston. Long. 71. 5. W. Lat. 42. 45. N.

NEWCASTLE, a town in Carmarthenshire, with a market on Friday. It had a fine castle, now in ruins; and is seated on the Tyvy, 17 miles N.W. of Carmarthen, and 219 W.N.W. of Lower. Long. 4. 30. W. Lat. 52. 4. N.

NEWCASTLE, a borough of Ireland, in the county of Dublin, 10 miles W.S.W. of Dublin.

NEWDIGATE, a village in Surrey, five mile S.E. of Dorking. Here is a medicinal spring of the same nature as that of Epsom.

NEWENBERG, a town of Germany, in the county of Feldkirche, three miles N.W. of Feldkirche.

NEWENHAM CAPE, a rocky point of considerable height, on the W. coast of North America, forming the N. extremity of a vast bay called Bristol Bay, of which the promontory of Alaska is the S. boundary. It was discovered by Captain Cook in 1778. Long. 162. 24. W. Lat. 58. 42. N.

NEWENT, a town in Gloucestershire, with a market on Friday, seated near a branch of the Severn, eight miles N.W. of Gloucester, and 114 W.N.W. of London. Long. 2. 20. W. Lat. 51. 56. N.

NEWHAVEN, a town of Suffolk, at the mouth of the river Oule, with a quay on the E. side. It is seven miles S. by E. of Lewes, and 56 S. of London. Long. 0. 5. E. Lat. 50. 48. N.

NEWHAVEN, a town of the United States in Vermont, 75 miles N. of Bennington. Long. 73. 8. W. Lat. 44. 6. N.

NEWHAVEN, a town of the United States, in Connecticut, with a university, consisting of one college, called Yale College. It carries on a considerable trade with New York and the West-India islands; and lies round the head of a bay, four miles N. of the Sound, and 132 N.N.E. of New York. Long. 72. 58. W. Lat. 41. 17. N.

NEWNHAM, a corporate town in Gloucestershire, with a market on Friday. It is governed by a mayor, and seated on the Severn, eight miles S.W. of Gloucester, and 112 W.N.W. of London. Long. 2. 23. W. Lat. 51. 4. N.

NEWPORT, a borough in the Isle of Wight, with a market on Wednesday and Saturday. It is governed by a mayor, and sends two members to parliament. It is seated on the river Cowes, which is navigable for small vessels, 17 miles S. by E. of Southampton, and 91 S.W. of London. Long. 1. 15. W. Lat. 50. 40. N.

NEWPORT, a borough in Cornwall, which has no market, but sends two members to parliament. It is three miles N. of Launceston, and 214 W. by S. of London. Long. 4. 36. W. Lat. 50. 43. N.

NEWPORT, a town in Shropshire, with a market on Saturday, and a handsome free-school, 17 miles E. of Shrewsbury, and 140 N.W. of London. Long. 2. 18. W. Lat. 52. 45. N.

NEWPORT, a town in Monmouthshire, with a market on Saturday, seated on the river Uik, over which is a bridge. It is walled round, and was formerly defended by a castle, considerable remains of which are yet in being. Near it are the vestiges of a camp. It stands 19 miles S.S.W. of Monmouth, and 152 W. by N. of London. Long. 3. 4. W. Lat. 51. 36. N.

NEWPORT, a corporate town in Pembrokeshire, with a market on Saturday, and the ruins of a castle. It is governed by a mayor, and seated at the foot of a high hill, at the bottom of a bay of the same name, 18 miles N.E. of St. David's, and 235 W.N.W. of London. Long. 4. 50. W. Lat. 52. 6. N.

NEWPORT, a sea-port of the United States, in Rhode Island. Its harbour is one of the finest in the world; and to the west of the town is Goat Island, on which is a fort. Newport has a handsome state-house and an elegant public

library. It is 80 miles N.E. of New York. Long. 71. 6. W. Lat. 41. 35. N.

NEWPORT-PAGNEL, a town in Buckinghamshire, with a market on Saturday. It has a manufacture of bone-lace, and is seated on the Ouse, 14 miles E.N.E. of Buckingham, and 51 N.N.W. of London. Long. 0. 43. W. Lat. 52. 4. N.

NEWPORT PRATT, a sea-port of Ireland, situate near the mouth of a river which runs into Clew Bay, eight miles W. of Gallesbar. Long. 9. 21. W. Lat. 53. 53. N.

NEW RIVER, a fine artificial stream, brought from two springs, at Chadwell and Amwell, near Ware, in Hertfordshire, for the supply of the metropolis with water. It was finished in 1613, by Sir Hugh Middleton, a citizen of London, who expended his whole fortune in the undertaking. This river, with all its windings, is nearly 39 miles in length, and is under the management of a corporation called the New River Company.

NEWRY, a borough of Ireland, in the county of Down, situate on the side of a steep hill, at the foot of which is Newry-water, having over it two stone bridges; and there is a third bridge over a navigable canal, by which it has a communication with Lough Neagh and Carlingford Bay. It has suffered greatly by the rebellions in Ulster, and was burnt by the Duke of Berwick in 1689; but it is now so much improved in trade and buildings, that it is the largest town in the county. It is 49 miles N. of Dublin. Long. 6. 20. W. Lat. 54. 15. N.

NEWRY-WATER, a river of Ireland, which separates the counties of Armagh and Down, and watering Newry, enters Carlingford Bay.

NEWSHAM, a village in Durham, situate on the Tees, five miles from Darlington. This being the usual ford over the river from the south, the Bishop of Durham is met here, at his first coming to the see, when the Lord of Stockbora, just below it, being at the head of the country gentlemen, advances into the middle of the river, with his truncheon, and presents it to the bishop, who returns it, and is then conducted along amid the acclamations of the populace. Here was formerly a nunnery.

NEWTON, a borough in Lancashire, with a market on Saturday. It sends two members to parliament, and is five miles N. of Warrington, and 190 N.W. of London. Long. 2. 45. W. Lat. 53. 28. N.

NEWTON, a borough in the Isle of Wight, which sends two members to parliament, but has no market. It is 14 miles S. of Southampton, and 93 S.W. of London. Long. 1. 16. W. Lat. 50. 43. N.

NEWTON, a town of Montgomeryshire, with a market on Saturday, seated on the Severn, seven miles S.W. of Montgomery, and 169 W.N.W. of London. Long. 3. 12. W. Lat. 52. 21. N.

NEWTON-BUSHEL, a town in Devonshire, with a market on Wednesday, seated on the Teign, 15 miles S. by W. of Exeter, and 188 W.S.W. of London. Long. 3. 38. W. Lat. 50. 32. N.

NEWTON-STEWART, a town in Wigtonshire, situate on the Cree, which is navigable for small vessels to within two miles of the town. There is a handsome bridge over this river, whose mouth, in Wigton Bay, affords a valuable salmon-fishery. Several manufactures have been commenced with success in this town, which is indebted for its rise and name to the family of Stewart earl of Galloway. It is 26 miles E. by N. of Port Patrick.

NEWTOWN, a village in Renfrewshire, to the south of Paisley. It is noted for several large print fields.

NEWTOWN, the capital of the county of Bucks, in Pennsylvania, five miles from the Delaware, and 20 N.N.E. of Philadelphia. Long. 75. 1. W. Lat. 40. 14. N.

NEWTOWN ARDES, a town of Ireland, in the county of Down, situate on the northern point of the lake of Strangford. It has a considerable linen manufacture; and is 87 miles N. of Dublin. Long. 5. 45. W. Lat. 54. 40. N.

NEWTOWN BARRY, a town of Ireland, in the county of Wexford, 38 miles S. of Dublin. Long. 6. 30. W. Lat. 52. 35. N.

NEWTOWN LIMAVADDY, a borough of Ireland, in the county of Londonderry, seated near the N. coast of Lough Foyle, 15 miles E.N.E. of Londonderry.

NEWTOWN MOUNT KENNEDY, a town of Ireland, in the county of Wicklow, 17 miles S. of Dublin.

NEW-YEAR'S-HARBOUR, a part of Staten Land, in South America. Long. 64. 11. W. Lat. 54. 48. S.

NEW-YEAR'S-ISLANDS, small islands of South America, on the N. side of Staten Land.

NEYLAND, a town in Suffolk, with a market on Friday, and a manufacture of fays and bays. It is seated on the Stour, over which is a bridge, 16 miles S.W. of Ipswich, and 57 N.E. of London. Long. 1. 5 E. Lat. 52. 1. N.

NGAN-LO-FOU, a rich and populous city of China, in the province of Houquang, containing, in its district, two cities of the second and five of the third class. It is 425 miles W. by S. of Nanking.

NIAS, a small island, near the W. end of the island of Sumatra, remarkable for the beauty of the women, who are purchased as slaves by the Dutch and Portuguese. Long. 97. 0. E. Lat. 1. 10. N.

NIBE, a town of Denmark, in North Jutland, nine miles W.S.W. of Alburg.

NIBIANO, a town of Italy, in the duchy of Piacenza, 16 miles S.W. of Piacenza.

NIBANO, a town of Italy in the duchy of Parma. Long. 10. 0. E. Lat. 45. 5. N.

NICHABURG, a city of Persia, the largest and richest in Korafan, famous for a mine of turquois stones in its neighbourhood. It is 37 miles S. of Meshed. Long. 57. 48. E. Lat. 35. 30. N.

NICHOLAS ISLAND, a small island on the N. coast of the island of Cuba. Long. 79. 40. W. Lat. 33. 50. N.

NICHOLAS, St. a town in France in the department of Meurthe, with a handsome church, dedicated to St. Nicholas, to which pilgrims formerly resorted. It is seated on the Meurthe, five miles S.E. of Nanci, and 265 E. of Paris.

NICHOLAS, St. a sea-port of Russia, in the government of Archangel, seated at the mouth of the Dwina, on the White Sea, six miles S. of Archangel.

NICHOLAS, St. of MALE ST. NICHOLAS, a town, harbour, and cape, of the West Indies, at the N.W. extremity of St. Domingo, commanding the strait called the Windward Passage. The harbour is nine furlongs broad at the entrance; and ships of any burthen may ride at anchor in the basin, even during a hurricane. It was taken by the English, aided by the French royalists, in 1793; and was evacuated in 1798. Long. 73. 20. W. Lat. 19. 15. N.

NICHOLSBURG, a town of Germany, in Moravia, with a castle, 27 miles N. of Vienna.

NICKING the tail of a horse, an operation designed to make him carry it more gently. There are particular machines or pulleys, so contrived as to keep the tail up, which may be better comprehended by seeing the figure

in Pl. 22. vol. III, and referred to in the article FARRIERY. The number of the nicks are to be proportionate to the length of the tail, but generally three are sufficient. When the operation is over, the wounds may be dressed with a mixture of powdered rosin, honey, and spirits of wine; and a doffel of row, dipt in the same mixture, should be laid between the nicks, wrapping the tail up as usual. The next morning the covering should be cut open, down the back part of the tail, and the following morning it should be taken quite off, in order to plait the hair, and set the tail. You should let the tail down every two or three days, and bathe the upper part next the rump with hot vinegar, in which a bit of alum is dissolved, and mixt with honey. If the tail should happen to swell, and the hair come off, it must be fomented and poulticed with a mixture of scalded bran, cow-dung, linseed-meal, and a little lard. When seven or eight days are expired, the horse should be suffered to stand without the machine or pulley for a few hours, that you may see how he carries his tail. He must likewise have his tail kept up a few hours every day, till the wounds are quite healed, or, in other words, till new flesh is formed in the nicks.

Of this practice Mr. John Lawrence speaks in the following terms:—"Of *nicking*," says he, "I shall say but little; in truth if nobody were more attached to it than I am, the art would soon be lost from disuse. At present, I must allow, we set horses' tails in a more natural form, than some years back, when it was the custom to cock them brist upright, in a most burlesque, and preposterous manner, and a young horse, with his blazing meteor displayed *a posteriori*, looked just as naturally and in character, as a young fellow with his head enveloped in the curls of an enormous perriwig. My prejudice in favour of every thing appertaining to the turf, may perhaps warp my judgment; but I am all for broom or racing tails, such as are 'cut square by the Russian standard'; these I think are becoming and natural to all sorts and sizes of horses, but more particularly at this time, now the flow of blood is so universal. As to the art of nicking, every dealer or farrier can perform it."

NICOPOLI, or GLANISH, an ancient town of Armenia, built by Pompey the Great, in memory of a victory gained over Mithridates. It is seated on the Cerauna, 165 miles S.W. of Erzerum. Long. 37. 55. E. Lat. 38. 15. N.

NICOSIA, a strong town, capital of the island of Cyprus, seated between the mountain Olympus and a chain of other mountains. It was formerly well fortified by the Venetians, but now the works are in ruins. It is three miles in circumference; and there are plantations of olives, almonds, lemons, oranges, mulberries, and cypress-trees, interspersed among the houses, which give the town a delightful appearance. The church of St. Sophia is an old Gothic structure, which the Turks have turned into a mosque. It is 100 miles W. of Tripoli, and is 160 S.W. of Aleppo. Long. 34. 45. E. Lat. 34. 54. N.

NICOTERA, a sea-port of Naples, in Calabria Ulteriore, with a bishop's see, 35 miles N.E. of Reggio, and 185 S.E. of Naples. Long. 16. 30. E. Lat. 38. 34. N.

NICOYA, a town of New Spain, on the Pacific Ocean, at the bottom of a bay, 45 miles S.E. of Leon de Nicaragua. Long. 88. 0. W. Lat. 10. 15. N.

NICARA, a town of Turkey in Asia, in Caramania, with an archbishop's see. It is 10 miles N. of Tocat. Long. 36. 0. E. Lat. 39. 25. N.

NIDAU, or NIPOW, a handsome town of Switzerland, capital of a bailiwick of the same name, in the canton of Bern, with a castle. It is situate on the lake of Bienné, 15 miles N.W. of Bern, and 60 S.W. of Zurich.

NIDDA, a town of Germany, in Upper Hesse, 20 miles N.E. of Frankfort, and 38 E.N.E. of Mentz. Long. 8. 58. E. Lat. 50. 17. N.

NIDEBEKEN, a town of Germany, in the duchy of Juliers, situate on a rock, and surrounded by rocks. It is 13 miles S.S.E. of Juliers. Long. 6. 16. E. Lat. 50. 46. N.

NIDIJABAD, a town of Hindoostan Proper, in the province of Oude, 80 miles N.N.E. of Delhi, and 96 N.N.W. of Berilly. Long. 78. 41. E. Lat. 29. 35. N.

NIEBLA, an ancient town of Spain, in Andalusia, seated on the Rio Tinto, 40 miles W. of Seville. Long. 5. 56. W. Lat. 37. 26. N.

NIEDERBIEBER, a village of Germany, in the principality of Wied, three miles from Neuwied. Many valuable antiquities, and the traces of a Roman city, were discovered here in 1791.

NIEMECZ, a strong town of Moldavia, between Soczoway and Brassaw, being 25 miles from each. Long. 26. 16. E. Lat. 46. 48. N.

NIEN CLOSTER, a town of Lower Saxony, in the bishopric of Schwerin, three miles E. of Wismar.

NIENHUIS, or NEUNHAUS, a town of Germany, in the bishopric of Paderborn, seated on the Lippe, 20 miles E. of Lipstadt. Long. 8. 55. E. Lat. 51. 50. N.

NIESTADT, a town of Lower Saxony, in the duchy of Mecklenburgh, 15 miles S. of Schwerin. Long. 11. 46. E. Lat. 53. 59. N.

NIESADT, a town of Germany, in the middle marche of Brandenburg, seated on the Fuyhre, 25 miles N.E. of Berlin. Long. 1. 14. E. Lat. 52. 49. N.

NIEUPORT, a sea-port of Austrian Flanders, seated on the German Ocean, at the mouth of the Yperlee. In 1383, it was burnt by the rebels of Ghent. In 1583, it was taken by the Prince of Parma. In 1626, Prince Maurice gained here a great victory over the Spaniards. It has been taken and retaken in the subsequent wars; the last time by the French in 1794. It is nine miles S.W. of Ostend, and 16 N.E. of Dunkirk. Long. 2. 45. E. Lat. 51. 7. N.

NIGER. See NILE, *Suppl.*

NIGONO, a town of Italy, in the duchy of Modena, 22 miles S.W. of Modena.

NIKOPING, a town of Denmark, capital of the island of Falster, or Hulsler, in the Baltic, with a strong fort, 55 miles S.W. of Copenhagen. Long. 12. 7. E. Lat. 54. 50. N.

NIKOPING, a town of Sweden, in Sndermania, 60 miles S.W. of Stockholm. Long. 16. 40. E. Lat. 58. 40. N.

NILE (*Encycl.*) In the British Magazine for 1800, an opinion is maintained that the Nile and the Niger are one and the same river. Dr. Arthur Browne, Senior Fellow of Trinity College, Dublin, and member in parliament for that University, previous to the union, supports his conjectures in the following way:

"Herodotus heard," says he, "from certain Cyreneans, that on an expedition they made to the Oracle of Ammon, they had conversed with Etearchus, sovereign of the country, who informed them, that some Lamonians (a people who inhabit the Syrtis) had related to him, that certain young men, sons of persons of distinction, had signalled themselves by some extravagance of conduct. Among other things, they deputed by lot five of their companions to explore the solitudes of Africa, and to endeavour at extending their discoveries beyond all preceding adventurers. After a long peregrination they came to a city washed by a great river, which flowed from east to west, and abounded in crocodiles. This Etearchus conjectured to be the Nile,

which, says Herodotus, probability confirms. The Nile, continues he, certainly rises in Lybia, which it divides; and if it be allowable to draw conclusions from things which are well known concerning those uncertain and obscure points, it takes a similar course with the Jeten, that is, from west to south-east.

"In this opinion of Herodotus, that the Nile and the Niger were the same river, the Grecians generally concurred. The Romans formed a different opinion, and the moderns have varied so far as to believe, for many hundred years past, that the Niger ran to the westward, was the same river with the Senegal or Gambia, and ran into the Atlantic Ocean.

"Mr. Park discovered, beyond a doubt, that the Niger ran to the east; and he says it abounds in crocodiles. Every modern discovery has proved, that where Herodotus formed an opinion, or spoke of a fact within his own knowledge, or depending upon testimony of which he could himself judge, that he has been right almost universally. I have the strongest faith in his rational accounts; and as to the irrational, he only reports them as fables. In short, I have scarcely a doubt, I would say not any whatever, if the wonderful ingenuity of Major Rennel would permit me, that the Niger is the Nile.

"Believe me, it will ere long be found to be the case, notwithstanding the very powerful and ingenious arguments of Major Rennel as to the level of the river, and the contemporaneous rise of their waters. Those difficulties, I believe, are capable of solution; and if I had time and leisure I would communicate my reasons here for thinking so. But as I expect every moment to be anticipated by the actual discoveries of some of the later explorers of Africa since Mr. Park's expedition, who, as I have been told, are every day approaching to that opinion, I venture to prophesy now, that they will find it to be the case. It is impossible for any man to have greater respect for Major Rennel than I have, but I cannot conceive a greater difficulty, than to suppose, that the mighty river Niger terminates in morasses, lakes, or sands."

NIMBURG, a town of Bohemia, near the Elbe, 26 miles E.N.E. of Prague, and 70 S.E. of Dresden.

NING-KOUÉ FOU, a city of China, in the province of Kiang-nan, noted for its manufactures of paper, made of a species of reed. Its district contains six cities of the third class.

NINOVE, a town of Flanders, on the river Dender, with an abbey, 13 miles W. of Brussels. Long. 4. 5. E. Lat. 50. 52. N.

NIORT, a town of France, in the department of the Deux Sevres. Here are manufactured druggets, ferges, and other coarse woollen goods; and its dry sweetmeats are much esteemed. It is 28 miles N.E. of Rochelle. Long. 0. 33. W. Lat. 46. 20. N.

NISBEN, or **NESBEN**, a very ancient and celebrated town of Diarbek, now greatly decayed. It is seated in a vast plain, 70 miles S.W. of Diarbekar. Long. 38. 26. E. Lat. 36. 10. N.

NISIDA, a small island on the coast of Naples, very fertile, and would be more so but for the great number of rabbits. It has a harbour, called Porto Pavone, five miles W.S.W. of Naples.

NISSA, or **NESSAVA**, a town of Turkey in Europe, in Servia. It was burnt by the Imperialists in 1689, and is seated on the Morava, 20 miles E. of Precep, and 120 S.E. of Belgrade. Long. 22. 32. E. Lat. 43. 32. N.

NITH, a river in Dumfriesshire, which rises in the mountains to the N.W. and gives the name of Nithdale to

that part of the county through which it flows. A little above Dumfries, it joins the Cairne, and their united streams form a fine estuary in Solway Frith.

NITRIA, a famous desert of Egypt, 37 miles in length, on the coast of the Mediterranean Sea. It had formerly a great number of monasteries, which are now reduced to four; and it takes its name from a salt lake, out of which is procured the natrum of the ancients.

NIXABOUR, a town of Persia, in Chorasan, 80 miles S.E. of Meshed. Long. 61. 32. E. Lat. 35. 40. N.

NIZAMPATAM, a town of the peninsula of Hindoostan, situate at the mouth of the Kistnah, 34 miles S.W. of Masulipatam. Long. 80. 50. E. Lat. 15. 55. N.

NIZNEI NOVOGOROD, a town of Russia, in a government of the same name, with a citadel, and an archiepiscopal see. It is seated on a mountain, at the confluence of the Volga and Occa, 280 miles E. by N. of Moscow. Long. 46. 30. E. Lat. 56. 34. N.

NIZZA-DELLA-PAGLIA, a town of Italy, in Monteferrat, seated on the Belbo, 15 miles S.W. of Alexandria. Long. 8. 36. E. Lat. 45. 15. N.

NOAILLES, a town of France, in the department of Vienne, six miles S.E. of Poitiers.

NOANAGUR, a town of Hindoostan Proper, capital of a district, on the S. coast of the gulf of Cutch, inhabited by a piratical tribe, called Sangarians. It is 300 miles N.W. of Bombay.

NOCERA, an ancient town of Italy, in the duchy of Spoleto, with a bishop's see; seated at the foot of the Apennines, 18 miles N.E. of Spoleto. Long. 12. 49. E. Lat. 42. 1. N.

NOGARA, a town of France, in the department of Gers, 21 miles S.W. of Condom, and 27 W.N.W. of Auch. Long. 0. 9. W. Lat. 43. 46. N.

NOGARCOT, a town of Hindoostan Proper, in the province of Napoul, with a celebrated pagoda, 50 miles N.E. of Catmandu. Long. 85. 12. E. Lat. 28. 40. N.

NOGENT-SUR-SEINE, a town of France, in the department of Aube, seated on the Seine, 25 miles N.W. of Troyes. Long. 3. 40. E. Lat. 48. 30. N.

NOGENT-LE-ROU, a town of France, in the department of Eure and Loire, seated on the Huïsse, 35 miles N.E. of Mans. Long. 9. 50. E. Lat. 48. 26. N.

NOIR, CAPE, a promontory of S. America, at the S. extremity of Terra del Fuego. Long. 73. 3. W. Lat. 54. 32. S.

NOIRMOUTIER, an island of France, near the mouth of the river Loire. It is seventeen miles long and eight broad, full of bogs, and yet there are good pastures. The English made an unsuccessful attack on it in 1795. The principal town is of the same name. Long. 2. 10. W. Lat. 47. 0. N.

NOLA, an ancient town of Naples, in Terra di Lavoro, with a bishop's see, 10 miles N.E. of Naples. Long. 14. 28. E. Lat. 40. 56. N.

NOLI, a town of Italy, in the territory of Genoa, with a bishop's see, and a good harbour, five miles N.E. of Final, and 30 S.W. of Genoa. Long. 8. 41. E. Lat. 44. 18. N.

NOMBRE-DE-DIOS, a town of Terra Firma, in the province of Darien, a little E. of Porto-Bello, to which its once flourishing trade is now transferred. Long. 78. 35. W. Lat. 9. 40. N.

NOMENY, a town of France, in the department of Meurthe, seated on the Selle, 15 miles N. of Nanci. Long. 6. 15. E. Lat. 48. 56. N.

NONTRON, a town of France, in the department of

Dordogne, 21 miles N. of Perigueux, and 30 S.S.W. of Limoges. Long. 0. 33. E. Lat. 45. 32. N.

NOOPOUR, a town of Hindoostan Proper, in the province of Guzerat, 55 miles E. of Surat, and 142 W. of Burhanpour. Long. 73. 50. E. Lat. 21. 11. N.

NOORDEN, a considerable town of Westphalia, 12 miles N. of Embden. Long. 7. 5. E. Lat. 53. 38. N.

NORBERG, a town of Sweden, in Westmanland, near which are the best iron mines in the province. It is 34 miles N. of Stroemsholm. Long. 16. 12. E. Lat. 60. 2. N.

NORCIA, a town of Italy, in the duchy of Spoleto. It is a kind of republic, and seated among the mountains, 20 miles S.E. of Spoleto. Long. 13. 4. E. Lat. 41. 36. N.

NORD. See NORTH, *Suppl.*

NORDBURG, a town of Denmark, at the N. extremity of the isle of Alsen, with a castle, nine miles N.N.W. of Sunderburg.

NORDHAUSEN, an imperial town of Lower Saxony, under the protection of the Elector of Saxony. The inhabitants are Protestants. It is 25 miles S.W. of Halberstadt. Long. 11. 3. E. Lat. 51. 45. N.

NORDKÖPING, a town of Sweden, in E. Gothland. It covers a large space of ground, being 10 miles in circumference; but the houses are scattered, and the inhabitants do not exceed 10,000. The river Motala flows through the town, forms a series of cataracts, and is divided into four principal streams, which encircle several rocky islands, covered with buildings: at the extremity of the town it is navigable for small vessels. Here are manufactures of cloth and fire-arms; some sugar-houses, and a brass foundry. Corn is exported hence in great quantities; and a salmon-fishery gives employment and riches to many of the inhabitants. It is 50 miles S.W. of Stockholm. Long. 15. 50. E. Lat. 58. 28. N.

NORDLAND, a province of Northern Norway, included in the government of Drontheim.

NORDLINGEN, a commercial and free imperial town of Suabia, seated on the Aigre, 38 miles N.W. of Augsburg. Long. 11. 40. E. Lat. 48. 52. N.

NORDSTRAND, an island of Denmark, in the duchy of Sleswig, which was entirely overflowed in 1634. Long. 9. 15. E. Lat. 54. 40. N.

NORHOLM, a town of Norway, in the diocese of Christianland, 16 miles N.N.E. of Christianland.

NORLAND, one of the five general divisions of Sweden, comprehending the provinces of Gestrickeland, Helsingland, Madepadia, Hiemland, Herjedalia, Ongermania, and West Bothnia.

NORRISTOWN, a town of the United States, capital of the county of Montgomery, in Pennsylvania. It is seated on the Schuylkill, 12 miles N.W. of Philadelphia. Long. 75. 24. W. Lat. 40. 7. N.

NORTELGA, or NOR TELGE, a sea-port of Sweden, in the province of Upland. This town suffered much from the ravages committed here by the Russians in 1719: near it is a forge for making fire-arms. It is 30 miles N.E. of Stockholm. Long. 10. 32. E. Lat. 50. 44. N.

NORTH, or NORM, a department of France, including the late French provinces of Hainault, Flanders, and the Cambrésis.

NORTH COAST, a department of France. See COTES DU NORD.

NORTHALLERTON, a borough in the N. riding of Yorkshire, with a market on Wednesday. It sends two members to parliament, and is seated on a small brook, Vol. X.

which, a mile below, runs into the river Wilt. It is a well-built trading place, 30 miles N.N.W. of York, and 223 N. by W. of London. Long. 1. 20. W. Lat. 54. 23. N.

NORTHAMPTON, a county of Pennsylvania, 111 miles long and 35 broad. In 1790, it contained 24,250 inhabitants. Easton is the capital.

NORTHCURRY, a town in Somersetshire, with a market on Tuesday and Saturday, seated on the Tone, 20 miles S.W. of Wells, and 134 W. by S. of London. Long. 3. 0. W. Lat. 51. 0. N.

NORTHFLEET, a village in Kent, seated on the Thames, one mile W. of Gravesend. The church is very large, and contains fragments of monuments as ancient as the fourteenth century. Vast quantities of lime are made, and great numbers of extraneous fossils have been dug up here.

NORTHLEACH, a corporate town in Gloucestershire, with a market on Wednesday, several almshouses, and a free grammar-school. It is seated on the Lech, 25 miles E. of Gloucester, and 80 W. by N. of London. Long. 1. 43. W. Lat. 51. 46. N.

NORTHORP, a town of N. Wales, in Flintshire, near which are large potteries of coarse earthen ware, fire-bricks, &c. It is 11 miles N.W. of Chester.

NORTHUMBERLAND, a county of Pennsylvania, 130 miles long and 80 broad. In 1790, it contained 17,161 inhabitants. Sunbury is the capital.

NORTHUMBERLAND, a town of Pennsylvania, seated in the angle formed by the junction of the W. and E. branches of the Susquehanna, just above Sunbury, and 138 miles N.W. of Philadelphia.

NORTHUMBERLAND ISLANDS, a chain of islands in the S. Pacific Ocean, near the N.E. coast of New Holland. Long. 150. 20. E. Lat. 22. 0. S.

NORTON, or CHIPPING NORTON, a corporate town in Oxfordshire, with a market on Wednesday. Roman coins have been frequently found here, and it formerly sent members to parliament. It is 12 miles S.W. of Banbury, and 74 N.W. of London. Long. 1. 17. W. Lat. 51. 55. N.

NORWICH, a town of the United States, in Connecticut. The executive courts of law are held at this place and New London alternately. Here are made paper of all kinds, stockings, buttons, stone and earthen ware, and all kinds of forge work. It is seated at the head of the Thames, 12 miles N. of New London.

Norwich, a town of the United States, in Vermont, 100 miles N.N.W. of Boston, and 182 N. of New York. Long. 72. 22. W. Lat. 43. 40. N.

NOSSEN, a town of Upper Saxony, situate on the Muldau, 12 miles S.W. of Meissen, and 18 W. of Dresden. Long. 13. 0. E. Lat. 51. 2. N.

NOSTRUM, denotes any medicine the composition of which is supposed to be secret, and confined to the knowledge of one, or a few individuals.

The natural desire of health and longevity, has in all ages afforded a pretext to designing men, to invent medicines, with the absurd pretence of curing every disorder. It is true, that the confidence in *panaceas*, or universal remedies, is gradually declining, among the higher as well as the lower classes of society; but innumerable elixirs, drops, pills, &c. for particular complaints, are daily imposed upon the public by pretenders, whose chemical and medical knowledge is so confined, that they are generally obliged to borrow the recipes for such preparations from printed books. To aggravate the evil, their pernicious compounds

for the most part contain opium, hemlock, or other narcotic drugs, which are rendered still more deleterious by the addition of stimulating gums and aromatic substances.

The duration and extent of such bale practices, it is difficult to determine; though we conceive, that so long as the thoughtless and dissipated indulge in sensual pleasure of every description, the audacity of pretenders to the healing art will continue to increase. Experience has too often evinced, how little efficacy *medicines* possess in a variety of cases, without a strict adherence to a proper regimen; and much less may be expected from any nostrum, however strongly recommended by the dignitaries of church and state. Nay, the excellence and dignity of medical science can neither be supported, nor depreciated, by the illusion of great names.—If a due regard were more generally had to the laws of temperance and sobriety, if the cool dictates of reason were more frequently consulted, there would be fewer diseases, and those who enrich themselves at the expence of a credulous public, would speedily fall into contempt.

NOTCHENGONG, a town of the Deccan of Hindoostan, in the province of Berar, 47 miles S.S.W. of Nagpou, and 75 S.S.W. of Ellichpou. Long. 79. 17. E. Lat. 20. 32. N.

NOTE (*Encycl.*). See **BILL**, *Supp.*

By the act 30 Geo. 3. cap. 107. from and after December 1, 1799, there shall be paid on bills of exchange and promissory notes for small sums, the several duties herein-after mentioned; (that is to say),

For every bill of exchange, promissory note, or other note, draft, or order, whether payable on demand or otherwise, where the sum expressed therein shall be for one pound, and one pound and one shilling each, a stamp duty of two pence.

And where the sum expressed therein shall be five shillings, as herein-after mentioned, one halfpenny.

For every promissory note, or other note for the payment of money to the bearer on demand, payable only at the place where issued, and which may be re-issuable after payment at that place, where the sum expressed therein shall be for one pound, or one pound one shilling, there shall be charged a stamp duty of two pence.

And where the sum expressed therein shall be five shillings, one halfpenny.

For every promissory note, or other note for the payment of money to the bearer on demand, payable at two or more different places, or at any place different from that where it shall have been originally issued, and which may be re-issued after any payment at the same or any other place, where the sum expressed therein shall be for one pound, or one pound and one shilling, there shall be charged a stamp duty of four pence.

And where the sum expressed therein, or made payable thereby, shall be five shillings, one penny. [The five-shilling notes are only issuable in Scotland.]

The duty is payable by the giver of the note.

Draws payable on demand upon a banker residing within ten miles of the drawer, are not liable to duty. And the Bank of England notes are exempted from the duties charged by this act on a composition of 4000l. and from all additional duties imposed since the act 31 Geo. 3. c. 25. on a composition of 8000l. payable half-yearly.

No bill of exchange shall be re-issued. But notes payable on demand, on which a duty of two pence or one halfpenny is respectively imposed, paid by persons giving them at the places where first issued, may be re-issued; but if paid by any other persons, or at any other place, in pur-

suance of appointment expressed therein, shall be cancelled; and if re-issued, or if not cancelled, the party to forfeit 20s. And such notes, not cancelled, but again issued, shall pay the same duty as when first issued.

Notes stamped with the duty of 5s. and 1d. respectively, may be re-issued, though paid by other persons than by whom, and at other places than where, first issued. And notes to be re-issuable shall be the property of the persons holding them.

The acts 15 Geo. 3. c. 51. and 15 Geo. 3. c. 30. so far as they relate to notes payable on demand for one guinea and one pound, to be suspended until and upon November 30th, 1802.

From July 5, 1799, the bank of Scotland and the royal bank of Scotland, the British Linen Company, the Carron Company, and all other banks and banking companies in Scotland, may issue notes payable to bearer on demand for 5s. sterling, as they have heretofore issued notes for 20s. and upwards. And such issue may continue till December 1, 1802; and to the end of the next session.

And from December 1, 1799, no bill of exchange or promissory note shall be issued in Scotland under 5l. sterling, except for five shillings or one guinea, on penalty of 10l. But the banks or companies in Scotland may, on licence, issue or re-issue notes for 5s. sterling, and also 1l. and one guinea, drawn under the regulations mentioned in the act, untamped, upon giving security for payment of the duties.

NOTEBURGH, a town of Russia, in the government of Petchaigh, seated on an island in the lake Ladoga, at the place where the Neva proceeds from this lake. It has a good ciadel, and was capital of Ingria, before Petersburg was built. It is twenty-five miles east of Petersburg. Long. 31. 9. E. Lat. 59. 56. N.

NOTTELEN, a town of Westphalia, in the bishopric of Munster, seven miles west of M. nitr.

NOTTINGHAM, a town of the United States, in Maryland, five miles N.E. of Baltimore.

NOVARA, an ancient and strong town of Italy, in the duchy of Milan, capital of the Novarese, with a bishop's see. It is seated on an eminence, twelve miles N.E. of Verceil, and 25 W. by S. of Milan. Long. 8. 35. E. Lat. 45. 25. N.

NOVA SCOTIA, or **ARCADIA**, a country of British North America, bounded on the W. by the United States, on the N. by the river St. Lawrence, on the E. by the gulf of that name, and on the S. by the Atlantic and bay of Fundy; being so indented by the latter, that its eastern part forms a peninsula. It extends from Cape Sable, its most southern point, in lat. 43. 23. to 49. 30. N. and from 60. 15. to 67. 0. W. long. In 1784, part of this country was formed into a new province. See **NEW BRUNSWICK**. The atmosphere, for a great part of the year, is clouded with a thick fog which renders it unhealthy; and, for four or five months, it is intensely cold. A great part of the country lies in forest; and the soil (except on the banks of the rivers), is thin and barren. Halifax is the capital.

NOVOMIROGOD, a town of Russia, in the government of Cathariensflaf, 136 miles W.N.W. of Cathariensflaf. Long. 31. 44. E. Lat. 48. 40. N.

NOUTRA, a town of Poland, in the palatinate of Cracow, on the frontiers of Hungary, near which are mines of gold and silver. It is 30 miles S. of Cracow. Long. 19. 46. E. Lat. 49. 40. N.

NOYA, an ancient town of Spain, in Galicia, seated on the Tamara, 15 miles W. of Compostella.

NOYERS, a town of France in the department of Yonne.

feated on the Serin, in a valley furrounded by mountains, 17 miles S.E. of Auxerre. Long. 4. 2. E. Lat. 47. 30. N.

NOZEROY, a town of France, in the department of Jura, with a castle, seated on a mountain, 20 miles S.E. of Salines, and 30 S. of Belançon. Long. 6. 13. E. Lat. 46. 47. N.

NUITZ, a town of France, in the department of Côte d'Or, famous for its excellent wines. It is seated at the foot of a mountain, 15 miles S.W. of Dijon, and 150 S.E. of Paris. Long. 5. 0. E. Lat. 47. 10. N.

NUN, or NED DE NUN, a province of Africa, to the S. of Sus, from which it is separated by a sandy desert. The Emperor of Morocco arrogates to himself the sovereignty of this country, but his real authority is extremely feeble. This vast, but desert, province is inhabited by different tribes of Arabs, whose camps are scattered over such interior parts of the country as are capable of cultivation.

NUNDYDROOG, a town and fortrefs of the peninsula of Hindoofan, capital of a considerable district, in the Myfore country. It is built on the summit of a mountain, 1700 feet in height, the greater part inaccessible; but was besieged and taken by the English, under Lord Cornwallis, in 1792. It is 70 miles N. of Seringapatam.

NUNEATON, a town in Warwickshire, with a market on Saturday. It has a manufacture of cambiet cloth; was formerly noted for its nunnery, and is seated on the river Anker, eight miles N. by E. of Coventry, and 99 N.N.W. of London. Long. 1. 25. W. Lat. 52. 36. N.

NUNEHAM, a village, five miles E. by S. of Oxford; remarkable for its spinning feast, an annual festival, instituted by Lord and Lady Harcourt, for the encouragement of virtue and industry.

NUNNY, a village in Somersetshire, two miles S.W. of Frome. It is remarkable for the ruins of a strong castle, the shell of which still remains nearly perfect, and is a fine piece of antiquity. It was taken by the parliament forces in 1645, and probably soon afterward dismantled.

NURTINGEN, a town of Suabia, in the duchy of Wurtemberg. The hospital here, founded in 1481, is said to be the richest foundation in the whole duchy. It is situate on the Neckar, 14 miles S.E. of Stuttgart, and 60 E. of Stralburg. Long. 9. 12. E. Lat. 48. 33. N.

NUSSERPOUR, a town of Hindoofan Proper, capital of a district of the same name. It is situate on the Sinde, 80 miles N.E. of Tatta. Long. 68. 20. E. Lat. 25. 20. N.

NUYS, a town of Germany, in the electorate of Cologne. It was taken by the French in 1794; and is seated on the Erift, five miles S.W. of Dusseldorf, and 20 N.W. of Cologne. Long. 6. 52. E. Lat. 51. 11. N.

NYBORG, a town of Denmark, in the isle of Funen, with the remains of an old palace, in which Christian II. was born. The ships trading to the Baltic that pass through the Great Belt are obliged to pay toll here, for which purpose a man-of-war is always stationed in the Belt. Nyborg is

seated on a commodious bay, 10 miles E. of Odenfee. Long. 10. 40. E. Lat. 55. 30. N.

NYMPHÆA (*Enceyl.*). A remarkable fact, in the department of Natural History, but particularly applicable as a counterpart to the modern rage for *cosmetics*, we shall communicate to our readers, in the author's words, from the first volume of his travels, in German, p. 232 and following:

"On the 20th of August," says M. Pallas, "the commandant of the port of Astrakhan, granted me a barge for an excursion to the mouth of the Volga, a distance from sixty to eighty versts. As I had learned from the late Dr. Lersch, that the *Nymphaea nelumbo* grew there in abundance, I sent a party of my escort, who procured a great number of the flowers and fruits of this plant, in different gradations of growth; some of which had nearly attained perfect maturity. These fruits are by the Russians called *sea-nuts*, or *morfyge orechi*; by the inhabitants of Tybet, *badma*; by the Persians, *dariopasta*; and by the Indians, *pabin* or *lilfar*: they are searched for and eaten with avidity by the last-mentioned nation, who regard them as sacred. According to their mythology and that of Tibet, the perfect divinities are regenerated in the richly scented flowers of this plant, which serve them for a throne. These flowers, indeed, have an agreeable flavour; and the distilled water which the apothecary of this city, Afellor Zettler, had the politeness to prepare for me, contained a pleasant and permanent taste of fine ambra, and when used as a lotion, imparts such a softness and delicacy to the skin of the face and hands, that it deserves to be introduced as an *innocent cosmetic* into all the apothecaries' shops; especially as the flowers may be collected throughout the summer, in the inlets of the Volga and the Bolda. I found the leaves of this plant completely free from zoophytes, and other aquatic insects. The seminal vessels are more conspicuous, and the germ more magnified, in the seed of the *Nymphaea nelumbo*, than in any other plant. When the nuts are inclosed in a lump of clay, and immersed under water, they readily germinate, particularly if a slight incision be previously made in the shell."

NYONS, a town of France, in the department of Drome, seated at the foot of a chain of mountains, on the river Aigues, with a lofty bridge of one arch, the work of the Romans. Here is a mineral spring, named Pontius, and some manufactures of soap and woollen stuffs. It is eight miles N.W. of Buis. Long. 5. 15. E. Lat. 44. 26. N.

NYSTADT, a town of Sweden, in Finland, with a commodious harbour, and a considerable trade in all kinds of wooden vessels. In 1721, a peace was concluded here, between the Emperor of Russia and the King of Sweden. It is seated on a bay of the gulf of Bothnia, 55 miles N.W. of Abo. Long. 21. 1. E. Lat. 61. 10. N.

NYSTED, or NYESTED, a town of Denmark, in the island of Laland, which carries on a considerable trade to the duchy of Mecklenberg and other provinces of Germany. Long. 11. 40. E. Lat. 54. 43. N.

O.

OKHAM. See **OKEHAM.**

OBAN, a village in Argyleshire, seated on the sea-coast, to the S. of Loch Etive. Here is an excellent fishing station, and a custom-house.

OBdach, a town of Germany, in the duchy of Stiria, seated at the confluence of the Achza and Traun, three miles below the lake Chienzee, and 35 W. of Gratz. Long. 14. 43. E. Lat. 47. 3. N.

OBERRICH, a town and castle of France, in the department of Lower Rhine, three miles from Straßburg, to whose late archbishop it belonged. Long. 7. 50. E. Lat. 48. 35. N.

OBERNBERG, a town of Bavaria, with a castle, seated on the Inn, 15 miles S. of Passau, to whose bishop it belongs. Long. 13. 36. E. Lat. 48. 15. N.

OBERNDORF, a town of Suabia, in the Black Forest, subject to the house of Austria. It is divided into the Upper and Lower Town, and seated on the Neckar, 14 miles N. of Rothweil. Long. 8. 45. E. Lat. 48. 22. N.

OBERSSTEIN, a town of Germany, in the palatinate of the Rhine, capital of a county of the same name. It is seated on the Nahe, 30 miles E. by S. of Treves. Long. 7. 26. E. Lat. 49. 42. N.

OBERSWESEL, a town of Germany, in the electorate of Treves, formerly imperial. It was taken by the French in 1794, and is seated on the Rhine, 40 miles E.N.E. of Treves. Long. 7. 48. E. Lat. 50. 1. N.

OBIDOS, a town of Portugal, in Estremadura, with a strong castle on a rock, 13 miles E. of Peniche, and 38 N. of Lisbon. Long. 9. 18. E. Lat. 39. 17. N.

OBOLLAH, a strong town of Persia, in Irac-Agemi, seated on a branch of the Tigris, near Busfarah. Long. 45. 15. E. Lat. 30. 15. N.

OBSKAYA, a bay of the Frozen Ocean, in Asia. Long. 72. 25. E. Lat. 70. 0. N.

OBVINSK, a town of Russia, in the government of Perm, situate on the Kama, 60 miles N. of Perm. Long. 56. 0. E. Lat. 58. 44. N.

OCANO, a town of Spain, in New Castile, seated on a plain, 18 miles E. of Toledo. Long. 2. 50. W. Lat. 39. 52. N.

OCCA, a river of Russia, which falls into the Volga, near Nishnei Novgorod.

OCHSENEURT, a town of Franconia, in the bishopric of Wurtzburg, seated on the Main, 10 miles S.E. of Wurtzburg. Long. 10. 10. E. Lat. 49. 35. N.

OCHSENHAUSEN, a town of Suabia, near which is a princely abbey, founded in 1100. It is 14 miles S. of Ulm, and 40 W.S.W. of Augsburg. Long. 10. 11. E. Lat. 48. 10. N.

OCKER, a river of Lower Saxony, which rises in the S. part of the duchy of Brunswick, runs by Goslar, Wolfenbuttle, and Brunswick, and falls into the Aller, E. of Zell.

ODER, a river of Germany, which has its source near a town of the same name, in Silesia. It runs N. by Ratibor, Oppelen, Breslaw, Glogaw, and Crossen, in Silesia; Franksfort, Lebus, Custrin, and Frinwalt, in Brandenburg; and

Gartz, Stetin, Cammin, Wellin, Usedom, and Wolgast, in Pomerania. Below Stetin it forms a large lake or bay, called Frischen Haif, and afterward falls into the Baltic Sea by three mouths; between which lie the islands of Usedom and Wollin.

ODERBERG, a town of Upper Saxony, in the middle marche of Brandenburg, situate on the Oder, 25 miles N.W. of Custrin, and 35 N.E. of Berlin. Long. 14. 15. E. Lat. 52. 58. N.

ODERBURG, a town of Silesia, near the confluence of the Oder and Elfa, 10 miles S. of Ratibor. Long. 18. 10. E. Lat. 50. 2. N.

ODERNHEIM, a town of Germany, in the palatinate of the Rhine, seated on the Seltz, 20 miles S. of Mentz. Long. 8. 20. E. Lat. 49. 31. N.

ODIHAM, a corporate town in Hampshire, with a market on Saturday, 24 miles N.E. of Winchester, and 42 W. by S. of London. Long. 0. 56. W. Lat. 51. 18. N.

ODONTALGIA (*Encycl.*). The following observations on this disease, with the explanation of an apparatus that has been successfully employed in relieving it (see Pl. 38), are addressed to the editors of the Medical and Physical Journal.

"The tooth-ach (says the author, Dr. Brown), the most frequent and painful disease incident to the human body, is often occasioned by being exposed to a partial current of cold air, or to sudden heat and cold; by residing in a marshy or damp situation; by morbid matter within, by acrid matter attached to the external surface of the teeth, and frequently by the muscles and membranes of the jaw being affected by the same diathesis which produces irritation, gout, and rheumatism, in other parts. Women are more liable than men to rheumatism and to tooth-ach; they are most subject to both in pregnancy, and during obstructions of the menstrual discharge.

"It has also been observed, that mercurial preparations thrown into the system, so as to affect the salivary glands; nervous affections; sipping hot liquors; frequent picking of the teeth with hard instruments; a scorbutic and some other acrimonious state of the fluids; probably often occasion a caries of the teeth; and I have known several families, who seemed particularly liable to their premature loss and decay."

The common people of Aberdeen, it seems, have an idle notion that the cause of the tooth-ach, is a worm, or worms, engendered in the tooth. Just so, in former times, it was generally supposed, that worms contained in the cavity of the affected tooth, by irritating its nerve, occasioned the acute pain that is sometimes productive of watchfulness, fever, loss of appetite, prostration of strength, convulsions in children, and delirium, in persons who have laboured under this exquisitely painful disease.

Hence in *Regimen Sanitatis Salerni*, p. 154:

"Sic dentes ferre porrorem collige grana,

"Ne carcas jure cum infirmiori simul are,

"Siqu; per embotum fumum cape dente remotum."

"To cure the tooth-ach, take the seed of leeks,
When that fell pain annoys and swells the cheeks;
But *seed* of Henbane must be mixt among.
And burn them both, to make the smoke be strong;
Hold thy mouth o'er, and to receive the fume,
The pain it flakes, and worms in teeth confume,
If through a tunnill, you the smoke allowe."

"Sir Hans Sloane gives an instance of the virtues of *scamen hyoscyami*, in alleviating the tooth-ach. A person of quality, tormented with this racking pain, had an empiric recommended to him, who conveyed the smoke of burning seeds of henbane, by means of a funnel, into the hollow tooth, and thereby removed the pain; but, at the same time, there dropped some maggots from the tooth (as the operator pretended) into a pail of water placed underneath for that purpose. Sir Hans procured one of these maggots, which he sent wrapped up to M. Lewenhoeck, at Delft, in Holland, where it arrived safe and alive. Upon examination, M. Lewenhoeck found it to be entirely like those bred in ordinary rotten cheese; therefore he procured some of these latter, and carefully fed them both, and that one Sir Hans Sloane had sent, on the same cheese; and they were all, according to the usual methods of nature, turned into small scarabei, both being returned such to Sir Hans, from Holland. Upon the whole, though the henbane seeds cured the tooth-ach, it is highly probable; that the maggots had been conveyed thither, and let drop into the water by some slight of hand."

"We learn from the writings of Dioscorides and others, that *hyoscyam*, which is a powerful remedy of the narcotic tribe, has been employed as an anodyne by the most illustrious physicians, from the earliest periods of medical history. It appears to have been the favourite sedative of Celsus; he gave it internally to mitigate pain and procure sleep; he used it externally as a collyrium, in cases of ophthalmia; and he employed it topically to allay the pains of the teeth and gums. Accordingly, under the head of "*Dentium doloris varia remedia*," he says, with his usual eloquence and precision, "The tooth-ach is a disorder that may be justly ranked among the greatest torments;" and he tells us, "if the pain be severe, a clyster is useful, with hot cataplasms applied to the cheek, as also some medicinal hot liquor held in the mouth, and frequently changed. For which purpose is used, henbane root, either in vinegar and water, or diluted wine, with the addition of a little salt to either of them, and poppy heads not over dry, and mandrake roots prepared in the same manner, but in these three, care must be taken not to swallow what is in the mouth."

"Mynsicht who has long been respectfully named in our dispensatories, gives, in his *Medico-Chymicum*, the following formula, which are all designed for the use of persons afflicted with painful affections of the teeth and gums, viz. *Tinctura Odontalgica*, *Pilule Odontalgice*, inserted in Dr. Lewis's Dispensatory, p. 330, 5th edit. *Trochisci* de Alumine with *radix Pyrethrum*, *Spiritus Odontalgicus*, in all which he directs a certain portion of the seeds of henbane. Salmon, whose labours seem not to have been duly appreciated by his countrymen, and Etmuller, prescribe them for the same purpose. Boerhaave had his senses disordered by only making a plaster from this plant. Yet, as the various medicines I had myself hitherto employed were of little avail, and as I had some teeth extracted, and obtained in one instance only twelve hours' respite from my sufferings, the pain flying either to another tooth, or attacking the *Anterior Maxillare*, I tried the effect of fumigating with two parts of henbane seed, added to carraway and cummin seeds, of each one part."

"After repeating the operation three times, I remained

near a fortnight exempt from pain: I then had occasion to have recourse to the fumigation again, and was again relieved; and in the mean time a permanent cure was obtained by the use of internal medicines, which had never occurred either to myself or any of the many skilful and experienced practitioners who had been consulted, on what appeared to some of them, as a case equally inveterate and extraordinary."

"In case of a carious tooth, extraction is often the only radical remedy; but as in some cases extraction is improper, and as in many instances it is obstinately avoided, Dr. Brown had a vessel made of copper, of which see an engraving in Pl. 38, fig. 1. The apparatus takes in pieces at the line *a, b*, and also at *c*. "The bottom is fitted into a wooden stand turned with a groove, to prevent its slipping out of the hand of the operator. In the centre of the bottom of this vessel (as the tube at the bottom of a lantern for the reception of a candle), is a piece of metal shaped to receive the bowl of a *large* tobacco-pipe, with an opening large enough to receive the stalk of the pipe opposite to the hole at *b*. The apparatus being taken asunder at *a, b*, the cup or bowl of an iron or common clay tobacco-pipe is made red hot, filled quickly with the seeds, placed in the aperture formed for its reception, the conical or upper part being restored to its place, as in the engraving; the tube *c*, is turned upwards or downwards, as the pain may happen to be seated in the upper or lower jaw; and being placed in contact with it, the operator, applying his mouth to the tube of the pipe, forces by his breath, into the mouth of his patient, the smoke of the burning seeds, which, by their heating, sedative, and salagogue effect (sometimes it being necessary to repeat the process), generally afford the patient considerable relief."

The small tube marked *d*, is intended to be used when pain is seated in the front teeth.

ODYSSEY (*Encycl.*). See some observations on the Geography of Homer's *Odyssey*, under GEOGRAPHY, *Supp.*

OELFELDT, a town, of Lower Saxony, in the duchy of Magdeburg, seated on the Aller, 25 miles E. of Brunswick. Long. 11. 20. E. Lat. 52. 27. N.

OKLS, or Olse, a strong and considerable town of Silesia, with a castle, where the duke generally resides. It is 17 miles N.E. of Breslaw. Long. 17. 26. E. Lat. 51. 10. N.

OELSNITZ, a town of Upper Saxony, in the territory of Voigtland, seated on the Elster, 20 miles S.S.W. of Zwickau, and 72 S.W. of Dresden. Long. 12. 10. E. Lat. 50. 10. N.

OEPEN, or EUPEN, a town of the Netherlands, in the province of Limburg. It has considerable manufactures of cloth, and is situate on the Weze, 12 miles S. of Aix la Chapelle.

OFFENBACH, a town of Franconia, taken by the French in 1796. It is seated on the Main, five miles E. of Frankfurt. Long. 8. 45. E. Lat. 49. 52. N.

OFFENBURGH, an imperial town of Suabia, under the protection of the house of Austria, seated on the Kintzig, 10 miles S.E. of Straßburg, and 20 S.S.W. of Baden. Long. 8. 1. E. Lat. 48. 31. N.

OFFIDA, a town of Italy, in the marquise of Ancona, 26 miles S. of Loreto. Long. 13. 46. E. Lat. 42. 53. N.

OGGERSHEIM, a town of Germany, in the palatinate of the Rhine, with a villa belonging to the elector. It is situate on the Rhine, four miles W.N.W. of Manheim.

OHLAU, a town of Silesia, in the principality of Brieg, with a large castle. Great quantities of tobacco are produced in the neighbourhood. It is situate on the Ohla, eight miles N.W. of Brieg, and 14 S.E. of Breslaw. Long. 17. 29. E. Lat. 50. 56. N.

OHRRDUF, a town of Upper Saxony, in the principality

of Gotha. It has several times been destroyed by fire, but is now in a very flourishing state, from its numerous manufactures. It is eight miles S.S.E. of Gotha, and 15 S.W. of Erfurt. Long. 10. 57. E. Lat. 50. 55. N.

OHRINGEN, a town of Franconia, 34 miles E.S.E. of Heidelberg, and 33 S. of Wertheim. Long. 9. 50. E. Lat. 49. 13. N.

OIGH, Loch, a lake in Invernesshire, extending four miles from E. to W. It contains some little wooded islands; and its waters flow through Loch Ness into Murray Frith.

OIRA, an ancient town of Naples, in Terra d'Otranto, with a bishop's see, and an old castle. It is seated at the foot of the Appennines, 20 miles N.E. of Tarento. Long. 17. 54. E. Lat. 40. 38. N.

OISANS, a town of France, in the department of Isere, 28 miles S.E. of Grenoble. Long. 6. 25. E. Lat. 45. 0. N.

OISE, a department of France, including part of the late province of the Isle of France. It takes its name from a river, which has its source in the Ardennes, and falls into the Seine, near Pontoise. Beauvais is the capital.

OKOTZK, a province of the government of Irkutsk, in Russia. Its capital, of the same name, is seated at the mouth of the Okota, in a bay of the Eastern Ocean.

OLDENBURG, a town of Westphalia, capital of a county of the same name, noted for its horses. The church of St. Lambert contains the tombs of the last counts of Oldenburg, which are very curious. It is seated on the Hunta, 22 miles W. of Bremen, and 45 S.E. of Embden. Long. 8. 8. E. Lat. 53. 7. N.

OLDENBURG, a town of Lower Saxony, in the duchy of Holstein, seated near the Baltic, 30 miles N. of Lubeck. Long. 10. 47. E. Lat. 54. 22. N.

OLDENDORF, a town of Lower Saxony, in the duchy of Lunenburg, seated on the Wenaw and Elica. Long. 10. 35. E. Lat. 53. 16. N.

OLDENDORF, a town of Westphalia, in the territory of Schawenburg, seated on the Weser, 28 miles S.W. of Hanover. Long. 9. 31. E. Lat. 52. 16. N.

OLDENZEEL, a town of the United Provinces in Overysel, 30 miles E. of Deventer. Long. 6. 57. E. Lat. 52. 20. N.

OLDESLOHE, a town of Lower Saxony, in the duchy of Holstein, seated on the Trave, 17 miles W. of Lubeck, and 25 N.E. of Hamburg. Long. 10. 18. E. Lat. 53. 52. N.

OLERON, an isle of France, five miles from the coasts of Aunis and Saintonge. It is 12 miles long and five broad; is populous and fertile, and defended by a castle. In the reign of Richard I. this island was part of the possessions of the crown of England; and here that monarch compiled the code of maritime laws, called the Laws of Oleron, which are received by all nations in Europe, as the ground and substruction of all their marine constitutions. Long. 1. 20. W. Lat. 46. 3. N.

OLESKO, a town of Poland, in Red Russia, 38 miles E.N.E. of Lemberg. Long. 25. 10. E. Lat. 50. 23. N.

OLIKA, a town of Poland, in Volhinia, with a citadel, 20 miles E. of Lucka. Long. 26. 8. E. Lat. 51. 15. N.

OLINDA, a town of Brazil, seated on the Atlantic, with a very good harbour. It was taken by the Dutch, in 1630, but retaken by the Portuguese. Long. 35. 0. W. Lat. 8. 13. S.

OLITA, a town of Spain, in Navarre, where their kings formerly resided. It is seated in a fertile country, 20 miles N. of Tudela. Long. 1. 46. W. Lat. 42. 22. N.

OLIVA, a sea-port of Western Prussia. Here is a celebrated monastery, which contains several tombs of the dukes of Pomerania, and in it a peace was concluded in 1660, be-

tween the emperor of Germany and the kings of Sweden and Poland. It is situate on a bay of the gulf of Dantzic, three miles W. by N. of Dantzic. Long. 18. 32. E. Lat. 54. 24. N.

OLIVENCA, a strong town of Portugal, in Alentejo, seated near the Guadiana, 13 miles S. of Elvas, and 40 E. of Evora. Long. 7. 4. W. Lat. 38. 30. N.

OLMEDO, a town of Spain, in Old Castile, seated on the Adaja, 30 miles S. of Valladolid. Long. 4. 29. W. Lat. 41. 20. N.

OLNEY, a town in Bucks, with a market on Monday, and a considerable manufacture of bone lace. It is seated on the Ouse, 12 miles S.E. of Northampton, and 56 N.N.W. of London. Long. 0. 54. W. Lat. 52. 5. N.

OLONE, an island, town, castle, and harbour of France, in the department of Vendee, 30 miles N.W. of Rochelle, and 258 S.W. of Paris. Long. 1. 43. W. Lat. 46. 30. N.

OLONETZ, a government of Russia, included formerly in the government of Novogorod. In this district are some considerable iron-works.

OLONETZ, a town of Russia, in a government of the same name, famous for its mines of iron, and its mineral water. It is situate on the river Olonza, which falls into the lake Ladoga. Long. 34. 20. E. Lat. 61. 26. N.

OLPE, a town of Westphalia, 37 miles E. of Cologne, and 50 E.S.E. of Dusseldorf. Long. 7. 38. E. Lat. 50. 59. N.

OLTEN, a town of Switzerland, capital of a bailiwick, in the canton of Soleure; It is dependent on the Bishop of Basle, and is seated a little to the N. of the Aar, between Arberg and Araw. Long. 7. 45. E. Lat. 47. 16. N.

OLTREI, a town of Italy, in Friuli, 24 miles E. of Cadore, and 38 N.W. of Friuli. Long. 12. 25. E. Lat. 48. 26. N.

OMAN, a province of Arabia, bounded on the N. by the Persian Gulf, on the E. by the ocean, and on the S. and W. by extensive deserts. It is possessed by a number of petty sovereigns, the most considerable of whom is the imam of Oman, the capital of the province, which is situate 60 miles N.W. of Mafcat. Long. 57. 20. E. Lat. 24. 0. N.

OMAGH, a town of Ireland, in the county of Tyrone, where the alizies are held. It is 20 miles N.E. of Inniskilling.

OMBO, a town of Egypt, on the E. bank of the Nile, 26 miles N. of Syene. Long. 31. 58. E. Lat. 24. 26. N.

OMBRONE, a river of Italy, which rises in the Siennese, and falls into the Mediterranean.

OMEGNA, a town of Italy, in the Milanese, with a castle, situate on the N.E. side of the lake Orta, 25 miles N.N.W. of Novara. Long. 8. 20. E. Lat. 45. 40. N.

OMMEN, a town of the United Provinces, in Overysel, seated on the Vecht, 17 miles N.E. of Deventer. Long. 6. 10. E. Lat. 52. 32. N.

OMMENBURG, a strong town of Germany, in the electorate of Mentz, seated on the Othern, nine miles S.E. of Marburg, and 45 N.E. of Francfort. Long. 9. 13. E. Lat. 50. 30. N.

OMMIRABIH, a river of Africa, which rises in Mount Atlas, separates the kingdom of Morocco from that of Fez, and entering the Atlantic, forms a capacious bay on the E. side of Azamor.

OMZK, a town and fortress of Russia, in the government of Tobolsk, situate at the confluence of the Om and Irutsh, 260 miles S.E. of Tobolsk. Long. 74. 54. E. Lat. 55. 4. N.

ONADAGO, a lake and river, in the state of New York, The river flows W. from the lake till it meets the Seneca,

when its course turns N. to Oswego, where it enters Lake Ontario. It is navigable for boats from its mouth to the head of the lake, except one fall which causes a portage of 20 yards. See ONEIDA.

ONANO, a town of Italy, in the patrimony of St. Peter, seated between Acquapendente and Petigliano, five miles from each.

ONE, a cape of Barbary, in Africa, near the mouth of the river Mulvia.

ONEG, a town of Russia, in the government of Archangel, situate on the Onega, near the White Sea, 80 miles S.S.W. of Archangel. Long. 37. 24. E. Lat. 63. 35. N.

ONEGLIA, a principality of Italy, surrounded by the territory of Genoa, but subject to the King of Sardinia. It abounds in olive-trees, fruits, and wine.

ONEIDA, or ONONDAGO, a lake of N. America, in the state of New York. It is 20 miles W. of Fort Stanwix, and extends westward about 25 miles, where its outlet, the Onondago River, runs into Lake Ontario, at Oswego. At the E. extremity of the lake, is Wood Creek, on the banks of which live a tribe of Indians, called Oneidas; and the Onondagos, another tribe, occupy the country S. of the lake and river.

ONEZKOE, a lake of Russia, in the government of Olonetz, 120 miles long, and 40 broad. It contains several islands.

ONGAR, or CHIPPING ONGAR, a town in Essex, with a market on Saturday, 12 miles W. of Chelmsford, and 21 E.N.E. of London. Long. 0. 16. E. Lat. 51. 43. N.

ONGOLE, a town of Hindoostan, in the Carnatic, seated on a river, not far from its entrance into the bay of Bengal, 150 miles N. by W. of Madras. Long. 79. 50. E. Lat. 15. 30. N.

ONORE, a sea-port of Canara, on the coast of Malabar, 110 miles N.N.W. of Mangalore. Long. 74. 45. E. Lat. 14. 20. N.

ONOTI, a town of Hungary, 50 miles N.E. of Buda. Long. 19. 22. E. Lat. 48. 10. N.

ONRUST, a small island, at the mouth of the harbour of Batavia, where the Dutch build and careen their ships.

ODEADURGAM, a town of the peninsula of Hindoostan, which gives name to a pafs, in the Myfore country. It is 31 miles S.E. of Bangalore, and 73 S. of Seringapatam.

OODOOANULLAH, a town of Hindoostan Proper, in Bengal, seated on the W. bank of the Ganges, at the foot of a chain of hills. The situation is esteemed unhealthy, on account of the forests in its vicinity. It was the seat of the government of Bengal, under Sultan Sujah, till he fell in the contest for empire with his brother Aurungzeb. The numberless ruins here, and in the neighbourhood, afford a proof of his magnificence; and there still remains a part of the palace, which, in his time, was nearly destroyed by fire. Here is an elegant bridge over the Ganges, built by the same prince, famous for the victory gained over Meer Cossim, in 1764, by Major Adams. Oodoanullah is 82 miles N. by W. of Moorshedabad. Long. 87. 55. E. Lat. 24. 58. N.

OOSTBORCH, a town and fort of Dutch Flanders, in the isle of Cadland, four miles N.E. of Sluys. Long. 3. 29. E. Lat. 51. 22. N.

OOSTENBY, a town of Sweden, in the isle of Oeland, 27 miles S. of Borkholm.

OOTATORE, a town of the peninsula of Hindoostan, in the Carnatic, 22 miles N.W. of Tanjore, and 80 S.W. of Pondicherry. Long. 78. 57. E. Lat. 11. 2. N.

OPHEIM, a town of Norway, in the province of Bergen, 45 miles N.N.E. of Bergen. Long. 5. 15. E. Lat. 60. 41. N.

OPIUM (*Encycl.*). The following observations on opium, and its component principles, with an account of various processes for obtaining it from the white poppy (*papaver somniferum* Linn.), are published by Citizen Dubuc, senior, in the *Annales de Chimie*.

"The natural history of opium," says Citizen Dubuc, "does not appear to be hitherto generally well understood. It is doubted whether there exists any drop-opium (*de l'opium en larmes*); all that seems to be fully established as a fact is, that this singular substance is extracted by the inhabitants of the east from the white somniferous poppy; but the following questions respecting it still remain to be resolved. What are the processes used for obtaining it? What degree of maturity must this plant have arrived at, in order to produce opium such as that of commerce? Finally, Is this vegetable subjected to any particular kind of preparation, before the opium is extracted?"

"None of these questions have been satisfactorily determined by any of the writers who have treated of this subject.

"Several natural historians, and especially Lemery, in his Dictionary of simple Drugs, asserts positively that *there exists no drop-opium*, and that the opium of the Levant is obtained from the leaves and heads of the poppy. The most celebrated chemists who have treated of the subject, such as Fourcroy, Chaptal, Beaumé, Bouillon-Lagrange, &c. are not agreed amongst themselves, whether it is extracted from the leaves, stalks, and capsules, whilst still fresh and green, or whether it is obtained directly from the heads of the poppy when arrived at its last stage of growth and maturity, by making the extract in the ordinary manner.

"This difference of opinion, which exists amongst authors whose knowledge in natural science cannot be called in question, determined me, two years ago, to occupy myself with the investigation of the nature of this substance, by cultivating, with this view, a great number of white poppies; (*Papaver album* & *somniferum* Linn.)

"But before I give an account of the various experiments which I have made in order to obtain opium, it will be proper that we should establish our opinion concerning two facts relative to this substance, such as it is brought to us from the Levant in the ordinary course of commerce.

"It is certain that the oriental opium contains impurities amounting at least to one fourth of its weight. I have frequently examined these heterogeneous substances, and, after different washings, I have easily discovered, that they were nothing else than the stalks, leaves, peduncles, capsules, and seeds of the poppy, in a state of very minute division.

"I shall shew hereafter that the addition of these substances contributes in a very great degree to give the opium that acrid and nauseous smell which it is known to possess.

"It is also known, that this acrid odour is extremely volatile, and that frequently it is not found to exist any longer at the surface of the cakes of opium, whether in consequence of the length of time that they have been kept, or owing to some artificial means that have been employed for that purpose; whilst the lower part of the same cake, which is still viscous, is thoroughly imbued with it, and emits an intolerable smell when cut through the middle: hence it appears, that this volatile principle, or *aroma*, is only an accidental property of the opium.

"The following experiments will elucidate what I have advanced, both with respect to the two last-mentioned facts, and the solution of the questions which I have proposed at the commencement of this memoir.

" *Experiment 1.* If we dry viscous opium, in a temperature not exceeding 40—50 degrees of Reaumur's thermometer, till it becomes pulverulent, it will lose its acrid narcotic smell, and assume that of laudanum, or the purified opium of the shops, from which it differs only in the impurities which it contains. The vapours which arise from it, when collected in a convenient apparatus, become there in part condensed into a liquid, which at first is almost colourless, but in the space of a few days assumes a slight yellowish tinge. This *aroma*, or distilled spirit, is accompanied by an ætiform fluid, which is not altogether miscible with water, and both diffuse an odour resembling that of opium cakes when cut in half, but so extremely strong as very speedily to suffocate animals exposed to an atmosphere of this gas.

" Last year I made the extract of white poppies, gathered at different periods of their growth, without ever having been able to obtain a substance that had the smell of opium, or even that of laudanum. I only perceived that a heap of poppy leaves that had been thrown away, exhaled an aromatic principle very analogous to that which was obtained in the preceding experiment. This led me to make the following experiments:

" *Experiment 2.* On the 3d Prairial (22d May) last, twelve leaves of the white poppy, which had attained to one-third of their full growth, were well pounded in a marble mortar, without adding any liquid. The juice was very abundant, of a brown colour, slightly mucilaginous, and had but little of a bitter taste. The whole was put into a vessel of stone-ware, and exposed to the atmosphere. The temperature of the atmosphere was between 10 and 12 degrees Reaumur.

" On the 4th I observed a slight swelling in the mafs. On the morning of the 5th it puffed up prodigiously, and already exhaled an acrid odour, very similar to that of the *aroma* obtained by the deficcation of the opium. On the 6th the vapour was exhaled in such large quantity, that it was impossible to approach it without becoming affected with a violent head-ach. On the 7th, I exposed the vessel to the sun for a space of twelve hours. The fermentation became still more vehement: I agitated the mafs from time to time, attending to what happened. I soon perceived that the exhalation of the narcotic odour abated, and was partly replaced by another, which had much analogy with azotic gas; the plant and the juice acquired a deeper colour; at length they became oxydated at the expence of the surrounding air, which probably gave birth to the nitric radical, which, combined with the *aroma* of the plant, produced that peculiar odour of which I have been speaking.

" *Experiment 3.* On the 24th of the same month, twelve pounds of poppy, that had arrived at about three-fourths of its growth, after having been prepared like those in the preceding experiment, were also exposed in a vessel to the air. On the 26th, the mafs began to ferment, and the acrid narcotic vapour was developed in a very perceptible manner; but this time I did not expose the mafs to the sun. On the 28th the smell peculiar to opium was very perceptible: I then pressed out the juice, filtrated it cold, and evaporated it, with a very moderate heat, to the consistence of an extract.

" I thought I had the best grounds to expect that I should obtain real opium as the result of this experiment; but I was disappointed; for, in proportion as the juice gradually thickened, it lost its narcotic odour, and the extract which I obtained had no other smell than that peculiar to the extract obtained from inodorous plants: hence I drew the further conclusion, that this *aroma* was of the same nature as that obtained in experiment 2.

" *Experiment 4.* On the 14th of Messidor (2d July) following, I exprest two pounds of juice from poppies partly in bloom, and partly ready to blossom. This juice was of a dirty yellow colour, nearly resembling that of the *Chelidonium majus*; it had a very slight smell of laudanum, and a marked bitterness, and left a very considerable roughness upon the tongue. I exposed it to the air in a vessel of earthen-ware, in which it fermented rapidly, so that, on the 17th, it exhaled an odour similar to that of the opium of Egypt. This juice I filtrated cold, and, hoping to preserve its odour, I thickened it by exposing it in plates to the heat of the sun. The extract which I obtained still resembled that of the preceding experiment.

" *Experiment 5.* On the 19th Messidor, I extracted about one kilogramme of the juice of poppy heads, partly in flower, and partly after the leaves had fallen off, and the capsules had become very large. This juice was more bitter than that obtained in the preceding experiments. I reduced it to one-half of its quantity by the application of a very gentle heat, hoping that the mafs being more dense, and its particles in closer contact with each other, I should obtain, after fermentation, a substance whose odorous principle would be more coercible.

" The juice thus inspissated did not begin to ferment till the 25th, though the heat of the atmosphere was greater than during the preceding experiments. On the 30th it had the desired odour, and the experiment seemed very promising.

" Again was I disappointed: I reduced half of the mafs to an extract, which perfectly resembled that obtained in experiments 3 and 4: the other half I kept in a well-corked flask, to be used in another experiment.

" *Experiment 6.* On the 28th of Messidor, four hectogrammes of capsules, sufficiently green, but arrived at their full size, and twelve decagrammes of the leaves and stalks pulled off near to the peduncle of the plant, were well bruised and pounded in a mortar. They yielded a thick viscous mafs, and the juice was deeper coloured, and more bitter, than that obtained in the preceding experiments. The whole being exposed to the air in an earthen vessel, it soon fermented, and four days were sufficient to produce the evolution of an odour like that of the true oriental opium.

" Of this mafs I preserved one-part, to be used afterwards, and inspissated the other in a temperature not exceeding 40 degrees. This extract retained a very tight smell of laudanum; it was a mixture nearly similar to the opium of commerce, excepting that the *aroma* had been evaporated by the heat.

" It would be superfluous to describe here the numerous experiments which followed the two last mentioned: the result in each of them was an inodorous extract, or one almost so. It is, however, proper to observe, that the pounded leaves, stalks, capsules, &c. of the poppies, always exhaled, after fermenting, for a longer or shorter period, the narcotic odour, or that of the *aroma*, obtained in experiment 1; but they lost it again after being exposed ten or twelve days to the air.

" Before I proceed to relate other experiments, I ought to mention several remarks which I have made upon poppies, from the period at which they blossom till that when the capsule begins to grow yellow, after which they exude no more juice.

" During a period of fifteen days, I made incisions, both upon the peduncle and upon the lower part of a great number of very fine poppy heads, from whence there issued a whitish yellow juice, almost inodorous, but very bitter, which filled up the incision, and assumed a blackish colour in a very short

space of time: its taste was not changed by exposure to the air, but it first acquired the acid colour, which, in the preceding experiments, was developed by fermentation: this, however, was soon evaporated by exposure to the sun, and the juice retained only that of laudanum.

"I also remarked in my bed of poppies, that some of the capsules were of a form almost entirely spherical, whilst others affected the oval figure.

"The first naturally produced opium without any incision being made into them. This juice collected itself in two, three, and sometimes four futures, which are found in the peduncle, where it concretes, and in a very short time acquires the smell and colour of laudanum. I have collected small masses of it, some of which weighed eight grains. I took two grains of this opium, which procured me a very tranquil and protracted sleep.—*This was drop-opium.*

"All these poppies were sowed on the 10th of Germinal last (March 30), in a very rich and well-manured soil, defended against the north and north-east winds, by a building and a wall. The finest plants were at the distance of a foot from each other.

"Nature having completed her work, I imagined also, according to the result of experiment 6, that it would be possible for me to attain my object, and make opium with poppies arrived at their last degree of maturity.

"*Experiment 7.* For this purpose I took twelve fine poppy heads, six of which were oval and six globular. I pounded them together with their seeds, with twenty-four decagrammes of rain-water. Having exposed them to the air, in an earthen vessel, I was very much surprised, four days afterwards, to observe spots of mold upon them. I repeatedly stirred the whole mass, but none of the phenomena of the preceding experiment took place: the mass, left to itself, was destroyed in the manner usual with all vegetables.

"*Experiment 8.* I made an extract, according to the usual method (by decoction), from a considerable quantity of poppies. The decoction was saturated, and became slightly mucilaginous as it cooled, without however emitting any thing of the odour of laudanum. I gave the extract a pulverulent consistence: it differed essentially from those of the inodorous plants, possessing a degree of cohesion which is not usual with those, and which I attribute to the resin contained in it, &c.

"*Experiment 9.* A portion of the dried extract obtained in the preceding experiment was well triturated with a sufficient quantity of the viscous residuum that had been laid by in experiment 5, in order to obtain a mass having the same consistence as the opium of commerce. This mixture much resembled the laudanum of the shops in colour, taste, and smell.

"*Experiment 10.* The other portion of the extract obtained in experiment 8, was likewise reduced to the consistence of opium with the residuum that had been laid by in experiment 6. Three days after its formation, this mass might, by its impurities, viscosity, colour, and taste, have been confounded with the opium of the Levant, excepting that it was not wrapped, and in some measure kneaded, with poppy leaves *.

"To sum up the results of my observations, I am induced, by the experiments above related, to believe:

"1. That the opium of commerce is not merely the extract or inspissated juice of the stalks, leaves, or green capsules of the poppies; for, were that the case, it would not contain so large a quantity of impurities, which are diffri-

buted in an almost uniform manner throughout the whole mass.

"2. That this same juice or extract, if prepared with the intervention of heat, however moderate, would not have the acid nauseous odour, which the oriental opium retains as long as it preserves its viscosity, as is demonstrated by experiments 3, 4, 5, and even 6.

"3. That the opium of the East is not mere extract prepared by the infusion or decoction of the heads of the white poppy after it arrives at the stage of maturity; since that which was obtained by experiment 8 was by no means odorous, and was also exempt from impurities.

"I should add, that I have had in my possession capsules of the white poppy of Egypt, between which and those cultivated in France there appeared to me to be no difference.

"4. That it appears to be made out by experiments 9 and 10, that the opium of the East is the inspissated extract of every kind of the white poppies, gathered from the time when they begin to flower till they have arrived at maturity, and afterwards mixed together, and reduced to the consistence which is observed in the acid odorous mass, obtained from the stalks, leaves, and green capsules, of the same kind of poppies, pounded and fermented till the moment when the acid nauseous odour is evolved, as appears by the result of the above-mentioned experiments, and particularly experiment 6; and, finally, that this mass is divided into cakes, which are wrapped and kneaded at their surface with poppy leaves, in part dried, and thus sent to foreign nations.

"5. That it appears, by the observations inserted between experiments 6 and 7, that there does really exist drop-opium, and that the substance which is thus termed by some natural historians, naturally exudes from that variety of the white poppy, the capsules of which affect the spherical form.

"This opium differs from that of commerce by its being almost entirely soluble in water, by its purity, by its taste, which is less bitter and acid than that of the latter, and by its odour, which is less narcotic and nauseous.

"This investigation is not so complete as might be wished; and I am well aware of numerous objections that might be made against what I have advanced, such as the analysis of my opium compared with that of commerce, its medicinal properties, &c. &c. I have not the vanity to imagine that I have completed the work which I have undertaken, but its deficiencies may still be supplied. I did not think it necessary to enlarge upon the medicinal virtues of this substance. This part of the investigation is the province of the medical writer: I only assert, that the drop-opium which I obtained produced a perfect tranquillity in the system, without occasioning vertigo.

"However, I do not doubt the possibility of procuring good opium from poppies cultivated in the temperate zone; and the reader is also requested to observe, that those upon which I made my experiments were raised in one of the northern departments of France. I wish that the same experiments might be repeated with poppies raised in the south of the Republic. I keep a considerable number both of the spherical and oval kind, and shall with pleasure procure them for any person, who may be inclined to occupy himself with this kind of labour, and to bring to perfection a work of which I have only sketched the outlines. When this shall be accomplished, we shall cease to be tributary to the foreign nations who sell us this substance at a very high price."

* "I have observed that poppy leaves, when half dry, contract the narcotic smell, which leads me to believe, that they are used in the East, thus prepared, for wrapping the cakes of opium in them."

That similar attempts have been made to produce this valuable drug in our own country will appear from the following account of a method of preparing opium from poppies grown in Great Britain, equal in quality to the best foreign opium, by Mr. Thomas Jones, of Fifth-street-hill, London. For this the Society for the Encouragement of Arts, Manufactures, and Commerce, voted Mr. Jones a premium of fifty guineas.

"In the summer of 1794," says he, "I cultivated a considerable number of white poppies (entitled in the New London Pharmacopœia, *papaver fomiferum*, and, in another place, *papaver hortenfe*, *femine albo*), when a few of the heads or capsules having been broken off by the wind, I observed at the extremity of the stalks a substance in every respect resembling Turkey opium. This accidental circumstance bringing to my recollection its method of production, as related in the Encyclopædia and elsewhere, I wounded a considerable number of them with my penknife, and, in the course of the day, collected a small quantity of the above-mentioned substance. As this circumstance took place while we were cutting lavender, it happened that an old experienced servant, who was afterwards to distil it, was directing and assisting, and we agreed that it was probably in effect equal to, and was certainly more pure than, any we had ever seen.

"From this period I have never entirely lost sight of the object I am now to consider; but, on account of various avocations, and particularly my rhubarb plantation, which at this time required all the attention I could well spare, it was not in my power to engage in an undertaking of such magnitude; and more especially on a scale so extensive as that which I had already determined to adopt, under a persuasion that experiments, when more confined, are for the most part fallacious.

"As preparatory, however, I have not failed every year to repeat the operation, at once establishing its practicability, and availing myself of many advantages which can only be derived from observation and experience.

"The inclosed certificates will inform the Society that at length my plan has been carried into execution, but not with the degree of success that ought, and might have been expected to attend so large and expensive an experiment.

"It must be confessed, that had I been at all aware what an almost Herculean labour I was about to encounter, I really suspect whether my resolution would have been equal to the task. Left, however, this should discourage others from prosecuting this object, it is necessary to be more explicit.

"Difficulties, and such indeed as are considerable, must necessarily attend most undertakings which have been hitherto unattempted; but the disappointments I sustained, though more numerous than generally fall to the share of a person under such circumstances, and more aggravated, did not all arise out of the undertaking itself, but from causes, some of which may be easily guarded against in future, while others may never again occur.

"Two years have passed, in producing what, I flatter myself, the Society will consider deserving their premium, particularly if I am enabled to render the operation much more simple than may at first sight be supposed.

"The claimant, I observe, is required to submit to the Society his particular method of cultivating the poppies. As the mode adopted in the present instance arose rather from necessity than choice, I must go back as far as the autumn of 1797, to shew how it happened,

"Five acres of ground and upwards, situated in the parish of Enfield, in the county of Middlesex, I appropriated to this experiment, at the period above mentioned; which, being ploughed several times previous to the following March, were then sown broad-cast; and the weather proving favourable, the seed soon vegetated, and appearances were very promising. From the neglected state of the land, however, to which I was unfortunately a stranger, such a profusion of weeds sprang up among them, that, after many fruitless efforts at recovery, I was under the mortifying necessity of ploughing them all up together. This circumstance not taking place till the latter end of April, the season for sowing was elapsed; and as to cropping my field with oats or barley, a measure very strongly recommended to me, I considered it as a deviation from my original purpose, and therefore, without paying any attention to it, gave the field a summer-fallowing, conceiving the poppies might be sown with equal and perhaps greater advantage in autumn.

"Finding that the broad-cast method of sowing precluded the possibility of hoeing where the land is much infested with weeds, I now adopted a different mode, and drilled in the seed with a very simple yet efficient machine, which I purchased of Mr. Macdougall, of Oxford-street: but, as the weather began to be very severe so early as November, and continued so with few intermissions, the succeeding March found me very little forwarder. Yet still I persevered, and once more resolved to drill the whole five acres: they came up extremely well, and, as I expected, accompanied with innumerable weeds; but these by well-timed application were eradicated, though not without considerable difficulty.

"I now thought myself secure; for nothing could assume a better appearance, till the beginning of May. Alas! I could not foresee the cold and remarkably dry weather that ensued, and prevailed, I believe, for six weeks successively. Hence the growth of some became stunted, and others were entirely destroyed; but happily some warm refreshing showers fell just time enough to rescue the remainder.

"From these I have procured upwards of twenty-one pounds of opium, five of which, in compliance with the Society's requisition, I have sent for their inspection and examination.

"At one time I began to despair of even procuring this, comparatively speaking, small quantity, though it is not a fifth part of what I ought to have had, owing to the extraordinary rains and winds which we experienced through the whole of the summer months.

"This recital, as I have before observed, ought on no account to intimidate others from a co-operation; for it is obvious, that the former inconveniences originated in my own ignorance, whilst the latter depended upon causes that in all probability may never happen again.

"Mr. Ball, in a letter published in one of the volumes of the Society's Transactions, advances an opinion which I consider as very fallacious, respecting the quality of land adapted to the growth of poppies. He seems to be very little concerned about this point, and hints the probability of their being cultivated almost every-where. I well know that poppies, like many other vegetables, will grow in soils of any description; but of this I am fully assured, that, like the rest, they have their particular and favourite soil, viz. a sandy loam, and that the better this is, the more advantages will accrue to the cultivator. For it should be considered, that, in bad as well as good ground, the same expences of cultivation, scarification, and collecting, will be incurred, for perhaps a fourth share of the produce.

"There is also another error in the same communication,

which, having a tendency to mislead, ought to be pointed out. He tells us, to use his own words, "That, by a calculation he has made, supposing one poppy growing in one square foot of earth, and producing only one grain of opium, more than fifty pounds (I suppose he means, of course, apothecaries weight) will be collected from one statute acre of land." Now, as there are no more than 43,560 square feet in an acre, and allowing one grain for each, the produce can be no more than ninety ounces and six drachms. This calculation appears to be as much in the extreme one way, as that of Mr. Ball is in the other. The medium is most probably nearest the truth; but upon this point I cannot at present speak with any degree of precision, on account of the scattered situation of my crop, and the extraordinary intemperance of the last season. Judging, however, from the number of heads we perceived, and comparing them with the total quantity, they seem to have yielded three fourths of a grain each, upon an average, large and small.

I shall now lay before the Society some general remarks on the cultivation of poppies, and then conclude, with submitting a few hints and directions respecting the preparation of opium.

"Having a tap-root, their size will consequently be proportionate to the depth of earth they are enabled to penetrate. Hence the necessity of land that will admit of deep ploughing. The fineness of the surface too is very essential. As the seed is so small, and the plants, on their first coming up, so exceedingly tender, the bush-harrow should always be used after those which are commonly employed. By this means a greater number are likely to vegetate, and their roots being better protected are less liable to injury.

"Poppies (and when I use this name, I mean that particular kind before specified) may be cultivated both by the drill and broad cast mode of husbandry; at the same time it must be remembered, that the land for each requires a different disposition. In the former this is not so material, the sowing-machine, regulating the distances of the rows according to the will of the operator; these ought to be nine inches or a foot asunder, and in beds containing four rows, allowing a foot and a half between each. But, with respect to the latter, this point must be strictly attended to: the ridges should never exceed four feet in breadth; so that the furrows will answer the double purpose of preserving the land throughout the winter, and, in the season for collecting the opium, serve as paths for the workmen.

"Besides two chances of a crop, I am decidedly in favour of autumnal sowing; and the first week in September seems to be the most favourable period for this purpose. If the weather continues open, they will make such progress as to be capable of resisting the severity of an inclement winter, without on the other hand being too forward; a circumstance highly dangerous, as the first severe frost is inevitably destructive.

"On this account, whether by the drill or otherwise, a large proportion of seed should be sown at this season, for the plants will defend each other; and as all the plants will not be equally forward, so, let the winter prove as it may, provided the seed has vegetated freely, there will be great probability of a good appearance in spring. If unfortunately, however, such a winter as the last should again occur, and the whole plantation fail, a circumstance which has happened to myself, the spring sowing ought not to be deferred longer than the first week in March.

"I do not, without sufficient reason, recommend that this operation should be performed in autumn. The poppies are not only generally larger, but even, when this is not the case, I know from experience, that they will yield a much larger proportion of opium: for it seldom happens that a spring poppy will bleed, as we term it, more than twice, while the others will bear scarifying till they are nearly ripe. This I imagine can only arise from the length of time the one has been in the ground in comparison with the other. Indeed, the difference is so striking, that if the present winter destroys my plants, I shall be almost tempted to dispose of my spring sowing to other purposes. In drilling, the necessity of covering the seed by harrowing is suspended by the operation of the machine; and, in the broad-cast method, a shower of rain will have all the effect without further trouble or expence.

"Excepting great additional care, turnip and poppy hoeing are similar, and in every respect may be conducted in the same manner. I believe the turnips are rather benefited, they certainly are not injured by being shaken, and will recover from the effects of a wound; but if the poppies are accidentally touched, they will either exhaust themselves by bleeding, or dwindle so as to be of no value. But it is high time to proceed to the last point I purposed to consider, namely, the production and preparation of opium.

"In ordinary seasons, the heads or capsules of the autumnal poppies will be large enough for our purpose in the month of June; for at this time they will have attained about half their growth, or be equal in size to a small tea-cup. I have invented a variety of instruments as scarificators; but as only two kinds were actually used, I am unwilling to trouble the Society with a description of any other *.

"Seven, and sometimes eight, boys were employed, from eight to twelve years of age, together with a man as a superintendent. The children's book, which accompanies the instrument, contains only an account of six, as the eldest, being the son of my gardener, is included in another book. To the youngest I gave three pence per day, and, if tractable and well disposed, an additional penny for every additional year.

"The steel instrument was used by the latter, and the others by the former. I have great reason to be satisfied with their construction; for, notwithstanding their simplicity, they

* Mr. Jones has since added the following description of the instruments, and their mode of application. They remain in the Society's Repository for inspection.

"The first of these instruments consists of two thin steel blades fixed by a wedge in a wooden handle, so as to make incisions about one-fourth of an inch from each other.

"The other is made entirely of steel, and resembles in form the tuning-fork of a harpsichord. It consist of four bars, proceeding from a handle of a convenient length, a quarter of an inch wide, and two and a half long, each terminating with a bolster, through which a screw passes that fixes the scarificators. The centre bars should be so elastic as to yield to the curvature of the capsule, while, upon the outer ones being pressed by the finger and thumb; and by this means four incisions are made three quarters in width; but, from the two outer blades, only an inch and a quarter. The bolsters are a quarter of an inch in diameter, and the scarificators a proportionate length, namely three eighths. The wedge in the former, and a longitudinal aperture in the scarificators, or blades, of the latter, will regulate the depth of the incisions, at the will of the operator. It is of the utmost importance that these should not be made through the inner coat of the capsules."

proved themselves fully equal to my purpose; and so considerable a trial has not suggested any other improvement, than that in the largest the two inner bars only should be elastic; for the continual pressure of the finger and thumb on the two outer ones, which is absolutely necessary for the others to act, would be avoided, and consequently much fatigue and inconvenience prevented.

"It is of very little consequence whether the first incisions are made horizontally or vertically, with this instrument; for, however luxuriantly the milk may flow, by making four at one time, it so divides the stream that seldom any escapes. With the smaller ones we most commonly made them horizontally, beginning as near the top of the head as possible, and for this reason—all the juices, if the first incision was made at the bottom, would be naturally attracted by the aperture, and render every other completely fruitless, besides occasioning the certain loss of a considerable quantity, by falling on the surrounding leaves; whereas, on the other hand, a proportion of milk will exude from each, and the opium be equally distributed over the whole surface of the head.

"No particular directions seem necessary for repeating this operation, any further than at each time it should be performed in a contrary direction, and continued till no more will exude, at intervals of four or five days or more, according to circumstances: for, as the weather proves very rainy or fair, they will be shorter or longer, the heads being sooner replenished in the one than the other.

"Each of the children being provided with a tin eup, having one handle, so contrived as to fix itself to a girdle fastened round his waist, with a common gardening knife they scraped off the opium that appeared upon the heads in a soft ash-coloured substance. Dewy mornings are best calculated for this purpose, and it should be discontinued so soon as the sun has gained a sufficient power to dissipate it; for, if persevered in throughout the day, some of the opium will recede into the interstices, and more, in defiance of every endeavour, will remain upon the heads. The principal quantity exudes in the course of the night, and, uniting with the dew, it is taken off as readily and completely as with a sponge.

"Several regulations were adopted to excite, as much as possible, a spirit of emulation. The name of each boy was written upon his cup, so as to ascertain, on their return from collecting, who had been the most active. And although, in consequence of the unsettled state of the weather, this part of our process continued so long as from the 6th of July to the second week in September inclusive, the good effects were felt to the last. And as, for the reason already mentioned, an hour in the morning became so invaluable, those who appeared in the ground at five o'clock, at the most busy period, became entitled to an additional penny to their daily pay. This measure succeeded at first only with a few; but the remainder, overcome by shame, at length attended equally well. In addition to this encouragement, I am under an engagement (in case I succeed with the Society), to such whose behaviour has been uniformly good, to celebrate the circumstance by a public dinner.

"The interval from breakfast time to sun-set, if the weather assumed a settled appearance, was occupied by scaring. And here I again felt the good effects of stimulating measures: certain places were allotted to particular children, according to their ability, so as to discover who scarified the most and the best; the superintendent occasionally following all of them, to observe whether any work was left unfinished, and, if there were any, to complete it. If, in our progress, any one proved refractory, which happened in more instances than one, rather than have recourse to severity, and for the sake of example, he was immediately discharged.

I had numerous applications, and the first on the list always had the preference as his successor.

"Upon the whole, considering it was the first attempt of the kind, every thing proceeded very regularly; and had the summer been propitious, notwithstanding my former disappointments, I should have had great cause for satisfaction. The largest quantity that my man, seven children, and myself, were able to procure in one morning, from five to nine o'clock, was one pound and a half: this happened when the dew was remarkably great, and succeeded one of the warmest days in the summer.

"From the experience I have had, the precariousness of our climate appears to me the only obstacle to the production of opium in this kingdom. It may be said that the same inconveniences attend every other agricultural pursuit; and that hay, and a variety of productions, particularly hops, are much prejudiced from the same cause. I allow that they are so; but the evil produced by a sudden alteration in this case is irreparable; for, should it happen after a fine scaring day, we do not only lose the labour of that day, but all its produce. It becomes obviously necessary, therefore, to be particularly circumspect; and this is the only remedy we are able to procure. The poppies will receive no damage from remaining entire; while, on the other hand, impatience may be injurious, if not destructive.

"As my notes furnish me with no further particulars, I have very little more to add. The opium, when first collected, from its union with the dew, is much too soft to be so formed as the Society will receive it.

"To reduce it to a proper consistence, taking nature for our guide, it should be thinly spread in shallow dishes, and exposed, under glasses, to the rays of the sun. My opinion is, that Turkey opium suffers considerably from the operation of fire; certain it is, that, with respect to its effluvia, it undergoes a complete alteration. I have covered it with its own leaves, thinking this a very convenient mode of package, and conceiving it to be important, in every new undertaking, by studying appearances, to yield to the general prejudices which naturally prevail in favour of the article to which we have been accustomed."

The following testimony of the quality of the opium is extracted from a letter from Dr. Woodville to Mr. Jones.

"I have examined the opium collected by you from the capsules of the white poppy; and I have no doubt, from its taste, smell, colour, and purity, but that it is more powerful and efficacious than the best foreign opium imported into this country."

OPPELEN, a strong town of Silesia, capital of a duchy of the same name, with a castle. The chief tribunal of justice, and the first consistory of Silesia, were settled here in 1742. It is seated on the Oder, in a pleasant plain, 35 miles S.E. of Breslaw, and 40 N. of Troppaw. Long. 17. 50. E. Lat. 50. 41. N.

OPPIDO, an episcopal town of Naples, in Calabria Ulteriore, seated at the foot of the Appennines, 25 miles N. of Reggio. Long. 16. 21. E. Lat. 38. 19. N.

ÖPPURG, a town of Upper Saxony, in the circle of Neustadt, four miles W.S.W. of Neustadt.

ORACH, a town of Turkey in Europe, in Bosnia, near the river Drino, 60 miles S.W. of Belgrade.

ORANIENBAUM, a town of Upper Saxony, in the duchy of Anhalt Dessau, six miles S.E. of Dessau.

ORANIENBAUM, a town of Russia, in the gulf of Finland. Here is a royal palace, built by Prince Menzikoff, afterward converted into an hospital; but much used as a residence by Peter III. It is 20 miles W. of Peterburg. Long. 29. 26. E. Lat. 59. 52. N.

ORANIENBURG, a town of Upper Saxony, in the middle marche of Brandenburg. It was anciently called Bretzow, and takes its present name from a villa built by the elector. In 1699, a colony of the Vandois was established here, after being driven from their country on account of their religion. It is situate on the Havel, 18 miles N. of Berlin, and 28 N.N.E. of Potsdam. Long. 13. 26. E. Lat. 52. 50. N.

ORATAVIA, a town of Teneriff, one of the Canary Islands. It is seated at the bottom of an amphitheatre of mountains, out of which rises the Pike of Teneriff. Its port is at three miles distance. Long. 16. 20. W. Lat. 28. 23. N.

ORBARESAN, a town of Piedmont, between Turin and Pignerol. Long. 7. 30. E. Lat. 45. 2. N.

ORBE, an ancient town of Switzerland, in the Pays de Vaud, capital of the bailiwick of Echallens, the sovereignty of which is divided between the cantons of Bern and Friburg. Its romantic situation, and the boldness of its single-arched bridge projecting over the Orbe, are the admiration of all travellers. It is 24 miles W. of Friburg, and 40 W. by S. of Bern. Long. 6. 43. E. Lat. 46. 49. N.

ORBE, a town of Germany, in the electorate of Mentz, celebrated for its salt works. It is 26 miles E. of Frankfort.

ORBITELLO, a strong sea-port of Tuscany, in the Siennese, defended by several forts, and seated near the Albegna, 58 miles S. by W. of Sienna, and 85 S. of Florence. Long. 11. 10. E. Lat. 42. 18. N.

ORBRE, a river of France, which rises in the Cevennes, waters Beziers, and falls into the gulf of Lyons, five miles below that town.

ORCHIES, an ancient town of France, in the department of the North, 14 miles S.E. of Lille. Long. 3. 25. E. Lat. 50. 28. N.

ORCHILLA, an island of the Caribbean Sea, 80 miles N. of the coast of Terra Firma, and 160 E. by S. of Curacao. Long. 65. 20. E. Lat. 12. 0. N.

ORCHIMONT, a town of the duchy of Luxemburg, situate on the Semois, 18 miles N. of Sedan.

ORDINGEN, or **URDINGEN**, a town of Germany, in the electorate of Cologne, 11 miles N. of Dusseldorf, and 32 N.N.W. of Cologne.

ORDUNNA, a sea-port of Spain, in Biscay, seated in a valley, surrounded by high mountains, 20 miles S.W. of Bilbao. Long. 3. 26. W. Lat. 43. 11. N.

OREBRO, a town of Sweden Proper, capital of the province of Nericia, seated near the W. extremity of the lake Hielman. In the middle of the town, on a small island formed by two branches of the Svarf, stands the castle, formerly a royal residence. Here are manufactures of firearms, cloth, and tapestry; and it has a considerable trade with Stockholm, across the lakes Hielman and Maeler, by means of the canal of Arboga; sending iron, vitriol, and red paint, in particular, to that capital. Orebro is 95 miles S.W. of Stockholm. Long. 15. 12. E. Lat. 59. 12. N.

OREGRUND, a sea-port of Sweden, on the coast of Upland, in the gulph of Bothnia, opposite the small island of Ginston, 60 miles N. of Stockholm. Long. 18. 15. E. Lat. 60. 20. N.

OREL, a government of Russia, once a province of the government of Bielgorod. Its capital, of the same name, is seated on the Occa and Orel, 207 miles S.S.W. of Moscow. Long. 35. 20. E. Lat. 53. 0. N.

ORENBURG, one of the two provinces of the government of Ufa, in Russia. Its capital, of the same name, is seated on the Ural, formerly called the Yaik, 480 miles N.E. of Astracan. Long. 55. 0. E. Lat. 51. 46. N.

VOL. X.

ORFORD NESS, a cape of England, on the S.E. coast of Suffex, where a light-house is erected for the direction of ships. Long. 1. 6. E. Lat. 52. 4. N.

ORGAN (*Encecl.*). The following is extracted from the specification of a patent granted to Mr. John Longman, of Penton-street, Pentonville, Middlesex, for certain improvements in the construction of barrel-organs, with a view to prevent them from getting out of order. It is so contrived, also, that another musical instrument may easily be attached to it, and made to play with the same barrel. This invention is shewn by the figures in Pl. 34, which are explained thus: "The part of barrel-organs employed in fixing the tune," says Mr. Longman, "has hitherto been detached from the barrel and key-frame, whence many and continual musical imperfections arise. I therefore attach to the barrel a circular plate or plates, of any metallic or other substance, to which is adapted a proper key-frame (as described in the above drawing) by this is gained a regular, precise, uniform movement of the barrel, without any reverberatory motion whatever. The nice and steady connection of the plate or plates fixed to the barrel with the key-frame is the principle which gives not only variety of mechanical adaptation, but also accuracy of execution to this above all other barrel-organs. A reverse method may be used, by having the wheel A, which is fixed to the barrel, made thick enough to contain a number of grooves cut round it, and the plate B, which before was called a notch-plate, to be a plain piece of metal, to run in the above-mentioned grooves."

"Fig. 2. The spiral barrel is made by cutting one part of the wheel A, and inclining one of the parts one way, so that when the key-frame comes to that part of the wheel, the inclined part gradually draws the key-frame until it receives the next notch in the plate B, and has then passed one round."

"Fig. 3. The exact connection which my discovery gives to all parts of barrel-organs with each other enables me to add, with great advantage, as accompaniments, bells, tambourines, &c. to improve and enlarge the force and beauty of the instrument. The instrument thus improved, with or without accompaniments, is not liable to be injured by change of position or carriage."

The several parts of the machinery are thus described with reference to the plate.

Fig. A, the plates on the barrel. B, notch-plate to receive the plate A. C, a roller, and A, one of the plates, either of which may be used to keep the key-frame a proper distance from the barrel. D, the bell action. E, the bells. F, an index directing to place the tunes.

Fig. 2. A, plate on the barrel. B, notch-plate on the key-frame.

Fig. 3. Side-view of the bell action.

ORGANFORD, a village near Poole, in Dorsetshire, remarkable for the prodigious quantity of pennyroyal, here called *organ*, produced in the neighbourhood.

ORGAS, a town of Spain, in New Cadix, with a castle, 15 miles S. of Toledo. Long. 3. 22. W. Lat. 39. 36. N.

ORGELET, a town of France, in the department of Jura, seated at the source of the Valouse, 30 miles N. by E. of Bourg. Long. 5. 39. E. Lat. 46. 36. N.

ORGIVA, a town of Spain, in the province of Granada, 25 miles S. of Granada. Long. 3. 50. W. Lat. 36. 43. N.

ORIA, a decayed town of Naples, in Terra d'Otranto, with a citadel, and a bishop's see; seated at the foot of the Apennines, 40 miles N.W. of Otranto. Long. 17. 48. E. Lat. 40. 39. N.

ORIO, a town of Spain, in Guipuzcoa, at the mouth of 11 E.

the Orio, eight miles S.W. of St. Sebastian. Long. 2. 19. W. Lat. 43. 23. N.

ORISSA, a province of the peninsula of Hindoostan, bounded on the N. by Bahar and Bengal, on the W. by Berar, on the S. by Golconda, and on the E. by the bay of Bengal. The district of Midnapour, in this province, is subject to the English East-India Company; but all the rest belongs to the Berar Maharatas.

ORKENED, a town of Sweden, in Schonen, 24 miles N. of Christinistadt. Long. 14. 9. E. Lat. 56. 48. N.

ORLAMUND, a town of Upper Saxony, in Thuringia, belonging to the Duke of Saxe Gotha. It is seated on the Sala, opposite the mouth of the Orla, 50 miles S.W. of Leipzig. Long. 11. 24. E. Lat. 50. 53. N.

ORLANDO, a cape on the N. coast of Sicily, 15 miles W. by N. of Patti. Long. 15. 4. E. Lat. 38. 14. N.

ORLEANS, CANAL OF, commences at the river Loire, five miles above Orleans, crosses the forest of Orleans, joins the Loing, near Montargis, and passing by Memours, falls into the Seine. It was finished in 1682, and has 30 locks in its course, which is above 50 miles in extent.

ORLEANS, an island and town of Lower Canada, a little to the E. of Quebec. Long. 69. 50. W. Lat. 47. 0. N.

ORLEANS, New, a city, and the capital, of Louisiana, built during the regency of the Duke of Orleans. In 1788, seven eighths of this city were destroyed by fire. It is seated on the E. side of the Mississippi, 105 miles from its mouth. Long. 89. 53. W. Lat. 30. 2. N.

ORLENGA, a town of Russia, in the government of Irkutsk, situate on the Lena, 132 miles N. of Irkutsk. Long. 105. 40. E. Lat. 56. 0. N.

ORMEA, a town of Italy, in the county of Asti. It was taken by the French in 1794; and is situate on the Tanaro, 10 miles S. of Ceva. Long. 8. 9. E. Lat. 44. 16. N.

ORMYAH, a town of Persia, in the province of Tauris, 120 miles S.W. of Tauris.

ORNANS, a town of France, in the department of Doubs. In its vicinity is a well, which, during the time of the great rains, overflows in such a manner as to inundate the adjacent country; and the fishes which it disgorges are called *umbres*. Ornans is seated on the Louvre, eight miles S.E. of Besançon.

ORNE, a department of France, including the late province of Perche and part of that of Normandy. It takes its name from a river, which falls into the English Channel, eight miles below Caen. The capital is Alençon.

ORNITHORHYNCHUS PARADOXUS, from New South Wales, a singular quadruped, concerning which some anatomical remarks, by Prof. Blumenbach, appear in a periodical work (see Pl. 38): "The most remarkable circumstance in this curious animal," says the author, "is the great similarity of its head with that of a duck, which, however, is still more striking in its internal structure. From the external form of the skull of this animal, one might be more easily led to conclude that it belonged to such an aquatic bird, than to a creature of the mammalia tribe. Both the jaws are as broad and low as in a duck, and the calvaria has, at least in my specimen, no traces of a future, as is generally the case in full-grown birds. There is likewise a singularity in the cavity of the skull (*caverna ancephali*), of which nothing like it is known in any quadruped animal of the mammalia, though there exists something analogous in the clats of birds, viz. a considerable bony falx (*g*), which is situated along the middle of the *os frontis*, and the *ossa pregmatia*. This processus is in general scarcely to be seen in the mammalia, even in those that have a bony

tentorium cerebelli. I know no instance of any animal of that tribe being provided with such a bony falx as the ornithorhynchus [*Ichnebelthier*, as the professor calls it, i. e. *beak animal*, or *beaked animal*], if we except some anomalous formations; as I possess the skull of a woman, in which the tabula vitrea of the *os frontis* has formed a similar bony crista. Amongst the bird tribe, however, in which Willis and others deny the existence of such a crista, I have discovered it in the skull of a cock of the wood (*urogallus*), which surprisingly agrees as well in the situation as in the form with that in the ornithorhynchus. The mandible of this animal is very singular, consisting of a beak, the under part of which has its margin indented as in ducks (*g*), and of the proper instrument for chewing that is situated behind, within the cheeks. This has, at least in my specimen, no teeth, nor even the traces of alveoli, but only two broad processes of a peculiar formation on each side, whose undulated superficies fit one another (*n. o.*). Dr. Shaw says of the specimen he examined, that it had no teeth, "dentium nulla sunt vestigia."—Vide No. 118 of the Naturalist's Miscellany. But Sir Joseph Banks, to whose liberality I am indebted for my specimen, informs me, that Mr. Home has found, in a specimen that belongs to the Society of Natural History at Newcastle, on each side of the jaws, two small and flat molar-teeth. The fore part of this anomalous mandible, or the beak, is covered and bordered with a coriaceous skin, in which three parts are to be distinguished: 1. The proper integument of the beak (*integumentum rostri*). 2. The labiated margins of it (*marginibus labialis*). 3. A curious edge of the skin of the beak (*limbus transversarius*). Into these three parts of that membrane numerous nerves are distributed, of which those in the upper part of the beak arise from the second branch of the fifth pair, viz. in the *limbus transversarius*; that which penetrates through the foramen infraorbitale (*h*), in the margo labialis; that which comes forth behind the *os intermaxillaria* (*i*) and to the *integumentum rostri*, three branches, which run out between the *os intermaxillaria* (*u*). From this quantity of nerves, with which the integument of the beak is provided, no doubt is left of this part being intended as the organ of feeling, a sense which, besides men and the quadrumanes, very few mammalia enjoy, that is to say, few animals possess the faculty of distinguishing the form of external objects and their qualities by organs destined for that purpose; a property that is different from the common feeling, by which every animal is able to perceive the temperature and presence of sensible objects, but without being informed by the touch of them, of their peculiar qualities. Thus, for instance, the skin in the wings of a bat, and its ear, serve probably as organs of common feeling, by means of which they are enabled to flutter, even after being blinded, without flying against any thing. The whiskers (*vibrissæ*) of many animals seem likewise to serve for the purpose of informing them of the presence of sensible bodies, on which account Dr. Darwin compares them with the antennæ of insects; but they are not able to inform themselves of the properties of those objects. It is true that the snout of a mole has been considered by Derham, and the snout and tongue of many other animals likewise by Buffon, as organs of touching; but this seems only to be their secondary use. The fame may be said of the elephant's trunk, which Buffon also conceives to be an organ of touching, although from its manner of living, the necessity of such an organ of touching does not appear. The ornithorhynchus, however, is an animal which, from the similarity of its abode, and the manner of searching for food, agrees much with a duck, on which account it has

been equally provided by nature with an organ for touching, viz. with the integument of the beak, richly endowed with nerves. This instance of analogy in the structure of a singular organ of sense in two species of animals from classes quite different, is highly instructive for comparative physiology, and on this account the ornithorhynchus belongs to one of the most remarkable phenomena in zoology, and may in general be looked upon as one of the most interesting discoveries with which that part of natural history has been enriched during the last century."

ORONSA, a small fertile island of Scotland, one of the Hebrides, seven miles W. of Jura. Here are the ruins of an abbey, with many sepulchral statues, and some curious ancient sculpture.

OROPESA, a town of Spain, in New Castile, 22 miles E. of Placentia, and 50 W. of Toledo. Long. 4. 36. W. Lat. 39. 50. N.

OROPESA, a town of Peru, seated at the foot of the mountains, 150 miles N.E. of Potosi. Long. 63. 30. W. Lat. 18. 0. S.

ORR, a river in Kircudbrightshire, which rises near New Galloway, waters the town of Orr, and enters the Solway Frith.

ORSOVA, a town of Upper Hungary, in the bannat of Temeswar, seated on the N. side of the Danube, almost opposite Belgrade. It is subject to the Turks. Long. 22. 0. E. Lat. 45. 30. N.

ORSOY, a town of Westphalia, in the duchy of Cleves, taken in 1672, by the French, who demolished the fortifications. It is 20 miles S.E. of Cleves. Long. 6. 43. E. Lat. 51. 28. N.

ORTA, a town of Italy, in the patrimony of St. Peter, with a bishop's see. It is seated on the Tiber, 10 miles E. of Witerbo, and 30 N. of Rome. Long. 12. 37. W. Lat. 42. 22. N.

ORTA, a town of Italy, in the Milanese, situate on a lake of the same name, 21 miles N.W. of Novara, and 36 W.N.W. of Milan. Long. 8. 30. E. Lat. 45. 37. N.

ORTA, a town of Naples, in Capitanata, 11 miles N.N.E. of Ascoli.

ORTENBERG, a town in Germany, in the circle of Upper Rhine, and county of Hanau. Munzenberg, situate on the Nidder, 17 miles N.E. of Frankfurt, and 17 S.E. of Gießen. Long. 8. 50. E. Lat. 52. 12. N.

ORTEN URG, a town and citadel of Lower Bavaria, capital of a county of the same name, 10 miles W. of Passau. Long. 13. 25. E. Lat. 48. 20. N.

ORTENBURG, a town of Austria, seated on the S. bank of the Drave, opposite its confluence with the Lifer. Long. 13. 38. E. Lat. 46. 52. N.

ORTHEZ, a town of France, in the department of Lower Pyrenées, seated on the declivity of a hill, on the river Gave de Pau, 17 miles S.W. of Pau. Long. 0. 24. W. Lat. 43. 5. N.

ORTON, a town in Westmoreland, with a market on Wednesday, 12 miles S.W. of Appleby, and 27 N.W. of London. Long. 2. 40. W. Lat. 54. 28. N.

ORTZA, a town of Lithuania, in the palatinate of Witpeik, with a castle, seated on the confluence of the Oresla and Dnieper, 50 miles W. of Smolensko. Long. 31. 5. E. Lat. 54. 45. N.

ORWILL, a river in Suffolk, which runs S.E. by Ipswich, and uniting with the Stour, forms the fine harbour of Harwich. Above Ipswich, it is called the Gipping.

OSACA, a large town of the island of Nippon, in Japan, with a magnificent castle. It has a harbour, and is one of the most commercial places of Japan. The hours of the

night are proclaimed by the sound of different instruments of music. Long. 133. 45. E. Lat. 35. 20. N.

OSCHATZ, a town of Upper Saxony, in the margravate of Meissen, which has some manufactures of cloth. It is 16 miles N.W. of Meissen, and 30 N.W. of Dresden. Long. 13. 24. E. Lat. 51. 24. N.

OSERO, or **OSORO**, an island in the gulf of Venice, belonging to the Venetians, having that of Cherfo to the N. to which it is joined by a bridge. The capital is of the same name, with a bishop's see. Long. 15. 30. E. Lat. 45. 0. N.

OSEY, an island in Blackwater Bay, near Malden, in Essex, it is covered with wild fowl, at certain seasons; and here the coal ships for Malden unload their cargoes.

OSIMO, an ancient town of Italy, in the marquise of Ancona, with a rich bishop's see, and a magnificent episcopal palace. It is seated on the Musone, 10 miles S. of Ancona, and 110 N.E. of Rome. Long. 13. 34. E. Lat. 43. 29.

OSMA, an ancient town of Spain, in Old Castile, with a bishop's see, and an university. It is almost gone to ruin, and is seated on the Douero, 80 miles N. by E. of Madrid. Long. 2. 12. W. Lat. 41. 30. N.

OSORNO, a town of Chili, seated on Rio-Bueno, in a territory where there are mines of gold, 80 miles S. of Baldivia. Long. 73. 20. W. Lat. 40. 58. S.

OSSETIA, the country of the **Ossi**, or **OSSETI**, one of the seven Caucasian nations, between the Black Sea and the Caspian; bounded on the N. by Great Cabarda, on the E. by the Lelguis Tartars, and on the S. and W. by Imeritia. It contains 19 districts, of which one is subject to Imeritia, and the others to Georgia. These districts are of very unequal size; some containing only five, and others 50 villages, each of which comprises from 20 to 100 families. Their language has some analogy with that of the Persian. Their history is entirely unknown. The Circassians and Tartars call them Kutha.

OSSIFICATION (*Enceyl.*). A French surgeon, Citizen Grandchamp, relates two curious instances of preternatural ossification; the first was a bony substance as big as a fist, situated between the bladder and the uterus, and inclosed in a proper sac, formed by the peritonæum. The woman in whose body it was found, had during her life a habitual ischuria, from which the only was relieved by a horizontal situation on the back. This complaint might have been easily mistaken for the stone. The second observation is an uncommon ossification of the gall bladder, found in the body of a woman of sixty-seven years of age. The place at the bladder was occupied by a hard mass as big as the head of a fix or seven months fetus; the ductus cysticus was wanting, and the ductus hepaticus joined the liver immediately with the duodenum; the mass itself cohered to the liver by a small piece of the size of a small coin. On opening it, a glaucy substance was seen, softer in the middle, and harder the more it approached to the periphery, till it gradually became ossified.—*Hufeland's Neueste Annalen.*

OSTAGIO, a town of Italy, in the territory of Genoa, 15 miles N.W. of Genoa. Long. 8. 31. E. Lat. 44. 36. N.

OSTERODE, a town of Lower Saxony, in the principality of Grubenhagen. Here is a manufacture of woollen stuffs, also a magazine for corn, which is delivered out to the miners of the Hartz forest, always at a fixed price. It is 16 miles S.W. of Gollars. Long. 10. 33. E. Lat. 51. 50. N.

OSTERRODE, a town of Prussia, in the province of Oberland, with an ancient castle, situate on the Dribentz, 65 miles S.E. of Dantzic, and 70 S.S.W. of Königsberg.

OSTERWIECK, a town of Lower Saxony, in the principality of Halberstadt. It has several woollen manufactures, and is situate on the Ilse, 13 miles W. of Halberstadt, and 15 N. E. of Goslar. Long. 10. 52. E. Lat. 52. 10. N.

OSTIGLIA, a town of Italy, in the Mantuan, seated on the Po, 15 miles E. of Mantua. Long. 11. 8. E. Lat. 45. 7. N.

OSTINGHAUSEN, a town of Westphalia, situate on the Alst, eight miles W. of Lijfthadt.

OSTROGOTHIA, the eastern part of Gothland, in Sweden.

OSWALD, Sr. a village in Northumberland, on the Ficks' Wall, N. of Hexham, by some called Heavensfield, on account of Oswald's total defeat of Cedwall, a British usurper, who was killed on the first onset. Here Oswald, who was afterward faint, set up the first cross in the kingdom of Northumberland.

OSYTH, Sr. a village in Essex, nine miles S.E. of Colchester. Here are the remains of an ancient monastery, now the seat of the Earl of Rochford.

OTAHU, one of the Society Islands, in the South Pacific Ocean. It lies N. of Ulitea; and is divided from it by a strait, which, in the narrowest part, is not more than two miles broad. This island is smaller and more barren than Ulitea, but has two very good harbours.

OTOQUE, an island of South America, in the bay of Panama. Long. 81. 10. W. Lat. 7. 50. N.

OTTENDORF, a town of Lower Saxony, in the duchy of Saxe Lauenberg, situate on the Mæden, 24 miles N. of Sade. Long. 8. 20. E. Lat. 53. 53. N.

OTTENSHEIM, a town of the archduchy of Austria, on the N. side of the Danube, 5 miles W.N.W. of Linz, and 16 S.W. of Freystatt.

OTTONA, or **ORTONA**, an episcopal town of Naples, in Abruzzo Citeriore, seated on the gulf of Venice, 10 miles N. of Lanciano, and 43 E. of Aquileia. Long. 14. 50. E. Lat. 42. 28. N.

OTTEWILLER, a town of Germany, in the circle of Upper Rhine, and principality of Nassau Saarbruck, with a castle, 40 miles S.E. of Treves.

OUDE, a province of Hindoostan Proper, subject to a nabob, whose dominions lie on both sides of the Ganges, occupying (with the exception of the district of Rampour) all the flat country between that river and the northern mountains, as well as the principal part of that fertile tract lying between the Ganges and Jumna, known by the name of Doab, to within 40 miles of the city of Delhi. Oude and its dependencies are estimated at 360 miles in length from E. to W. and in breadth from 150 to 180. The nabob is in alliance with the British; and a brigade of the Bengal army is constantly stationed on his western frontier; which answers the purpose of covering Oude as well as Bengal, and of keeping the western states in awe; and, in consideration of this, the nabob pays an annual subsidy of 420,000l. His capital is Lucknow.

OUDEH, an ancient city of Hindoostan Proper, in the province of Oude, the remains of which are seated on the Gogra, nearly adjoining Fyzabad. It is said to have been the first imperial city of Hindoostan, and the capital of a great kingdom, 1200 years before the Christian era. It is frequently mentioned in the Mahabaret, a famous Hindoo work in Sanscrit, under the name of Adjudiah. But whatever may have been its former magnificence, no traces of it are left. It is considered as a place of sanctity; and the Hindoos frequently come hither, in pilgrimage, from all parts of India.

OUDENBURG, a town of Austrian Flanders, eight miles S.E. of Ottend, and ten W. of Bruges. Long. 3. 0. E. Lat. 51. 9. N.

OVEN (*Enceps*). By a mistake in the alphabetical arrangement, that article is placed after the article **OVERBAUW**. The ovens used by private families are usually made on a more diminutive scale, of cast or hammered iron, and some are heated by the same fire which serves for the cooking of other provisions.

Among the ovens of this construction, that of Mr. Powers, who obtained for it a patent in 1801, deserves to be noticed. In Pl. 40. it is given to the scale of $\frac{1}{2}$ an inch to the foot, and one foot deep. Fig. 1, represents the oven detached, so constructed as to be used for a laundry, or any other small stove. Fig. 2, represents the oven and hot closet complete. Fig. 3, is the inside view of fig. 2. A, the hot closet, which is gradually heated to any degree, by means of the large valve, in the chimney G. F, is the splitter, so called because it divides equally the heat of the fire, and throws it up the flues a, a, and heats both the oven and hot closet. In case the splitter should retain too great a heat for the oven B; b is a valve, for the reception of air, which may be regulated at option. H, is the small valve (fig. 8), made round, and fixed about two inches from the front of the oven, with holes in the sides, to secure it from the foot falling into the oven; the use of this valve is in case any noxious scent may arise from baking; a current of air passes through the ventilator C, and carries the scent into an open chamber I. The large valve is about twelve inches from the extremity of the oven. K, is the scraper, a piece of iron, carried over the hot closet, which, when pulled out by the two handles d, d, scrapes the foot which adheres to the top, and carries it down the flues into an open chamber L, and is swept out of the doors E, E, by a brush. C, the furnace, which is about eight inches square at bottom, and regularly passed up the sides, front and back. e, e, f, f, are baking fins. D, the cinder-hole. Fig. 4, is a baker's oven, similar in construction to the former one; but with these exceptions, it is four feet long, two deep, and two and a half high, with three ovens, two of which are regulated by ventilators at bottom. LL, is an open chamber, to prevent too great or sudden heat from the splitter. Fig. 6, the ventilator, which is turned by the handle f to enable g to admit or secure any quantity of air. Fig. 7, the large valve, which is placed in the chimney G, and acts as a damper, to graduate the heat to the hot closet; it is made with sheet-iron, like the oven, the size of the oven-pipe, turned by a strong thick wire handle in its centre. Fig. 8, is on the same construction, except being closed at the top, and holes in the sides already specified, and rendered, when down, air-tight by two pieces of iron on each side, i, i. The splitter is formed of sheet-iron, as in fig. 5.

In the year 1800, the Society for the Encouragement of Arts, &c. conferred a bounty of fifteen guineas on Mr. S. Holmes, for his invention of an oven, which is heated without flues. The whole consists of a cast-iron oven, from the side of which a solid piece of that metal projects into the fire, where it constantly remains; and, on becoming red hot, communicates to the whole oven a degree of heat sufficient for baking bread, while it at the same time assists the fire in roasting meat.

In the common iron ovens, the heat is communicated by means of flues, which waste a considerable part of the fire in its passage, and likewise require much labour to keep them of an uniform heat. The contrivance last alluded to, is intended to supply this and other inconveniences; and Mr. Holmes states, that his oven uniformly remains at a baking heat, without any additional expence, or trouble. We understand, however, that such improvement is by no means new; and that a similar method of saving fuel has for several years been practised in the west of England.

Cottage-Oven, a cheap and simple oven of a square form, made of sheet iron, and fixed in brick work; with a closed fire-place beneath, calculated to confine the heat and consume the smallest possible quantity of fuel.

Although we have thought it incumbent on us to give a place in this work to the different inventions of ingenious men, yet we have in general cautiously avoided giving any opinion on their merits. Justice to the public, however, requires that we should caution those who will not take the trouble of *examining for themselves*, at least to rely on the assurances of philosophical, disinterested, and impartial men, who have made *laborious experiments* purely for their benefit, rather than on the boastings of advertising shopkeepers; many of whose ovens and fire-places are certainly constructed on *false principles*.

Count Rumford, in the first part of his tenth essay, has recommended small iron ovens for cottagers, and nests of small ovens for the kitchens of families. "Of these," he says, in the second part, "I have had occasion to know first, that several persons have adopted them. I have likewise been made acquainted with the results of many of the trials that have been made of them, and with the complaints that have been brought against them. 'As I am more than ever of opinion that iron ovens will always be found useful when they are properly constructed and properly managed, I shall in this place add a few observations to what I have already published concerning them.

"And in the first place I must observe, that a small iron oven stands in need of a good door; that is to say, of a door well contrived for confining heat; and the smaller the oven is, so much the more necessary is it that the door should be good.

"The door must not only fit against the mouth of the oven with accuracy, but it must be composed of materials through which heat does not easily make its way.

"An oven door constructed of a single sheet of plate iron, will not answer, however accurately it may be made to fit the oven, for the heat will find its way through it, and it will be carried off by the cold air of the atmosphere, which comes into contact with the outside of it. The bottom of the oven may be made hot by the fire under it; but the top and sides of it cannot be properly heated, while there is a continual and great loss of heat through its door. But an oven, to perform well, must be very equally heated in every part of it.

"If the flame and smoke of the fire be made to surround an oven on every side, and if the fire be properly managed, there can be no difficulty in heating an iron oven equally, and of keeping it at an equal temperature, provided the loss of heat by and through the door be prevented.

"If the door be constructed of sheet iron, it must either be made double, or it must be covered on the outside with a panel of wood. By a double door, I do not here mean two doors, but one door constructed of two sheets or plates of iron, placed parallel to and at a certain distance from each other; and so constructed, that the air which is between the two plates may be shut up and confined. The two plates or sheets of iron, of which the double door of an oven is made, must not touch each other, except at their edges (where they must join, in order to their being fastened together); for, were they to lie one flat upon the other, the heat would pass too rapidly through them, notwithstanding there being two of them; but it is not necessary that they should be further asunder than an inch, or an inch and a half. One of the plates may be quite flat, and the other a little convex. The end of the oven must be made quite flat, or level, so as to be perfectly closed by a flat surface

placed against it. The door is that flat surface; and the greatest care must be taken that it apply with accuracy, or touch the end of the oven in every part, when it is pressed against it; for if any opening be left, especially if it be near the top of the oven, the hot air in the oven will not fail to make its escape out of it.

"It never should be attempted to make the door of an oven or of a closed fire-place fit, by causing it to shut into a rabbet. That is a very bad method; for besides the difficulty of executing the work with any kind of accuracy, the expansion of the metal with heat is very apt to derange the machinery, when the door is so constructed.

"From what has been said of the necessity of causing the door of an oven to fit with accuracy, it is evident that care must be used to place its hinges properly; and I have found, by experience, that such a door is closed more accurately by two turn-buckles, placed at a proper distance from each other, than by a single latch. I beg pardon for repeating what has already been said elsewhere."

The Count adds the following directions as to the management of the fire in heating an iron oven. "If," says he, "a certain degree of attention is always necessary in the management of fire, there is certainly nothing on which we can bestow our care that repays us so amply; and with regard to the trouble of managing a fire in a closed fire-place, it is really too inconsiderable to deserve being mentioned.

"Whenever a fire is made under an iron oven, in a closed fire-place, constructed on good principles, there is always a very strong draft or pressure of air into the fire-place; and this circumstance, which is unavoidable, renders it necessary to keep the fire-place door constantly closed, and to leave but a small opening for the passage of the air through the ash-pit register. The fire-place too should be made very small, and particularly the bottom of it, or the grate on which the fuel burns.

"If any of these precautions are neglected, the consequences will be—the rapid consumption of the fuel—the sudden heating and burning of the bottom of the oven—and the sudden cooling of the oven as soon as the fire-place ceases to be filled with burning fuel.

"It is a fact which ought never to be forgotten, that, of the air that forces its way into a closed fire-place, that part only which comes into actual contact with the burning fuel, and is decomposed by it in the process of combustion, contributes any thing to the heat generated; and that all the rest of the air that finds its way into and through a fire-place, is a thief, that steals heat, and flies away with it up the chimney.

"The draft occasioned by a fire in a closed fire-place being into the chimney and not into the fire, cold air is as much disposed to rush in over the fire, as through it, and it violently forces its way into the hot fire-place by every aperture, even after all the fuel is consumed, carrying the heat away with it up the chimney and into the atmosphere. It even makes its way between the bars of the grate whenever they are not quite covered with burning fuel: hence it appears how necessary it is to make the grate of a closed fire-place small, and to give to that part of the fire-place which is destined for holding the fuel, the form of an inverted truncated cone or pyramid, or else to make it very deep in proportion to its length and width.

"But the prevention of the air from finding its way through the fire-place without coming into contact with the burning fuel, is not the only advantage that is derived from constructing closed fire-places in the manner here recommended; it serves also to increase the intensity of the heat

in that part of the fire-place which contains the fuel, which tends very powerfully to render the combustion of the fuel complete, and consequently to augment the quantity of heat generated in that process.

"To prevent the bottom of the oven (or boiler) from being too much affected by this intense heat, nothing more is necessary than to make the fire-place sufficiently small, and to place it at a sufficient distance below the bottom of the oven. It will be indispensably necessary however with such a (small) fire-place, situated far below the bottom of an oven, to keep the fire-place door well closed, otherwise so much cold air will rush in over the fire, that it will be quite impossible to make the oven hot.

"I have found by recent experiments, that a fire-place in the form of an oblong square or prism, six inches wide, nine inches long, and six inches deep, is sufficient to heat an iron oven eighteen inches wide, twenty-four inches long, and from twelve to fifteen inches in height; and that the grate of this fire-place should be placed about twelve inches below the bottom of the oven. More effectually to prevent the fire from operating with too much violence upon any one part of the bottom of the oven, the brick-work may be so sloped outwards and upwards on every side from the top of the burning fuel to the extreme parts of the sides and ends of the bottom of the oven, that the whole of the bottom of the oven may be exposed to the direct rays from the fire.

"In some cases I have suffered the flame to pass freely up both sides of the oven to the top of it, and then caused it to descend by the end of the oven to the level of its bottom, or rather below it, and from thence to pass off by an horizontal canal into the chimney; and in other cases I have caused it to pass backwards and forwards in horizontal canals by the sides of the oven, before I permitted it to go off into the chimney. Either of these methods will do very well, provided the smoke be made to descend after it has left the top of the oven, till it reaches below the level of the bottom of it, before it is permitted to pass off into the chimney; and provided the canal by which the smoke passes off be furnished with a damper.

"In setting an oven, provision should be made, by leaving holes, to be stopped up with stoppers, for occasionally cleaning out all the canals in which the smoke is made to circulate; and in order that these canals may not too often be choked up with soot, they should never be made less than two inches wide, even where they are very deep or broad; and where they are not more than four or five inches deep, they should be from three to four inches wide, otherwise they will be very often choked up with soot.

"To clean out the flues of an oven, roaster, or large fixed boiler, a strong cylindrical brush may be used, which may have a flexible handle made of three or more iron wires, about one eighth or one hundredth of an inch in diameter, twisted together.

"Holes closed with fit stoppers must of course be left in the brick-work for occasionally cleaning out these flues.

"If the iron door of an oven be made double, the outside of it may with safety be japanned black or white, which will prevent its rusting, and add much to the cleanliness and neatness of the appearance of the kitchen.

"To save expence, small ovens for poor families may be closed with flat stones, or with tiles; and the fire-place door for such an oven, and its ash-pit register, may be made of common bricks placed edgewise, and made to slide against those openings.

"There is a circumstance respecting the iron ovens I am describing, which is both curious and important. The fire-

place for an oven of the smallest size should be nearly as capacious as one which is destined for heating a much larger oven; and I have found by repeated experiments, that a nest of four small ovens, set together, and heated by the same fire, will require but very little more fuel to heat them than would be necessary to heat one of them, were it set alone. An attentive consideration of the manner in which the heat is applied—of the smallness of the quantity, in all cases, that is applied to the heating of the contents of the oven—and the much greater quantity that is expended in heating the fire place and the flues, will enable us to account for this curious fact, in a manner that is perfectly philosophical and satisfactory.

"A *collage-oven*, eleven inches wide, ten inches high, and sixteen inches long, will require a fire-place five inches wide, five inches high, and seven inches long; and for four of these ovens, set together in a nest, the fire-place need not be more than six inches wide, six inches high, and eight inches long.

"I have in my house at Brompton, two iron ovens, each eighteen inches wide, fourteen inches high, and twenty-four inches long, set one over the other, and heated by the same fire; and their fire-place is only six inches wide, six inches high, and nine inches long.

"If the fire-place of an iron oven be properly constructed, and if the fire be properly managed, it is almost incredible *how small a quantity of fuel* will answer for heating the oven, and for keeping it hot. But if the fire-place door be allowed to stand open, and a torrent of cold air be permitted to rush into the fire-place and through the flues, it will be found quite impossible to heat the oven properly, whatever may be the quantity of fuel consumed under it; and neither the baking of bread, nor of pies, nor any other process of cookery, can be performed in it in a suitable manner.

"A very moderate share indeed of ingenuity is required in the proper management of a fire in a closed fire-place, and very little attention; and as it requires no bodily exertion, but saves labour, and expence, and anxiety; and as moreover it is an interesting and amusing occupation, attended by no disgusting circumstance, and productive of none but pleasing, agreeable, and useful consequences; we may, I think, venture to hope, that those prejudices which prevent the introduction of these improvements, will in time be removed."

Count Rumford next shews that ovens may be used in boiling and stewing, and also in warming rooms, it being necessary, in the latter case, merely to leave the door of the oven open.

Roasting-Oven, an invaluable contrivance of Count Rumford's, calculated *either for roasting or baking* in private families.

"Roasters on this simple construction (without blow-pipes—see *ROASTER*), which," says Count Rumford, "I shall call *roasting-ovens*, were at first made with flat bottoms, but of late they have been made cylindrical; and as I think the cylindrical form much the best in many respects, I shall give a description of one of them.

"In Pl. 40. fig. 1, represents a front view of a cylindrical roasting-oven with its door shut. The front end of the large cylinder, which constitutes the body of this oven, instead of being turned over a stout wire, is turned outwards, and riveted to a flat piece of thick sheet iron, which in this figure is distinguished by vertical lines, and which I shall call the front of the oven.

"The door of the oven is distinguished by horizontal lines. The general form of the front of the oven is circu-

lar; but it has two projections on opposite sides of it, to one of which the hinges of the door, and to the other the turnbuckles for fastening it when it is closed, are fastened. There is another projection above, which serves as a frame to the door-way, through which a brush is occasionally introduced for the purpose of cleaning the flues. On one side of this projection there is a small hole, which is distinguished by the letter *a*, through which the handle of projecting axis of the circular register of the vent-tube (which is not seen) passes.

"In the body of the oven, at the distance of half its semi-diameter below its centre or axis, there is an horizontal shelf, which is fixed in its place, not by resting on ledges, or by being rivetted to the sides of the oven, but by its hither end being turned down, and firmly rivetted to the vertical plate of iron, which I have called the front of the oven. This shelf, which should be made double to prevent the heat from passing through it from below, must not reach quite to the farther end of the oven; there must be an opening left, about one inch in width, between the end of it and the further end of the oven, through which opening the air heated below the shelf will make its way upwards into the upper part of the oven.

"From what has been said, it will be evident that the hollow space below the shelf we have just been describing, which I shall call the air-chamber, is intended to serve in lieu of the blow-pipes of a roaster; and this office it will perform tolerably well, provided means are used for admitting cold air into it, from without, occasionally. This is done by means of a register, which is situated at the lower part of the vertical front of the roaster, a little below the bottom of the door. This register is distinctly represented in figure 2.

"Fig. 2, which represents a vertical section of the oven through its axis, shews the (double) door of the roaster shut, and the two dripping-pans, one within the other, standing on the shelf we have just been describing, and a piece of meat above them, which is supposed to be laying on a gridiron placed in the second dripping-pan; The register of the air-chamber, below the shelf, which supplies the place of the blow-pipes, is represented as being open; and a part of the steam-tube is shewn, through which the steam and vapour are driven out of the oven, by the blast of hot air from the air-chamber.

"The cylinder which constitutes the body of the oven, is two feet long, and is supposed to be of cast-iron. It is cast with a flanch, which projects outwards about one inch at the opening of the cylinder, by means of which flanch it is attached, by rivets, to the front of the oven, which, as I have already observed, must be made of strong sheet-iron, which may be near one eighth of an inch in thickness.

"As the shelf is not attached to the sides of the oven, but to its front, the body of the oven need not be perforated, except in one place, namely, where the steam goes off; and as the bottom, or further end of the cylinder, and the flanch at its hither end, and the cylinder itself, are all cast at the same time, and as the form of the oven is such as will deliver well from the mould, it appears to me that the article might be afforded at a low price, especially in this country, where the art of casting in iron is carried to so high a pitch of perfection.

"The shelf might easily be made of cast-iron, as might also the dripping-pans and the double door of the oven; and I should not be surprised if English workmen should succeed in making even the front of the oven, and the register of the air-chamber, and every other part of the machinery, of that cheap and most useful metal.

"If the shelf be made of cast-iron, to save the trouble of rivetting in making it double, it may be covered by an inverted shallow pan of cast-iron, and in the bottom of this pan, which will be uppermost when it is inverted, there may be cast two shallow grooves, both in the direction of the length of the pan, and consequently parallel to each other, in which grooves (which may be situated about an inch from the sides of the inverted pan) two parallel projections at a proper distance from each other, cast at the bottom of the lower dripping-pan, may pass. These projections passing freely in the grooves which receive them, will serve to keep the dripping-pan steady in its proper direction when it is pulled into or drawn out of the oven.

"To increase the effect of the air-chamber when this oven is used for roasting meat, a certain quantity of iron wire in loose coils, or of iron turnings, may be put into the air-chamber.

"The door of the oven, which is very distinctly represented in the figure 2, should be about nineteen inches in diameter, if the oven is eighteen inches in diameter within, or in the clear. In this figure the internal edge or corner of the hither end of the body of the oven is indicated by a dotted circle, and the position of the shelf is pointed out by an horizontal dotted line.

"In fastening the vertical plate, which forms the front of the oven, to the projecting flanch at the hither end of the cylindrical body of the oven, care must be taken to beat down the heads of the rivetting nails in front, otherwise they will prevent the door of the oven from closing it with that nicety which is requisite.

"In siting this roasting-oven, the whole of the thick-nets of the vertical front of it should be made to project forward before the brick-work. The fire-place doors, ash-pit, register-door, damper in the chimney, &c. should be similar in all respects to those used for roasters; and the flues should likewise be constructed in the same manner.

"I have been the more particular in the description of this roasting-oven, because I think it bids fair to become a most useful implement of cookery. As an oven it certainly has one advantage over all ovens constructed on the common principles, which must give it a decided superiority; by means of the air-chamber and the steam-tube it may be kept clear of all ill-scented and noxious fumes, without the admission of cold air."

Count Rumford thus speaks of the difference between a roasting oven and a roaster; (see ROASTER).

"From the account of the roasting-oven that has just been given," says he, "it might be imagined that it possesses all the properties of the roaster, and in the same degree; but this is not the case. The essential difference between them is this; the blow-pipes of the roaster being surrounded by the flame on all sides, they are heated above as well as below, and the air in passing through them is much more exposed to the heat than it is in passing through the air-chamber of the roasting-oven. The particles of air which happen to come into contact with the bottom of the oven will of course be heated; but if, in consequence of their acquired lightness on being heated, they rise upwards to the top of the air-chamber, they will there come in contact with the bottom of the shelf, which, instead of communicating more heat to them, will deprive them of a part of that which they bring with them from below; but circumstances are very different in the blow-pipes of a roaster; in them, the particles of air acquire continually additional heat from every part of the surface with which they come into contact in their passage through the tube.

"From this view of the subject, we see how very essential

it is that the shell of a roasting-oven should be so composed or constructed, that heat may not readily find its way through it; and we see likewise how necessary it is to manage the registers of blow-pipes and of air-chambers with proper care."

We earnestly recommend these and all other inventions which Count Rumford has announced to the public after the most decisive experiments to ascertain their properties: and we add this important caution—*not to devote a title from the instruction given in his admirable essay, as to their form, or the manner of their being placed, which the workmen employed are continually proposing, and often obstinately bent upon.*

OVERFLACKEE, an island of the United Provinces, in Holland, between the mouths of the Maese. Meliland is the principal town.

OVERSEER, a person of authority who superintends those who are employed as labourers in any art or manufacture. The term however is used in other senses, according to the nature of the superintendence.

OVERSEERS OF THE POOR, are persons employed to carry the poor laws into effect in the different parishes wherein they are appointed. Their duties are remarkably well pointed out in the following charge to overseers of the hundred of Stoke, in the county of Bucks, by Thomas Bernard, esq. published in the Reports of the Society for bettering the Condition of the Poor. Addressing the party himself, he says,

"The office, to which you are this day appointed, is of no small importance; inasmuch as the welfare of a considerable part of our fellow-subjects depends upon the due execution of it. It is your duty, fir, to be the Guardian and Protector of the Poor;—and, as such, to provide employment for those who can work, and relief and support for those who cannot; to place the young in a way of obtaining an honest livelihood by their industry, and to enable the aged to close their labours and their life in peace and comfort.

"In the execution of this office, it is your duty to consider how you may best improve the situation of the poor in your parish, so as to lessen the calls for parochial relief, and thereby to diminish your parish rate.—In this respect, much may be done by pecuniary aid and encouragement to parishioners with large families; much, by means of regular employment for children, either at home or in schools of industry; so as to fit them to be placed out in service at an early age;—and much, by a judicious management of your poor-house, if you have one, and by making a proper distinction and separation between the honest and industrious, who are driven thither by age, infirmity, or misfortune, and the idle and profligate, whose loose and vicious habits of life have made them a burden and a disgrace to their parish.

"You are, fir, within the space of 14 days, to receive the books of assessments and of accounts from your predecessors, together with such money and materials as shall be in their hands; and, if any balance is due to them, you are to pay it out of the first monies that come to your hands.

"In conjunction with the church-wardens of your parish, you are, by a parish rate, to raise money, to purchase a sufficient stock of materials for setting the poor to work, and to supply competent sums for the relief of the lame, impotent, old, blind, and such among you as are poor and unable to work, and for putting out poor children apprentices.

"In making the poor's rate, it is necessary that a majority of the church-wardens and overseers should co-operate; and it is your duty, to make an equal and impartial rate, without favour or affection, upon every occupier of lands, houses, tithes, mines, and saleable underwoods in your parish.

When such rate is made, it is to be approved and signed by two justices, dwelling in or near your parish; and, on the Sunday after, to be published in your parish church.

"In case the rates, so made, shall not be regularly paid, you may obtain a summons for the person making default to appear before two neighbouring justices; who may, by warrant, authorize such rates to be raised by distress in your parish; or, if sufficient goods of such person making default be not found in your parish, then, upon application to one justice, to be levied in any other county, or district, where the defaulter may have property.

"With regard to the poor's rate, we know that there are instances, in some parts of England, where it has been levied upon the poor; we mean, by the poor, those who have not the advantage of any profession, trade, property, or income, nor other means of support, except their daily labour; and who have only a cottage, a little garden, and a few articles of furniture, merely such as are necessary for them and their families; and we think it our duty to observe, that, to charge such poor persons to the rate at all, appears to us to be directly contrary to the authority, under which the rate is made; viz. the statute of Elizabeth, which was passed soon after the dissolution of the monasteries, and entitled 'An Act for the Relief of the Poor,' an act, in which, if cottages had been intended to have been included, they would have been expressly named, as well as houses; from which they were then considered as totally different, and distinguishable in point of law.

"It is impossible to read that statute, without perceiving that it was never intended to compel the poor, who are frugal and industrious, to support those who are not so; but that there is, throughout, a distinction made between the class of men, not having income or property, who are to be entitled to relief under it, and those who from the income of their property, profession, trade, or occupation, are to contribute to that relief;—that by the poor are intended the labouring cottagers; who, if out of employment, are, under that act, to have work found them;—if lame, impotent, old, or blind, and unable to work, are to receive pecuniary or other relief;—who, if habitations are wanting, are to have them erected at the charge of the parish;—and whose children, if unemployed, are to be set to work, and, at a fit age, to be placed out apprentices in service, or to a trade.

"But, whatever may be the opinion as to the law, there can be no doubt in point of prudence, that while the day labourer, who has children, is exerting himself to maintain his family without parochial aid, it is a dangerous experiment to attempt to make him contribute to the support of your other poor, with the probable, or even a possible, consequence of driving a large family on the parish.

"There is, however, one class of labouring men, who have still a superior claim to exemption from parish rates;—the Members of Friendly Societies, who are acquiring for themselves, out of the savings of their own industry, an eligible and honourable provision, independent of the poor laws. As these societies, particularly where they enjoy the advantage of having their rules framed and confirmed according to law, have the effect of greatly reducing the poor's rate, it is required of you, as an act, not merely of justice, but of prudence, not to endeavour, in any case, to compel such labouring men, being members of friendly societies established according to law, to contribute to the support of the other poor of their own parish.

"In applying the rate for the relief of the poor, we request that you will attend to the permanent improvement of their condition, rather than to the little expedient or economy of the moment.—If a poor man's family is visited by sickness

Count Rumford's Roasting-Oven.

or calamity, it is better for your parish that he should receive a timely supply of medical and other necessary assistance at home, and be re-established in the power of maintaining himself and his family by his labour, than that they should be neglected, until it becomes necessary to move them into the poorhouse, where they may probably remain, a burthen to the parish, for many years.—If the poor of your parish want employment, there is more economy in supplying them with instruction, encouragement, spinning-wheels, wool, and other means of earning a livelihood, than in leaving them to be oppressed by poverty, and by that languid and desponding indolence, which is often rather the misfortune than the vice of the poor; with the consequence of being obliged to maintain the family afterwards, at ten times the expence that would have been incurred at first, by a timely supply of relief to themselves. Upon this head, we have one earnest request to make; that whatever is made by their labour, they may have the whole produce of it, without any deduction, on any pretence whatever.—The earnings of the poor should be sacred and inviolate, in order to encourage them to work, and to exempt the character of their employers from the imputation of interested motives.

“Upon the authority of the case of the King and North Shields (20 Geo. III.) we have, where parents have applied for support for their infant children under seven years of age, ordered them relief at home, without removing the parents or children into the parish workhouse; adopting the humane and judicious sentiments, which Mr. Justice Buller delivered on that occasion;—that it would be injurious to parishes, if, “when one of a numerous family wants relief, the whole must go to the parish workhouse;” and that it would be very unjust “that the parish should be entitled to the labour of a whole family, because one of them might want relief.”—Any difficulties, however, that did exist on this subject, have been removed by the act (36 Geo. III. cap. 23.) which enables magistrates to make special orders for the relief of industrious poor persons at home.

“It is your duty, sir, to see that there are proper habitations for the poor of your parish; and if, by the decay of cottages, or by the increase of population, more habitations are wanted for them, you are, with the leave of the lord of the manor, to erect cottages for them at the parish expence, on the waste or common, within your parish.

“After every thing is done for the encouragement and protection of the deserving poor, there remains another class, which it will be necessary to reform by punishment; I mean those drones of society, idle and disorderly persons, whom the law has described, as vagrants, rogues, and vagabonds. It is due to the honest exertions of the industrious cottager, that, while he receives aid and encouragement, they should not escape correction; that every distinction should be made between him and those who wander about, endeavouring to subsist, without labour, on the industry of others; of whom many have deserted their families, and almost all have quitted the place, or situation, where their services might have been useful, and where they ought to have been employed. —In bringing these to punishment, with a view to amendment, it will be prudent for you to apply for directions to this bench, where you have found regular attendance and assistance from the magistrates for the space of nine years; and it will be merciful to select the objects, as that the punishment of few may have its effect in the reform of many.

“As in your conduct towards the poor out of the workhouse, so, in respect of those within its walls, there should be a marked distinction between the industrious and the idle, and between the orderly and the profligate. There is nothing in the internal regulation of this country, more subversive of its credit, or more inimical to its prosperity, than the

uniform and unvaried treatment, which the best and the worst of our fellow-subjects receive in a parish workhouse. In that place it is of the utmost importance, not merely to the poor persons who are driven thither by the tempest of fortune, but to the very well-being of the country itself, that there should be a decisive boundary—a line of separation—drawn between the industrious and honest poor, who are suffering under a calamity from which neither you nor we can presume to be exempt, and those vicious and abandoned characters, which are the pests of society, and the objects of punishment.

“In administering relief, we enquire into the industry and character of the person who applies. We have found no small benefit in adhering strictly to this rule; and we confidently recommend to you, as an encouragement to the energy and good habits of the poor, not to give to the idle the same encouragement, as is due to the honest and industrious labourer, suffering under sickness or misfortune. If it appears that the person who applies has exerted himself honourably and diligently in his situation, it is your duty sir, and it is the interest of your parish, that he be relieved, kindly, and liberally.

“There is an act of parliament, which enables you, if you are so disposed, to farm your workhouse.—It is possible, that a farmed workhouse, confided to a deserving person, like absolute power in the best and most virtuous hands, may be the instrument of good; but there is no instance whatever, in which the duty and interest of the person intrusted are so completely in opposition to each other, as in that of the farmer of a parish workhouse. For, while his duty should direct him to improve the state of the workhouse, it is his interest to keep it in such a condition, as to deter any competitor from offering for it, at the end of the year. The necessary consequence of this is the increase of parochial expences; and we find, from the different returns throughout the kingdom, that, where workhouses have been farmed, though there was some saving at first, yet in a few years the expences thereby have been greatly increased, and the poor-rate accumulated to an alarming amount. Where, indeed, a principal land-owner, or land occupier, of a parish can be induced to contract for the parish workhouse, he has an interest in the permanent improvement of its condition, and in the diminution of the distresses of the poor; but where a vagrant speculating contractor visits your parish, with a view of making his incidental profit by farming your workhouse, we trust you will consider the Christian principle of doing as you would be done by; and that you will not confide the poor, whose Guardian and Protector it is your duty to be, to one, into whose hands you would not trust an acre of your land, or any portion of your own property.

“With regard to your *workhouse*, we have another observation to make, and that respects your parish children.—As you regard your own interest and their welfare, we entreat you to educate them out of the workhouse. You can do it with as little, and even less, expence to the parish; with much less annoyance to the old people in the workhouse, who are too often the sport of those little, unthinking, and uneducated creatures;—and with much more benefit to the children, who get earlier and more advantageous situations in service, and succeed better in life, proceeding from a parochial school or cottage, than from a workhouse.

“With regard to the removal of labourers belonging to other parishes, consider thoroughly what you may lose, and what the individual may suffer, by the removal, before you apply to us on the subject. Where you have had, for a long time, the benefit of their labour, and where all they want is a little temporary relief, reflect whether, after so many years spent in your service, this is the moment and the cause for

removing them from the scene of their daily labour to a distant parish. There are cases, in which removals from one parish to another are proper and justifiable; but, in every instance, before you apply for an order of removal, consider whether it is prudent; and, if prudent, whether it is just.

"Within four days after the appointment of your successors, you are to produce your accounts before two of the neighbourhood justices for examination; and, within fourteen days after such appointment, you are to deliver your books, materials for work, and balance of cash, to the persons appointed to succeed you.—If you shall have executed your office duly and conscientiously, you will then quit it, with the blessings of the poor, the esteem and respect of the other classes of society, and with the approbation of your own conscience."

We earnestly recommend this charge to the notice of all Overseers of the poor, as well as to those who have the means of impressing these *most sacred duties* on their minds.

OVERYSCHÉ, a town of Austrian Brabant, seated on the Ysèbe, six miles N.E. of Brussels, and 9 S.W. of Louvain. Long. 4. 30. E. Lat. 50. 53. N.

OUGEIN, a town of Hindoostan Proper, in the province of Malwa, capital of one of the Western Mahratta chiefs. It is a place of great antiquity, 452 miles S.W. of Poona. Long. 75. 56. E. Lat. 23. 26. N.

OUZLZ, a town of Piedmont, 12 miles W. of Suza. Long. 6. 46. E. Lat. 45. 20. N.

OUNDLE, a town in Northamptonshire, with a market on Saturday; seated on the Nen, over which are two bridges, 26 miles N.E. of Northampton, and 83 N. by W. of London. Long. 0. 42. W. Lat. 52. 26. N.

OUREM, a town of Portugal, in Estremadura, with a castle, on a mountain between the rivers *Leira* and *Tomar*. Long. 7. 40. W. Lat. 39. 34. N.

OURIQUE, a town of Portugal, in Alentejo, remarkable for a victory obtained by Alphonso, king of Portugal, over five Moorish kings, in 1139. The heads of these five kings are the arms of Portugal. It is 32 miles S.E. of Lisbon. Long. 8. 49. W. Lat. 38. 26. N.

OUSSORE, a town of the peninsula of Hindoostan, in the Mysoor country, taken by the English in July, 1792. It is 19 miles S.E. of Bangalore, and 69 E.N.E. of Seringapatam. Long. 77. 47. E. Lat. 12. 50. N.

OUTERIO, a town and fortress of Portugal, in Trallos-Montes, nine miles S.E. of Braganza, and 21 N.W. of Miranda do Douro. Long. 6. 37. W. Lat. 41. 55. N.

OWERRA, or **OWEIRO**, a town and territory of Guinea, in the kingdom of Benin. The air is unwholesome, and the soil dry and lean; but there are several kinds of fruits, such as bananas and cocoa nuts. Long. 6. 0. E. Lat. 6. 0. N.

OX, a general appellation for male black-cattle; but which strictly denotes a castrated bull.

Having already treated, under different heads, of the best mode of feeding and fattening oxen; and shewn their superiority over horses, under *HUSBANDRY*, we shall confine our observations, in the present article, to the most advantageous way of harnessing and managing them, as beasts of burthen, or draught.

The principle of draught depends, as Lord Somerville has justly observed, on the joint power of the neck and base of the horn. This object is effected in Portugal, by a long leather strap, which is wrapped round the yoke; thence round the lower part of the horns; and is again fastened to the yoke. Thus, the heads of oxen become more steady in performing their work, and the animals themselves are rendered more tractable.

Another mode of working oxen, is that termed, by the

head, which is practised in France, and represented in Pl. 38. fig. 1.

To afford a more complete idea of the manner in which the French oxen are fastened to the bow, we have added an accurate front view of the upper part of the animals' heads; as such method, in the opinion of Lord Somerville, is the best preparatory step towards introducing that practised in Portugal. See fig. 2.

This method was a few years since introduced into Ireland, by Lord Shannon, with complete success; two oxen thus harnessed, being able to draw with great ease three tons in weight.

The most valuable breeds of these animals for draught, in this country, are those of Suffex, Devon, Herefordshire, Glamorgan, and Pembrokehire; which, on account of their large size, are well calculated for labour, and justly preferred, in those counties, to cart-horses. The Suffex oxen have benten horses at plough, in the deepest clays; and those of Herefordshire are reputed to be superior in long journeys, for conveying chalk, or similar heavy materials, over a hilly and stony country. Although some prejudiced persons may object that oxen are unfit for draught in mountainous situations, yet let it be remembered, as Mr. Comber pertinently remarks, see his "*Real Improvements in Agriculture*," &c. (8vo. 1772, 1s. 6d.) that in such instances, "no draught can be well used;" and that the descending of steep hills is in all respects as hurtful to horses as to oxen.—The Devonshire cattle walk with uncommon speed; and, if four or five horses can till 100 acres of land, the same work might doubtless be managed equally well by a similar number of the Devonshire or Herefordshire breeds, if they were trained and fed (particularly with a view to speed) with the same care as horses: the farmer would also save a considerable part of the expence in their food. For though, after being very hardly worked, they require a little corn, yet their keep, in all other respects, is much cheaper; and, if well food, they will perform every kind of draught in the same manner as horses: lastly, they will pay for their labour; and, after being moderately worked, for 10 or 12 years, if properly managed, they will leave all the profit of their growth, in clear gain, to their owners. Besides, should an ox, from any unforeseen accident, be lamed, or become blind or old, he may be fattened, and sold at any time for a larger price than he originally cost; because these animals uniformly feed in a more kindly manner, and sooner grow fat, after they have been worked for several years.—On the contrary, the value of a horse decreases, after he attains the age of seven years; and, should any accident happen, he becomes utterly useless.

Oxen, then, being of extensive and permanent utility, deservedly claim every attention from the humane and unbiassed husbandman, particularly with respect to shoeing; as they will thus be enabled to walk and draw, both with greater speed, and with superior effect, when carefully shod. This operation is usually performed by casting them on their backs, when the farrier proceeds to affix the shoes, in a manner similar to that practised on horses. By such attempts, however, they are liable to numerous accidents; for the prevention of which, an ingenious machine has been contrived, in order to secure the animal by means of short posts. On these, the fore or hinder legs are fastened according to circumstances; and thus the shoes are applied, so that it is almost impossible to injure the helpless creature. The curious reader will find two neat engravings of this useful contrivance, in the 26th vol. of *Annals of Agriculture*.

OZWICZIN, a town of Little Poland, 34 miles W. of Cracow. Long. 19. 10. E. Lat. 50. 10. N.

P.

PACEM, a town in the N. part of Sumatra, in the East Indies. Long. 97. 15. E. Lat. 5. 0. N.

PACHUCA, a town of Mexico, famous for its silver mines. Gemelli says, that in the space of six leagues there are not less than a thousand. One of them, called Trinity, is supposed as rich as any in Mexico, there having been taken from it in ten years' time only, above forty millions of silver. It is 45 miles N.N.E. of Mexico. Long. 100. 4. W. Lat. 20. 32. N.

PACY, an ancient town of France, in the department of Eure, seated on the Eure, eight miles S. by E. of Vernon. Long. 1. 41. E. Lat. 48. 58. N.

PADANG, a sea-port on the W. coast of Sumatra, in the East Indies, in the possession of the Dutch. In 1797, it was almost totally destroyed by an earthquake, and upward of 300 lives were lost. Long. 99. 46. E. Lat. 0. 50. S.

PADRON, a town of Spain, in Galicia, seated on the Ulla, 12 miles S. of Compostella. Long. 8. 17. W. Lat. 43. 40. N.

PADSTOW, a sea-port in Cornwall, with a market on Saturday. It has some trade to Ireland, and is seated at the mouth of the Camel, on the Bristol Channel, 30 miles W. of Launceston, and 243 W. by S. of London. Long. 4. 45. W. Lat. 50. 42. N.

PADULA, a town of Naples, in Principato Citereio, 14 miles N. of Policastro. Long. 15. 41. E. Lat. 40. 29. N.

PAEFENHOFFEN, a town of France, in the department of Lower Rhine, seated on the declivity of a mountain, near the river Motter, eight miles W. of Haguenau. Long. 7. 38. E. Lat. 48. 48. N.

PAGLIANO, a town of Naples, in Abruzzo Ulteriore, 15 miles E.S.E. of Aquila. Long. 13. 46. E. Lat. 42. 28. N.

PAINBOEUF, a sea-port of France, in the department of Lower Loire, at the mouth of the Loire. Hence all the ships belonging to Nantes take their departure, and here they anchor on their arrival. It is 20 miles W. of Nantes. Long. 1. 33. W. Lat. 47. 15. N.

PAINSWICK, a town in Gloucestershire, with a market on Tuesday. It has a manufacture of white cloths for the army, and for the India and Turkey trade; and hence is brought a stone, remarkable for its beauty and neatness, for the pavement of floors. Painswick is situate so high, as every way to command extensive views over a vale of vast richness and variety, of the windings of the Severn, Malvern Hills, and parts of the counties of Salop, Hereford, and Monmouth. It is seven miles S.E. of Gloucester, and 101 W. by N. of London. Long. 2. 11. W. Lat. 51. 46. N.

PAINT (*Encycl.*). The preparations employed in painting houses, being principally white-lead, the vapour of which, whether taken into the stomach or lungs, or absorbed by the skin from the surrounding atmosphere, is the most subtle of our domestic poisons, and the grinding of which is also extremely detrimental to health, we shall state the following process, lately invented by M. de Vaux. Should this prove an effectual substitute for the pernicious paint prepared from the oxide of lead, it will be of inestimable service to society. He directs two Paris pints of sweet skimmed-milk (two quarts

English measure), six ounces (6½ ounces English averdupois) of fresh flaked lime, four ounces of nut, caraway, or linseed oil, and three pounds of whiteing, to be used in the composition. The lime must first be introduced into a stone vessel, to which should be added such a proportion of milk as will produce a mixture resembling thin cream. Next, the oil is to be gradually poured in; the whole being gently stirred, and the remainder of the milk added. The whiteing must next be crumbled in, or scattered on the surface of the fluid, which it gradually imbibes, and at length sinks; when the whole should be briskly agitated.

M. de Vaux observes, that the milk ought not to be four; because, in such case, it would form, with the lime, a calcareous acetite, which strongly attracts moisture. Either of the oils above mentioned may be used; but, if white paint be required, that of caraways is preferable, as it is perfectly transparent.—In order to obtain a distemper or size-colour, the paint thus prepared may be tinged with levigated charcoal, yellow-ochre, &c. for painting with which, the most common oils may be used.

The quantity here preferred is, further, stated to be sufficient for the first coat of six toises, or from twenty-four to twenty-seven square English yards: it may be applied in the usual manner; and costs in Paris the sum of nine sols, or 4½d. sterling.

Another and perhaps better substitute for white-lead paint, and one which the public safety demands that we should resort to, is that prepared with the oxide of zinc, for which a patent has been obtained, and which is almost equally cheap, and no less beautiful and durable.

PAISHAWUR, a city of Hindoostan Proper, capital of a district in the country of Cabul. It is situate on the Kameh, 125 miles S.E. of Cabul, and 170 N. of Moultan. Long. 70. 36. E. Lat. 33. 18. N.

PALACIOS, a town of Spain, in Andalusia, 12 miles S. of Seville. Long. 5. 24. W. Lat. 37. 20. N.

PALAIS, a town of France, capital of the island of Belleisle, off the coast of Bretagne. It has a strong citadel, which stood a long siege against the English, in 1761, and then surrendered on honourable terms. Long. 3. 2. W. Lat. 47. 18. N.

PALAIS, St. a town and district of France, in the department of Lower Pyrenées, which, with the town and district of St. John Pied-de-Port, forms nearly the whole of the late province of Lower Navarre. This is only a very moderate portion of the kingdom of Navarre, wrested, in 1512, from John d'Albert, by Ferdinand king of Aragon and Castile. This portion, separated from Upper Navarre by the Pyrenées, made part of the kingdom of France, having been annexed to it by Henry IV. who held it in right of his mother, Jeanne d'Albert. St. Palais is seated on the Bidouze, 15 miles S.E. of Bayonne. Long. 1. 4. W. Lat. 43. 21. N. See NAVARRE.

PALAMCOTTA, or **TINEVELLY**, a town of Hindoostan, in the Carnatic, 410 miles S.W. of Madras. Long. 77. 54. E. Lat. 8. 43. N.

PALAMOS, a strong sea-port of Spain, in Catalonia, seated on the Mediterranean, 47 miles N.E. of Barcelona. Long. 2. 58. E. Lat. 41. 58. N.

PALAMOW, a town of Hindoostan Proper, in the province of Bahar, 210 miles S.S.W. of Patna. Long. 84. 10. E. Lat. 23. 40. N.

PALANKA, a town of Upper Hungary, seated on the Ibola, 37 miles N. of Buda. Long. 18. 23. E. Lat. 48. 9. N.

PALAZZO, a town of Piedmont, in the county of Canavese, five miles E. of Ivrea.

PALAZZUOLO, a town of Sicily, in Val di Noto, 80 miles S. of Messina. Long. 15. 5. E. Lat. 37. 3. N.

PALAZZUOLO, a town of Italy, in the Bresciano, seated on the Oglio, 30 miles N.E. of Milan. Long. 9. 56. E. Lat. 45. 40. N.

PALENO, a town of Naples, in Abruzzo Citeriore, nine miles E. of Solmona.

PALENZUELA, a town of Spain, in Old Castile, 25 miles S.W. of Burgos. Long. 3. 15. W. Lat. 42. 5. N.

PALEIRNO, a town of Naples, in Calabria Citeriore, six miles S.S.W. of Cosenza.

PALICANDCHERRY, a town of the peninsula of Hindoostan, in the country of Calicut, 20 miles S.W. of Coimbatore, and 66 S.E. of Calicut.

PALIMBAM, the capital of a kingdom of the same name, in the island of Sumatra, seated on the E. coast, 120 miles N.E. of Bencoolen, and subject to the Dutch. Long. 103. 31. E. Lat. 3. 30. S.

PALLISER'S ISLANDS, a group of islands, in the South Pacific Ocean. Long. 146. 30. W. Lat. 15. 30. S.

PALMA, a town of Portugal, in Alentejo, seated on the river Cadoan, 20 miles E. of St. Ubes. Long. 8. 40. W. Lat. 38. 37. N.

PALMA, a town of New Granada, 50 miles N.W. of St. Ede-Bogota. Long. 73. 40. W. Lat. 4. 30. N.

PALMARIA, a small island in the Mediterranean, about 15 leagues from the coast of Naples, and three miles W. of the island of Ponza. Long. 12. 45. E. Lat. 40. 58. N.

PALMARIA, a small island in the Mediterranean, near the coast of Genoa, at the entrance of the gulf of Spezzia, seven miles S. of Spezzia. Long. 9. 46. E. Lat. 44. 1. N.

PALMAS, the capital of the island of Canaria. See CANARY.

PALMAS, one of the Philippine Islands, 16 leagues S.E. of Mindanao. Long. 127. 0. E. Lat. 5. 33. N.

PALMAS, CAPE, a promontory of Africa, on the Ivory Coast of Guinea. Long. 5. 34. W. Lat. 4. 26. N.

PALMELA, a town of Portugal, in Efremaadura, with a castle on a rock, seated on the Gadaon, 19 miles S.E. of Lisbon. Long. 8. 56. W. Lat. 38. 29. N.

PALNAUD, a district of the peninsula of Hindoostan, belonging to the Carnatic, but situate toward the river Kistna, to the W. of the Guntoor Circar.

PALOS, a town of Spain, in Andalusia, with a pretty good harbour; remarkable for being the place whence Christopher Columbus sailed on his first adventurous voyage in 1492. It is seated at the mouth of the Rio Tinto, 46 miles S.W. of Seville. Long. 6. 39. W. Lat. 37. 14. N.

PALOS, CAPE, a promontory of Spain, in Murcia, to the S. of a town of the same name, 20 miles E. of Carthagena. Long. 6. 39. W. Lat. 37. 37. N.

PALOTA, a town of Lower Hungary, in the county of Alba Regalis, taken from the Turks in 1687. It is 40 miles S.W. of Buda. Long. 18. 0. E. Lat. 47. 0. N.

PALOTZA, a town of Hungary, situate on the Poprat, 54 miles N. of Caffovia, and 112 N.N.W. of Zatmar. Long. 21. 20. E. Lat. 47. 42. N.

PALTE, a famous lake of Thibet, lying to the S. of Lissa, about three days' journey, and 12 miles S. of the river Sappo or Burrampooter. It is 250 miles in circumference; and in

the middle of it is one large island. On the W. shore of this island, or congeries of islands, is a monastery, and the seat of the Lamiffa Turcepamo, or the Great Regenerate, in whom the Thibetians think that a divine spirit is regenerated, as it is in the Great Lama. The word *Lama* signifies a priest, and *Lamiffa* is the feminine of Lama.

PAMBERS, a town of France, in the department of Arriège, with a bishop's see. It is not so considerable as formerly, nor peopled in proportion to its extent. Near it is a mineral spring, said to cure the gout and obstructions. Pambers is seated on the Arriège, eight miles N. of Foix, and 30 S. of Toulouse. Long. 1. 32. E. Lat. 43. 8. N.

PAMLICO SOUND, a kind of inland sea, of North Carolina, 100 miles long, and from 10 to 20 broad. It is separated, in its whole length, from the Atlantic, by a beach of sand, hardly a mile wide, generally covered by small trees or bushes. It has several inlets; but that of Ocrecock is the only one that will admit vessels of burthen. This inlet is in long. 76. 20. W. Lat. 35. 10. N.

PAMPELONNE, a town of France, in the department of Tarn, 15 miles N. by E. of Alby. Long. 2. 17. E. Lat. 44. 10. N.

PANCERAS, St. a village in Middlesex, a little to the N.W. of London. It has a church dedicated to St. Pancras; and the church-yard is remarkable for being the principal place of interment for the Roman-catholics. At a public-house near the church is a medicinal spring. Here is the Veterinary College, established in 1791, for the improvement of horsemanship, and the treatment of cattle in general.

PANGA, a town of the kingdom of Congo, capital of the province of Bamba. Long. 142. 29. E. Lat. 6. 30. S.

PANJAB, a country of Hindoostan Proper, being that watered by the five greatest branches of the Indus. It was the scene of Alexander's last campaign, and the termination of his conquests. It forms a square of 250 miles, and includes the whole of Lahore, and a great part of Moultan Proper. To the lower part of Moultan it is flat and marshy, and inundated by the periodical rains which fall between May and October.

PANNANACH WELLS, a village in Aberdeenshire, situate a little below the waterfall, called the Lin of Dee, in the valley of Glenmuick. It is noted for its mineral waters; and has a lodge for the accommodation of the company that frequent this place in summer.

PANNIPUT, a town of Hindoostan Proper, situate in an extensive plain between the cities of Delhi and Sirhind. This plain is celebrated for a battle, in 1761, between an army of 200,000 Marhattas, and Abdallah, sultan of Candahar, at the head of 150,000 Mahometans, in which the former were totally defeated. Panniput is 72 miles N.W. of Delhi. Long. 76. 45. E. Lat. 29. 15. N.

PANOMI, a town of Turkey in Europe, in Macedonia, 16 miles S. of Salonichi. Long. 23. 10. E. Lat. 40. 25. N.

PANORMO, a town of Turkey in Europe, in Albania, situate on a gulf of the Adriatic, opposite the island of Corfu, 45 miles S.S.E. of Valona. Long. 20. 2. E. Lat. 40. 0. N.

PANTALARIA, an island in the Mediterranean, between Sicily and the coast of Tunis, 17 miles in circumference. It abounds in cotton, fruits, and wine, and is subject to the king of Naples. Long. 12. 31. E. Lat. 36. 55. N.

PANTFKA, a town of Turkey in Asia, in Natolia, on the N.E. coast of the sea of Marmora, 12 miles S.E. of Constantinople.

PAOOM, one of the New Hebrides, in the South Pacific Ocean, to the S. of Malicollo. Long. 168. 28. W. Lat. 16. 30. S.

PAPER (*Engel.*). Amongst the great variety of vegetable

Substances convertible into paper, barley-straw is, perhaps, the most abundant and profitable material which might, in this respect, serve as a substitute. Dr. Schaeffer, a German physician, whose inventions have not always been acknowledged, obtained a yellowish paper of this straw, after soaking it in boiling water, then steeping it in lime-water, and adding the 20th part of linen-rags.

For manufacturing straw into paper, his majesty's patent, as well as enact of the legislature, have recently been obtained; but the ingenious editor of the *Domestic Encyclopedia* asserts, on the authority of a paper-maker near London, that the processes described were well known previously to both grants, and that he actually procured specimens of paper manufactured of raw vegetable materials, in this country, in 1790. If so, it follows, that the patentee is not entitled to the sole exercise or monopoly of this manufacture, but any paper-maker in the United Kingdom, has a right to make use of the discovery.

In a later volume of the *Annales de Chimie*, we meet with some useful hints, relative to the manner of re-manufacturing the paper of old books (or even new ones of a certain description), or any letters, or other paper already used for writing or printing; by M. M. de Yeux, Pelletier, Molard, and Verhagen.

1. *Process for re-fabricating Printed Paper*:—All paper of the same quality should be collected, and separated from such as may have any writing on the pages; the edges of those leaves which may have become yellow, and also the backs of books, being cut off by the instrument used by book-binders.—One hundred weight of paper is now to be put, sheet by sheet, into vats, sufficiently capacious to contain it, together with 500 quarts of hot water; but which ought to be filled about one-third:—the whole is next stirred by two men for the space of one hour, who are gradually to add as much water as will rise about three inches above the paper; after which it is left to macerate four or five hours; the agitation being occasionally repeated, so as to separate, and at length to form the paper into a kind of paste.

The water is now drawn off by means of pipes, and the pulp conveyed to the mill, where it is to be coarsely ground for one hour; at the expiration of which, it is boiled in a cauldron for a similar space, with a sufficient quantity of water to rise four or five inches above it. A short time before the mixture begins to boil, thirteen quarts of caustic ley of pot-ash are to be added to every cwt. of paper. The ley alluded to, is prepared by dissolving 100 lbs. of pot-ash in 300 quarts of boiling water, to which are to be added 20 lbs. of pulverised quicklime; and the whole must be briskly agitated, till it become of an uniform consistence, when it is suffered to stand for 12 hours; at the end of this time it must be drawn off, and 75 quarts of boiling water added to the sediment, which being stirred for half an hour, and suffered to stand till it become clear, is to be mixed with the liquor first decanted.

When the paste has boiled in this ley for one hour, the fire is to be extinguished, and the matter suffered to macerate for 12 hours; after which it must be taken out, drained, put into bags, and submitted to the action of a strong press for a similar length of time, to deprive it of all moisture; and, if it appear white, so that the printers' ink be properly extracted, it may be re-manufactured in the usual manner.

2. *Process for the re-fabrication of Written Paper*:—The paper must be sorted; the yellow edges cut off; and the whole thrown, leaf by leaf, into a tub half-full of boiling water, where it is to be agitated as before directed. After it has macerated four hours, the water should be drawn off; a fresh quantity of boiling water added; and the mixture stirred for

half an hour; at the expiration of which the paper is again left to dissolve for three hours.

The fluid is now drawn off, and 260 quarts of cold water poured on each cwt. of paper; which being perfectly mixed, 6 lbs. of oil of vitriol are to be gradually added; and the whole strongly agitated for a considerable time, that the paper may thoroughly imbibe the liquor.

This composition is next suffered to macerate for twelve hours, the agitation being occasionally repeated; when the tub is to be filled up with cold water; and the mixture again stirred, to wash the paper, which will now be reduced to a perfect paste. Lastly, after drawing off the water, the pulp must be put into bags, pressed, and ground in a mill; after which it is conveyed to the vat, and worked in the manner practised with linen rags.

In the year 1801, a patent was granted to Mr. Koops, for extracting ink from printed paper, and restoring it to its original state.—His process varies little from that above described; the paper being agitated in hot water, to extract the size, and reduce it into a pulp: next, the adhesion of the ink is to be removed by a caustic alkali prepared of lime and pot-ash, the quantities of which should be proportioned to those of the paper. After discharging the ink, he directs the pulp to be bleached by means of the oxygenated marine acid, in the proportion of 10 or 12 gallons to 140 lbs. of the material; and, when sufficiently whitened, it is re-manufactured in the usual manner.—According to the patentee's account, writing paper does not require so large a proportion, if any, of the caustic alkali; but is bleached by confining it in a wooden box, rendered air-tight, into which the acid gas is thrown directly from the retort wherein it was produced.

In the last volume of the *Repository of Arts*, p. 200, is described the method of *bleaching the pulp* used in manufacturing writing paper, by Citizen Loyel.

PAROUI, St. a town of France, in the department of Ande, seated on the Lembe, eight miles E. of Castlenaudary, and 35 S.E. of Toulouse. Long. 2. 10. E. Lat. 43. 21. N.

PARA, a fort of Brazil, seated near the mouth of the river Amazon, and to the E. of the eastern branch of it. Long. 50. 0. W. Lat. 2. 0. S.

PARACELS, a vast multitude of small islands and rocks, in the China Sea. They form a long cluster, lying N. and S. for near 400 miles, off the coast of Cochin China.

PARADELLA, a town of Portugal, in Beira, 12 miles S.E. of Lamego. Long. 7. 23. W. Lat. 41. 4. N.

PARAGO, or PALAWAN, a large island in the Indian Ocean, between the Philippines and Borneo, which has a king, tributary to Borneo. The Spaniards have a fort here.

PARAGUA, the most westerly of the Philippine Islands, about 180 miles in length and 20 in breadth. Long. 117. 44. E. Lat. 10. 0. N.

PARAMARIBO, the capital of Surinam, in Guiana, and the chief place of the Dutch colonies in South America. It has a small but strong citadel; and a noble road for shipping, where there are seldom less than 80 vessels loading coffee, sugar, cotton, and indigo. The streets are straight, and lined with orange, shaddock, tamarind, and lemon trees, in continual bloom. It surrendered to the English in August, 1799. It is situate on the E. side of the river Surinam, 16 miles from its mouth. Long. 55. 25. W. Lat. 5. 48. N.

PARAIBA, a town of Brazil, on a river of the same name. The Dutch got possession of it, in 1635, and fortified it with a slight rampart; but the Portuguese retook it soon after. The soil is pretty fertile, and produces sugar-canes, and a great number of trees of Brazil wood. Long. 49. 53. W. Lat. 6.

50. S.

PARAMOUSIC, one of the Kurile Islands, lying S. of that of Shoonika. See KURILES.

PARANA, a province of Paraguay, so named from a large river, which uniting with the Paraguay, and afterward with the Uruguay, forms the Rio de la Plata.

PARCHIM, a town of Lower Saxony, in the duchy of Mecklenburg, seated on a small river which falls into the Elbe. It is 20 miles S.E. of Schwerin. Long. 12. o. E. Lat. 51. 34. N.

PARCHWITZ, a town of Silesia, in the principality of Lignitz, with a considerable manufacture of cloth. It is 12 miles W. of Wohlau, and 10 N.E. of Lignitz. Long. 16. 42. E. Lat. 51. 17. N.

PARDOBITZ, a fortified town of Bohemia, in the circle of Chrudim, with a manufacture of knives and sword-blades. It is five miles N. of Chrudim, and 55 E. of Prague. Long. 15. 45. E. Lat. 49. 55. N.

PAEIRA BRAVA (*Encycl.*). Erroneously spelt **PAEIRA BRAVA**.

PARELLA, a town of Piedmont, in the county of Canavez, four miles S.S.W. of Ivrea, and 20 N. of Turin.

PARILLA, or **ST. PARILLA**, a town of Peru, in the audience of Lima, seated at the mouth of the river Santa, 50 miles S.E. of Truxillo, and 230 N.W. of Lima. Long. 77. 50. W. Lat. 8. 36. S.

PARISH-DINNER, a recent mode of supplying the poor with wholesome and cheap food under the superintendence of the parish. Such institutions may be adapted to circumstances in every town and village; as will be seen in the following account of a parish dinner for *poor children*, at Epping, published by Thomas Bernard, esq. in the Reports of the Society for bettering the Condition of the Poor.

At Epping, in the county of Essex, where there is a school of industry for the employment of children, an ordinary was, on the recommendation of Mr. Conyers, opened in October last; and a general dinner has been provided on week days, for any children of that place whose parents desire it, on the following terms:

The price of the ordinary is six pence a-week for each child; they dine at table in a regular manner at one o'clock, in a room which adjoins to, but is unconnected with, the rooms of the workhouse; and which, during the rest of the day, has been used as a spinning school. Grace is regularly and decently said before and after dinner; and a voluntary expression of thanks and obligation to the mistress, for the good dinner she has provided them, generally precedes their quitting the room. Their table of diet is, on Mondays, Wednesdays, and Fridays, baked rice pudding; on Tuesday and Saturday beef stew and soup; and on Thursday pease soup. They are allowed to eat as much as they please; and their healthy countenances and decent behaviour evidence the plenty and comfort of their meal. The same dinner is also given, in another room, to the parish children and the other persons in the poor-house. The number of those who partook of it, in the week, from the 12th to the 17th of the preceding month of February, was 77; the expence of that week's dinner for the materials merely and their bread (but without reckoning for dressing and attendance) being 1*l.* 2*s.* 1*d.* which is less than a penny a-head each day.

A particular account of this dinner may be useful; as it will prove that what is provided for them is good in quality, and sufficient in quantity; and as it will serve to explain to others, how they may, with some attention and very little expence, contribute greatly to the comfort, the health, and the good habits of the children in their own neighbourhoods. The following is an account of the week's fare of 77 persons, from Monday the 12th to Saturday the 17th of

February, 1798, both days inclusive, with the expence of each article.

MONDAY. Baked rice pudding.	s. d.
20 lb. and a half of rice	2 6½
3 lb. of suet	1 6
6 gallons of milk	1 3
Salt and allspice	2½
	5 6

N. B. The rice is soaked in the milk the night before baking, and produces with the other materials about 80 lb. weight of pudding.

TUESDAY. Beef stew and soup.	s. d.
Ox's cheek	1 6
2 quarts of Scotch barley	4½
3 quarts of pease	10½
1 quart of oatmeal	2½
1 peck of potatoes	3
Pepper, salt, and allspice	6½
	3 8½

WEDNESDAY. Baked rice pudding, as on Monday	s. d.
	5 6

THURSDAY. Pease soup.	s. d.
4 lb. of pork	1 8
6 quarts of pease	1 8½
2 quarts of oatmeal	4½
Pepper, salt, and allspice	6½
	4 3½

FRIDAY. Baked rice pudding, as before	s. d.
	5 6

SATURDAY. Beef stew and soup.	s. d.
5 lb. and a half of beef	2 3½
2 quarts of pease	7½
2 quarts of Scotch barley	4½
Pepper, salt, and allspice	6½
	3 9½

Onions, mint, and carrots, for the week	1 0
A quarter of a pound of bread allowed on each of the three soup days, being 58 lb. a-week	4 10

Six days' dinners for 77 persons	1 14 1½
----------------------------------	---------

The children are generally those whose behaviour is approved, and who are paid for by the week; but any others, in cleanly and decent order, are allowed to dine at the same rate, when there is room. In case of sickness, they may send for their dinners home.—The common labourers find they can maintain their children in this manner much better, and a great deal cheaper, than in the usual way of leaving them to consume at home a great deal of white bread, with very little comfort; for example, a labourer who has four children finds that, by appropriating 2*s.* a-week out of his earnings, all his four children have a plentiful, regular, and decent meal, six days in the week; with twice the benefit to them, that they could have possibly derived from 2*s.* worth of white bread, eaten in the usual solitary, uncivilised, and comfortable manner.

The situation of Epping, a large market-town, with a surrounding forest, the scene and object of petty thefts, and a public road through it, was not very favourable to the industry and regular habits of the poor; nor was their usual dinner, of a hunch of bread, part to be swallowed with a little water as they went along (the other part being most frequently thrown away) conducive either to their health, or to habits of economy. It is therefore a most pleasing circumstance to state, that, within one month after this dinner had been regularly pro-

vided at Epping, the appearance and manners of the poor children there were totally altered. Their fallow countenances had acquired a healthy complexion and tone, from the daily and regular supply of a plentiful meal; and their manners, by the habits of an orderly table regularly served and attended, were improved and meliorated. To those, who had been confined by illness, this dinner has proved of particular service; as it has afforded them the means of re-establishment in a state of convalescence; a period when the poor are subject to great disadvantages, and are frequently a long time recovering their health and strength, because they are not provided with regular and nourishing food.—“Four months have now passed,” says Mr. Bernard, “since the children at Epping have been thus assembled once a-day, at a decent and civilized table. I have attended it to-day, and with very great satisfaction have beheld the decency, the cheerfulness, and the general neatness of all the members of this little society; and, being able to add my own testimony to the information I have received, I can say, that such effects appear to have been already produced on the health and good order of these little children, as must be extremely gratifying to every one, who interests himself in the welfare of his fellow-creatures.

“One consequence of this establishment has been, that several labourers, who have large families, and are industrious and deserving, have found themselves exonerated of a great part of the maintenance of their children by their richer neighbours; who each take some of these little ones, in their turn, under protection, and subscribe for them to the public dinner. This contributes to increase that mutual good-will and connection, which ought to subsist between the rich and the poor; and makes the one mindful of his duty, and the other satisfied with his condition.

“The benefits of this establishment are many and various. It converts benevolence to better purposes, and into better channels than those through which it commonly flows; it brings the children of the poor into notice, teaching them regular habits, and the desire of profiting by their own industry; and it not only supplies the persons in the workhouse, but several poor families that are out of it, with sufficient food, comfortably, and at a very cheap rate. Where a labourer requires relief out of the house, the overseer, if he see cause, directs messes of the parish dinner, proportionate to the family, to be sent to his house; and from fifteen to twenty indigent families are supplied in this manner with a good meal at home every day. This affords much more effectual relief, and at less expence to the parish, than the little pittance of money which is usually given, and which they have not means to make an advantageous use of.” See PAROCHIAL, *Supp.*

PARISH-MILL. See MILL, *Supp.*

PARKGATE, a village in Cheshire, 12 miles N.W. of Chester. It is situate on the N.E. coast of the river Dee, and hence packet-boats frequently sail to Ireland.

PARKSTEIN, a town of Bavaria, in the principality of Saltzbach, 16 miles N. of Naburg. Long. 12. 14. E. Lat. 59. 40. N.

PARNASSUS, now called PARNASSO, a mountain of Livadia. It has two heads, one of which was famous for being consecrated to Apollo and the Muses, and the other to Bacchus. It is the highest in Greece, and from the top is a prospect as far as Corinth. Here also is a fine fountain, supposed to be the ancient Castalia. It is eight miles N. of Livadia.

PAROCHIAL, any thing belonging to a parish. (See PARISH.) The mode of affording parochial relief to the necessitous is a most important branch of civil polity, since the commission of errors in distributing the sums raised for the relief of the poor, have the most fatal effects on public in-

dustry. The following account of the mode of parochial relief at Wendover, by the Rev. Joseph Smith, deserves particular attention.

In that place and its neighbourhood, the calculation of the relief of the poor has been made on the presumed and supposed earnings of the labourer, and not on the actual amount of what he does actually acquire by industry and exertion. The object was to render the overseer's duty as easy as circumstances would admit, and to make the labourers contented under the pressure of the times, by giving them the power of exerting every act of superior industry to their own advantage. The sum of nine shillings per week was adopted as an *average of earnings*; to be increased out of the poor's-rate to reach a sum, as would purchase every week, for the cottager, his wife, and every child under 10 years of age, a half-peck loaf each. “If they can earn more,” says Mr. Smith, “we do not enquire the amount; but leave it to them, as an encouragement of industry. If they are indolent, and earn less, it is their own loss; as is the case of those who throw themselves on the parish for work, and are allowed only eight shillings a-week.

“No allowance is, in general, made for children above 10 years of age; they having a regular supply of work, and being deemed capable of earning their own maintenance. Single women and widows unincumbered with any family, are also presumed to be able to earn their own subsistence by lace-making, and therefore are also excluded from the allowance; except in cases of sickness or old age, or where they can shew that they have not the benefit of those means of supply. These, however, are only shades of difference, depending on the peculiar supply of occupation in a country, or upon the particular regulations of a place. Wherever the attention of the parish, or local circumstances, afford a supply of work to women, children, or to any other class of applicants, it would be a dangerous experiment to permit them to confess idleness, and to plead indolence to avail themselves of their means of subsistence; and therefore to allow them to be classed among paupers receiving relief.”

To this account are annexed the following very pertinent observations:

“It is impossible for those who reside at a distance from the metropolis, and act as magistrates in an agricultural country, not to extend their reflections from the present scarcity and temporary pressure, to consequences which may be still more afflictive, and of longer duration; and which, unless removed by exertions beyond the power of mere parochial relief, may be augmented and continued, as a destructive inheritance attached to the landed property;—the consequence of that parochial relief, which, in obedience to the laws, the landed property now affords the labourer, through the medium of the tenantry, to enable him to meet the great advance in the price of every necessary of life.

“In most parishes this has been judiciously calculated to make up with their actual earnings, whatever they might be, a certain allowance for each in family; so that they who have earned least by their own hands, have received most from the parish. A very little consideration will convince any one, that, by such a measure, all spur to industry, and all energy to contend with difficulty, must be entirely destroyed. For, when the habit is acquired of applying to the parish, and the daily earnings of the labourer, without additional resources, are inadequate to the support of his family, no inducement is left for him to exert his best abilities and industry. If the amount is to be the same in all cases, how can it be expected that they will toil, merely to lessen the parish rates? The lamentable fact is, that an indolent habit has been thus superinduced, and labourers do not exert themselves as they did formerly. Their spirit is so broken down by circumstances, that they grow

reconciled to the idea of being paupers, and relying on parish relief, in preference to the more valuable and more honourable exertions of their own industry. The alarming consequence of this is, that the poor's-rates through the country have increased, and are increasing, to a degree that may well excite the fears of all who are interested in the fate of the landed property. The narrow policy of the farmer, operates to augment the evil. The rates, at present, are paid by the occupier: he feels the frequent demand of the overseer, without reflecting upon the increased price which he receives for his commodity at market; and the overseers, in general, being unprovided with other work for the labourers who apply for employment, send them to the farmer. He imagines that he gains some remuneration for his extra rates, by receiving the labourer into his yard from the overseer at an under price; the deficiency being to be made up out of the rates of the parish. But labourers, so employed, never work cheerfully or well. The farmer scarcely ever has more labour performed than he actually pays for; and the money contributed out of the rates is all expended, not only without any return of labour, but with the melancholy consequence of having materially contributed to the extinction of honest industry, and laudable exertion.

"In some parishes in my neighbourhood, the magistrate has been able to introduce a better regulation;—that of affixing an average price of labour, as a standard from which parochial relief shall be calculated; allowing the labourer to employ his extra hours, or extra labour in task-work, for his own exclusive advantage. This, however, is by no means generally adopted; nor, if it were, would it be sufficient to correct the evil of the extinction of that character of independence, which the English labourer did once so pre-eminently possess, and by which the community was so greatly benefited. There is too much reason to fear, that without great exertions from the land-owners to restore the labourer to his former honourable state, either by affixing him with a cow and ground to keep her, or by some other effectual incitement to exertion and industry, they will not remain stationary at their present point of deterioration. Unless they improve, they will become worse. Their inclination to indolence, and to those vices which are connected with it, will increase. Their demands upon their respective parishes will become more urgent: and the poor's-rates will so increase, that tenants will no longer be able to bear the expenses attendant upon the occupation of their farms. The proprietors may then discover, not only the difficulty and disadvantage of occupying their lands themselves, but that, in a parish incumbered with paupers, the land may prove insufficient to the maintenance of the parochial poor."

PARRAMATTA, a town or settlement of English convicts, in New South Wales. It is seated at the head of the harbour of Port Jackson, 11 miles W. of Sydney Cove, between Rose Hill and the landing-place in the creek which forms the head. In 1791, near 1000 acres of land were either in cultivation, or cleared for that purpose; and the soil, in most places, was found to be remarkably good. Long. 151. 39. E. Lat. 35. 50. S.

PARSBURG, a town of Bavaria, in the principality of Neuburg, 18 miles N.W. of Ratibon. Long. 11. 55. E. Lat. 49. 8. N.

PARSCHWITZ, a town of Silesia, in the principality of Lignitz, eight miles N.E. of Lignitz.

PARTHENAY, a town of France, in the department of Two Seves. It carries on a considerable trade in cattle and corn, and is seated on the Thoue, 17 miles S. of Thouars. Long. 0. 19. W. Lat. 46. 44. N.

PARTENIKIRK, a town of Bavaria, 40 miles S.W. of Munich. Long. 11. 0. E. Lat. 47. 36. N.

PARYS, a mountain in the isle of Anglesey, famous for a copper mine, which is not wrought in the common manner of subterraneous mines, but, like a stone quarry, open to day; and the quantity of ore raised is prodigious. The purest part is exported raw to the smelting works at Swansea and other places: the moist impure is first calcined and deprived of most of its sulphur on the spot. Quantities of merely pure copper are obtained from the waters lodged beneath the bed of ore, by the intervention of iron. A lead ore, rich in silver, is also found in this mountain.

PAS, a town of France, in the department of the Straits of Calais, 12 miles S.W. of Arras. Long. 2. 40. E. Lat. 50. 9. N.

PAS DE CALAIS, or **STRAITS OF CALAIS**, a department of France, containing the late provinces of Artois and Boulonnais. Arras is the capital.

PASEWALK, a town of Upper Saxony, in Anterior Pomerania. Near it are some iron-works. It is situate on the Ucker, 21 miles W. of Stettin, and 66 S.S.E. of Stralsund. Long. 13. 57. E. Lat. 53. 27. N.

PASSAROWITZ, a town of Turkey in Europe, in Servia, remarkable for a peace concluded there, in 1718, between Emperor Charles VI. and Achmet III. It is situate near the river Morava, 33 miles E.S.E. of Belgrade, and 44 W. of Orfova. Long. 21. 16. E. Lat. 45. 6. N.

PASSO, a cape of Peru, under the equator, in long. 78. 50. W.

PASSAGE, a sea-port of Spain, in Biscay, between those of Pontarabia and St. Sebastian, and 60 miles E. of Bilbao. Long. 2. 4. W. Lat. 43. 21. N.

PASSARO, a cape on the coast of Ianna, in Greece, between the gulfs of Amiroi and Zeiton.

PASSARVAN, a town of the island of Java, in the East Indies. Long. 114. 15. E. Lat. 7. 0. S.

PASSENHEIM, a town of Prussia, in the province of Oberland, 70 miles S. of Konigsberg. Long. 20. 50. E. Lat. 53. 40. N.

PASSERO, CAPE, anciently called Pachinus, the most southerly point of Sicily. It is a barren island, about a mile round, separated from the rest of Sicily by a strait, half a mile broad. It has a fort, to protect the country from the incursions of the Barbary corsairs, who are often very troublesome on the coast. Off this cape, Sir George Byng, in 1735, defeated a Spanish squadron. Long. 15. 22. E. Lat. 36. 35. N.

PASSIGNIANO, a town of Italy, in the Ecclesiastical State, seated on the lake Perugia, 17 miles N.W. of Perugia. Long. 12. 5. E. Lat. 43. 16. N.

PASTO, or **ST. JUAN DE PASTO**, a town of South America, in Popayan, seated in a fine valley, 120 miles N. by E. of Quito. Long. 76. 55. W. Lat. 1. 50. N.

PASTRANA, or **PATRANA**, a town of Spain, in New Castile, seated between the Tajo and Tajuna, 32 miles E. of Madrid. Long. 2. 46. W. Lat. 40. 26. N.

PATAK, a town of Hungary, with a Protestant college, situate on the Latorca, 25 miles S.S.W. of Caffovia. Long. 21. 35. E. Lat. 46. 35. N.

PATEHUCA, or **PATOCUA**, a town of New Spain, in the audience of Mexico. Near it is a silver mine. It is 70 miles N. of Mexico. Long. 99. 55. W. Lat. 21. 0. N.

PATERNO, a town of Sicily, in Val di Demona, built on the ruins of Hybla, so celebrated for its honey. It is 15 miles W. of Catania. Long. 15. 14. E. Lat. 37. 55. N.

PATHHEAD, a considerable manufacturing village in Fifeshire, a little to the E. of Kirkcaldy.

PATRIA, a town of Naples, in Terra di Livorno, situate near a lake, to which it gives name, 13 miles N.W. of Naples.

PATRIMONY OF ST. PETER, a province of Italy, in the Ecclesiastical State. It is 35 miles long and 30 broad; bounded on the N. by Orvieto, on the E. by Umbria and Sabina, on the S. by Campagnadi Roma, and on the S.W. by the sea. Viterbo is the capital.

PATRINGTON, a town of the E. riding of Yorkshire, with a market on Saturday. Here the Roman road from the Picts' Wall ended. It is seated at the mouth of the Humber, 50 miles S.E. of York, and 191 N. of London. Long. 0. 8. E. Lat. 53. 49. N.

PATTEES, a well-known contrivance, consisting of a sole of wood attached to an iron ring. They are worn by women chiefly, during wet weather, to protect their feet from moisture, and their garments from dirt.

As pattens formed upon the common construction are liable to break, in consequence of which frequent accidents happen, various expedients have been devised by those who manufacture these articles, with a view to prevent such misfortunes. A patent was granted in 1798, to Mr. Jethro Hornblower, of Whitehall, in the county of Cornwall, engineer, for a method of making pattens (to be worn by women); by altering the composition and clumsiness of their shape; preventing them from breaking; and removing the uneasiness they occasion to the feet. A more excellent contrivance, however, has been made public, by a manufacturer at Birmingham, who, by the simple expedient of fixing a spring immediately beneath the hollow of the foot, by which the instep is kept uniformly in contact with the tie or band of the patten, has found means to prevent the clacking noise, and consequent splashing of mud upon the stockings, which usually happen in walking in common pattens.

PATTENSEN, a town of Lower Saxony, in the principality of Calenberg, formerly surrounded with walls, moats, and ramparts. It is six miles S. of Hanover.

PATTI, a town of Sicily, in Val di Demona, with a bishop's see, seated on the gulf of Patti, 28 miles W. of Messina. Long. 15. 22. E. Lat. 38. 11. N.

PATTIARY, a town of Hindooftan Proper, in the country of Oude, 55 miles N.W. of Carogue, and 55 E.N.E. of Agra. Long. 79. 45. E. Lat. 27. 33. N.

PATTUN, or **PUTTAN**, a town of Hindooftan Proper, capital of a Circar of the same name, in the country of Guzerat. It is 48 miles N. of Amedabad, and 132 S.W. of Oudipour. Long. 72. 30. E. Lat. 23. 45. N.

PATUXEN, a river of the United States, which falls into the Chesapeake, 30 miles S. of Annapolis.

PAUL, St. an island in the Indian Ocean.

PAUL, St. a town of France, in the department of the Straits of Calais, 16 miles W.N.W. of Arras. Long. 3. 30. E. Lat. 50. 24. N.

PAUL, St. a town of Brazil, in the province of St. Vincent, surrounded by inaccessible mountains and thick forests. It is a kind of independent republic, composed of the banditti of several nations, who, however, pay tribute to the Portuguese. Long. 45. 52. W. Lat. 23. 25. S.

PAUL-DE-FENOUILLEDES, a town of France, in the department of Gard, seated among mountains, on the river Eglis, 30 miles N. of Montpellier. Long. 3. 58. E. Lat. 44. 7. N.

PAUL-LES-VENTE, St. a town of France, in the department of Var, five miles W. of Nice, and 450 S.E. of Paris. Long. 7. 13. E. Lat. 43. 42. N.

PAUL-TROIS-CHATEAUX, St. an ancient town of France, in the department of Drome, seated on the declivity of a hill, 16 miles S. of Montelimar. Long. 4. 57. E. Lat. 44. 21. N.

VOL. X.

PAULA, a town of Naples, in Calabria Citeriore, seated near the sea, in a fertile and well-cultivated country, 12 miles W. of Cosenza. Long. 16. 9. E. Lat. 39. 24. N.

PAULOGRADE, a town of Russia, in the government of Catharinenski, 32 miles E. of Catharinenski. Long. 35. 54. E. Lat. 47. 10. N.

PAVOASAN, a sea-port of Africa, in the ile of St. Thomas, with a fort, a bishop's see, and a good harbour. It belongs to Portugal, and lies under the equator, in Long. 8. 30. W.

PAUSILIPPO, a mountain of Italy, five miles from Puzzoli, celebrated for a grotto, which is a subterraneous passage, through the mountain, near a mile in length, about 20 feet in breadth, and 34 to 43 in height. People of fashion generally drive through this passage with torches; but the country people find their way, without much difficulty, by the light which enters at the extremities, and at two holes pierced through the mountain, near the middle of the grotto, which admit light from above. On this mountain also is the celebrated tomb of Virgil, overgrown with ivy, and shaded with a bay-tree, shrubs, and bushes.

PAUTZKE, a town of Western Prussia, in Pomerellia, 25 miles N.W. of Dantzic. Long. 18. 41. E. Lat. 54. 44. N.

PAYERNE, a town of Switzerland, in the canton of Bern, 22 miles S.W. of Bern. Long. 6. 55. E. Lat. 46. 38. N.

PAZ, a town of Peru, in the audience of Los Charcos, with a bishop's see; seated at the foot of a mountain, in a valley abounding in wine and fruits, 350 miles S.E. of Cuzco. Long. 68. 50. W. Lat. 17. 0. S.

PAZZY, a town of Turkey in Europe, in Romania, near Gallipoli, with a bishop's see. Long. 26. 59. E. Lat. 40. 33. N.

PEARL-ISLANDS, islands lying in the bay of Panama. The inhabitants of Panama have plantations in them.

PEASANT (*Encycl.*). See the various means of bettering the condition of this useful class of the poor in Britain, under the articles COTTAGER, COTTAGE-GARDENS, INDUSTRY, SOCIETY, &c. in this SUPPLEMENT.

PEAT-BORER, a new-invented augre, calculated for cutting into peat. An account of it is given by T. Eccleston, esq. of Scaresbrick-hall, in Lancashire, in the Transactions of the Society for the Encouragement of Arts, &c.

"The greatest obstacle to the effectual draining of many boggy lands," says Mr. Eccleston, "consists in the earth in the bottoms of the ditches or drains when newly cut, and more especially if made to any considerable depth, rising from the pressure of the waters contained in the bog, by which the new-cut drains and ditches are frequently so nearly filled up, as to impede the flowing of the water they were intended to carry off, and thereby rendering the work comparatively ineffectual.

"There are different layers, or strata, in moss or peat lands, which will not allow the water easily to filtrate through them, and yet are of so soft and spongy a nature as to rise from the pressure of the water contained in the bog.

"It becomes necessary to give a free vent to the above confined water, effectually to drain such lands. This has been most successfully done by the augre, a model of which I have herewith presented to the Society.

"A common augre, or even a pole, will force a passage, and give vent to the water for a short time; but, owing to

the peat being only pressed sideways, and not cut out, the parts soon join again, and the passage of the water, of course, becomes completely obstructed; but by means of this auger, a cylindrical column of peat of six inches diameter will be clearly cut out and taken thence, and a free passage maintained for a very considerable space of time.

"The first experiment made produced a clear auger-hole of the above dimensions, four yards in depth, in one hour; and the water, which had been pent up in the bog, rose above the level of the bottom of the ditch, from four to six inches; and the bottom of the ditch, which was previously very soft, and had begun to swell and rise, in a few days became more firm and solid, and this in so great a degree, that when cleared it remained without swelling or rising in the least. It will considerably reduce the expence of draining such lands, by rendering them so firm as to cause the first end-diams to stand.

"The most proper depth to bore depends on the situation. Where the moss lands lie low, and are in danger of being flooded, no greater depth than what is absolutely necessary for draining the surface should be bored, as by deep boring the land may be sunk so low as to be liable to inundation."

The following are the references to the figure in Pl. 41.—A, the cutter of the borer, which penetrates the peat. B, the body of the borer, six inches in diameter. C, the aperture through which the peat introduced by boring is drawn out. D, a portion of the iron bar of the borer, to the upper part of which a cross handle is to be fixed.

PEATHS, or PEESE, a vast chafin in the mountains of the N.E. part of Berwickshire. It is more than 160 feet deep; and over it is a noble bridge of four arches. From its vast height, it greatly resembles an ancient Roman aqueduct.

PEQUENCOUR, a town of France, in the department of the North, seated on the Scarpe, five miles E. of Bouay. Long. 3. 16. E. Lat. 50. 23. N.

PEDEE, a river of the United States, which rises in North Carolina, and is there called Yaddin River: on entering South Carolina, it takes the name of Pedee, and flows into the Atlantic Ocean, 12 miles below George Town.

PEDENA, an ancient town of Italy, in Venetian Iliria, with a bishop's see, 25 miles S.E. of Capo d'Illiria. Long. 14. 13. E. Lat. 45. 34. N.

PEDEBNEIRA, a sea-port of Portugal, in Esfremadura, 28 miles N.E. of Peniche. Long. 8. 6. W. Lat. 39. 31. N.

PEDIR, a town of Sumatra, in the East Indies, 40 miles E. of Achen. Long. 96. 36. E. Lat. 5. 22. N.

PEDOMETER, (*Encycl.*). The utility of pedometers for the purpose of surveying land being obvious, various instruments of this description have been constructed by ingenious mechanics, in order to facilitate the practice of geometry. Among these, Mr. Edgeworth's late contrivance deserves to be first mentioned, on account of its great simplicity; but, as it is calculated only for level grounds, and is apt to be decaraged by hilly or irregular surfaces, we decline to enter into any detail.

A pedometer, upon a new plan, was a few years since contrived by Mr. W. Frazer, mathematical instrument-maker, of New Bond-street. It is stated to be perfectly correct, and not liable to be out of order. The wheel-work is constructed on the scale of 1000 paces to a mile; and, as it winds itself up, while in motion, being adjusted to pockets of all sizes, it is attended with no trouble to the wearer. It is provided with a compass, by means of which the traveller is enabled to ascertain the different directions which he

takes on his excursion; while he learns the accurate distance which he has walked. Hence it recommends itself to those invalids, who are obliged to take a certain degree of exercise within doors; as they may thus measure the thousandth part of a mile.

Another machine, which deserves more immediate attention, is the pedometer invented by Mr. Lewin Tugwell, of Beverlione, in the county of Gloucester, and which is represented in Pl. 41. where A, is the stock of the pedometer; B, B, B, &c. twelve spokes; one end of which is fastened by means of a screw to the outward ring, or periphery of the wheel, while the other is inserted in the stock. C, the periphery, which is an iron ring fifteen and a half feet, or one pole, in circumference; and which is divided into twenty-five equal parts, corresponding to the links of Gunter's chain for land-measuring, &c. D, D, D, &c. are twelve small plates, representing the separate spokes, and each of which includes two links of the chain above mentioned; the twelfth spoke being divided at its foot, for comprehending the twenty-fifth link. E, an iron axis, being a screw with 320 circumlocutions, each of which is marked separately on an engraved index on one of its flides; and, in order to apply this part of the machine, it is screwed firmly into the stock of the wheel, with which it revolves when in motion. F, a flyle, or alidade, being an expanding screw-nut, that embraces the axis, along which it screws, as the latter revolves with the wheel; and, as each revolution describes an exact longitudinal pole (four of which are computed to a chain), the flyle being pendant, and moving towards its proper figure, denotes the length of ground passed; and it is divided into chains and poles on the index of the axis E, and into links on the periphery C. G, is a small adjusting screw; which being turned, the flyle may be removed to the beginning of the index, after the given line, in surveying or measuring land, has been ascertained in chains, poles, &c. H, represents a cross, or square, with figurs for determining perpendiculars in land-measuring. It is suspended at its ends on the axis, whence it may be occasionally detached by a simple touch of the finger and thumb, when in use. Further, this cross prevents the flyle from being revolved with the axis by any accident. As the 320 divisions marked on the index of the axis E, describe a mile, the flyle F, after having passed over them, will stop; and, as it will now move round with the axis, it will carry with it the standard; which will strike on the wrist of the operator, and thus prevent him from proceeding to any further distance, till he withdraws his hand from between such standard and the axis. Having received this hint, he turns the screw G; puts the flyle F back to the bottom of the index; and continues the revolution of the machine, till he has completed his course.

Mr. Tugwell's contrivance is particularly calculated to prevent error in measuring land; as one person may thus survey with greater accuracy and expedition, than by the use of the chain alone. Besides, no fraud can possibly be committed by labourers, in measuring task-work; a circumstance of the utmost importance to agriculturists.

The last contrivance we shall mention, is that of Mr. Ralph Gout, of Bunhill-row, London; whose new pedometerical patent watch differs from the instrument invented by Mr. Frazer, in this essential circumstance, that the former is connected with a time-piece, while the latter is combined with a compass. Those who live in the metropolis, or visit places, the situation of which is known to the traveller, will perhaps give the preference to Mr. Gout's expanded metal watch with a pedometer, which he manufactures by subscription for 15l. 15s. for the pedometer alone, for

Buchanan's Fire-Engine Pump.

Peat-Borer.

8l. 8s.)—on the other hand, we conceive, persons residing in the country, especially sportsmen, who are generally provided with a watch, on their excursions, will probably find Mr. Frazer's pedometer, on account of its compass, the more useful instrument.

PEDRO, POINT, the most northern point of the island of Ceylon, opposite Point Calmyere, on the continent of India. Long. 80. 27. E. Lat. 9. 53. N.

PEDRO, St. one of the islands in the South Pacific Ocean, called Marquesas. Long. 138. 51. W. Lat. 9. 58. S.

PEER, a town of the Netherlands, in the bishopric of Liege, 24 miles N.N.W. of Maestricht. Long. 5. 20. E. Lat. 51. 8. N.

PEGAU, a town of Upper Saxony, situate on the Elster, 10 miles S.W. of Leipzig, and 58 W. of Dresden. Long. 12. 22. E. Lat. 51. 13. N.

PEGNAPHEL, a town of Spain, in Old Castile, remarkable for its palace, castle, and fortifications; and its churches are said to be the best in Spain. It is seated on the Douero, 20 miles S.E. of Valladolid. Long. 4. 0. W. Lat. 41. 41. N.

PEGNA-MACOR, a town of Portugal, in Beira, with a castle, 40 miles N.W. of Alcantara. Long. 6. 32. W. Lat. 39. 50. N.

PEGNARANDA, a town of Spain, in Old Castile, 30 miles S.W. of Oñeda. Long. 4. 8. W. Lat. 40. 59. N.

PEINE, a town of Lower Saxony, in the duchy of Brunswick; famous for a battle fought in 1553, when Maurice, elector of Saxony, and the margrave of Brandenburg, were killed. It is 17 miles W. of Brunswick. Long. 10. 19. E. Lat. 52. 27. N.

PELUS, a large lake of Russia, in the government of Livonia. The river Narova issues from this lake, by which it has a communication at Naiva, with the gulf of Finland.

PEISHORE, or **PEISHOUR**, a considerable city of Hindoostan Proper, in the province of Cabul. It is subject to the King of Candahar, and is 50 miles N.W. of Attock. Long. 66. 54. E. Lat. 32. 44. N.

PELTZ, a town of Upper Saxony, in the Ucker marche Brandenburg. In the neighbourhood are iron mines, and manufactures of pitch and turpentine. It is 30 miles S.S.W. of Frankfurt on the Oder. Long. 8. 35. E. Lat. 52. 5. N.

PELAGNISI, an island in the Grecian Archipelago, about eight miles in circumference. Long. 24. 12. E. Lat. 39. 30. N.

BELLIGRINO MOUNT, a promontory on the N. coast of the island of Sicily, nearly two miles W. of Palermo. The prospect from this mount is beautiful and extensive: most of the Lipari Islands are discovered in a clear day, and also a large portion of Mount Etna, although at the distance of almost the whole length of Sicily. On this mount is a cavern, in which is the image of St. Rosalia, who is said to have died here; and round the cave of this saint (who is the patroness of Palermo) a church is built, where priests attend, to watch the precious relics, and receive the offerings of the pilgrims.

PELISSA, a town of Lower Hungary, capital of a county of the same name. It is seated near the Danube, 15 miles N. of Buda. Long. 18. 20. E. Lat. 47. 40. N.

PELISSANE, a town of France, in the department of the Mouths of the Rhone, 15 miles W.N.W. of Aix. Long. 5. 21. E. Lat. 43. 26. N.

PELLA, a town of Turkey in Europe, in Ionia, 50 miles W. of Salonichi. Long. 21. 53. E. Lat. 40. 42. N.

PELLERIN, a town of France, in the department of

Lower Loire, situate on the Loire, with a harbour for small vessels, 10 miles N. of Nantes, and 13 S.E. of Painboeuf. Long. 1. 44. W. Lat. 47. 23. N.

PELOSO, a town of Naples, in Basilicata, 35 miles W. of Br. Long. 16. 20. E. Lat. 41. 26. N.

PEMBA, a town of Congo, capital of a province of the same name. Long. 18. 25. E. Lat. 7. 30. S.

PEMBA, or **PENDA**, an island in the East-Indian Ocean, near the coast of Africa, about 100 miles in circumference, governed by a king, tributary to the Portuguese. Long. 40. 0. E. Lat. 5. 50. S.

PEMBRIDGE, a town in Herefordshire, with a market on Tuesday, seated on the Arrow, 12 miles N.W. of Hereford; and 145 W.N.W. of London. Long. 2. 42. W. Lat. 52. 14. N.

PENA GARCIA, a town of Portugal, in Beira, with a castle. It was taken by Philip V. in 1704; but he retired from it at the approach of the allies. It is six miles E. of Idanha Velha. Long. 6. 6. W. Lat. 39. 40. N.

PENALVA, a town of Portugal, in Beira, seated on a hill, with a castle, eight miles S. of Coimbra. Long. 8. 17. W. Lat. 40. 4. N.

PENAUTIER, a town of France, in the department of Aude, four miles N. of Carcassonne. Long. 2. 25. E. Lat. 43. 18. N.

PHENMUNDER, a fortress of Upper Saxony, in Prussian Pomerania, seated in the isle of Usedom, at the mouths of the Pene and Oder, in the Baltic Sea. Long. 14. 10. E. Lat. 54. 16. N.

PENGUIN ISLAND and **BAY**, on the coast of Patagonia, 182 miles N. of Port St. Julian. Lat. 47. 48. S.

PENHA GARCIA, a town of Portugal, in Beira, on the borders of Spain, nine miles E. of Castel Branco. Long. 6. 30. E. Lat. 39. 50. N.

PENICHE, a strong town of Portugal, in Estremadura, with a good harbour and a citadel, 34 miles N. of Lisbon. Long. 9. 5. E. Lat. 39. 16. N.

PENICK, a town of Upper Saxony, in Misnia, belonging to the Elector of Saxony. Here is a manufacture of woollen stuffs, and a pottery. It is seated on the Mulde, eight miles E. of Altenburg. Long. 12. 44. E. Lat. 50. 59. N.

PENISCOLA, a town of Spain, in Valencia, seated on a high point of land on the Mediterranean, 60 miles N. of Valencia. Long. 1. 0. E. Lat. 40. 29. N.

PENISHEHR, a town of Hindoostan Proper, capital of a district, in the country of Cabul, 46 miles N. of Cabul. Long. 68. 24. E. Lat. 35. 16. N.

PENKRIDGE, a town in Staffordshire, with a market on Tuesday. It was formerly a large place, but now greatly reduced, and principally noted for its horse fairs. It is six miles S. of Stafford, and 129 N.W. of London. Long. 2. 0. W. Lat. 52. 54. N.

PENKUM, a town of Upper Saxony, in Anterior Pomerania, 15 miles S.W. of Stettin, and 43 N.N.W. of Custrin.

PENNAFLOR, a town of Spain, in Asturias, seated on the Asta, 14 miles S.W. of Oviedo. Long. 5. 56. W. Lat. 43. 15. N.

PENNAFLOR, a town of Spain, in Andalusia, seated near the Xenil, 10 miles N. of Ecija. Long. 4. 12. W. Lat. 37. 44. N.

PENNANT (Thomas), a distinguished naturalist and traveller, was born in 1726, in Flintshire, where his family had lived for some centuries. He received the rudiments of his education first at Wrexham, and afterwards at a seminary at Fulham in Middlesex. At a proper age he was entered at Ox-

ford, and having made a considerable proficiency in the classics, he applied himself, within the walls of that university, to attain a knowledge of jurisprudence; but we do not find that he ever entered himself of any of the Inns of Court, or followed the law as a profession.

The ruling passions of mankind are excited, and the future current of their lives frequently directed, by trivial circumstances. One of the greatest painters of our age was attracted with an irresistible impulse towards his art by the perusal of a treatise on it; and we have the authority of the subject of this memoir for asserting, that a present of Willughby's Ornithology, at an early period, first gave him a turn for natural history, which never once abandoned him through the course of a very long life.

Mr. Pennant commenced his travels with great propriety at home, where he made himself acquainted with the manners, productions, and curiosities, of his native country, before he sallied forth to inspect those of other nations. He then repaired to the continent; and not only acquired considerable additional knowledge relative to his favourite studies, but became acquainted, and established a correspondence, with some of the greatest men of the age.

On his return he married, and had two children, but did not come into the family fortune until he was thirty-seven years of age, at which time he was settled at Downing.

Having lost his wife, he appears to have set out once more for the continent, and to have formed an acquaintance with Voltaire, Buffon, Haller, Pallas, &c. He had by this time acquired considerable reputation as a scientific man, having commenced his career as an author so early as 1750. His British Zoology established his reputation as a naturalist; and this received a fresh accession of celebrity in consequence of his acquaintance with Linnæus, and his intercourse by letters with all the celebrated naturalists in Europe.

Early in life he had undertaken a most interesting tour to Cornwall; and he now entertained an ardent desire to survey the works of nature in the northern extremities of the island. He accordingly set out for Scotland, and in 1771 favoured the public with an entertaining account of his Tour, which was so well received as to pass through several editions. Not content with the main land of Great Britain, he was ambitious to survey the islands in the vicinity, and accordingly penetrated to the Hebrides, and visited Man.

It is not to be supposed that he would leave his own country unexplored; on the contrary, he minutely described all its wonders. He did not fail on this occasion to present the world with the result of his enquiries, for in 1778 he commenced the publication of his *Welch Tour*.

In four years after this (1782) appeared the account of the Journey from Chester to London, in which he refutes the vulgar opinion that it is uninteresting; and in two years more his *Arctic Zoology*, an admirable work, greatly prized both here and in other countries.

In 1790 appeared a quarto volume, simply entitled, "*Of London*;" in which he observes, that this work is composed from observations, originally made without any view of publication; and requests the good inhabitants of London and Westminster not to be offended at his having stuffed their *liad* into a nutshell.

Notwithstanding a parting address, which was annexed, we find Mr. Pennant adventuring once more in the ocean of literature at a late period of his life. He accordingly published the *Natural History of the Parishes of Holywell and Downing*, within the precincts of the latter of which he had resided about half a century. He also presented the public, a very short time before his death, with a splendid work, consisting of 2 vols. 4to. entitled, "*The View of Hindoostan*;" in the pre-

face to which he candidly states his motives for this new attempt. These valuable volumes are drawn up by Mr. Pennant in the manner of his introduction to the *Arctic Zoology*. The plates, 23 in number, are admirably engraved, and one (the Napaul pheasant), is beautifully coloured.

In addition to the list of literary labours already enumerated, is a letter on an earthquake felt at Downing in Flintshire, in 1753; another inserted in the same publication, in 1756, on coralloid bodies (*κοραλλοειδής*) collected by him; his Synopsis of Quadrupeds, published in 1771; a pamphlet On the Militia; a paper On the Turkey; and a volume of Miscellanies.

Mr. Pennant attained academical honours of all kinds, having had the degree of LL.D. conferred on him by the university in which he was educated, he was a Fellow of the Royal Society, and a member of the Society of Antiquaries, a Fellow of the Royal Society of Upsal in Sweden, a member of the American Philosophical Society, an honorary member of the Linnean Society of London, &c.

The ample fortune left him by his father enabled Mr. Pennant to keep an hospitable table, and also to prevent the profits of several of his works to public institutions, particularly the Welsh charity-school in Gray's-inn-lane. He encouraged several engravers by his patronage, and was not a little serviceable to the advancement of the fine arts.

In 1776 he married a second time, on which occasion he became united to Miss Mostyn, sister of his neighbour, the late Sir Roger Mostyn, in Flintshire. The latter part of his life was cheerful, and he scarcely felt the approaches of old age. He died at his seat at Downing in his 72d year.

He has left several works behind him in MS. under the title of, "*Outlines of the Globe*;" and, as a proof that it will be a very voluminous and interesting publication, it is only necessary to observe, that *The View of Hindoostan* composed the 14th and 15th volumes.

Mr. Pennant possessed a well-compacted frame of body, an open and intelligent aspect, an active and cheerful disposition, and a vivacity which rendered him always entertaining, as well in conversation as in writing. Though not without a share of irascibility, his heart was kind and benevolent. He was exemplary in the relations of domestic life, and sensibly felt for the distresses of his poor neighbours, whose relief in seasons of hardship he promoted with great zeal and liberality. His candour and freedom from ordinary prejudices, are sufficiently displayed in his writings; and Scotland was forward to confess, that he was the first traveller from this side the Tweed, who had visited the country with no unfriendly spirit, and had fairly presented it under its favourable as well as its less pleasing aspect. As a writer, his style is lively and expressive, but not perfectly correct. His principles of arrangement in zoology are judicious, and his descriptions characteristic. If in some of his later works a little vanity appears, and a propensity to think that important to the world which was so to himself, it may readily be pardoned to one who has afforded such copious and valuable entertainment to the public.

PENNAR, a river in the peninsula of Hindoostan, which flows by Gooty, Gandiccotta, Cuddapah, and Vellore, and enters the bay of Bengal, at Gangapatnam.

PENNON, a fort of Barbary, seated on a small island before the harbour of Algiers.

PENNON DE VALEZ, a very important sea-port of Barbary, seated on a rock in the Mediterranean, near the town of Velez. It was built by the Spaniards in 1508, taken by the Moors in 1522, and retaken in 1664. It is 75 miles E. of Ceuta. Long. 4. o. W. Lat. 35. 25. N.

PENOBSCOT, a bay of North America, in the district

of Main, at the mouth of the river Penobscot. It is long and capacious; and its E. side is lined with a cluster of small islands.

PENRISE, a sea-port in Glamorganshire, with a market on Thursday; seated on the British Channel, 20 miles S.E. of Carmarthen, and 279 W. of London. Long. 4. 12. W. Lat. 51. 37. N.

PENSFORD, a town in Somersetshire, with a market on Tuesday. It is noted for its hats and broad, and seated on the Chew, seven miles W. of Bath, and 117 W. by S. of London. Long. 2. 30. W. Lat. 51. 23. N.

PENTLAND HILLS, a ridge of mountains in Edinburghshire, extending about ten miles from S.W. to N.E.

PENZA, a government of Russia, formerly a province of Kafan. Its capital, of the same name, is seated on the Sura, where it receives the rivulet Penza; 220 miles S.W. of Kafan.

PENZLEIN, a town of Lower Saxony, in the principality of Mecklenburg, 53 miles E. of Stettin. Long. 15. 36. E. Lat. 53. 30. N.

PEQUIGNY, a town of France; in the department of Somme; remarkable for the interview between Lewis XI. of France and Edward IV. of England, in 1475, on a bridge built for that purpose. It is seated on the river Somme, 15 miles S.E. of Abbeville. Long. 2. 5. E. Lat. 49. 58. N.

PERAY, St. a village of France, in the department of Ardèche, noted for its wines. It is 21 miles N.W. of Privas.

PERCASLAW, a town of Russia, in the government of Kiof, 44 miles S.E. of Kiof. Long. 31. 50. E. Lat. 50. 0. N.

PERECZAS, a town of Upper Hungary, capital of a county of the same name, 50 miles E. by N. of Tockay. Long. 22. 26. E. Lat. 48. 30. N.

PERGA, a town of Turkey in Europe, in Albania, opposite the island of Corfu. Long. 20. 19. E. Lat. 39. 40. N.

PERGAMAR, a town of Turkey in Europe, in Rumania, with a bishop's see; 60 miles S.W. of Adrianople, and 65 N.W. of Gallipoli. Long. 25. 55. E. Lat. 41. 10. N.

PERGAMO, an ancient town of Natolia, with a bishop's see, a palace, and a castle. It is not so considerable as formerly, but has nine mosques, and occupies an oblong circumference of three miles, at the foot of a mountain. Here parchment was invented. It is seated on the Germassi, 15 miles from its mouth, and 37 N. of Smyrna. Long. 27. 27. E. Lat. 39. 5. N.

PERIA, a town of Persia, in the province of Irac, 90 miles W. of Ispahan. Long. 51. 25. E. Lat. 32. 20. N.

PERIAC, a town of France, in the department of Aude, celebrated for its salt-works, six miles S.W. of Narbonne.

PERIAPATAM, a town of the peninsula of Hindoostan, 24 miles S.W. of Seringapatam, and 54 N.E. of Tellicherry. Long. 76. 31. E. Lat. 12. 15. N.

PERINDA, a town of the Decan of Hindoostan, in the province of Dowlatabad, 188 miles N.W. of Hydrabad. Long. 75. 10. E. Lat. 18. 33. N.

PERLEBERG, a town of Upper Saxony, the capital of the marche of Prignitz, 62 miles N.W. of Berlin. Long. 12. 36. E. Lat. 53. 25. N.

PERM, a government of Russia, formerly a province of Kafan. It is divided into two provinces, namely, Perm, the capital of which is of the same name, seated on the river Kama; where it receives the Zegochekha; and Catharinienburg, the capital of which is of the same name, seated near the source of the river Isef.

PERNALLA, a town of the Decan of Hindoostan, in the province of Guzerat, 20 miles W. of Dorampour, and 38 S. of Surat. Long. 72. 53. E. Lat. 20. 35. N.

PERNE, a town of France, in the department of the Mouths of the Rhone. It is the birth-place of the celebrated orator Flechier, bishop of Nîmes, and a little to the W. of Apt.

PERNEAU, a town of Russia, in the government of Livonia, with a castle. It is seated near the mouth of a river of the same name, 35 miles N. of Riga. Long. 23. 37. E. Lat. 58. 26. N.

PERNES, a strong town of France, in the department of the Straits of Calais, seated on the Clarence, 17 miles N.W. of Arras. Long. 2. 31. E. Lat. 50. 29. N.

PERNO, a town of Sweden, in the province of Nyland, on the coast of the Baltic, 36 miles E. of Helsingfors. Long. 25. 40. E. Lat. 60. 30. N.

PERNOV, a town of Russia, in the government of Riga, fortified and defended by a castle. It is 92 miles N. of Riga. Long. 24. 30. E. Lat. 58. 30. N.

PEROUSA, a town of Piedmont, the chief place of a valley of the same name. It is seated on the Cluson, 16 miles S.W. of Turin. Long. 7. 18. E. Lat. 44. 59. N.

PERSAIN, a town of the kingdom of Pegu, near a river of the same name, 132 miles S.W. of Pegu. Long. 94. 55. E. Lat. 16. 45. N.

PERSIA, GULF OF, a gulf between Persia and Arabia Felix. The entrance near Ormis is not above 30 miles over; but within it is 180 in breadth, and the length from Ormus to the mouth of the Euphrates is 420 miles.

PERTHES, a town of France, in the department of Seine and Marne, six miles S.W. of Melun.

PETHES, a town of France, in the department of Upper Marne, six miles N.W. of St. Dizier.

PERTIGI, a town of the island of Sardinia, 19 miles S.E. of Castell Aragonese.

PERTUIS, a town of France, in the department of the Mouths of the Rhine, 10 miles N. of Aix, and 27 of Marfeilles. Long. 5. 36. E. Lat. 43. 44. N.

PERUGIA, an ancient and populous city of Italy, capital of Perugia, with a strong citadel, a university, and a bishop's see. The churches, and many other buildings, public and private, are very handsome. It is seated on a hill, 75 miles N. of Rome. Long. 12. 20. E. Lat. 43. 6. N.

PESCIA, a town of Tuscany, with a bishop's see. The oil made here is much esteemed. It is 10 miles S.W. of Pistoia. Long. 11. 22. E. Lat. 43. 47. N.

PÊSTI, a town of Naples, in Principato Citeriore, seated near the magnificent ruins of the ancient Pæstum, 20 miles S.E. of Salerno. Long. 15. 7. E. Lat. 40. 20. N.

PETAPA, a town of Mexico, in the province of Guatimala, 20 miles S. of Guatimala. Long. 90. 30. W. Lat. 13. 20. N.

PETER AND PAUL, St. of PETROPAWLOSKOJ, a sea-port of Kamtschatka, in the Russian government of Irkutsk. The town consists of some miserable log-houses and a few conical huts. Captain Clerke, who succeeded Captain Cook, and died at sea, was interred here. Long. 158. 43. E. Lat. 53. 0. N.

PETERSBERG, a town of Lower Saxony, in the duchy of Magdeburg, 48 miles S.E. of Magdeburg.

PETERSBURG, a town of the United States, in Georgia, situate at the confluence of the rivers Savannah and Broad, 50 miles N.W. of Augusta. Long. 81. 32. W. Lat. 33. 46. N.

PETERSDORF, a town of Prussia, in the province of Samland, 24 miles E. of Königsberg.

PETERSHAGEN, a town of Germany, in the principality of Minden, seated on the Weser, three miles from Minden, and 37 W. of Hanover. Long. 10. 6. E. Lat. 52. 25. N.

PETHERTON, a town in Somersetshire, with a market on Tuesday; seated on the Parret, 18 miles S. by W. of Wells; and 133 W. by S. of London. Long. 2. 41. E. Lat. 50. 56. N.

PETIGLIANO, a town of Tuscany, in the Siennese, eight miles W. of Castro, and 45 S. E. of Sienna. Long. 11. 42. E. Lat. 42. 23. N.

PETIT GUAUVE, a sea-port of St. Domingo, seated on a bay at the west end of the island. It is 400 miles E. of Jamaica. Long. 72. 52. W. Lat. 18. 27. N.

PETOUNE, a city of Eastern Chinese Tartary, in the Department of Kirin. It has scarcely any inhabitants but Tartar soldiers, and Chinese condemned to exile. It is seated on the Songari, 112 miles N. by E. of Kirin, and 500 N. E. of Pekin. Long. 124. 55. E. Lat. 45. 3. N.

PETRELLA, a town of Naples, in the Molise, 31 miles E. of Molise.

PETRELLA, a town of Turkey in Europe, in Albania, 25 miles S. E. of Durazzo. Long. 19. 36. E. Lat. 41. 35. N.

PETRIKOW, a town of Great Poland, in the palatinate of Siradia, 80 miles S. W. of Warsaw. Long. 19. 46. E. Lat. 51. 12. N.

PETRINA, or **PETRINTA**, a strong town of Austrian Croatia, seated on the Petrina, 27 miles E. of Carlsbad. Long. 16. 0. E. Lat. 49. 0. N.

PETTAPOLLY, a sea-port of Hindoostan, on the coast of Coromandel, where the Dutch have a factory, 42 miles S. W. of Masulipatam. Long. 80. 46. E. Lat. 15. 49. N.

PETTAU, a town of Austria, in the duchy of Silesia. It belongs to the Bishop of Salzburg, and is seated on the Draue, 28 miles S. by E. of Graz. Long. 15. 37. E. Lat. 46. 46. N.

PETTYCUR, a harbour in Fifeshire, one mile from Kinghorn, in the frith of Forth. It is the usual landing place of passengers from Leith, on the opposite shore.

PEVENSEY, a village in Sussex, situate on a small river, which runs into a bay of the English Channel, called Pevensey Harbour, 14 miles W. S. W. of Hastings. Here is an ancient castle, which belonged to Robert earl of Moreton, and is said to be the largest and most entire remain of Roman building to be seen in Britain. Pevensey was anciently a famous haven, though now it is nearly two miles from the sea. Here Swaine landed in 1049, when he carried off his cousin Beorn and murdered him: Godwin, and his son Harold, afterwards ravaged it, and took away many ships: and here William the Conqueror landed, when he invaded England.

PFaffenHOFEN, a town of Upper Bavaria, with a Benedictine monastery at a small distance. It is seated on the Ilm, 10 miles N. W. of Ratibon. Long. 12. 3. E. Lat. 49. 27. N.

PFALGEL, a town of Germany, in the electorate of Treves. Here is a convent, which was formerly a palace of the kings of the Franks. It is three miles N. E. of Treves.

PFIRT, or **FORRETT**, a town of France, in the department of Upper Rhine, 10 miles W. of Basil. Long. 7. 20. E. Lat. 47. 37. N.

PFORTZHEIM, a town of Suabia, in the marquisate of Baden-Durlach, with a castle, seated on the Entz, 15 miles S. E. of Durlach. Long. 9. 45. E. Lat. 48. 57. N.

PFREIMB, a town of Upper Bavaria, with a castle, seated at the confluence of the Pirent and Nab, 10 miles N. E. of Amberg. Long. 12. 21. E. Lat. 49. 21. N.

PFULENDORF, an imperial town of Suabia, seated on

the Andalsbach, 37 miles S. W. of Ulm. Long. 9. 27. W. Lat. 48. 8. N.

PIANAGORIA, a small and beautiful island of Asia, on the E. side of the strait of Cadiz.

PHANTASMAGORIA, an appellation lately given to an exhibition of curious optical illusions in London. Though it will be difficult, we apprehend, to prove any exclusive property in phenomena that every experimental philosopher must have practised on a smaller scale, this has been the subject of a patent granted to Mr. Philipshall, of the Lyceum, in the Strand, who describes his method of representing, in a dark space or scene, human figures, in various characters, proportions, and sizes.

"The apparatus of some of these exhibitions," says he, "consists of two concave glasses, or rather two concave metal reflectors, before which an artificial light, proportionable to their focus, is applied.

"These enlightened concave metal reflectors are secured in a closet or box proportionable to their size, and their requisite light, in such a manner that all the rays of light are directed upon a transparent picture, representing the apparition; which picture reflects, by means of lenses, upon a transparent body, and giving the necessary direction to this apparatus, according to the nature of its circumstances; in such a manner that the apparitions represent themselves to the eye of the spectator arbitrarily, either in a larger or smaller, in a nearer or more distant perspective point of view.

"In the same manner I can likewise represent landscapes and buildings in a very striking and deceiving manner, in a voluntary size.

"Another sort of apparition is produced by the refraction of light, by means of transparent bodies, of various shapes and sizes, which are fixed in a dark closet as aforesaid, and, by means of the refraction of an artificial light, are either made visible or invisible. If those bodies are made to liken deceased persons which are required to be seen, then the apparition is the more striking, and answers fully the ideas commonly formed of a spectre.

"A third sort of these optical deceptions I produce in the following manner, viz. By opaque moveable figures, of various sizes and shapes. These are moderately enlightened by the refraction of a concave metal reflector, fixed in a dark closet; but the rays of light must be properly distributed by the refraction of a lens, of a proportionable focus, in order that the enlightened object may alone represent itself to the eye; if therefore, according to the description, the enlightened figures imitate mechanically the motions of men, and appear in proper dress or draperies, then this becomes the most striking illusion, as one may by this regulation, by giving an easy motion to their drapery, produce various groups, and pantomime scenes, out of the world of spirits.

"A fourth sort of optical illusion is operated in the following manner, in order to produce a multiplicity of apparitions. There is between the transparent body upon which the figures reflect, another dark body slipped in, upon which a fixed number of figures are applied, and are distributed in a symmetrical manner; upon these figures either a greater or less light is directed, according to the disposition of the groups, and gives to the apparatus the necessary direction, in order that those which reflect upon the transparent bodies may move through one another, and form all manner of groups; the positions of which are very comic and striking, and they procure the most agreeable entertainment."

By means of this apparatus and method of working, a thousand different diversions may be produced, only by adapting it to the space and place where it is exhibited, and moderating the rays of light in a suitable manner.

PHARZA, anciently **PHARSALIA**, a town of Turkey in Europe, in Janna, famous for the decisive victory gained by Julius Cæsar over Pompey, in 48 B.C. This town is an archiepiscopal see, and seated on the Enipeus, 10 miles S. of Larissa.

PHILIPPINE, a strong town of Dutch Flanders. It was taken by the French in 1747, restored in 1748, and again taken in 1794. It is seated on an arm of the Scheldt, 12 miles S.E. of Flushing. Long. 3. 51. E. Lat. 51. 16. N.

PHILIPPINES, New, otherwise called **PALAOOS**, and **CAROLINAS**, islands in the North Pacific Ocean, to the E. of the most southern of the Philippine Islands. There are about 32 in all, between the equator and the Ladrões; but they are very little known to the Europeans.

PHILIPPOLI, a town of Romania, with an archbishop's see. It is chiefly inhabited by Greeks, and is seated on the Mariza, 82 miles N.W. of Adrianople, and 188 of Constantinople. Long. 24. 50. E. Lat. 42. 15. N.

PHILIPS-NORTON, a town in Somersetshire, with a market on Thursday, seven miles S. of Bath, and 104 W. of London. Long. 2. 16. W. Lat. 52. 16. N.

PHILIPSBURG, a town of the United States, in New Jersey, situate on the river Delaware, opposite Easton in Pennsylvania, 41 miles N.W. of Trenton. Long. 75. 30. W. Lat. 40. 45. N.

PHILIPSTADT, a town of Sweden, in Wermeland, seated in a hilly and rocky country, abounding in iron mines, between two lakes, and watered by a rivulet. It was built by Charles IX. and called after his son Philip. In 1775, it was destroyed by fire, but has been since rebuilt. It is 20 miles N.E. of Carlstadt, and 140 N.W. of Stockholm. Long. 14. 10. E. Lat. 59. 30. N.

PHILIPSTOWN, a borough of Ireland, capital of King's County, 40 miles W. of Dublin. Long. 7. 3. W. Lat. 53. 18. N.

PHILIPVILLE, a strong town of France, in the department of the North, seated on an eminence, 25 miles S.E. of Mons, and 123 N. by E. of Paris. Long. 4. 24. E. Lat. 50. 7. N.

PHILIP ISLANDS, two islands in the South Pacific Ocean, discovered by Captain Hunter in 1791, and named after the governor of New South Wales. They are five miles asunder, but almost joined by a sandy spit, which reaches, for about two thirds of the distance, from the easternmost island to the most westerly, which last is the smallest. They are covered with shrubs, have few tall trees on them, and the land is low. Long of the eastern island 140. 3. E. Lat. 8. 6. S.

PHILOLOGY (*Encycl.*). Dele the reference to *OSIAN* and *GABRIEL*, lines 1st and 2d of col. 2d.

PHILOSOPHY (*Encycl.*). The appellation of *Critical Philosophy* has been recently given to a system of science, founded by the celebrated Professor Kant of Königsberg, and particularly well received in Germany. Against this system some serious charges have been brought by the learned in different parts of Europe, but more especially by the Abbé Barthelemy; whilst, on the other hand, it has been no less ably defended by its friends and admirers. It is unsuitable for us, on many accounts, but particularly in this advanced state of our undertaking, to enter at great length into a subject so much controverted; for which reason we content ourselves with referring to the article *KANT* (*Suppl.*), where the reader will be gratified with some remarks in defence of the *Critical Philosophy*, drawn up by a gentleman particularly well qualified for the task.

PHOTOMETER, an apparatus for measuring the inten-

sity of light, and likewise the transparency of the medium through which it passes. Count Rumford, when making the experiments which are described in the *Phil. Trans.* was led, step by step, to the construction of a very accurate photometer, in which the shadows, instead of being thrown upon a paper spread out upon the waistcoat, or side of the room, are projected upon the inside of the back part of a wooden box $7\frac{1}{2}$ inches wide, $10\frac{1}{2}$ inches long, and $3\frac{1}{2}$ inches deep in the clear. The light is admitted into it through two horizontal tubes in the front, placed so as to form an angle of 60° ; their axes meeting at the centre of the field of the instrument. In the middle of the front of the box, between these two tubes, is an opening through which is viewed the field of the photometer (see Pl. 42. fig. 1). This field is formed of a piece of white paper, which is not fastened immediately upon the inside of the back of the box, but is pasted upon a small pane of very fine ground glass; and this glass, thus covered, is let down into a groove, made to receive it, in the back of the box. The whole inside of the box, except the field of the instrument, is painted of a deep black dead colour. To the under part of the box is fitted a ball and socket, by which it is attached to a stand which supports it: and the top or lid of it is fitted with hinges, in order that the box may be laid quite open, as often as it is necessary to alter any part of the machinery it contains.

The count had found it very inconvenient to compare two shadows projected by the same cylinder, as these were either necessarily too far from each other to be compared with certainty, or, when they were nearer, were in part hid from the eye by the cylinder. To remedy this inconvenience, he now makes use of two cylinders, which are placed perpendicularly in the bottom of the box just described, in a line parallel to the back part of it, distant from this back $2\frac{1}{8}$ inches, and from each other 3 inches, measuring from the centres of the cylinders; when the two lights made use of in the experiment are properly placed, these two cylinders project four shadows upon the white paper upon the inside of the back part of the box, or the field of the instrument; two of which shadows are in contact, precisely in the middle of that field, and it is these two alone that are to be attended to. To prevent the attention being distracted by the presence of unnecessary objects, the two outside shadows are made to disappear; which is done by rendering the field of the instrument so narrow, that they fall without it, upon a blackened surface, upon which they are not visible. If the cylinders be each $\frac{1}{8}$ of an inch in diameter, and $2\frac{3}{8}$ inches in height, it will be quite sufficient that the field be $2\frac{1}{8}$ inches wide; and as an unnecessary height of the field is not only useless, but disadvantageous, as a large surface of white paper not covered by the shadows produces too strong a glare of light, the field ought not to be more than $\frac{1}{8}$ of an inch higher than the tops of the cylinders. That its dimensions, however, may be occasionally augmented, the covered glass should be made $5\frac{1}{8}$ inches long, and as wide as the box is deep, viz. $3\frac{1}{2}$ inches; since the field of the instrument can be reduced to its proper size by a screen of black pasteboard, interposed before the anterior surface of this covered glass, and resting immediately upon it. A hole in this pasteboard, in the form of an oblong square, $1\frac{1}{8}$ inch wide, and two inches high, determines the dimensions, and forms the boundaries of the field. This screen should be large enough to cover the whole inside of the back of the box, and it may be fixed in its place by means of grooves in the sides of the box, into which it may be made to enter. The position of the opening above mentioned is determined by the height of the cylinders; the top of it being $\frac{1}{8}$ of an inch higher than the tops of the cylinders; and

as the height of it is only two inches, while the height of the cylinders is $2\frac{2}{3}$ inches, it is evident that the shadows of the lower parts of the cylinders do not enter the field. No inconvenience arises from that circumstance; on the contrary, several advantages are derived from that arrangement.

That the lights may be placed with facility and precision, a fine black line is drawn through the middle of the field, from the top to the bottom of it, and another (horizontal) line at right angles to it, at the height of the top of the cylinders. When the tops of the shadows touch this last-mentioned line, the lights are at a proper height; and further, when the two shadows are in contact with each other in the middle of the field, the lights are then in their proper directions.

We have said that the cylinders, by which the shadows are projected, are placed perpendicularly in the bottom of the box; but as the diameters of the shadows of these cylinders vary in some degree, in proportion as the lights are broader or narrower, and as they are brought nearer to or removed further from the photometer, in order to be able in all cases to bring these shadows to be of the same diameter, which is very advantageous, in order to judge with greater facility and certainty when they are of the same density, the count renders the cylinders moveable about their axes, and adds to each a vertical wing $\frac{1}{10}$ of an inch wide, $\frac{1}{10}$ of an inch thick, and of equal height with the cylinder itself, and firmly fixed to it from the top to the bottom. This wing commonly lies in the middle of the shadow of the cylinder, and as long as it remains in that situation it has no effect whatever; but when it is necessary that the diameter of one of the shadows be increased, the corresponding cylinder is moved about its axis, till the wing just described, emerging out of the shadow, and intercepting a portion of light, brings the shadow projected upon the field of the instrument to be of the width or diameter required. In this operation it is always necessary to turn the cylinder outwards, or in such a manner that the augmentation of the width of the shadow may take place on that side of it which is opposite to the shadow corresponding to the other light. The necessity for that precaution will appear evident to any one who has a just idea of the instrument in question, and of the manner of making use of it. They are turned likewise without opening the box, by taking hold of the ends of their axes, which project below its bottom.

As it is absolutely necessary that the cylinders should constantly remain precisely perpendicular to the bottom of the box, or parallel to each other, it will be best to construct them of brass; and, instead of fixing them immediately to the bottom of the box (which, being of wood, may warp), to fix them to a strong thick piece of well-hammered plate brass; which plate of brass may be afterwards fastened to the bottom of the box by means of one strong screw. In this manner two of the count's best instruments are constructed; and, in order to secure the cylinders still more firmly in their vertical positions, they are furnished with broad flat rings, or projections, where they rest upon the brass plate; which rings are $\frac{1}{10}$ of an inch thick, and equal in diameter to the projection of the wing of the cylinder, to the bottom of which they afford a firm support. These cylinders are likewise forcibly pushed, or rather pulled, against the brass plate upon which they rest, by means of compressed spiral springs placed between the under side of that plate and the lower ends of the cylinders. Of whatever material the cylinders be constructed, and whatever be their forms or dimensions, it is absolutely necessary that they, as well as every other part of the photometer, except the field, should be well painted of a deep black dead colour.

In order to move the lights to and from the photometer with

greater ease and precision, the observer should provide two long and narrow, but very strong and steady, tables; in the middle of each of which there is a straight groove, in which a sliding carriage, upon which the light is placed, is drawn along by means of a cord which is fastened to it before and behind, and which, passing over pulleys at each end of the table, goes round a cylinder; which cylinder is furnished with a winch, and is so placed, near the end of the table adjoining the photometer, that the observer can turn it about, without taking his eye from the field of the instrument.

Many advantages are derived from this arrangement: first, the observer can move the lights as he finds necessary, without the help of an assistant, and even without removing his eye from the shadows; secondly, each light is always precisely in the line of direction in which it ought to be, in order that the shadows may be in contact in the middle of the vertical plane of the photometer; and, thirdly, the sliding motion of the lights being perfectly soft and gentle, that motion produces little or no effect upon the lights themselves, either to increase or diminish their brilliancy.

These tables must be placed at an angle of 60 degrees from each other, and in such a situation, with respect to the photometer, that lines drawn through their middles, in the direction of their lengths, meet in a point exactly under the middle of the vertical plane or field of the photometer, and from that point the distances of the lights are measured; the sides of the tables being divided into English inches, and a vernier, shewing tenths of inches, being fixed to each of the sliding carriages upon which the lights are placed, and which are so contrived that they may be raised or lowered at pleasure; so that the lights may be always in a horizontal line with the tops of the cylinders of the photometer.

In order that the two long and narrow tables or platforms, just described, may remain immovable in their proper positions, they are both firmly fixed to the stand which supports the photometer; and, in order that the motion of the carriages which carry the lights may be as soft and gentle as possible, they are made to slide upon parallel brass wires, 9 inches asunder, about $\frac{1}{16}$ of an inch in diameter, and well polished, which are stretched out upon the tables from one end to the other.

The structure of the apparatus will be clearly understood by a bare inspection of Plate 42.: where fig. 1 is a plan of the inside of the box, and the adjoining parts of the photometer; fig. 2, plan of the two tables belonging to the photometer; fig. 3, the box of the photometer on its stand; fig. 4, elevation of the photometer, with one of the tables and carriages.

The count's first attempts with his photometer were to determine how far it might be possible to ascertain, by direct experiments, the certainty of the assumed law of the diminution of the intensity of the light emitted by luminous bodies; namely, that the intensity of the light is every-where as the squares of the distances from the luminous body inversely. As it is obvious that this law can hold good only when the light is propagated through perfectly transparent spaces, so that its intensity is weakened merely by the divergency of its rays, he instituted a set of experiments to ascertain the transparency of the air and other mediums.

With this view, two equal wax candles, well trimmed, and which were found, by a previous experiment, to burn with exactly the same degree of brightness, were placed together, on one side, before the photometer, and their united light was counterbalanced by the light of an Argand's lamp, well trimmed, and burning very equally, placed on the other side over against them. The lamp was placed at the distance of

Count Rumford's Photometer.

Fig. 1.

100 inches from the field of the photometer, and it was found that the two burning candles (which were placed as near together as possible, without their flames affecting each other by the currents of air they produced) were just able to counterbalance the light of the lamp at the field of the photometer, when they were placed at the distance of 60.8 inches from that field. One of the candles being now taken away and extinguished, the other was brought nearer to the field of the instrument, till its light was found to be just able, singly, to counterbalance the light of the lamp; and this was found to happen when it had arrived at the distance of 43.4 inches. In this experiment, as the candles burnt with equal brightness, it is evident that the intensities of their united and single lights were as 2 to 1, and in that proportion ought, according to the assumed theory, the squares of the distances, 60.8 and 43.4, to be; and, in fact, $60.8^2 = 3696.64$ is to $43.4^2 = 1883.56$ as 2 is to 1 very nearly.

Again, in another experiment, the distances were,
 With two candles = 54 inches. Square = 2916
 With one candle = 38.6 = 1489.96

Upon another trial,
 With two candles = 54.6 inches. Square = 2981.16
 With one candle = 39.7 = 1576.09

And, in the fourth experiment,
 With two candles = 58.4 inches. Square = 3410.56
 With one candle = 42.2 = 1780.84

And, taking the mean of the results of these four experiments,

	Square of the Distances.	
With two Candles.		With one Candle.
In the experiment No. 1. 606.64	—	1883.56
No. 2. 2916	—	1489.96
No. 3. 2981.16	—	1576.09
No. 4. 3410.56	—	1780.84
4) 13004.36	4) 9730.45	

Means 3251.09 and 1682.61
 which again are very nearly as 2 to 1.

With regard to these experiments, it may be observed, that were the resistance of the air to light, or the diminution of the light from the imperfect transparency of air, sensible within the limits of the inconsiderable distances at which the candles were placed from the photometer, in that case the distance of the two equal lights united ought to be, to the distance of one of them single, in a ratio less than that of the square root of 2 to the square root of 1. For if the intensity of a light emitted by a luminous body, in a space void of all resistance, be diminished in the proportion of the squares of the distances, it must of necessity be diminished in a still higher ratio when the light passes through a resisting medium; or one which is not perfectly transparent; and from the difference of those ratios, namely, that of the squares of the distances, and that other higher ratio found by the experiment, the resistance of the medium might be ascertained. This he took much pains to do with respect to air, but did not succeed; the transparency of air being so great, that the diminution which light suffers in passing through a few inches, or even through several feet of it, is not sensible.

Having found, upon repeated trials, that the light of a lamp, properly trimmed, is incomparably more equal than that of a candle, whose wick, continually growing longer, renders its light extremely fluctuating, he substituted lamps to candles in these experiments, and made such other variations in the manner of conducting them as he thought bid fair to lead to a discovery of the resistance of air to light, were it

possible to render that resistance sensible within the confined limits of his machinery. But the results of them, so far from affording means for ascertaining the resistance of the air to light, do not even indicate any resistance at all; on the contrary, it might almost be inferred, from some of them, that the intensity of the light emitted by a luminous body in air is diminished in a ratio less than that of the squares of the distances; but as such a conclusion would involve an evident absurdity, namely, that light moving in air, its absolute quantity, instead of being diminished, actually goes on to increase, that conclusion can by no means be admitted.

The ingenious author's experiments all conspired to shew that the resistance of the air to light is too inconsiderable to be perceptible, and that the assumed law of the diminution of the intensity of light may be depended upon with safety. He admits, however, that means may be found for rendering the air's resistance to light apparent; and he seems to have thought of the very means which occurred for this purpose to M. de Saussure.

From a number of experiments made with his photometer, Count Rumford found, that by passing through a pane of fine, clear, well polished glass, such as is commonly made use of in the construction of looking-glasses, light loses 1073 of its whole quantity, i. e. of the quantity which impinged on the glass; that when light is made to pass through two panes of such glass standing parallel, but not touching each other, the loss is 3184 of the whole; and that in passing through a very thin, clear, colourless pane of window-glass, the loss is only 1203. Hence he infers, that this apparatus might be very usefully employed by the optician, to determine the degree of transparency of glass, and direct his choice in the provision of that important article of his trade. The loss of light when reflected from the very best plane glass mirror, the author ascertained, by five experiments, to be $\frac{1}{3}$ of the whole which fell upon the mirror.

PHYSIOLOGY (*Encycl.*) In that article (p. 51, col. 1, near the bottom), a seeming importance has been given to the imposture of *animal magnetism*. The reader will be pleased to erase the three paragraphs in which that fallacious doctrine occurs.

PIADELLA, a town of Italy, in the duchy of Milan, 20 miles N. of Como. Long. 9. 10. E. Lat. 46. 5. N.

PIANEZZA, a town and castle of Piedmont, seated on the Dora, eight miles from Turin.

PIANOZA, an island of Italy, off the coast of Tuscany, six miles S. of that of Elba. It is level and low, as the name imports. Long. 10. 34. E. Lat. 42. 46. N.

PIARA, a river, which rises in the mountains of Tyrol, and falls into the gulf of Venice, by two mouths, a little north of Venice.

PIAZZA, a town of Naples, in Principato Citeriore, 13 miles E.N.E. of Salerno.

PIAZZA, a town of Sicily, in Val di Noto. It contains 18,000 inhabitants, and is situate almost in the centre of the island, 15 miles N.W. of Calata Girona.

PICIS' WALL, a famous barrier against the Picts, of which some small remains are left. It began at the entrance of Solway Frith, in Cumberland, and running by Carlisle, was continued from W. to E. across the island to Newcastle, and ended at Timmouth.

PIDAUURA, a town of Turkey in Europe, in the Morea, the ancient Epidaurum. It is situate on the W. coast of the gulf of Engia, 25 miles E. of Napoli-di-Romania. Long. 23. 22. E. Lat. 37. 40. N.

PIENZA, a populous town of Tuscany, in the Sienneffe, with a bishop's see; 25 miles S.E. of Sienna, and 56 S. of Florence. Long. 11. 42. E. Lat. 43. 0. N.

PIERRE LE MOUTIER, *Sr.* a town of France in the department of Nievre, seated in a bottom, surrounded by mountains, and near a lake, which renders the air unwholesome, 15 miles N.W. of Moulins, and 150 S. of Paris. Long. 3. 12. E. Lat. 46. 48. N.

PIERRE, *St.* a small desert island near Newfoundland, ceded to the French in 1763, for drying and curing their fish. They were dispossessed of it by the English in 1793. Long. 56. 0. W. Lat. 46. 39. N.

PIETRO, *Sr.* an island in the Mediterranean, near Sardinia, taken by the French in 1793, but retaken soon after.

PIG (*Encycl.*). The following extract from an account of the advantage of a cottager keeping a pig, by the Rev. Dr. Glasse, is published by the Society for bettering the Condition of the Poor, &c.

“ James Bramsgrove, a farmer’s labourer at Greenford, in Middlesex, had saved by his industry the sum of four guineas. With this he purchased a hog, which he put up to fatten in the beginning of April last. In the course of the fattening, he used three quarters and a half of beans, and seven bushels of pease, with which he had been supplied, chiefly upon credit, by his master and his neighbours.—He has a wife and five children; the two eldest, girls; one twelve years old, the other something younger. He, his wife, and his two girls, during the last harvest, earned two guineas a-week, and in one week the sum of 2l. 11s. so that he has continued to maintain his family, and has paid off all that was due from him for beans and pease.—He has since killed his hog, at Michaelmas; the weight was 64 stone 3lb.; part of it he has sold at 7½d. per pound; the rest he has reserved for the use of his own family. Estimating the whole at 7½d. per pound, the value of the hog would have been above 16l.; but, as what he sold consisted of the prime pieces, some deduction ought to be made on that account.”

Where a cottager possesses any property, when he has a garden, a pig, or a cow, his advantage is to be estimated, not merely by the pecuniary profit produced, but by the superior tone of industry and economy which he acquires. In the instance mentioned of James Bramsgrove and his family, the prospect of increased comfort, and of improved means of subsistence, gave an incentive and pleasure to all their labour and exertions, during the late harvest. Perhaps it may be needless to observe, that habits of application and good conduct, when once acquired and enjoyed, continue in almost every instance, through life, a blessing to the possessor; and that where the cottager has acquired at home a pleasurable object of industry, to which his hopes and wishes are directed, it has the effect of attaching him to his situation, of augmenting his energy, and of reconciling him to a life of labour and hardship.

There are situations, in which, on account of the high value and rent of land, or on account of there being very little grass land or common, a cow cannot be kept, with advantage, by the cottager. There, it is probable, no better mode can be suggested of supplying the poor with milk, than that so successfully adopted by Mr. Gibborne, near Lichfield: but a pig may be kept, and a garden cultivated with benefit to the cottager, in every part of the kingdom. See *COTTAGER, COW, and Cottage-Garden, Supp.*

PIGEON ISLAND, a small island, eight miles from the coast of Malabar, and 15 from the town of Onore. Long. 74. 0. E. Lat. 14. 1. N.

PIGNEY, a town of France, in the department of Aube, 12 miles N.E. of Troyes. Long. 4. 25. E. Lat. 48. 20. N.

PILLAU, a sea-port of Prussia, on the Baltic. The harbour is good, and it is well fortified, being considered as the bulwark and key of the kingdom. It is 20 miles W. by S,

of Königsberg, of which it is the port. Long. 20. 20. E. Lat. 54. 38. N.

PILNITZ, a town of Upper Saxony, in the margravate of Meissen, celebrated for a treaty entered into by the princes of Europe against France in 1702. It is seven miles S.E. of Dresden.

PILSEN, a strong town of Bohemia, capital of a circle of the same name. It has often been taken and retaken, and is seated near the confluence of the Mísa and Watto, 47 miles W. by S. of Prague. Long. 13. 55. E. Lat. 49. 46. N.

PILSNA, *PILSNO*, or *PILZOW*, a town of Little Poland, in the palatinate of Sandomir, seated on the Wilake, 30 miles E. of Cracow. Long. 21. 10. E. Lat. 50. 0. N.

PINES, *Isle of*, an island in S. the Pacific Ocean, off the fourth end of New Caledonia. It is 14 miles over in a S.E. and N.W. direction. It is high and remarkable in the middle, being quite a pointed hill, sloping towards the extremities, which are very low. The low land has many tall pine-trees upon it. It was discovered by Captain Cook in 1774. Long. 167. 38. E. Lat. 22. 38. S.

PINHEL, a strong town of Portugal, in Tra-os-Montes, capital of a territory of the same name. It is seated at the confluence of the Coha and Pinnel, 25 miles N. of Guarda. Long. 6. 40. W. Lat. 40. 46. N.

PIN-HIANG-FOU, a city of China, in the province of Chan-shi. Its district contains six cities of the second, and 28 of the third class. It is 240 miles S.W. of Peking. Long. 111. 55. E. Lat. 35. 55. N.

PINNENBURG, a fort and town of Lower Saxony, in the duchy of Haltsen, capital of a county of the same name. It is seated on the Owe, 15 miles N.W. of Hamburg. Long. 9. 40. E. Lat. 53. 46. N.

PINOS, an island of the West Indies, on the south side of Cuba, from which it is separated by a deep strait. It is 25 miles long, and 15 broad, and has excellent pastures. Long. 82. 33. W. Lat. 22. 2. N.

PINSK, a town of Lithuania, on a river of the same name. It was formerly a considerable place, but has been almost ruined by the Cossacks. Long. 26. 20. E. Lat. 52. 18. N.

PIOMBINO, a sea-port of Tuscany, capital of a principality of the same name. It is seated on a bay, 40 miles S. of Leghorn, and 60 S.W. of Florence. Long. 10. 23. E. Lat. 42. 57. N.

PIOMBINO, a principality of Tuscany, lying on the Mediterranean. The island of Elba depends upon it, and has its own prince, under the protection of the King of the Two Sicilies.

PIPE (*Encycl.*). A patent was granted to Mr. Wilkinson, of Broseley, in the county of Salop, for an improved method of making leaden pipes.

It is dated March 13, 1790.—He casts the lead in lengths, as is practised in the common way, *i. e.* put upon a polished rod or round maundrell of iron, or any metal, such maundrells being made of different lengths and diameters, according to the size that is wanted. This rod or maundrell, with the cast-lead upon it, is put repeatedly through or between rollers, with grooves, of different sizes, according to the external diameter required, and extended to the length or thickness ordered; or drawn through metal gauges or collars, of different dimensions, upon the said maundrell, each succeeding collar being less than the former, until the same is extended to the length and thickness required; all of which may be performed with a common water wheel, or any other rotative motion.

PIPERNO, a town of Italy, in Compagna di Roma, 50 miles S.E. of Rome. Long. 13. 36. E. Lat. 41. 39. N.

PIPLEY, a town of Hindoostan Proper, in Bengal, which formerly had English and Dutch factories. It is seated on a

river, 15 miles W. of Balafore. Long. 86. 31. E. Lat. 21. 20. N.

PIQUE MONTVALLIER, the highest mountain of the Pyrenees. It is in the form of a pike. Long. 0. 22. W. Lat. 42. 51. N.

PIRANO, a sea-port of Venetian Istria, on a peninsula, 10 miles S. of Capo d'Istria. Long. 14. 1. E. Lat. 45. 40. N.

PIRITZ, a town of Pomerania, in the territory of Stetin. The ancient dukes of Pomerania often resided here. It is seated near the lake Moldui, 20 miles S.E. of Stetin. Long. 14. 20. E. Lat. 53. 18. N.

PIRNA, a commercial town of Upper Saxony, situate on the Elbe, 11 miles S.E. of Dresden. Long. 14. 0. E. Lat. 50. 54. N.

PISANO, a territory of Tuscany, lying on the Mediterranean. It is 47 miles long, and 25 broad, and one of the best countries in all Tuscany.

PISCATAQUA, a river of New Hampshire, the mouth of which forms the only port in that state, and is 60 miles N. of Boston. Long. 70. 30. W. Lat. 43. 25. N.

PISCO, a town of Peru, in the audience of Lima, with a good road for ships. It is seated in a country fertile in excellent fruits and good wine, 140 miles S.S.E. of Lima. Long. 76. 15. W. Lat. 13. 36. S.

PISSELLO, the most northern cape of Natolia, which projects into the Black Sea, opposite the Crimea.

PITCAITLY WELLS, some remarkable saline springs, near Perth, in Scotland, deemed beneficial in scorbutic cases.

PITHEA, a sea-port of Sweden, in West Bothnia, seated on a small island, at the mouth of the Pithea, in the gulf of Bothnia. It is joined to the continent by a wooden bridge, and is 80 miles S.W. of Tornea. Long. 22. 40. E. Lat. 65. 11. N.

PITSCHEN, or **BITSCHEN**, a town of Silesia, in the principality of Brieg, formerly the see of a bishop, afterwards removed to Breslaw. It is 30 miles N.E. of Brieg, and 42 E. of Breslaw. Long. 17. 55. E. Lat. 51. 5. N.

PITTSBURGH, or **FORT PITT**, a flourishing town of Pennsylvania, capital of the county of Alleghany, situate on the W. side of the Alleghany mountains, on a point of land between the rivers Alleghany and Monongahela. Here was the French Fort du Queine; in an expedition against which, in 1756, General Braddock fell into an ambuscade, and was defeated and slain. This fort was abandoned by the French, in 1758, on the approach of General Forbes; and its name was changed to that of Pitt, in honour to the minister by whom the war was then directed. At this place, the Alleghany takes the name of Ohio. It is 320 miles W. of Philadelphia. Long. 79. 48. W. Lat. 40. 26. N.

PIURA, a town of Peru, capital of a jurisdiction of the same name. This was the first Spanish settlement in Peru, and was founded in 1531. It is 25 miles S.S.E. of Paiza. Long. 81. 0. W. Lat. 5. 55. S.

PIZZIGHETONE, a town of Italy, in the Cremonese, with a strong castle, in which Francis I. of France was kept prisoner. It was taken by the French in 1796, and retaken by the Austrians and Russians in 1799. It is situate on the Adda, nine miles N.W. of Cremona, and 13 S.E. of Lodi. Long. 9. 53. E. Lat. 49. 50. N.

PIZZO, a town of Naples, in Calabria Ulteriore, seated on the gulf of St. Eufemia, four miles from Monte-Leone.

PLACENTIA, a town of Spain, in Estremadura, with a bishop's see, and a castle. It is seated on the Xera, in a delightful plain, almost surrounded by mountains, 80 miles S.W. of Madrid. Long. 5. 0. W. Lat. 39. 45. N.

PLACENTIA, a town of Spain, in Guipulcoa, seated on the Dera, 25 miles S.E. of Bilbao. Long. 2. 40. W. Lat. 43. 10. N.

PLACENTIA, a sea-port of Newfoundland, on a bay on the S.E. part of the island, 40 miles W. of St. John. Long. 53. 43. W. Lat. 47. 15. N.

PLANE (*Encycl.*). The following account of an underground inclined plane, executed at Walkden Moor, in Lancashire, by the Duke of Bridgewater's directions, was presented by the Rev. Mr. Egerton, to the Society for the Encouragement of Arts, &c. who voted his Grace their gold medal.

At Worsley, the Duke of Bridgewater's navigation begins; it goes west to Leigh, and east to Manchester, where it locks up into the Rochdale canal. In its way to Manchester, it turns out, in a western direction, near Longford Bridge, to meet the Grand Trunk Canal, above Preston Brook; and from thence it goes north-west to Runcorn, where it locks down into the Mersey, in the tide-way to Liverpool.

To this navigation above ground, which, in all its directions, is extended through a length of forty miles, upon one level, without tunnel or lock, except the locks at the extremities, at Worsley an under-ground navigation is joined, which goes to the different mines of coal under Walkden Moor, from which mines, by these navigations above ground and under ground, Manchester and various other places are supplied with that valuable article. The canals of this underground navigation lie upon two levels, or stories. The lower is upon the same level with the open navigation, which it joins at Worsley; and consists, in the different lines which it pursues to the different seams of coals, of near twelve miles of tunnelling.

The higher is thirty-five yards and a half perpendicular height above the level of the lower, and varies from thirty-eight to sixty-one perpendicular yards below the surface of the earth, and consists of near six miles of tunnelling.

The tunnelling of each level is ten feet four inches wide, and eight feet six inches deep; and the depth of water, three feet seven inches.

Before a communication was made by an inclined plane, the coals were discharged by hand from the boats on the higher level, and were let down the pits in tubs, by an engine and a break-wheel, into those upon the lower. To convey the boats themselves from the canals of the higher level into that of the lower, was the intent of making this under-ground inclined plane. By the help of this machinery, the whole business is now done at once, without discharging or damaging the coal, and at one fourth of the expence: for the boats of the higher level, are bodily let down the inclined plane, and are floated from the foot of it through nearly three miles, in a straight line, of the lower level canal, into the open navigation at Worsley; and whereas they were before obliged to be drawn up to the surface of the earth at great inconvenience and expence, to be repaired at a work-shop on Walkden Moor, they now come of themselves, in their course of business, to be repaired at the great dock-yard, at Worsley.

The place where the inclined plane is constructed, is adapted in a singular way for the purpose. There is a bed of white rock, or grit, eight yards twelve inches deep, which dips one in four, lying exactly in the direction most convenient for the communication between the two levels; which bed of rock is hollowed into a tunnel, driven upon the rise of the metals, by blasting with gunpowder, and working it down with wedges and hammers. In this tunnel, formed through a rock reaching from the lower to the higher level, the inclined plane is fixed; and, by its being in the heart of a rock, the whole workmanship can be pinned, secured, and compacted together at the top, bottom, and sides, most effectually—an advantage which no inclined plane above ground can have, and which renders this a singular production, no-where perhaps to be imitated.

The run of the inclined plane is one hundred and fifty-one yards, besides eighteen yards, the length of the locks, at the north or upper-end: and the fall is one in four, corresponding with the dip of the rock. Of these one hundred and fifty-one yards, about ninety-four yards are formed into a double waggon-way, in order to let two boats, namely, the empty and the loaded boats, pass up and down; and are divided by a brick wall, supporting the roof, in which are openings for a person to escape out of the way of the boats; which double waggon-way joins in one, about fifty-seven yards from the lower level. The whole width of the double waggon-way is nineteen feet; and of the single waggon-way, after the junction, ten feet. These waggon-ways are supplied with iron rails, or gullies, laid on sleepers, down the whole run; and the height of the roof, above the iron rails, is eight feet.

At the top of the inclined plane there is a double lock, or rather two locks, side by side, formed in the heart of the fame rock, which deliver the loaded boats from the higher level down the inclined plane, and receive the empty boats from the lower. The length of that part of the tunnel in which these are formed, is eighteen yards; the width or diameter, twenty feet six inches; and the height of the roof, at the north end and above the locks, at *d d*, Pl. 42. fig. 1, twenty-one feet, to admit the break-wheel.

The bottom, or fourth end of the inclined plane, is six feet nine inches under the surface of the water, where the loaded boat floats off the carriage upon the canal of the lower level.

The depth of the locks, under water, at the north end, is four feet six inches; at the fourth end it is eight feet.

The wall between the locks is nine inches above the surface of the level water; its breadth is three feet.

The diameter of the horizontal main-shaft, upon which the rope works to let the loaded boats down, and to draw the empty boats up, is four feet eleven inches, and its circumference is fifteen feet five inches. The main rope is two inches and a half in diameter, and seven inches and a half in circumference. It is wrapped round with a small cord of about an inch in circumference, for the length of about one hundred and five yards, to prevent its wearing, which it does chiefly when it drags upon the bottom, when at work, at the place where the waggon-ways unite; and, for the same purpose, rollers of eight inches diameter are fixed at intervals down the run of the inclined plane. Moreover, a hollow cast-iron roller of eight inches and a half diameter is fixed across the west lock, parallel to the upper west lock-gate, and near the north end of the lock, but half a yard higher than the gate, in order to bear up the rope, and to prevent it from swagging.

A hold-fast rope is fastened to the main-rope, to stay each boat upon its wagon, as they go up or down. It is marked *k k*, in Fig. 1, and its uses are more particularly detailed in the table of reference, at *k k*, to that plate.

Upon this horizontal main-shaft is a break-wheel above mentioned, which regulates the motion of the loaded boat going down the inclined plane.

The number of iron teeth, or cogs, in the spur-wheel, which is fastened to the side of the break-wheel, is three hundred and seventy-two; and the little nut-wheel, No. 3, fig. 2, which sets it in motion, contains eleven teeth, or cogs. The nut-wheel is supported by two uprights from the pillar to the roof, and works between them. Two winches or handles, No. 4, fig. 2, on its axis, put the main-shaft, *d d*, fig. 1, or No. 1, fig. 2, in motion. The power of both united, enables a man, who uses a force equal to forty pounds weight, to let forward two tons upon the waggon-road: and this force, multiplied at the winches or handles, may be used to let forward the loaded boat out of one lock, and to bring the empty boat

into the other. The boats being thus put in motion, the little nut-wheel is disengaged from the main-shaft, by a slide drawing the little nut sideways, so as to disengage the teeth, or cogs, from the cogs of the spur-wheel. The weight of four tons going down, bring up about one.

The spur-wheel, however, which is fastened to the break-wheel, No. 2, fig. 2, is seldom used, as it is occasionally only put in motion to regulate the stretch of the ropes when new, and to draw the light boat into the lock, when, at any time, it may happen to be over-weighted with materials, such as mortar, props, slabs, &c. for the use of the higher level collieries, and will not move of itself, upon a balance, out of the lower level.

The length of the carriage, or cradle, is thirty feet; its width is seven feet four inches. It moves upon four solid cast-iron rollers, which run upon cast-iron plates; on one side of each of which there are iron crests, which stand two inches higher than the plates, and prevent the carriage from running off the road.

The weight of neat coal, contained in the loaded boat, is about twelve tons: the boat weighs about four tons; and the carriage, or cradle, in which the boat is placed, when conveyed down the inclined plane, is about five tons:—in all about twenty-one tons.

At this inclined plane, thirty loaded boats are now let down with ease, in about eight hours; that is to say, four boats are let down in a little more than an hour. The boats used in these collieries are of different sizes and dimensions; some will carry seven, some eight and a half, some twelve tons.

The weight of neat coal, independently of the weight of the carriage and boats, which is let down the inclined plane, in twelve-ton boats, in eight hours, will consequently be three hundred and sixty tons. The weight of the carriage, suppose five tons, let down in the same time, will be one hundred and fifty tons; and the weight of the boat, suppose four tons, thirty times down, in eight hours, will be one hundred and twenty tons:—in all six hundred and thirty tons down in eight hours.

The weight of the carriage thirty times up, and thirty boats up, in eight hours, will be

Carriage, at 5 tons,	30 times up =	150 tons
Boat, at 4 tons,	30 times up =	120 tons

In all 270 tons
up in eight hours.

So that there will be 630 tons down
270 tons up.

In all 900 tons moved at the inclined plane, in eight hours, exclusive of an indeterminate quantity of materials occasionally brought up for the use of the higher level collieries.

The various feeders which are loosened by opening the coals in the higher level collieries, as well as three sufficient reservoirs, which may occasionally be reforted to, and used in a dry season, keep the higher level always to its height, and afford a constant supply of water to fill the locks; for the purpose of working the inclined plane.

This inclined plane was begun in September, 1795: it was finished, and in use, in October, 1797.

Of this, as of most of his other great works, the Duke of Bridgewater was himself the planner and contriver:—to project greatly, and to execute completely, are the perfection of genius.

The singularity of the place in which it is constructed; the original boldness of the design; the ingenuity and mecha-

nism displayed in planning and executing it; the dispatch with which it has been finished; the simplicity, beauty, and harmony of its parts, tending to one united whole; and, above all, the perfection to which it is proved to have been brought, now that it is practically in use; render it equally astonishing with any other of the stupendous works which have been so ably planned, and so successfully executed, by the first projector and patriotic father of Inland Navigation.

References to Plate 42. Fig. 1, a to b, dip of the metals and wagon-road on the under-ground inclined plane. From b, on the lower level, to the mouth of the tunnel, is three miles; A, the east lock; B, the west lock; C, represents a section of the lock: the dotted line shews the horizontal depth, and the black line under it, the slope upon which the wagon-wheels run to receive the loaded boat, or to bring the empty boat into the lock; d d, the main-shaft, four feet eleven inches diameter, upon which the ropes work to wind the boats up and down; and here also the break-wheel is fastened on, together with a spur-wheel, and a nut-wheel. See fig. 2, No. 1: e, a passage between the higher level and the locks; f, f, a loaded boat going down, and an empty boat going up the under-ground inclined plane; G, a brick wall, from the sole to the top of the inclined plane, in order to give additional support to the roof; h, h, h, h, openings through the brick wall G, into which a person may step out of the way of the boats at the time they are passing up and down; i, a bell, which is rung by the rope dotted to b, upon the lower level, at the bottom of the under-ground inclined plane, to give notice when the empty boat is upon the wagon, or cradle, and when the men below are ready, that the loaded boat may be let down by the men above; k, k, holdfast-ropes fastened to the main-ropes, and hooked on to a ring at the fourth end of each boat, as it goes up or down, in order to stay the boats upon the wagon or cradle, that they may not swing, or slip off. These holdfast-ropes are spliced on, to the end of the main-ropes, and run above and between the two bridle-ropes when they are fastened to the iron uprights, which are upon each side of the waggon, or cradles; and they run over the north end of the boat, to be hooked on to the fourth end; l, l, the bridle-ropes fastened to the main-ropes at O, and secured to two iron uprights upon each side of the wagon, or cradle; O, O, the places where the main ropes, the bridle-ropes, and the holdfast-ropes, are fastened all together.

No. 1, an open space driven into the side of the lock A, to which a pit is sunk from the higher level, in order to convey the water out of the locks down to the lower level, and also to force a current of fresh air into the lower level collieries; No. 2, a paddle to let the water out of the lock A, into the pit No. 1; No. 3, a paddle to let the water out of the lock B, through a culvert, represented by dotted lines, under the lock A, into the pit No. 2; No. 7, 7, paddles in the lock-gates, to let the water out of the higher level into the locks; No. 8, 8, the two north lock-gates, one to each lock, which turn upon the heels of the gates, and swing round when they are opened or shut; No. 10, 10, two flops or cloughs, one to each lock, which serve as lock-gates to the fourth end, and are raised and let down by a windlass; S, a flop, which is used occasionally when the lock-gates want repairing; T, the place where the boats which are to pass to or from the lower single wagon-way are directed, at pleasure, into either part of the double wagon-way, by a moveable iron sleeper or plate at that point, upon which sleeper or plate the wheels of the boat-carriage or cradle run.

Fig. 2; 1, main-shaft, on which the rope laps; 2, break-wheel, on one side of which the spur-wheel is fastened; 3, nut-wheel, out of gear, but which slides into the spur-wheel, when used to draw the empty boat into the lock occasionally.

and which is supported by two uprights from the pillar to the roof; 4, 4, winches or handles, to work the nut and spur-wheel; 5, 5, the main-ropes fastened to the boats, and which are lapped to prevent their wearing; 6, the spur-wheel, which is fastened on one side of the break-wheel; and on which break-wheel is a strong iron-jointed timber brace, which, according to the pressure given thereto by the man who attends it, will allow the loaded boat to descend quick or slow, or detain it in its passage; 7, 7, paddles in the lock-gates, to let the water out of the higher level into the lock; 8, a hollow cast-iron roller, to prevent the main-ropes from swagging; 9, shroud-wheel, to prevent the ropes going over the end of the main-shaft, slipping off, jerking, or breaking. This stands three inches above the main-shaft.

PLANIEZ, a small island of the Mediterranean, in the road of Marseilles.

PLANO, a small island of the Mediterranean, in the bay of Alicante.

PLATA, an island of Peru, on the coast of Quito, surrounded by inaccessible rocks, and about five miles long and four broad.

PLATA, a rich and populous town of Peru, capital of the audience of Los Charcos, with an archbishop's see. It is seated on the Chimao, 500 miles S.E. of Cusco. Long. 63. 40. W. Lat. 19. 16. S.

PLATA, RIO-DE-LA, a province of Paraguay, on the S.W. of a river of the same name. It is subject to Spain, and at Buenos Ayres, the capital, a new vice-royalty was established in 1776. See PERU.

PLAUEN, a town of Lower Saxony, in the duchy of Mecklenburg, seated on a small river which falls into the Elbe, near a lake of the same name, 17 miles S. of Gustrów. Long. 12. 13. E. Lat. 53. 40. N.

PLAUEN, a town of Upper Saxony, in Voigtland, seated on the Elster, 67 miles S.W. of Dreiden. Long. 12. 17. E. Lat. 50. 12. N.

PLESHEY, a village in Essex, seven miles N. by W. of Chelmsford. It was the seat of the lord high constable of England, from the earliest times of that office to the year 1400. On the site of his castle is now a brick farm-house; and here are the remains of an ancient fortification, consisting of a mound, of an oval form, surrounded by an area that contains about two acres, and is bounded by a rampart and ditch, over which is a brick bridge.

PLESSE, a town of Silesia, with a castle, seated on the Vistula, 36 miles E. of Troppaw. Long. 18. 36. E. Lat. 50. 0. N.

PLETTENBERG, a town of Westphalia, in the county of Mark, governed by its own magistracy. It is situate on the Elfe and Oesfer, 28 miles S. of Ham. Long. 7. 48. E. Lat. 51. 8. N.

PLEYBERG, a town of Germany, in Carinthia, seated on the Peitzitz, at the foot of a mountain, 25 miles E. by S. of Clagenfurt.

PLOERMEL, a town of France, in the department of Morbihan, 27 miles N.E. of Vannes. Long. 2. 30. W. Lat. 47. 57. N.

PLÖTZKAU, a town of Upper Saxony, in the duchy of Anhalt Bernberg, 24 miles W.S.W. of Dessau. Long. 11. 45. E. Lat. 51. 48. N.

PLOUGH (*Encycl.*) Under that head, and also under HUSBANDRY, we have treated fully on this invaluable implement of agriculture. It remains, however, for us to notice the following new inventions which have been since brought forward.

1. The *Kentish turn-wrepl plough* consists of an oak beam, about ten feet in length, five inches in depth, and three

n breadth; to the end of which is *tenoned a foot*, or piece of timber ($3\frac{1}{2}$ feet long, 4 inches thick, and $3\frac{1}{2}$ inches broad), that is mortised at the bottom, to the end of the *chep*. The handles are fixed on the top of the beam, through which, at the distance of two feet five inches from the foot, is passed a *sheath* of oak, seven inches in width, and an inch and a half thick, being mortised into the chep in an oblique direction, so that the point of the share will be two feet ten inches asunder from the beam. The *chep* is five feet in length, four inches in width, and five deep: to this is fixed the share, which weighs about 32 lbs. and is manufactured of hammered iron, being one foot eight inches in length, and from four and a half to seven inches wide at the point. The upper end of the beam is supported on a carriage, furnished with two wheels, that are three feet two inches in height; on the axle-tree of which a gallows is placed, and provided with a sliding bolster, for the purpose of raising or lowering the machine. A clasp-iron likewise enters through the axle, to which a frog chain, or a tow passing over the beam, is fixed in such a manner, that the plough may, by means of notches, or a pin known under the name of a *check*, be let out to a greater length from the axle; and will consequently penetrate more deeply into the earth.

We have been induced to give this description of the Kentish Plough, because it is an instrument of great strength, and eminently calculated for rocky and hilly countries, as it turns the soil to a considerable depth, laying it perfectly level, without making any furrow, or opening; a circumstance of equal advantage and importance, in dry situations.—The price of the whole, with its tackle complete for drawing, is computed to be about five guineas.

2. A valuable implement has very lately been introduced into the county of Lancaster, by Mr. Duckett, jun.—It is denominated a *Trench-plough*, and furnished with two shares, one being directly over the other, so that one narrow superficial furrow may be drawn from the surface of the soil, while another, at a moderate depth, is taken off beneath. This machine is well adapted for ploughing in green crops, or long dung, by way of manure; and, if the surface of the soil be *fowl*, it may be turned under, and fresh soil brought up, from the depth of 10 inches, by employing three horses. The earth being thus loosened, the roots of plants are enabled to strike downwards without any impediment; and, while the land is drained, and exposed to the influence of the air, it is thereby considerably improved.

3. The *Scalp-plough*, or *Extirpator*, as it is generally termed, was lately invented by Mr. Hayward, of Stoke-Ath, in the county of Suffolk. Its beam is seven feet in length, and is furnished with two handles. The shares are eight inches broad, nine in length, and are fixed to *stalks*, about ten inches in height, and eleven inches asunder. This implement may be adapted to the wheels of a common plough, and will penetrate the soil to a greater or less depth, in a similar manner. The object of this contrivance is, the eradication of weeds, and the clearing of ploughed lands for seed; in which respect it is said to be more serviceable than any other instrument. Before the extirpator is employed, the soil ought to be once ploughed; and, if it have lain fallow during a summer, the scalp is passed over it twice; namely, the first time about two inches deep, and the next, in a transverse direction, at the depth of about four inches. This operation, together with harrowing the ground once, will not only destroy all weeds, but will pulverize and prepare the soil for the reception of seed, whether drilled, or broad-cast. Further, if lands, intended for the production of spring-crops, be ploughed in autumn, and the extirpator be afterwards passed over them, they will be rendered fit for immediate sowing.—

This machine may be drawn either by two or by three horses, according to the nature of the soil, and the depth required: it possesses the peculiar advantage, that it may be worked on all arable lands, by any person capable of directing a plough, and that it will turn over an acre of ground, in one hour, without fatiguing either horses or oxen.—Should the soil, however, be overrun with weeds, it will be advisable to plough it with the scalp, twice; and, in some cases, three times; a short space being allowed to intervene, with a view to deprive the weeds of their vegetating power.

4. Among the most valuable implements that have, within a few years, been constructed and adopted in this country, is the *Beveridge-plough*, designed, or at least improved, by the ingenious Mr. Lewin Tugwell, of Beveridge, in the county of Gloucester. See Pl. 43.

In the Domestic Encyclopedia, are given the following dimensions of this useful plough:

	Feet.	Inches.
A to B	2	4
A - C	2	5
C - D	1	4
D - E	2	5
Diameter of the wheel	1	9
D to F	0	11
G - H	0	10 $\frac{1}{2}$
E - I	1	3 $\frac{1}{2}$
K - L	0	9
Breadth at the heel	0	9
Breadth of the fin	0	7
Top of beam at the heel to the ground	0	8 $\frac{1}{2}$
The mould-board projects at the top more than the breadth at the heel	0	6
1 to 3	6	0
3 - 4	3	8
3 - 5	4	3
5 - 6	2	5
7 - 6	2	8
1 - 3	1	5
1 - 8	2	10
1 - 9	4	8
From the heel to the tuck-hole of the share	2	6 $\frac{1}{2}$
From the tuck-hole to the point of the share	0	8 $\frac{1}{2}$

This excellent machine, which considerably varies from the Rotherham, and other valuable ploughs, gained the prize at the *ploughing-match* in 1798, held near Pipers-Inn, Somersetshire, under the patronage of the Bath and West of England Society. It may be easily worked by a pair of oxen, without a driver; and, on account of its simplicity, we believe that the representation given in Pl. 43. will be sufficient to guide a skilful carpenter in the construction of a similar implement.

5. The *double or two-furrow scing and wheel-plough*, demands the attention of every enlightened agriculturist: we have therefore subjoined a representation in the plate, copied from the 2d vol. of *Communications to the Board of Agriculture*.

This machine, we understand, was originally invented by Mr. Duckett, but has lately been materially improved by the patriotic Lord Somerville. The construction of the beam is nearly the same as that of the Beveridge Plough; which his lordship (in his Address to the Board, in 1798) acknowledges to have adopted, from a consciousness of his inability to substitute another more adapted to the purpose. The chief and most important improvement relates to the mould-board, one end of which was formerly cut off; and the deficiency supplied by driving in wedges, to the consequent injury of the mould-

plate. As this expedient, however, was attended with much trouble, it was generally omitted; and, consequently, the land imperfectly tilled. With a view to remedy such inconvenience, Lord S. proposes (after the mould-board is formed, and the plate is fitted in the usual manner) to cut off the parts marked *a, a*, in the delineation before communicated, and to connect them again with the fixed part of the board, by means of flat hinges, or of thin, flexible plates of hard-hammered iron; so that those parts may be easily set to have different inclinations with such fixed part, by the aid of two screws that pass from the inside through the lower parts of the handle of the plough, opposite to the backs of the moveable pieces *a, a*. The screws, he observes, may be so regulated as to keep such pieces at any degree of inclination that may be required, according to the nature of the land intended to be broken up.

The two-furrow plough is best adapted to light and level soils, particularly for stirring *ley-grounds*; and, as these cannot be laid too flat, or *seed-earths* be turned too much on an edge, the plough may be adapted to either purpose with the utmost facility, by this improvement of the mould-board. When the moveable parts, above alluded to, are screwed outwards, a proportionate convexity or elevation will be left at the base of the furrow; and thus more earth will be exposed for covering the seed. Lastly, as the part of the mould-plate, marked with the dotted lines *C, C*, is most liable to wear off by repeated friction, Lord Somerville directs it to be made twice as thick as the other parts of the plate; viz. double the thickness of a new crown-piece, or about one fourth of an inch; in which case it will remain unimpaired, nearly as long as the whole of the machinery.

The chief improvement made by Lord Somerville, being in the mould-plate of his useful plough, we have engraved two figures, representing its internal structure, in different points of view, by which its mechanism may be more clearly understood. See fig. 2 and 3 in the plate.

a, a, *a*, are the screws that advance or withdraw the moveable mould-plate; *b, b*, the moveable plates; *c, c*, ribs, which serve to strengthen the plates; *d*, grooves, sunk in the mould-board for the reception of the ribs, when the mould-plate is withdrawn.

Lord S. observes, that "the principle of this moveable plate may not at first catch the attention of every reader;" but it deserves to be generally adopted, and has indeed met with strong advocates in ploughmen; for it not only relieves their right arm of considerable labour, that must otherwise be performed in wedging and hammering mould-plates; but much exertion is also saved to the right leg, in attempting to tread those furrows flat, which had been left on an edge by the plough. Lastly, these plates are indispensably necessary, in order to qualify two-furrow ploughs for all *broad* work, and particularly breaking up leys; and such implements ought (in the technical phrase) *to work on their own base, close at heel*; or otherwise the furrow will be irregularly laid; and they will be immediately "thrown out of work."

Before we conclude the account of this valuable contrivance, it is but justice to state the result of a trial made at Kew, in March, 1799, on His Majesty's farm, in consequence of a challenge given to Lord Somerville. The quantity of land, till then in a state of nature, amounted to 17½ statute acres, and was worked by this implement, four Devonshire oxen (six years old), and a man, with a boy as drivery, in six days and four hours. The cattle were in good condition when they commenced the task; after the accomplishment of which, they appeared in better order than before. They were allowed no corn; consumed every day, upon an average, about 40 lbs. of hay, during their continuance at Kew; and worked eight hours each day including half an hour for bait.

The land, thus tilled, was viewed by many gentlemen and able agriculturists, who highly approved of it, and were induced to order numbers of these ploughs; which, we trust, will soon be generally adopted.

The two-furrow plough has, indeed, been introduced into some of the midland counties, where it is employed with five horses and one man, in tolerably level soils, which it divides as effectually as two single ploughs. It is also used, together with the single-wheel plough, in Staffordshire; as it requires only a lad to drive the horses, and to turn the plough at the end of the furrow. For breaking up the turf, an iron *flay* is screwed to the coulter; by which the sward is cut off, and turned into the furrow, so as to be covered with earth. Thus, by the aid of an additional horse, the soil will resemble a fallow, and may be harrowed with equal facility.

6. The latest British plough, which merits particular notice, is that invented by Mr. J. Turner, jun. of Bockleton, Warwicks; and of which the figure in the plate will convey an accurate idea.

A, is the iron at the end of the beam, to which the horses are hooked; and which is called, in Staffordshire, the *buck*; in the county of Worcester, the *ear*; *B, B, B, B, B*, the beam; *W, W, W, W, W*, a strong piece of wood, denominated by the inventor a *wing*, that projects in the middle; and in which one of the coulters, *C*, is fixed. This piece of timber is fastened, at a proper distance from the *ear*, to the side of the beam, by means of long screws passing throughout the latter; with the opposite side of which they connect another wing, containing a second coulter, likewise marked with the letter *C*. These two coulters are placed in a parallel direction, and are both strengthened with a piece of iron, called the *flay*; one end of which is fixed about two inches beneath the wing, and the other is inserted in the wing itself. *F*, represents the whole *flay* of the coulter *C*; and *f* delineates part of the other coulter *C*; *T*, denotes part of the *drock*, a piece of wood, that forms the lower extremity of the plough; and which is about six inches in width, three in depth, and rather more than two feet in length. To the top of the *drock* is fastened an erect piece of timber, known by the name of *spindle*, *M, M*; and behind which are two tails, *D, D*. To the upper end of the spindle *M*, is fixed the beam *B*, the end of which is fastened between the tails, by means of an iron pin; *P, I*, and *P, R*, are two *shelve-boards*, combined with the *drock* and spindle; and which meet at the angular point *P*. The ends of both these boards are strengthened by means of a short wooden *flay*, that is fixed in them, as well as in the tails; *g*, represents this *flay*; *K*, a coulter fastened to the plough-share *S*, and which is bent at the end, in order that it may be more easily admitted through a hole in the beam, behind the two coulters *C, C*, when the share is put on the end of the *drock*.

The object of this contrivance is the formation of small drains or gutters in meadows, and pasture-land, with a view to carry off stagnant waters; which, by remaining on the surface, materially injure the soil. To adjust the plough for work, a mark is first made in the middle of that end of the *drock* which is contiguous to the tails; when a straight line is traced on a level spot of ground, on which such mark and the point of the share are put, and made to coincide. Next, the fore-coulters must be equidistant from the line; then let the dotted line, *b, y, p, n*, represent a straight line made on level ground; *p*, the point of the share *S*; *m*, the middle point of the end of the *drock* *T*; and, if *m* and *p* correspond with the line *b, y, p, n*, *x, y*, and *d, d*, will describe the distance from each of the fore-coulters.

The most effectual method of working this plough is, in the opinion of its inventor, to fasten a chain round the axle-

tree of a pair of cart-wheels (the body of which has been taken off); to hook such chain to the ear A, at the end of the beam; and, by lengthening or shortening the chain, this machine may be so regulated as to penetrate the soil to a greater or less depth, according to the nature of the ground. When the plough is at work, the fore-coulters C, C, cut the outside of the gutter.—K, the coulters, divides the ground exactly in the middle: the further shelve-board throws out half the soil on one side, while the near shelve-board removes the other half to the opposite side; and thus a complete gutter is left, which extends from eight to ten inches in width, and is from six to eight inches deep.

One of the most important advantages resulting from this invention, is the saving in manual labour, which is computed at *three-fourths*; as 400 perches of land may thus be drained in one day, by a team of five horses, two drivers, and a holder; the expence of which, the inventor calculates at 16s.; whereas, if the same quantity of land were to be dug by *hand*, the cost would amount to 3l. 6s. 8d.

Mr. Turner's plough may be applied to another valuable branch of agriculture; namely, the *planting of potatoes*. His method is as follows: First, trenches are made with the machine, at the distance of about two feet from each other; and in which the potatoes are set. Some manure is next spread on them in such trenches, and they are covered by drawing the plough through the intermediate spaces; so that each trench is filled by a ridge of soil. When the growing potatoes require an additional covering of mould, the weeds are previously cut, either by a hoe or weeding-hook; and, the two fore-coulters being taken off the plough, the implement is drawn between the ridges; it throws up an additional portion of soil upon them; and thus expeditiously effects the operation of *moulding*.

Beside these, now described, several other ploughs have been contrived for particular purposes; but, having already given an account of the most valuable improvements, under the heads of *DRAINING, DRILLING, &c.* we shall refer the reader to a description of M. Simonde's *Tableau de l'Agriculture Toscane*, for an account of two ploughs, used in Tuscany, and in other parts of Italy, which, from the simplicity of their construction, deserve to be generally known in Britain.

PLUDENTZ, a town of Germany, in the Tyrol, capital of a county of the same name. It is seated in a pleasant plain, on the river Ill, 65 miles W. of Inspruc. Long. 12. 10. E. Lat. 47. 10. N.

P. UVIERS, or **PITHIVIERS**, a town of France, in the department of Eure and Loire, 20 miles N. of Orleans. Long. 2. 0. E. Lat. 48. 14. N.

PLYMOUTH DOCK, a town in Devonshire, contiguous to the royal docks in the harbour of Hamoaze, at Plymouth. It has a chapel in the dock-yard, and a church about a quarter of a mile from the town. The royal hospital is situate on the right, on an elevated spot that is favourable to a supply of wholesome air; and on the left is the governor of Plymouth's house, overlooking the harbour from a rocky eminence, which is fortified with some regular works for the defence of the dock-yards.

PLYNLIMMON HILL, a vast and lofty mountain of Wales, partly in Montgomeryshire, and partly in Cardigan-shire. The Severn, the Wye, and other rivers, have their source in this mountain.

PO, a river of China, in the province of Kiang-si. It empties itself into the lake Poyang-hou, a small distance from Jaocheou-fou.

POCKLINGTON, a town in the E. riding of Yorkshire, with a market on Saturday; seated in a stream that falls into

the Derwent, 14 miles E. of York, and 196 N. by W. of London. Long. 0. 40. W. Lat. 53. 58. N.

PODENSTEIN, a town of Franconia, in the bishopric of Bamberg, seated among forests, near the source of the Putlach, 30 miles S.E. of Bamberg.

PODOLSK, a town of Russia, in the government of Moscow, 28 miles S. of Moscow. Long. 37. 29. E. Lat. 55. 16. N.

PODOR, a fortress of Africa, on the river Senegal, built by the French, but ceded to the English in 1763. It was afterward retaken by the French, and confirmed to them by the peace of 1783.

POGGIBONZI, a town of Tuscany, famous for its excellent tobacco. It had a citadel, now in ruins; and is seated near the Elsa, 16 miles S. of Florence.

POGGIO, a town of Tuscany, near Florence, famous for a handsome palace of the great duke.

POIRINO, or **POVERINO**, a town of Piedmont, 15 miles S.E. of Turin.

POISONS (*Encycl.*). Under that article, we have noticed various vegetable substances of a poisonous nature, and under **EARTH-NUT**, in this Supplement, have alluded to some instances in which a root, resembling the latter in its external form, was eaten by mistake, and proved fatal. The reference, in the latter, should have been to the article **OENANTHE**, *Encycl.*

POISSY, an ancient town of France, in the department of Seine and Oise, seated near the forest of St. Germain, 15 miles N.W. of Paris. Long. 2. 12. E. Lat. 48. 56. N.

POL, St. a town of France, in the department of the Straits of Calais. It is noted for its mineral waters, and is 16 miles N.W. of Arras.

POLA, an ancient and strong sea-port of Italy, in the S. part of Istria, with a citadel, and a bishop's see. Here are the ruins of a Roman amphitheatre and a triumphal arch. It is seated at the bottom of a bay, and has a spacious harbour, 80 miles S.E. of Venice. Long. 14. 9. E. Lat. 45. 13. N.

POLACHIA, or **PODLACHIA**, a palatinate of Poland, 89 miles long, and 30 broad; bounded on the N. by Prussia and Lithuania, on the E. by Lithuania, on the S. by the palatinate of Lublin, and on the W. by that of Malovia. Bialsk is the capital.

POLIGNANO, a populous town of Naples, in Terra di Bari, seated on a bishop's see. It is seated on a craggy rock, near the sea, 16 miles E. of Bari. Long. 17. 24. E. Lat. 41. 25. N.

POLIGNI, a town of France, in the department of Jura, seated on a rivulet, 32 miles S.W. of Belançon. Long. 5. 55. E. Lat. 46. 50. N.

POLINA, an ancient town of Albania, with a Greek arch-bishop's see. It was formerly a considerable place, but is now almost in ruins, and is 12 miles S. of Durazzo. Long. 19. 20. E. Lat. 41. 42. N.

POLITZ, a town of Upper Saxony, in anterior Pomerania, near the Frisch Hoff, celebrated for its hops. It is eight miles N. of Stetin.

POLLOCKSHAW, a manufacturing town in Renfrewshire, seated on the river White Cart.

POLORE, a town of Hindoostan, in the Carnatic, 26 miles S.S.W. of Arcot, and 55 N.W. of Pondicherry. Long. 78. 52. E. Lat. 12. 10. N.

POLOTZK, a government of the Russian empire, formed of part of a palatinate of Lithuania, dismembered from Poland by the treaty of partition in 1772. Its products are chiefly grain, hemp, flax, and pasture; and the forests furnish

Lord Somerville's Two-Furrow Plough.

Fig. 3.

Beverstone Plough.

M^r Turner's Plough.

great abundance of masts, planks, oak for ship-building, pitch, tar, &c., which are chiefly sent down the Dwina to Riga.

POLOTZK, a strong town of Russia, capital of a government of the same name, seated on the Dwina, at the mouth of the small river Polota, 50 miles S.W. of Vitepsk. Long. 27. 50. E. Lat. 55. 43. N.

POLTEN, Str. a town of Lower Austria, seated on the Draava, which falls into the Danube, near Hohenburg, eight miles from Vienna.

POMBAL, a town of Portugal, in Estremadura, 16 miles N.E. of Leiria, and 21 S. of Coimbra. Long. 8. 16. W. Lat. 39. 50. N.

POMEGUE, an island in the Mediterranean, near Marseilles.

POMERELIA, a district of Polish or Western Prussia, forcibly seized by the King of Prussia. Dantzic is the capital.

POMESANIA, a large county of Western Prussia, which extends from E. to W. from the Passarge as far as the Vistula, between E. and W. Prussia. It is full of lakes and morasses.

POMONA, the principal of the Orkney Islands. See **MAINELAND**.

POND (*Encycl.*). In the first vol. of the Journal de Physique, we meet with an interesting method of making ponds water-tight, without the aid of masonry, by M. Dambourney. He directs the pit to be dug to a convenient depth; and its sides to be carefully sloped to an angle of about 40 degrees. The cement with which it is to be lined, should then be prepared in the following manner:

A sufficient quantity of brick-clay ought previously to be procured, in a moist state, so that it may be easily worked and incorporated with one-fourth part of quick-lime, slaked the preceding evening, in such a portion of water, as will reduce it to the consistence of cream-cheese; and the whole must be formed into balls, about two feet in circumference. When an adequate stock is collected, the workman descends into the cavity, and an assistant supplies him with a ball, which the former throws with all his strength on the ground, near the centre of the pit: thus, he continues the plastering with other balls, in such a direction that each may come in contact with the next following, till the sides and bottom of the intended pond are perfectly lined. If the whole cannot be finished in one day, the last row laid on in the evening should be moistened, in order that it may be sufficiently adhesive to incorporate exactly with the new part of the work on the subsequent morning. Two or three days after this composition is applied, it should be beaten with a flat piece of wood; and, accordingly as its firmness increases, the beating must be stronger, and the surface occasionally wetted, to prevent cracks, till it become one uniform, solid piece. Lastly, the whole is to be covered with a coat of any cheap oil; and (previously to the admission of water) with gravel, to the thickness of one inch. By this management, the coating will acquire a very remarkable degree of firmness; and, if the pond be constantly full, no repairs will become necessary; as the only injury to be apprehended, may proceed from intense frost, which is apt to damage such parts of the work as are exposed to the air.

In the sixth volume of Annals of Agriculture, an account is given of a simple method of making artificial ponds, in dry soils:—the figure given in Pl. 42. represents an outline of their construction.

The line A describes a circular hole made in the ground, of such size as may be found necessary; and on which a stratum of clay, B, must be carefully beaten, and trodden into a solid, compact body, from four to six inches in thickness; C, represents a layer of quick lime about an inch, or an inch and a half thick; and which should be uniformly spread over the

whole; D, is a second stratum of clay, that ought to be of a thickness similar to that above mentioned, and should be pressed down in the same manner; E, denotes stones, or gravel, either of which must be spread on the second layer of clay, to such depth as may prevent the pond from being injured by the feet of cattle; for otherwise, they will penetrate the stratifications of clay and lime; in consequence of which, the water will be discharged through the pores of the earth. When thus completed, according to the section above given, the pond will remain five feet deep, and forty-five in diameter; at which size these reservoirs are in general constructed; the letter F, representing the line of level, both of the water and of the ground.

This method of forming ponds was contrived in Yorkshire, about 25 or 30 years ago, by a well-sinker: numerous artificial pools have since been made in that, as well as the adjoining counties. The expences attending a work of the dimensions above stated, are computed to be from 4l. to 6l. according to the distance from which the clay is carried. Such a pond will remain unimpaired for a series of years; because the lime prevents worms from striking either upwards or downwards, and consequently from injuring the clay, which naturally refits moisture.

PONDESTURIA, a town of Italy, in Monterrat, seated on the S. side of the Po, 33 miles E. of Turin. Long. 8. 25. E. Lat. 45. 2. N.

PONFERRADA, a town of Spain, in Leon, on the river Sill, 40 miles S.W. of Leon. Long. 6. 6. W. Lat. 42. 30. N.

PONS, Str. a town of France, in the department of Herault. It was a bishop's see before the revolution, and is seated in a valley surrounded by mountains, in which are fine marble quarries. It is 24 miles N. of Narbonne. Long. 2. 47. E. Lat. 43. 29. N.

PONTA DELGADA, a sea-port of St. Michael, one of the Azores. It is defended by a citadel; and contains about 8,000 inhabitants. Long. 25. 40. W. Lat. 37. 45. N.

PONTA-MOUSSON, a considerable town of France, in the department of Meurthe, with a university. There were lately several religious houses, and the premonstratens had a magnificent church here. It is seated on the Moselle, which divides it into two parts, two miles N.W. of Nancy. Long. 6. 16. E. Lat. 48. 43. N.

PONT-ARLIER, an ancient town of France, in the department of Jura, seated on the river Doubs, near Mount Jura. It is a commodious passage into Switzerland, and is defended by a strong castle. Long. 6. 26. E. Lat. 46. 55. N.

PONT AUDEMER, a town of France, in the department of Eure, seated on the Rille, 13 miles E. of Honfleur, and 85 N.W. of Paris. Long. 0. 35. E. Lat. 49. 21. N.

PONT-DE-CE, a town of France, in the department of Maine and Loire, seated on the Loire, three miles from Angers, and 178 S.W. of Paris. Long. 0. 29. W. Lat. 47. 25. N.

PONT-DE-LARCHE, a town of France, in the department of Eure, with a castle. It is seated on the Seine, over which is a bridge, five miles N. of Louviers, and 62 N.W. of Paris. Long. 1. 15. E. Lat. 49. 5. N.

PONT-DE-VAUX, a town of France, in the department of Ain, seated on the Reffouille, 8 miles S. of Macon. Long. 4. 55. E. Lat. 46. 28. N.

PONT-DU-VESLE, a town of France, in the department of Ain. It has a manufacture of stuffs called Augustines, and also of tapestry for the coverings of arm-chairs and sofas, of the same kind as those of Ambouss. It is seated on the Vesle, 12 miles W. of Bourg. Long. 5. 4. E. Lat. 46. 16. N.

PONTE-DE-LIMA, a town of Portugal, in Entre-Douero-e-Minho, with a palace. It is seated on the Lima, over which is a magnificent bridge, 13 miles N.W. of Braga, and 190 N. of Lisbon. Long. 8. 44. W. Lat. 41. 51. N.

PONTEFA, or **PONTAFELLA**, a town of Germany, in Carinthia, seated on the Fella, over which is a bridge that leads to the best passage over the Alps. It is 20 miles N.W. of Friuli. Long. 13. 0. E. Lat. 46. 25. N.

PONTE-STURA, a town of Italy, in Monterrat, seated at the confluence of the Stura and Po, three miles S.W. of Casal.

PONTE-VEDRA, a town of Spain, in Galicia, seated on the Leris, and famous for its fishery of pilchards. It is 10 miles E. of Porto Nova. Long 8. 27. W. Lat. 42. 20. N.

PONT-GIBAUT, a town of France, in the department of Puy de Dome. Near this place is the village of Rore, with a silver mine, and a vinous fountain of mineral water. It is 10 miles W.N.W. of Clermont. Long. 2. 58. E. Lat. 45. 51. N.

PONTIVY, a town of France, in the department of Morbihan, seated on the river Blavet. It was the first town after the revolution of 1789 that set the example of national federations.

PONT-LEVEQUE, a town of France, in the department of Calvados, seated on the Touque, 10 miles N.W. of Liseux. Long. 0. 6. E. Lat. 49. 17. N.

PONTOISE, a town of France, in the department of Seine and Oise. It is seated on an eminence, on the Oise and Vienne, with a bridge over the former, whence it takes its name. In 1435, the English took it by a singular stratagem: the ground being covered with snow, the assailants dressed themselves in white, with ladders painted white, and scaled the walls before the sentinels could perceive their approach. Charles VII. retook it by storm in 1442. The parliament of Paris was transferred to this place in 1652, 1720, and 1753. It is 43 miles S.E. of Rouen, and 27 N.W. of Paris. Long. 2. 11. E. Lat. 49. 3. N.

PONT-ORSON, a town of France, in the department of the Channel, seated on the Coesnon, 20 miles E. of St. Malo. Long. 1. 30. W. Lat. 48. 30. N.

PONT-REMOLI, a town of Tuscany, with a strong castle, seated on the foot of the Apennines, 40 miles E. of Genoa, and 66 N.W. of Florence. Long. 9. 40. E. Lat. 44. 25. N.

PONT ST. ESPRIT, a town of France, in the department of Gard. It is seated on the river Rhone, over which is one of the finest bridges in Europe, consisting of 19 great and 4 small arches. To facilitate the passage of the water in time of floods, apertures are made through each pier, six feet above the common level of the river; and to stem the extreme rapidity of the Rhone, the bridge is not built in a right line, but in the form of a curve. This passage is defended by a citadel, within which is the church of the Holy Spirit, projecting into the river. As the bridge is so slight, the goods are conveyed over in sledges, by way of precaution. Pont St. Esprit is 17 miles S. of Viviers, and 55 N.E. of Montpellier. Long. 4. 46. E. Lat. 44. 13. N.

PONT ST. MAIXENCE, a town of France, in the department of Seine and Oise, seated on the Oise, five miles N. of Senlis. Long. 2. 40. E. Lat. 49. 18. N.

PONT-SUR-SEINE, a town of France, in the department of Aube, with a castle, seated on the Seine, 17 miles N.W. of Troyes, and 55 S.E. of Paris. Long. 3. 40. E. Lat. 48. 28. N.

PONT-SUR-YONNE, a town of France, in the department of Yonne, seated on the Yonne, eight miles N.W. of Sens. Long. 3. 14. E. Lat. 48. 16. N.

PONZONE, a town of Italy, in the duchy of Monterrat, 10 miles S. of Acqui, and 18. N. of Savona. Long. 8. 35. E. Lat. 44. 30. N.

POOLORON, or **POLERON**, one of the Banda Islands, from which the Dutch expelled the English, not for any advantage it afforded, it being a barren spot, but to secure the monopoly of the spice trade, by preventing the English from having any settlement in these parts. It is 100 miles S.E. of Amboyna. Long. 130. 0. E. Lat. 4. 20. S.

POOLWOY, one of the Banda Islands, on which the Dutch have a regular pentagon, called Fort Revenge. Here nutmegs and the most delicious fruits were once abundant.

POONAH, a town of the Decan of Hindoostan, in Vissapour. It is the capital of the Western Mahratta empire; but it is not large, and lies open and defenceless. It is 100 miles S.E. of Bombay. Long. 73. 55. E. Lat. 18. 30. N.

POOR (*Enyel.*). The comforts of the poor lie within a small compass: they should therefore be respected. Mere animal existence is not sufficient for rational creatures. To sweeten the cup of life, to soothe pain, and to relieve labour, man must enjoy comfort here, and his views must be directed to happiness hereafter.

One great source of comfort to the poor man is, his wife and children, if he can but earn means of maintaining them. Humble and insignificant as he may appear abroad, he is of consequence and authority at home. In his own house he finds those who respect him, who obey him; those, to whom he may say, Go, and they go, and Come, and they come. He is not insensible to the charities of father, son, and husband. The parental affection of the poor is increased by imperious necessity, and by the helpless condition of their offspring. When sick and dispirited, it is to them the greatest of comforts to be attended by those who love and regard them;—by those who have an interest and anxiety in their existence. In times of sickness and distress, the stoutest heart may be overcome by the forcible separation of husband and wife, of parent and child; whose mutual attachment (even if humanity could for a moment be silent on so interesting a subject) it would be policy to encourage, as an incentive to virtue, and a surety for conduct.

The poor man, poor as he is, loves to cherish the idea of property. To talk of my house, my garden, my furniture, is always a theme of delight and pleasure. When, therefore, his whole domestic establishment is overwhelmed and destroyed by a removal to the workhouse, can we wonder that he should grieve for the loss of those things, which by use were become precious to him? The apartments of the workhouse may be better than his cottage; but he does not like to exist as a mere lodger, or a permitted guest, though in a finer mansion than his own. The diet of the workhouse may be more wastefully abundant, than any which he possesses or even desires at home; but his cottage diet, though poor and scanty, is his own; he has earned it by his labour; and it is sweeter to him than more costly food, which he is taught to consider as gratuitous and unmerited. His pauper's coat is warm; but it belongs to the community, and not to himself.—And are not these prejudices respectable? Are they not consonant to the energy of a free country?

The poor man is reconciled to poverty, by the possession of liberty. However pressed by narrowness of circumstances,—however impelled by necessity to labour, yet still it is one of his comforts and pleasures, that he is free;—that he may go out or come in, work or play, at his own option. He likes to be the judge of his own wants, and to provide for them after his own manner. He even chooses to have the free and unmolesed determination, whether he shall boil or bake his Sunday's dinner. Under confinement he can enjoy no

comfort; the very thought of being under lock and key is hateful to him: no man, in his opinion, deserves a prison, who has not committed a crime. To be of little consequence in the community, to have no authority beyond the narrow limits of his own cottage and garden, he is reconciled to. Habit, a second nature, has made him easy under it; but he has an unconquerable aversion to arbitrary rule being exercised over all his actions. And is it in England that one would wish to extinguish these feelings?

Some part of the poor man's comfort (often, it must be acknowledged, more than his true friends would wish) is placed in social enjoyment. When, however, the labourer does not carry this indulgence to an excess prejudicial to his own happiness, or to that of his family, who will not say, "Much good may it do him?"—If, after his week's labour, he should love to relax a little in that place which affords "an hour's importance to the poor man's heart," the gratification cannot be very blameable while it does not pass the bounds of discretion. The evening chat at a neighbour's door, the Sunday's church-yard politics, the holiday festivities, the ruffic games, and athletic exercises, are as welcome to the cottager, and afford as much relief after care and labour, as the more costly and fashionable amusements of the rich*. To get drunk, to squander at an alehouse what ought to maintain his family, is worse than wrong or imprudent:—it is unjust and wicked. In this world, it causes the ruin of those who depend upon him, and who look up to him for subsistence;—of that wife, and of those children, to whom he should be attached by every tender tie:—and, as to the next world, we read in holy Scripture (and, "God is not a man, that he should lie") the drunkard shall not inherit the kingdom of God.—If, however, you with the cottager to be more domestic, and thereby to become more happy, aid and encourage him in the comfort and cleanliness of his little mansion;—give him pleasurable occupation at home, in the care of his pigs and cow, and in the cultivation of his garden;—assist him in the education of his children, and in the habits and resources of life. When more interesting objects present themselves at home, the alehouse will soon be forgotten and neglected. Many in all ranks of life take refuge in a public-house, for want of satisfactory occupation at home.

Lastly, the great and essential comfort of the poor, and particularly in old age and in sickness, is religion. In labour and fatigue, in sorrow and anxiety, it is most consoling to the afflicted mind to look up with habitual hope and gratitude to that Being, whose tender mercy is over all his works. It is by confidence in his wisdom and goodness, and by the hope of unfailling happiness hereafter,—by these consolations delivered to us in his revealed will,—and by these only,—that the rugged path of life can be smoothed, the crooked ways of man be made straight, and the rough places plain. It is, therefore, of infinite consequence that the poor should have the full benefit of religion; that they should be taught, in the sanctuary of God, the use of those gradations of rank and wealth, which in infinite wisdom he has thought fit to establish in this transitory life, as stimulants to the industry and energy of man;—and that he should be instructed to look forward to that blessed state, where "they shall hunger no more, neither thirst any more; neither

shall the sun light on them, nor any heat. For the Lamb which is in the midst of the throne shall feed them, and shall lead them unto living fountains of waters: and God shall wipe away all tears from their eyes."—To the aged this comfort is of peculiar importance. At a time, when the power of labour and activity is enfeebled, and the gratification of the senses diminished and exhausted, it is, indeed, true charity to give the poor the advantage and comfort of religious meditation; and to open their eyes, and raise their hopes, to those scenes of bliss, which become brighter, and more enchanting, as we approach the confines of the grave.

Health of the Poor. Under the article *GOLDEN-RULES* (*Suppl.*) will be found some valuable admonition to the poor on the subject of domestic economy. The following extract from a paper written by Dr. Ferriar, of Manchester, contains very useful information for the preservation of their health, particularly in manufacturing and other populous towns.

Avoid living in damp cellars: they destroy your constitutions, and shorten your lives. No temptation of low rents can counterbalance their ill effects. You are apt to crowd into the cellars of new buildings, supposing them to be clean. This is a fatal mistake. A new house is always damp for two years, and the cellars, which you inhabit under them, are generally as moist as the bottom of a well. In such places, you are liable to bad fevers, which often throw the patient into a decline; and you are apt to get rheumatic complaints, that continue for a long time, and disable you from working.

If you cannot help taking a cellar, be attentive to have all the windows put in good repair before you venture into it; and, if possible, get it white-washed. If you attempt to live in a cellar with broken windows, colds and fevers will be the certain consequences.

In many parts of the town you sleep in back rooms, behind the front cellar; rooms, which are dark, and have no proper circulation of air. It would be much more healthy to sleep in the front part: at least, when you have large families, which is often the case, you ought to divide them, and not crowd the whole together in the back cellar.

Keep your persons and houses as clean as your employments will permit: and do not regret the loss of an hour's wages, when your time is occupied in attending to cleanliness. It is better to give up a little time occasionally in order to keep your houses neat, than to see your whole family lying sick, in consequence of working constantly, without cleaning. It would be of great service, if you could contrive to air your beds and bed-clothes out of doors, once or twice a-week.

Always wash your children from head to foot with cold water, before you send them to work in the morning. Take care to keep them dry in their feet, and never allow them to go work, without giving them their breakfast, though you should have nothing for them but a crust of bread, and a little water. Children who get wet feet, when they go out early fasting, seldom escape fevers or severe colds.

If you know that any of your neighbours are in a starving condition, apply to some opulent persons in the neighbourhood; get them recommended to the overseer; or, if they are sick, to the infirmary. Want of necessary food produces bad fevers; and many of you may suffer from

* Much of the preceding part of this paper is taken, though with variation and addition, from *Observations on the Rights and Comforts of the Poor*, inserted in the *Gentleman's Magazine* of the year 1787. It is submitted to the reader, with a view of suggesting to his mind, how greatly the present mode of (what is called) Relief, viz. the removal of the cottager's family from his own dwelling into a parish workhouse, is inimical to the comfort of the poor, and destructive of those feelings, and of that energy, among them, which it is our duty and interest to preserve in full force.

neglecting poor distressed persons, whom timely relief would have preserved from the disease.

Therefore when you know, or have reason to believe, that any of your neighbours are afflicted with fevers, and that they have not taken care to procure the assistance afforded by the infirmary, you ought, both from a regard to them, and to yourselves, to give immediate information.

You ought to be very cautious in purchasing old clothes, or second-hand furniture; as they may be brought from houses infected with fever; and you may introduce the infection with them into your own dwellings. Every article of this kind ought to be stove, or ventilated, before it is admitted into your houses.

Your sick neighbours, when the fever gets into their houses, may often require assistance from you. It would be cruel to refuse them, yet it is hard that you should be obliged to expose your health, and that of your family. You ought never to visit them from idle curiosity. But when they require your help in making their beds, washing, or turning the sick, you may preserve yourselves from being infected (see *FEVER, Suppl.*) by tying a kerchief across your face, just below the eyes; to prevent the exhalations, from the bodies of the sick, from entering your mouth and nostrils. As soon as you return to your own house, wash your hands and face in cold water; and avoid touching any of your family for half or three quarters of an hour.

Your health will always be materially injured by the following circumstances:—living in small back buildings, adjoining to the open vaults of privies;—or in cellars, where the freets are not properly foughed, or drained;—or in narrow bye streets, where sheep are slaughtered, and where the blood and garbage are allowed to stagnate and corrupt;—and, perhaps more than all, by living crowded together, in dirty lodging houses, where you cannot have the common comforts of light and air.

It should be unnecessary to remind you, that much sickness is occasioned among you, by passing your evenings at ale-houses, or in strolling about the streets, or in fields adjoining to the town. Perhaps those who are most apt to expose themselves in this manner, would pay little attention to dissuasive arguments of any kind. However, those who feel an interest in your welfare, cannot omit making the remark.

There is another subject of great importance to you, on which you seem to want information. A great number of children die of the natural small-pox, almost every year. This mortality must be imputed in a great degree to your own negligence; for the faculty at the infirmary offer to inoculate your children, and give public notice of the proper time for making your application, twice a year. The next period for inoculation will be in March; the succeeding period in September. The chance of recovery, from the small-pox received by inoculation, is so much greater than the chance of recovery from the natural kind, that you ought to consider yourselves as performing a duty to your children, and to the public, in bringing those who have not yet had the small-pox, to be inoculated at the infirmary.

You ought to be informed, that there is scarcely any thing more injurious to the health of children, than allowing them to work at night in the cotton-mills. It may not always be in your power to prevent their being employed in this manner; but you should be made acquainted with the danger to which you expose them. There is no hazard

incurred by their working during the day, in clean, well-managed cotton-mills.

It is also proper to inform you, that you may be infected with fevers, by working in the same place with persons who have just recovered from fevers; or by people who come from infected houses, where they are at no pains to keep themselves clean. You had better collect something among yourselves, to support such persons for a fortnight after their recovery, than expose yourselves to the risk of catching a fever, by their returning too early to work.

Management of the Poor. The following is an extract from an account of the management of the poor, in the parish of Shipton Moyne, in the county of Gloucester, by Thomas Bernard, Esq.

On the 27th of February, 1801, a vestry was called in the parish of Shipton Moyne, to consider of regulations for the better management of the poor. Their first object was to provide immediate relief, in such a way as to furnish employment, and to encourage industry. For this purpose it was agreed that, upon any parishioner applying for relief, an account should be taken of the age and occupation of each individual of the family, and an estimate should be made of what they were able to earn; and then, if they could prove that they had earned to that amount, they should receive such relief as would make up the amount of a certain provision, fixed by their rules, for the weekly support of each individual in family; no extra earnings, nor any superior industry, being ever admitted as a ground of deduction from the calculated amount of relief. In addition to this provision, the poor, in case of sickness and of inability to provide medical relief for themselves, were to be allowed whatever the parish surgeon (with the privity of the overseer) should deem proper for them.

The general principle of relief being thus established, the next point was to secure them a regular supply of employment. For the occupation of the men, Mr. Estcourt (who has the honour of being the active promoter of these regulations) has agreed to furnish land for raising potatoes; the produce of which is hereafter to be sold, at a reasonable price, to the poor of the parish. In the cultivation of this ground, every poor man wanting work is to be employed in task-work, or as shall be most useful to him.—For the women and children, the workhouse, by a most extraordinary and incredible metamorphosis, is converted into a real house of industry; and all the women and children of that parish, who are clean and decent in their persons and orderly in their behaviour, are admitted to work in the house (now under the care of an assistant overseer, whose character and conduct have been well approved) during the day-time; they finding their own provisions*, and receiving the whole amount of their earnings, without any deduction whatsoever. The work-rooms (with exception of the time of meals and of cleaning the rooms) are open from six to six in summer, and in winter, from seven to seven; those parents who do not send their children to school, or employ them better elsewhere, being entirely excluded from all parochial relief.

In order to encourage attention to their religious duties, it has also been agreed, that every poor parishioner who has two or more children at home, and who in the ensuing year shall regularly attend the morning service, decent and clean in person, and being in church before the beginning

* A cheap ordinary for the children, and indeed for adults also, where they might get their dinners, if they wished it, might be very useful in this instance; to be paid for by a weekly deduction from their earnings. See *PARISH-DINNER, Suppl.*

of the prayers, shall have an annual allowance of clothing;—for each man, to the value of 20s.; for each woman, of 15s.; and for each boy or girl, of 10s.; a deduction of 6d. being made for each absence from church, unless occasioned by severe illness.

To promote the essential virtue of cleanliness, another encouragement has been proposed: that every poor parishioner, who shall annually whitewash his house in the month of September (being supplied with lime and brushes), and shall have the floors washed clean with water every Saturday in the winter months, shall on every such Saturday in January, February, and March, receive a donation of three pecks of coals. But no such donation of clothing or fuel is to be given to a parishioner, in case, during the preceding year, any member of his family shall have been convicted of any crime, subjecting him or her to fine, whipping, or imprisonment; unless satisfactory information shall be given, that the rest of the family were not privy or concerned, but had used all proper means to prevent the same.

There is, moreover, a regulation, that the village shop, which has been established in the preceding year for selling the most necessary articles to the poor at prime cost, shall be continued; and a list of the articles, and the prices, fixed up every week in a conspicuous part of the shop; and of the work-rooms of the house of industry.

In addition to these, there were added, not only individual encouragement and reward on the part of the rich, but also the supply of potatoe gardens for the benefit of the poor. For the first purpose, a liberal subscription was raised by the principal inhabitants; each subscriber being yearly or half yearly, at his or her option, to distribute, or to direct the distribution of, his or her own subscription publicly after divine service; the distribution being to be impartially made, with a view to their regular a tendency on divine worship—their honesty, sobriety, decency, and industry—their affectionate conduct to their relations and neighbours in sickness or infirmity—the cleanliness of their cottages—their attention to the morals, health, and welfare of their children—and their frugality and domestic management, in making the best use of their means of life. The period of probation is to be for one year (from the 1st of October, 1801); and all candidates for the rewards are required to enter their names, in the form directed, one month, at least, before the time.

The mode in which Mr. Eitcourt has provided for his cottagers' potatoe grounds is also deserving of attention. He has appropriated for this purpose, a field called North Leas; which has been laid out in lots of a quarter of an acre each; the cottagers being each allowed one lot, or two, according to their families, and to their ability and inclination to cultivate it to advantage. The landlord pays the tithes and taxes; manures the land, finds seed-potatoes, and allows the labourer 6d. a perch for his family's subsistence, while he is cultivating the land. For this benefit, the tenant pays the rent of 15s. every quarter of an acre; and undertakes to cultivate the ground, according to his landlord's regulations. He also agrees (in case the money advanced him, together with his rent, is not repaid before the crop is ready* to be taken up) half of the crop shall be set apart to be sold at Christmas, to secure the rent and money advanced him; the cottager receiving the overplus, and retaining the other moiety. And, in case the cottager neg-

lects the cultivation of his land, the landlord may take possession, paying him the full value of his labour thereon.

The subject of the management of the poor, will also be found treated under COTTAGER, GARDEN, LAND, HOUSE, and other heads, in this SUPPLEMENT.

Feeding the Poor. We have, under various heads in this SUPPLEMENT, spoken of the means by which wholesome sustenance may be provided for indigent persons at a cheap rate; but the subject still remains to be systematically treated. The following copy of a letter from Count Rumford to the Rev. Dr. Majendie, of Windsor, will answer this purpose most completely:

"In answer," says the count, "to the questions you have done me the honour to propose to me respecting the means that can be used with the fairest prospect of success, for relieving the distresses to which the poor are exposed, in consequence of the present scarcity of provisions, I would take the liberty to say, that in my opinion the providing of food for them in public kitchens, and selling it to them at such low price as they can afford to pay for it, would be the best method that could be adopted for that purpose; for, besides being an effectual relief to the poor in the moment of difficulty and distress, if in preparing this food care be taken to economize costly and scarce ingredients (which with due attention may be done to a surprising degree), the establishment of these public kitchens would have a direct and very powerful tendency to diminish the consumption of those articles of food, the scarcity of which is most sensibly felt by society at large.

"To this we may add, that the habit which the poor will acquire, in being fed from a public kitchen, of using good and palatable, and very cheap food, such as may at any time be prepared by themselves, in their own dwellings, at a much less expence than the victuals to which they are accustomed can be provided, may lead to a very important improvement in their system of cookery.

"I verily believe that the inhabitants of Great Britain might be well nourished—their hunger perfectly satisfied—their health and strength preserved—and the pleasure they enjoy in eating increased, with two thirds of the food they now consume, were the art of cookery better understood.

"I would beg leave to observe, that I would by no means propose to furnish the victuals from the public kitchens to all poor persons gratis.—The aged and infirm, and young children, cannot earn by their labour enough to defray the expences of their subsistence; but those who are able to work should not be maintained in idleness, at the public expence, and most certainly not in times of general distress. All that they can reasonably expect is, that they and their families be enabled to subsist for as small a sum of money, or for the same quantity of labour, in times of scarcity, as their subsistence usually costs them in times of plenty. To do more for them at any time would be unwise, and in a time of general alarm would be productive of the most fatal evils. It would have a tendency to make them careless, idle, and profligate; and, instead of being grateful for the assistance received, they would soon learn to consider it as their right; and, if it were discontinued, would demand it with clamorous importunity. But if the assistance afforded to the poor be so applied, as to be felt by them as an honourable reward for their good conduct, and as an encouragement to persevere in their industrious habits, in

* This time has a reference to the coming in of harvest work; a period when the cottager, if ever, would be able to make good his payment.

that case, their morals will rather be improved, than injured, by the benefits received.

"In all cases where it is possible, I think that a school of industry for children should be connected with a public kitchen; and it is certainly necessary that measures should be taken, for giving constant employment to the poor of all descriptions, who are able to work. The full amount of their earnings should always be given to them. This is proper, not only to encourage their industry, but also to keep alive in them a spirit of independence, without which they soon become disheartened, and extremely helpless and miserable. Where the poor are paid for their labour, it is evidently just and proper that they should defray, as far at least as it is in their power, the expenses of their maintenance. It sometimes happens, though very rarely, that profitable employment cannot be found for the poor: they should nevertheless be put to work; and even be kept to labour constantly and diligently, under the direction of those who in such circumstances must provide for their subsistence. Were no profitable employment to be found for them; and were there no other way of preventing their being idle, some public work might be undertaken for the sole purpose of employing them.

"But in the neighbourhood of Windsor, the poor can hardly be in want of useful employment. His Majesty has taken care to prevent that evil. It is much to be wished that his opulent subjects in Great Britain and Ireland might be induced to follow his illustrious example!

"As industry and economy are the preventives and the only cure for indigence, and as want is one of the strongest inducements to labour, it is evident that much caution is necessary in supplying the wants of the poor; lest we destroy the effects of those incitements which Providence, in infinite wisdom, has contrived, to rouse mankind from a state of indolence and torpid indifference, and to stimulate them to that constant exertion of their bodily strength and mental faculties, which we know to be necessary to the health of the body and of the mind, and essential to happiness and virtue. It seldom requires much ingenuity to make the assistance, that is given to the poor, operate as an incitement to industry; for rewards are as powerful motives as punishments, and the truly benevolent will always prefer them. But it should never be forgotten, that all that which is given to the poor, or done for them, that does not encourage their industry, never can fail to have a contrary tendency; and consequently must do real harm to them, and to society."

We earnestly hope these traits of the only efficient means by which the wants of the poor can be extensively relieved, and their virtue and happiness promoted, will not fail to sink deeply into the minds of those whose duty it is to attend to the subject. That there are not wanting in the *biggest* classes of society, honourable instances of an *active personal attention* to the welfare of those whom Providence has placed in the *lowest*, has been shewn in various articles relative to the poor in this SUPPLEMENT, and the following account of the manner in which the poor have been supplied with rice and beef at St. Alban's, by the Countess Dowager Spencer, is an additional proof of it:

"I never have found," says that amiable lady, "any supply of food for the poor of so much use, and give such thorough satisfaction, as that which I have lately established at St. Alban's. It is a mode which will not only be of use in times of scarcity, but will be very beneficial every winter when labour is scarce, and the weather severe.—My plan is, merely selling every week, at a low price, rice, and very excellent salt beef, to labourers, in proportion to their fa-

milies.—This is only meant to afford such a supply as shall enable the man's labour, or the parish allowance, with the addition of this cheap and wholesome food, to support their families in the dead time of the year.—The proportions I have allowed are as follow: the rice being sold at 3d. per pound, and the beef at 4d.

Classes.				
1st.	large families with 4, 5, or 6 children	2 lb. of rice 6d. $1\frac{1}{2}$ lb. of beef 6d.	} 17.	per week
2d.	Families with only 2, or 3 children	$1\frac{1}{2}$ lb. of rice 4½d. 1 lb. of beef 4d.		
3d.	A man and woman or one child	1 lb. of rice 3d. $\frac{1}{2}$ lb. of beef 2d.		
4th.	A single person	$\frac{1}{2}$ lb. of rice 1½d. $\frac{1}{4}$ lb. of beef 2d.		
			8½d. ditto.	
			5d. ditto.	
			3½d. ditto.	

"The above is what it costs the poor; but to engage people to subscribe (as I could not supply the whole myself), I have made out a plan, by which subscribers may have tickets at 2d. a pound for the rice, and 2d. a pound for the beef. Thus, if any subscriber wishes to assist any poor family, it will cost them as follows:

Class.	lb.	Per week.	For 6 weeks.	For 12 weeks.	For 18 weeks.
1st.	2 of rice 4d. 1½ of beef 3d.	7d.	3s. 6d.	7s.	10s. 6d.
2d.	1½ of rice 3d. 1 of beef 2d.				
3d.	1 of rice 2d. ¾ of beef 1d.	3	1 6	3	4 6
4th.	¾ of rice 1d. ½ of beef 1d.	2	1 0	2	3 0

"I have fixed upon eighteen weeks for the period of sale, stopping a couple of weeks between each six weeks. This is intended to make the poor feel the advantage which they derive from this supply, and to prevent their growing tired of it. It will likewise prolong the time, till the hay harvest may supply them all with employment, and many vegetables will be coming in.

"I pay a woman a farthing a pound for measuring out the rice, and a halfpenny a pound for cutting and weighing the beef; but this is more than is necessary. If I had been provident, and had bought the rice cheap, the expence would have been trifling. As it is, I am a loser of above a penny in the pound, when the subscribers have paid their 2d. and the poor their 3d. but that regards only myself. Upon the beef there will likewise be some loss, on account of the bones; of these I make soup, which might be sold to supply that loss. We have relieved, in this way, between eight and nine hundred families in the town and its environs; which made it necessary, in order to avoid confusion, that they should come on stated days:—the first class is therefore appointed on Mondays; the second on Tuesdays; the third on Wednesdays; and the fourth on Thursdays. And as the request for these tickets has extended to five, six, and seven miles distant, all which demands cannot be answered, I generally give the poor people who have come so far an occasional ticket for that one day only, that they may not be entirely disappointed.

"I must observe that, besides the expressions of thankfulness from all without exception who have partaken of this charity, several women have been to tell me, that the excellence of the food has restored health and strength to their families: one woman yesterday informed me, that she and her husband had been, from mere poverty, got into so low and weak a state of health, as to be scarcely able to earn any

thing; but that the continuance of this food, for some weeks together, had quite ter it up again."

This mode of feeding the poor is perhaps "*less expensive to the donor, and more acceptable to the receiver*," than any other. If any one was to give a large family half a guinea, or a poor widow three shillings, they would not be surprised at hearing that, in less than a month, the money was gone: while the same sum, by this means, will last from the middle of January to the middle of June."

POOR'S-RATE (*Envel.*). The following most interesting view of this subject is prefixed by Mr. Bernard to the second volume of the Reports of the Society for bettering the Condition of the Poor.

"The *increase of the poor's-rate*," says Mr. Bernard, "has been for some years a just subject of alarm. Complaints have been made, and with too much reason, of the prevalence and magnitude of the evil. Two millions and a half annually expended in parochial relief, and a larger sum in charities and benefactions, producing no improvement in the condition of the poor, but rather prejudicing their means of life by the general effects of the system,—this is a mystery in our internal polity, difficult, but very important, to be explained.

"To some it has appeared the necessary consequence of national prosperity. That, however, must be a very equivocal species of prosperity, which is inimical to the comfort and happiness of the great mass of the people, and tends to diminish their means of life.—By others it has been deemed a symptom of national decline, common to all states which have passed their zenith;—but this opinion is controverted by increase of trade and manufactures, by improvements in agriculture and every art and science, and by the unrivalled energy and glory which attend the British arms in every quarter of the globe.—Others have conceived that speculation in estates, a noxious tribe of land valuers and rent raisers, and the consequent press on the farmer to make his present greatest profit with the least possible out-goings, have given birth to an improvident system with regard to the poor; hostile to any permanent improvement in their condition, and operating to discourage foresight and good habits among them.

"Efforts have not been wanting to check this growing evil. Laws have been made to compel industry and economy; and workhouses have been erected, and farmed to the best bidder, in order to deter the poor from wanting relief: but parishes and parish officers have not as yet been aware that in every instance, in which a poor family is driven by distress and depression of circumstances to take refuge in a workhouse, an incumbrance has been entailed on the funds of the parish, never to be redeemed, even in part, except by a change of system; by encouraging that industry and prudence, which no act of parliament can compel; and by assisting them with increased means and advantages of life, calculated to enable them to support themselves and their families in their own cottages, without parochial relief.

"The poor in some parts of England have been deprived of many of their resources*; and have been reduced, as their sole subsistence, to the purchase of daily bread with the daily spend of their labour. This has gradually deprived them of foresight, and of every effort that looks to fu-

turity; and has left them to proceed in a spiritless continuation of daily labour, until sickness, misfortune, or increase of family, drives them into the workhouse; there to remain the life pensioners of the public, and to leave their widows the nurses and drudges of the house, and their children to acquire idle and unprincipled habits, among the dregs of the parish.

"The land owner should be aware that this is waste committed upon his estate, in the most destructive and irreparable way. It is not the pulling down of an unnecessary hovel, the premature repetition of a crop of wheat corn, or the ploughing up a slip of pasture ground (the usual trivial objects of impeachment of waste), that is the subject of consideration; but it is the relaxation of the nerve of the country, the destruction of the power of cultivating the land, the conversion of the strength and energy of a people into weakness and debility, and the exchange of the means of wealth and prosperity for sources of enormous and increasing expense.

"It is an essential part of political wisdom to give scope and increase to the energy of individuals, by affording to all the opportunity and hope of advancement in life. Where character, conduct, industry, and attention, receive their assured reward, candidates will not be wanting; and the example of a few will be reflected in the virtues of the many. If the child, in proportion to diligence and good conduct, be better fed, better clothed, more favoured, and have that pittance of reward laid up in store, which in their narrow scale of life constitutes wealth, the number of industrious and well-behaved children will increase:—If the young man finds that, by reserving out of his wages a little fund of wealth against his marriage, he can convert these early savings into the means of increased produce and comfort during life, and become the possessor of a cow, a garden, and his own cottage, he will acquire early habits of prudence and economy, and will enter into life with a better and more principled system of conduct:—and if the cottager who exerts himself in bringing up and placing out his family, is encouraged and assisted in his honest endeavours; and, in case of any untoward and unfortunate interruption of his plan of economy, receives timely relief, and is preserved from the apprehension of a workhouse; the thrift and the success of a few will produce many imitators; and the prospect of improved circumstances will awaken the energy of the poor, in every part of the kingdom.

"Many and various would be the advantages of giving to the poor a pleasing, and beneficial employment for their leisure hours, and affording them the means of productive husbandry at home, and within their own cottage and ground;—of supplying them to more advantage with the necessaries of life, and of relieving them from the burthen of their children, by placing them in a course of industry and occupation.—Where measures of this kind can be brought to produce any effect at all on millions, the benefit must be of very great magnitude. We may calculate the number of little hands hitherto idle, and now by a proper system of employment to be brought into action; we may estimate, in part, the benefit of so numerous a class of men being protected from petty extortion and imposition, and being fairly and honestly supplied with the necessaries of life; and we may reckon up, by long arithmetical deduction, the number

* Whoever travels through the midland counties, and will take the trouble of enquiring, will generally receive for an answer, that formerly there were a great many cottagers who kept cows, but that the land is now thrown to the farmers; and if he enquires still further, he will find that, in those parishes, the poor's-rates have increased in an amazing degree. See Cow, LAND, COTTAGER, &c. *Suppl.*

of acres which might be advantageously cultivated, and the myriads of hours which would be added to the amount of national labour, if every cottager was permitted and encouraged to improve the slips of waste land, which still remain in every part of the country, a discredit to the English nation—but it is not within the compass of political arithmetic, to calculate the increase of prosperity and security, which we might derive from the general introduction of such a system."

It is the endeavour of the Society for bettering the Condition of the Poor (see *SOCIETY, Suppl.*) to search for and disseminate useful and practical knowledge with regard to them; to co-operate in every plan that tends to increase their economy and domestic comfort; to hold up the industrious and thriving cottager as an example of imitation; and to promote his good habits, his industry, his welfare, and his happiness. "At the same time," continues Mr. Bernard, "we are not unmindful of the danger of diminishing the inducements to exertion, by theoretical philanthropy, or by injudicious or misapplied liberality; which may habituate the mind to a reliance on regular and periodical assistance, and (making exertion and foresight of less moment) deprive the poor of that best and most honourable relief, which can only be derived from themselves. It is of the utmost consequence that charity be directed to her true end—that of elevating and benefiting the object of her attention, instead of rendering it helpless and without resource; and that she should operate by increasing the energy, the virtue, and the hopes of the poor; so as to attach them to their situation in life, and to give stability and principle to the moral and religious character of so large and so valuable a part of the community."

"Impressed with this idea, the society has proposed that the principle which has directed the researches of the present age, in natural philosophy, in agriculture, in medicine, in every art and science in which the limits of human knowledge have been successfully extended,—that this principle should be adopted in the concerns of the poor; and actual existing facts be made the means of practical and systematic investigation, into what has really augmented their virtue and happiness, and has been sanctioned by use and experience.—After a variety of inefficient attempts, during more than two centuries, to enforce industry and prudence by penal laws and compulsory statutes, the society has ventured to submit to the consideration of the public, whether the same object may not be attained by encouragement, by kindness, by management,—and by giving effect to that master-spring of action, 'the desire implanted in the human breast of bettering its condition.' The influence of this invigorating spirit on commerce, on manufactures, and on agriculture, has been felt and acknowledged with pride and pleasure by every Englishman; and there can remain no doubt but that the same principle, which has produced such beneficial effects among the thriving and active members of the other classes of society, would, if properly encouraged, generate among the poor of the same nation, that degree of industry and prudence, which we have in vain endeavoured to produce by compulsion."

"I am very far from meaning to suggest upon this subject, that nothing is at present done, or that all is practicable. Much, I am convinced, has been recently done; and with such effect in exciting industry, as affords incontrovertible evidence of its utility.—All, I am satisfied, cannot be completely effected; but that, until the corruption of our nature is done away, there will ever be unhappy persons of every rank and order, and in every class of society, suffering under

the consequence of an erroneous course of life, and placed as landmarks to direct the conduct of others.—In fact, in that and in every important undertaking, there is danger from the expectation of too great, or of too rapid a progress. His who advances gently and gradually, and with caution, may have the hope of proceeding surely and successfully; and if, in a work interesting to millions, only part of the object be attained, and every ill consequence avoided, the labour of the individuals employed will be well applied."

"It is not at all essential to my purpose, that I should write a panegyric on the virtues of the poor. The contagion of bad example is generally caught by the lower from the higher orders; and I feel nothing very exemplary in our own conduct, to induce me to doubt but that the poor are as good and as prudent, and as industrious, as we should have been in the same circumstances, and under the same disadvantages. If this be conceded, the vices and faults of the poor must be deemed the vices and faults of an unfavourable situation, rather than of individual delinquency. Remove those disadvantages, and you add as much to moral character as to personal comfort."

"In the Reports of the society (to be had in a cheap form, at Hatchard's, Piccadilly), the rich and the benevolent will find subjects of experiment, methods of procedure, and accounts of expense. In the various details they will meet with something or other to put in action every valuable principle of the human mind. They will only have to employ their discretion, in proportioning the mode and extent of their operations to their means and circumstances. Many benevolent minds (says the Bishop of Durham) suffer their excellent dispositions for doing good to remain unemployed in the great service of christian charity, not for want of means, or of objects, but for want of knowing what good may be done within their own sphere, and how.—To remove this difficulty, to supply the public with details on every subject respecting the poor, to suggest the mode of active and useful charity, which in its effects shall not contribute to the increase of idleness and vice,—these are, and I trust will continue to be, the objects of the society."

"Upon the proposed subjects of enquiry, some information has been already collected; and the society is much gratified to find that it is producing immediate and beneficial effects, not only in this, but in a neighbouring kingdom. (See *DUBLIN and CORK, Suppl.*) As to parish relief, the fact is now pretty well ascertained, that the best and most economical application of the parochial funds, is that which tends to assist and encourage industry (see *OVERSEERS, Suppl.*) and good management among the poor, in their own cottages, in the care and conduct of their own families, and in placing out their children at an early age in a course of employment (see *PARENTS, Suppl.*); and that in those parishes, where the cottager has been supplied with a good cottage and garden, and the means of keeping his cow at a fair and moderate rent, the labourers are the steadiest and most orderly men, the poor's-rate is greatly reduced, and the value of landed estates much improved."

"With regard to protecting the poor from imposition in the purchase of the necessary articles of life, it appears that, with very little cost or trouble, great assistance may be given to them; and that more may be done for their real benefit in this respect, at a very trivial expense, than by millions, either added to our poor's-rates, or dispensed in the present system of pecuniary charity—that, in many parts of England, a weekly sale of coals in small quantities at prime cost, is a relief to the distress, and a preservative to the morals, of the poor; and that a supply of corn; potatoes, milk, cheese,

Bacon, and other necessary articles of food, to the labourer, at the wholesale price, whether by the farmer for whom he works, or from a village shop set up by the land proprietor, produces a very great saving to the labourer, encourages him in habits of thrift and economy, and attaches him to his situation in life.

"The poor have, in general, benefited by the means offered to them much more rapidly and effectually than their most sanguine friends could have expected. All the prejudice against Sours and novel cookery has vanished, wherever the experiment has been fairly made. Upon this subject, and that of village kitchens, a variety of information is submitted to the reader, respecting the village dinners prepared for children and others at Oakham and Epping (see PARISH-DINNER, *Suppl.*); and the several charities recently established, for supplying the poor with soups and other different articles of food, in villages,—in London,—at country mansions,—and in manufacturing towns. It is no small recommendation of these charities, that they tend to shew the poor their real interest, and to instruct them in preparing for themselves a more nourishing and more economical diet, than what they at present possess. They also give a fourfold effect to the operation of charity. In villages, they send comfortable and necessary relief into the houses of many aged and forlorn persons. In London, they supply food to a variety of those objects which the circumstances of such a city, the corruption of human nature, and the vicissitudes of things, too abundantly produce in a great metropolis. In country mansions, at a very trifling expence, they extend relief to a wide circle around; and draw blessings and affection on the proprietor and his family. But their influence is most beneficial among manufactories; in which the contests of nations, the mutability of fashion, and the ebb and flow of prosperity, do perpetually produce objects of distress, beyond any power of adequate parochial relief. The value of these charities can only be appreciated by those who have attended the conduct of them. During the preceding winter above five thousand manufacturers in London, and almost as many more at Birmingham distressed by the pressure of the times, have gratefully received from these soup-shops their daily supply of food for themselves and their families, at a fourth of what it must otherwise have cost them; and have been thereby preserved from want and despair.

"It has been too clearly proved, that by the conversion of many corn mills into mills for manufactories, and by other circumstances, the cottager has been subjected to a grievous monopoly in respect of bread, which is now become his prime necessary of life. The injury to the poor by this alone (if we may estimate from the facts which have come before us) is nearly equal to two-thirds of all the poor's-rates collected in England, and considerably exceeds 1,000,000. a-year. There is no doubt but the establishment of parochial mills (see PARISH MILL, FLOUR, &c. *Suppl.*) throughout the kingdom, would at once correct this monstrous and abominable evil, without any loss of income to the proprietors of the mills; which will afford five per cent. on the expenditure, and leave an annual surplus for charity to distribute, in the encouragement and support of the industrious poor.

"Of FRIENDLY SOCIETIES (see *Suppl.*) the benefit is well known; and it is enough to state what general experience gives testimony to, and what is confirmed by all the information which has been laid before the Society, that their effects, when legally and properly established, are sure and unvaried in promoting industry, economy, philanthropy, and every virtue, among the poor.

"As to COTTAGES (see *Suppl.*), with exception of some

favoured districts, it is too obvious that they are deficient both in number and condition; the inhabitants suffering in health and cleanliness, for want of that accommodation, which in this climate is necessary to life and well-being. It is due to the cottager, to ourselves, and to the general appearance of the country, that neatness and comfort in these habitations, by timely repairs, and by the very trivial expence of frequent WHITE-WASHING (see *Suppl.*), should be allowed to have their full effect in inducing habits of cleanliness, and, in the consequence, of regularity and morality in the possessors.

"Of parish workhouses (see HOUSE, WORKHOUSE, and INDUSTRY, *Suppl.*) it is not too much to say, that, however well managed, yet if they are made the common receptacle of all who apply for relief, they will, in their general effect, be the cause of injustice and unkindness to many individuals, and of prejudice and injury to the parishes. If none were placed there but the aged and infirm, who have no domestic retreat to recur to,—none, who could do better out of them (the disabled cottager, receiving relief in his cottage, the sturdy idler being subjected to legal correction, and the child finding an asylum in a PARISH SCHOOL, *Suppl.*), the poor who, for want of domestic connection and the means of sustenance, are compelled to take refuge in a poorhouse, would find it a decent and well-regulated asylum; while the cottager would preserve his little establishment at home, and not be compelled, by temporary distress, to become a permanent burthen to his parish; the idle and the sturdy would receive merited punishment; the parish-child would be boarded and instructed at less expence by some cottager's widow, from whose care he would go, at an earlier age, and with more character and principle, into service.

"There are several other subjects of enquiry, upon which we must refer the reader to the REPORTS themselves. On one only we shall trouble him with any further remarks; and that is upon county JAILS and houses of correction (see HOUSE, *Suppl.*).—The plan which has been successfully adopted at Dorchester, and in a very few other instances,—that of encouragement and inducement to work, by a liberal share of earnings, and by a distinction of food and treatment between the idle and industrious, and between the profligate and the well-disposed; the plan of sending them forth from the prison with character, and the means and habits of industry and livelihood, is fully developed in the account of the Dorchester jail and house of correction. The detail of the effects produced there, is confirmed by experience in every other instance, to which it has been properly applied. It is congenial to the nature of man, and to our own feelings. Let us not then despair, but that the example will be speedily followed in other counties, for the benefit of the inhabitants, and for the reform and restoration of many wretched and hopeless prisoners, now suffering under the servitude of vicious habits, without the means or prospect of release.

"In almost every establishment for the employment and benefit of the poor, the finding and keeping for them regular and proper work and occupation is one of the greatest embarrassments. This, more than any other cause, has checked the exertions of those who have been at times very anxious to promote the welfare of their poor neighbours. But, before they give up their labour of love, we entreat them to reflect, that, if the obtaining for a few necessitous families, who dwell near them, a regular supply of useful occupation, is difficult for the rich, and for those who possess talents, and leisure, and influence, what must be the nature of the difficulties which will attend the industrious efforts of the poor, the helpless, the ignorant, and the uninstructed. If

we are imposed upon, placed in a situation of embarrassment, when we seek the means of industry for them, what must be their distress and confusion in the same attempt.—Surely this consideration should rouse us to overcome, by activity and perseverance, that which to them may be insurmountable; and to provide those means of industry and thrift, which, in the present state of this country, it is impossible for many of the poor to obtain for themselves.

“The question whether the rich support the poor, or the poor the rich, has been frequently agitated by those who are not aware that, while each does his duty in his station, each is, reciprocally, a support and a blessing to the other. All are parts of one harmonious whole; every part contributing to the general mass of happiness, if man would but endeavour to repay his debt of gratitude to his Creator; and, by a willing habit of usefulness, to promote the happiness of himself and of his fellow-creatures. In this way the higher classes of society may, by superiority of power and education, do more service to the other parts of the community, than what they receive; the welfare of the poor being then, in truth, more promoted and assured by the gradations of wealth and rank, than it ever could have been by a perfect equality of condition; even if that equality had not been in its nature chimerical and impracticable; or (if practicable) had not been hostile and fatal to the industry and energy of mankind.—Rank, power, wealth, influence, constitute no exemption from activity or attention to duty; but lay a weight of real, accumulated responsibility on the possessor.

Is heaven tremendous in its frowns? most sure:
And, in its favours, formidable too.
Its favours here are trials, not rewards;
A call to duty,—no discharge from care;
And should alarm us full as much as woes.

YOUNG.

“If the poor are idle and vicious, they are reduced to subsist on the benevolence of the rich: and if the rich (I except those to whom health and ability, and not the will, is wanting) are selfish, indolent, and neglectful of the conditions on which they hold superiority of rank and fortune, they sink into a situation worse than that of being gratuitously maintained by the poor. They become paupers of an elevated and distinguished class; in no way personally contributing to the general stock, but subsisting upon the labour of the industrious cottager;—and whenever Providence thinks fit to remove such a character, whether in high or in low life, whether rich or poor, the community is relieved from an useless burthen.”

On the motives for co-operation with this excellent Society, Mr. Bernard expresses himself in the following just and forcible terms:—“If,” says he, “there should be among my readers, any one whose views are directed to himself only, I could easily satisfy him, that his means of self-indulgence would be increased, his repose would be more tranquil, his waking hours less languid, his estate improved, its advantages augmented, and the enjoyment permanently secured, by his activity in the melioration of the condition, the morals, the religion, and the attachment, of a numerous and very useful part of his fellow-subjects.—To the patriot, who wishes to deserve well of his country, I could prove that, from the increase of the resources and virtues of the poor, the kingdom would derive prosperity—the different classes of society, union—and the constitution, stability. To the rich, who have leisure, and have unsuccessfully attempted to fill up their time with other objects, I could offer a permanent source of amusement;—that of encouraging the virtues and industry of the poor, with whom by property, residence, or

occupation, they are connected;—that of adorning the skirts of their parks and paddocks, of their farms and commons, with picturesque and habitable cottages, and fruitful gardens; so as to increase every Englishman's affection for an island replete with beauty and happiness;—that of assisting the poor in the means of life, and in placing out their children in the world; so as to attach them by an indissoluble tie, and a common interest, to their country, not only as the sanctuary of liberty, but as an asylum, where happiness and domestic comforts are diffused, with a liberal and equal hand through every class of society.”

POORONDER, a fortress of Vissapour, in the Deccan of Hindoostan. It is seated on a mountain, 18 miles E.S.E. of Poona; is the place of refuge for that capital in case of an invasion; and here the archives of government are kept.

POOTE, a town of France, in the department of the Mayenne, and chief place of a canton, in the district of Villaine: two leagues and a half E.N.E. Villaine, and four W.S.W. Alençon.

POPERINGUE, a town of Austrian Flanders, on a river of the same name. Six miles W. of Ypres. Long. 2. 38. E. Lat. 50. 51. N.

POPO, a kingdom on the Slave Coast of Guinea. The inhabitants have scarcely any houses to dwell in, beside the king's village, which is an island in the midst of a river. Their chief trade is in slaves.

PORCAH, a town of the peninsula of Hindoostan, in the country of Travancore, taken from the Dutch by the English in 1795. It is 75 miles N.W. of Travancore. Long. 76. 30. E. Lat. 9. 15. N.

PORCHESTER, a village in Hampshire, four miles N. of Portsmouth, at the upper end of the harbour, between Fareham and Portsea Island. In has an ancient castle, which has served, of late years, for the reception of prisoners of war.

PORCO, a town of Peru, in the audience of Los Carcos, a little to the W. of Potosi. Long. 64. 60. W. Lat. 19. 40. S.

PORCUNA, a town of Spain, in the province of Juen, eight miles S.S.W. of Anduxar.

PORSELOON, or **PORSELOUC**, a rich and commercial town of the kingdom of Siam, situate on a large river which runs into the gulf of Siam.

PORT AU PRINCE, a sea-port of St. Domingo, seated on a bay on the W. side of the island, of which part it is the capital. It was taken by the English and royalists in 1794. Long. 72. 10. W. Lat. 18. 45. E.

PORT DE FRANCAIS, a harbour on the W. coast of America, discovered by M. de la Pérouse in 1786. It is of a circular form, not to be fathomed in the middle, and bordered by peaked mountains, of an extensive height, covered with snow. The natives on this coast are described as the most complete thieves, possessed of an activity and obsequy capable of executing the most difficult projects. Skins were found here in great abundance, particularly those of the sea otter. In this harbour is a small island. Long. 137. 30. W. Lat. 58. 37. N.

PORT DESIRE, an harbour of S. America, where ships sometimes touch in their passage to the Pacific Ocean. It is 100 miles N.E. of Port St. Julian. Long. 65. 40. W. Lat. 47. 50. S.

PORT LOUIS, a French fortress, on the S.W. coast of Hispaniola, demolished by Admiral Knowles in 1747, but since rebuilt. Long. 73. 16. W. Lat. 18. 18. N.

PORT LOUIS, a town and harbour of the Isle of France, in the Indian Ocean, strongly fortified. Long. 57. 28. E. Lat. 20. 9. S.

PORT PAIX, a town on the N. coast of St. Domingo,

in the West Indies, with a good harbour. Long. 72. 55. W. Lat. 19. 58. N.

PORT PATRICK, a sea-port in Wigtonshire, confined by the sea on one side, and on the other by over-hanging rocks and hills. It is noted for its ferry to Donaghadee in Ireland, from which it is only 20 miles distant; and a packet-boat sails from hence for that place every day. The harbour is good; and has one of the finest quays in Great Britain, with a reflecting light-house. It is 107 miles S.W. of Edinburgh, and 187 N.W. of London.

PORT ROYAL, a town and fort of the island of Martinico, 27 miles S.E. of St. Pierre. Long. 61. 9. W. Lat. 14. 3. N. PORT ROYAL, a town of the United States, in Virginia, on the river Rappahannock.

PORT ST. JULIAN, a harbour on the coast of Patagonia, where ships usually touch that are bound for the Pacific Ocean. Long. 68. 44. W. Lat. 49. 10. S.

PORT ST. MARY, a sea-port of Spain, in Andalusia. The English made a descent here in 1702, with a design to besiege Cadiz, but without success. It is ten miles N.E. of Cadiz. Long. 6. 0. W. Lat. 35. 37. N.

PORT SANDWICH, a harbour in the island of Mallicolo, in the S. Pacific Ocean. Long. 167. 53. E. Lat. 16. 25. S.

PORT VENDRE, a sea-port of France, in the department of the Eastern Pyrenées and late province of Roussillon. It was taken by the Spaniards in 1793, but retaken the next year. It is 25 miles S. by E. of Perpignan.

PORTADOWN, a town of Ireland, in the county of Armagh, with an extensive linen manufacture. It is situate on the river Bann, nine miles N.E. of Armagh, and 16 N. of Newry.

PORTAFERRY, a town of Ireland, in the county of Down, on the rapid ferry of Strongford, 80 miles N. of Dublin.

PORTALEGRE, a strong town of Portugal, in Alentejo, with a bishop's see. It is seated at the foot of a high mountain, in a pleasant country, 30 miles N.W. of Elvas, and 90 N.E. of Lisbon.

PORTARLINGTON, a borough in Ireland, partly in King's and partly in Queen's County. It is seated on the river Barrow, 31 miles N. of Kilkenny, and 36 S.W. of Dublin.

PORTERAGE, the sum paid to a porter who carries home a parcel after its arrival from the country. By the 30 Geo. III. c. 58. the rates of portorage, within the cities of London and Westminster, and the borough of Southwark, and the suburbs and liberties thereof respectively, and other parts contiguous thereto, not exceeding the distance of half a mile from the end of the carriage pavement in the several streets and places within the said cities, borough, and liberties, are as follow, viz.

For any distance not exceeding one quarter of a mile, *three pence*.

For any greater distance than a quarter of a mile, but not exceeding half a mile, *four pence*.

For any greater distance than half a mile, but not exceeding one mile, *six pence*.

For any greater distance than one mile, but not exceeding one mile and a half, *eight pence*.

For any greater distance than one mile and a half, but not exceeding two miles, *ten pence*; and so in the like manner the additional sum of three pence for every further distance not exceeding half a mile.

PORTLAND, a sea-port of the United States, capital of Cumberland County, in the district of Main. It is seated on a peninsula, and has an excellent harbour, 150 miles N.N.E. of Boston. Long. 69. 30. W. Lat. 44. 10. N.

PORTLAND ISLANDS, a cluster of islands in the S. Pacific Ocean. They are low, and covered with wood; and the centre one is in long. 149. 8. E. lat. 2. 33. S.

PORTLAND-POWDER, a particular compound, the recipe for which was imported from Switzerland, by an ancestor of the Duke of Portland. It consists of equal parts of round birthwort (*arifolochia rotunda*, L.); of gentian; of the tops and leaves of germander, ground-pine, and centaury; dried, pulverized, and sifted. These are to be carefully incorporated; and one dram of the composition is to be taken every morning in a glass of wine and water, tea, or any warm liquid; after which the patient should fast an hour and a half. Such course is to be continued for three months without intermission; at the expiration of which, the dose must be reduced to one half, and taken as before, for the space of six months; when it is to be continued every second day, for twelve months longer.—This famous nostrum has long been held in high estimation, for its supposed efficacy in curing the *gout*; and though, in the hands of judicious persons, it undoubtedly forms a powerful alternative, yet it must be classed among those quack-medicines that, by the length of time to which their operation is to be extended, cannot fail of doing frequent mischief. This indeed has been abundantly shewn in a paper lately inserted, by Dr. Fothergill, in the Medical and Physical Journal, where instances are adduced of the fatal result of the trials made with this remedy, even where it has succeeded in removing the *gout*.

PORTO, a small sea-port of Italy, in the patrimony of St. Peter. It is the see of a bishop, who is generally a cardinal, and dependent only on the pope. It is ten miles S.W. of Rome.

PORTO CAVALLLO, a sea-port of Terra Firma, on the coast of Caracaus. Here the English were repulsed, when they attacked it, in 1743. Long. 64. 30. E. Lat. 10. 20. N.

PORTO DEL PRINCIPE, a sea-port on the N. coast of Cuba, with a good harbour. It is seated in a large meadow, where the Spaniards feed a great number of cattle. Long. 78. 15. W. Lat. 21. 52. N.

PORTO GALLETO, a sea-port of Spain, in the bay of Biscay, seated on a small river, eight miles N. of Bilbao. Long. 3. 11. W. Lat. 43. 22. N.

PORTO GRUARO, a town of Italy, in Venetian Friuli, with a bishop's see. It is seated on the Lema, 15 miles W. of Marano.

PORTO HERCOLE, a sea-port of Italy, in the state of Presidii, situate on a peninsula, four miles S. of Orbitello. Long. 11. 12. E. Lat. 42. 14. N.

PORTO NOVA, a sea-port of Spain, in Galicia, seated near the mouth of the Leris, 54 miles W. of Orense. Long. 8. 36. W. Lat. 42. 19. N.

PORTO PEDRO, a sea-port in the Island of Majorca. Long. 2. 41. E. Lat. 39. 37. N.

PORTO PRAYA, a town and bay of St. Jago, one of the Cape de Verd Islands. The town stands on an elevated plain, and is the residence of the Portuguese governor of the islands. Long. 23. 29. W. Lat. 14. 56. N.

PORTO SANTA MARIA, a sea-port of Spain, in the bay of Cadiz, containing nearly 10,000 inhabitants. The principal trade is in salt. It is seven miles N. of Cadiz.

PORTSEA, an island between Chichester Bay and the harbour of Portsmouth, in Hampshire. It is a low tract of considerable extent, separated from the main-land by a creek, over which is a bridge. At the S.W. extremity of it is situate the town of Portsmouth.

PORTSMOUTH, a town of the United States, the largest in New Hampshire, seated on Piscataqua River, two miles from the Atlantic Ocean. Its harbour is one of the finest on the continent, well defended by nature, both against storms

and an enemy; and it has a light-house at the entrance. It is 24 miles N. of Boston. Long. 70. 37. W. Lat. 42. 46. N.

PORTUGALETE, a town of Spain, in the province of Biscay, situate on a bay of the Atlantic, 12 miles N.W. of Bilbao. Long. 3. 18. W. Lat. 43. 40. N.

POSATA, a town of the island of Sardinia, on the E. coast, 45 miles E.S.E. of Castel Aragonese. Long. 90. 30. E. Lat. 40. 36. N.

POSEGA, a strong town of Slavonia, capital of a county of the same name. It was taken from the Turks by the Austrians, in 1687. It is seated in a fertile country, on the river Oriana, 126 miles W. by N. of Belgrade. Long. 18. 59. E. Lat. 45. 36. N.

POSNAIA, or **POSEN**, a commercial town of Great Poland, in a palatinate of the same name, with a good castle, and a bishop's see. The cathedral is magnificent. By the partition of Poland, it became subject to the King of Prussia. It is seated in a pleasant plain, on the river Warta, 27 miles W. of Gnesna, and 127 W. of Warlaw.

POSSINHO, a town of Portugal, in Estremadura, ten miles N.E. of Santarém.

POSTAGE (*Encycl.*). By the act 41 Geo. III. c. 7. for repealing the duties of postage, and granting other duties in lieu thereof, the former rates of postage were, from and after April 5, 1801, to cease, and in lieu of the rates repealed, the following were to take place:

General Post.] A distance not exceeding fifteen measured miles, 3d. double 6d. treble 9d. ounce weight 1s.—Above fifteen and not exceeding thirty miles, single 4d. double 8d. treble 1s. ounce 1s. 4d.—Above thirty and not exceeding fifty miles, single letter 6d. double 10d. treble 1s. 3d. ounce 1s. 8d.—Above fifty and not exceeding eighty miles, single letter 6d. double 1s. treble 1s. 6d. ounce 2s. 6d.—Above eighty and not exceeding one hundred and twenty miles, single letter 7d. double 1s. 2d. treble 1s. 9d. ounce 2s. 4d.—Above one hundred and twenty and not exceeding one hundred and seventy miles, single letter 8d. double 1s. 4d. treble 2s. ounce 2s. 8d.—Above one hundred and seventy and not exceeding two hundred and thirty miles, single letter 9d. double 1s. 6d. treble 2s. 3d. ounce 3s.—Above two hundred and thirty and not exceeding three hundred miles, single letter 10d. double 1s. 8d. treble 2s. 6d. ounce 3s. 4d.—For one hundred measured miles above three hundred miles, single letter a further sum of 1d. double 2d. treble 3d. ounce 4d.—Above three hundred measured miles, and not amounting to one hundred miles, the like further sum for every single letter 1d. double 2d. treble 3d. ounce 4d.—And where the distance above three hundred measured miles shall exceed one hundred miles, and so progressively for any like excess of distance of one hundred miles, the like further sum for every single letter 1d. double 2d. treble 3d. ounce 4d.

Foreign Letters.] Letters to or from any part of the United Kingdom of Great Britain and Ireland, from or to any places out of the said kingdom, not within his majesty's dominions, in addition to all other rates now payable, single letter 4d. double 8d. treble 1s. ounce 1s. 4d.

Rates by the Two-penny Post.] For every letter originally sent by the post known by the name of the penny-post (and not first passing by the general post), the postage whereof shall not be paid on putting the same into the office of the said post, the rates herein-after mentioned shall be paid, viz.

For the conveyance of every letter sent by the said post from any place within the cities of London and Westminster, the borough of Southwark, and the respective suburbs thereof, the sum of 2d.—For the conveyance of every letter put into such last-mentioned post office to be forwarded by the general

post, the sum of 2d.—For every letter or packet first passing by the general post, and then passing by the two-penny post, over and above the general postage, 2d.—Merchants' accounts, bills of exchange, and bills of lading, shall be rated as for many several letters.

The postmaster general may undertake the conveyance of letters to and from places not being post towns, for such sums for extra service as may be agreed upon between the postmaster general and the inhabitants; but the inhabitants of such places may act as heretofore.

Irish Letters.] There shall also be paid for every letter conveyed by packet boats from or to the ports of Holyhead or Milford haven, to or from any ports in Ireland, over and above the rates payable for such letters, a packet postage, viz. for every single letter 2d. treble 6d. ounce 8d.

This act is not to alter the rates of postage upon single letters sent by or to seamen or soldiers, made payable by 35 Geo. III. c. 53. nor the manner of charging for patterns or samples of cloth, &c. under that act.

POST-HORSES (*Encycl.*). By the act 25 Geo. III. c. 51. all postmasters, innkeepers, or other persons, shall pay annually 5s. for a licence. Persons letting post-horses without a licence, forfeit 10l. and keeping more than one inn under one licence, 20l. They are to paint licensed to let post-horses on the fronts of their houses, on pain of 5l. And there shall be paid for every horse hired for travelling post, one penny halfpenny for every mile such horse shall be hired to travel post.

For every horse hired for a day, or less time, if the distance shall be ascertained, one penny halfpenny per mile; and if the distance shall not be ascertained, 1s. 9d. for each horse, to be paid by the person by whom the horse shall be hired.

Every licensed person to paint, on the outside panel of each door of the chaise, his christian and surname, and place of abode, on pain of 5l.

POT-ASH (*Encycl.*). In June, 1801, a patent was granted to Mr. Howard, of Manchester, for a method of making a British barilla and potash, and of obtaining a greater quantity of alkali than by any means hitherto discovered. The inventor's method is by saturating with quick lime the ashes made from bleachers' waste lye, rock salt, soda, natron, common salt, black ashes of the soap-boilers' lye, kelp, tobacco ashes, &c. sal enixum, caput mortuum of the vitriolic and muriatic acid; and also for separating the vitriolic and muriatic acids as they exist in common salt, sea water, bleachers' waste lye, and the lye or salt of soap-boilers' waste lye; these, or any or all of them together, or any other substance, that wholly or in part contains a vegetable mineral or fossil alkali.

"To obtain the alkali," says he, "contained in ashes made from the bleachers' waste lye, rock salt, common salt, soda, natron, black ashes of the soap-boilers' waste lye, kelp, or tobacco ashes, I take of the rock salt, common salt, black ashes from the soap-boilers' waste lye, kelp, or tobacco ashes, or any or all of them, twenty hundred weight; or of ashes made from bleachers' waste lye, soda, or natron, or any or all of them, 10 cwt.; and grind, pound, or roll them sufficiently fine, as to pass through a fine sieve. To which I add 16 cwt. of cokes or cinders, charcoal, small coal, dyers' waste wood, sawyers' dust, or any other combustible, destitute of sulphur, being first ground and sifted. These I mix till they appear of one sameness, and then spread on an even floor a thin layer of them; to which I add a layer of quick lime, on which I sprinkle as much common water, lye, brine, or sea water, as the mass will absorb. This done, I continue the layers until 1600 weight of lime is added: I let them here saturate, and whilst warm I cut down the layers,

and add a sufficient quantity of common water, lye, brine, or sea water, as when ground, beat, or trodden with the feet, or any other mode, it assumes the appearance of mortar; which, when done, and perfectly dried, either upon iron plates or pans, or any other more convenient way, introduce it into the reverberating furnace, and bring the same into a flux, at a moderate temperature, which in two, three, or four hours, or more (according to quantity), being repeatedly stirred, and the same temperature kept up, will produce what I call my British barilla.

"To obtain the alkali contained in *sal enixum* and *caput mortuum* of vitriolic and muriatic acids, I take, if of *sal enixum* or residuum of muriatic acid, 20 cwt. and if of vitriolic acid, 35 cwt.; to each of which quantities separately, or a due proportion of them jointly, I add of natron 10 cwt. of black ashes of the soap-boilers' waste lye, 15 cwt. of kelp, 20 cwt. of salts obtained from the soap-boilers' waste lye, 20 cwt., or any other neutral salt or alkali in proportion to its quality; to which I add 32 cwt. of cokes or cinders, charcoal, or small coal, fawyers' dust, or dyers' waste wood, or any other combustible substance destitute of sulphur. The above, ground, sifted, and well mixed, to be spread on an even floor, as before, until 32 cwt. of quick lime be added, and then proceed as before, which will also produce my British barilla.

"To obtain the separation of the vitriolic and muriatic acids as they exist in common salt, brine, or sea water, the bleachers' waste lye, and the soap-boilers' waste lye, or the salts obtained therefrom, I take of salts obtained from the soap-boilers' waste lye 20 cwt., or of common salt 20 cwt., and 10 cwt. of tobacco ashes. These, either separately or jointly, in the above proportions; to which, if salts obtained from soap-boilers' waste lye is used, add 16 cwt., and if common salt and tobacco ashes, 28 cwt. (or a due proportion, according to the salts used), of cokes or cinders, charcoal, &c. as before, to be ground, sifted, and mixed, as before. These spread in layers, and sprinkled with lye, brine, or sea water, until, if soap-boilers' salts are used, 16 cwt. of quick lime is used; and if common salt and tobacco ashes, then 28 cwt. of quick lime is used, or in that proportion, and then to undergo the aforementioned processes for making the British barilla.

"If to make potashes, I add to every 20 cwt. of the whole mass 20 cwt. of black ashes, salts obtained from soap-boilers' waste lye, or any other neutral salt or alkali, in due proportion, which I treat in the manner before mentioned with the aforesaid mass, or I introduce it in like proportion at the time of charging the reverberating furnace; but I prefer the former: in two, three, or four hours, from the introduction (according to the quantity), it will become a liquid mass, which I then tap, and call my British potash."

Notwithstanding the proportions above prescribed, the writer is aware that great diversity of opinion upon the proportions of each ingredient will be found amongst the consumers: first, on account of the alkaline basis, and secondly, with regard to the causticity desired; but he is of opinion, that the proportions he has laid down are preferable to any other.

POT-ASH-CAKE, a kind of biscuit, much used in the United States of America; and which is baked in the following manner:—Take two pounds of wheat flour, and half a pound of butter; to these must be added half a pound of sugar, that has previously been combined with a pint of milk; and a large tea-spoonful of salt of tartar, crystals of soda, or any other pure pot-ash, which has likewise been dissolved in a small quantity of water. The whole is to be carefully mixed, and kneaded together: when properly rolled, it may

be formed into cakes, which ought to be exposed to a brisk heat of an oven; as their lightness depends much on the expedition with which they are baked.

Pot-ash cake is equally nutritious and wholesome: being speedily prepared, it deserves to be adopted, especially where yeast cannot be easily procured.

POTATOE (*Encycl.*). From vol. II. of the Reports of the Society for bettering the Condition, &c. of the Poor, we shall extract an interesting paper on the preservation of potatoes, by Mr. Millington.—According to his statement, three pounds of potatoes were peeled, raised, and put in a coarse cloth between two boards, in a napkin-press, till they were compressed into a very thin cake, that was placed on a shelf to dry. The roots yielded, on expression, about one quart of juice; which, being mixed with an equal quantity of cold water, deposited in the course of an hour, upwards of one dram of white flour or starch, in every respect fit for making fine pastry.—Mr. M. presented in 1799 to the above-mentioned society, a cake, which had been thus prepared in the year 1797. In bulk, it occupied only one-sixth part of the original roots; and lost about two-thirds in weight by the process. Mr. Millington's second method of preserving these roots, is as follows: Five pounds of potatoes were properly cleaned and pounded in a mortar, without being previously peeled; and then pressed in a small wine-press into a thick cake; the whole being completed in the manner above described. This cake also was sweet and wholesome, but did not possess the clear whiteness of the former; nor does it appear that such as were prepared according to the last process, will remain sweet for the same length of time as those consisting of peeled potatoes.—At all events, this contrivance deserves to be further pursued and improved; for, independently of the immediate advantages that will result from supplying mariners with vegetables, it is an object of the greatest importance, when considered as a mean of preserving so useful, though perishable, an article for years; and of laying up a store in plentiful seasons, against the time of scarcity.

Another mode of keeping potatoes, was lately and successfully tried, by the patriotic Bath and West of England society; and which certainly is less complex than that before described. It consists simply in slicing potatoes, without taking off the rind or skin, and afterwards drying them in an oven or kiln. The roots thus prepared will remain sweet for almost any length of time: the society sent some to Jamaica in a barrel, which had been four years from Britain, and, on their return, were found not to be in the least degree affected.

POTENZA, a town of Naples, in Basilicata, with a bishop's see. It was almost ruined by an earthquake in 1694. It is seated near the source of the Basiento, eight miles S.E. of Naples.

POTOMAC, or **PATOMAC**, a river of Virginia, which falls into the bay of Chesapeake. On the banks of this river is now erecting the city of Washington, the intended metropolis of the United States.

POTTON, a town in Bedfordshire, with a market on Saturday, 12 miles E. of Bedford, and 48 N. by W. of London. Long. o. 18. W. Lat. 52. 11. N.

POUGHKEEPSIE, the capital of Dutchess County, in the state of New York, situate on the E. side of Hudson's River, N. of Wappinger's Creek.

POUGUES, a village of France, in the department of Nievre, noted for its ferruginous mineral waters. It is five miles N.W. of Nevers.

POULTICES (*Encycl.*). These are generally prepared of bread and milk, to which is added oil, lard, or other unctuous matter, to prevent their adhesion to the parts inflamed. **J**

large hospitals, the consumption of these articles for such purpose being very considerable, while the bread and milk are liable to become foul in warm weather, the following ingredients have, by Mr. Payne, surgeon, been proposed as substitutes:—Take, of the finest pollard, three parts; of genuine linseed flour, one part; both by measure; and, of boiling water, four parts: mix these ingredients with a spoon or a broad knife; and they will, in general, form a poultice of a proper consistence, without requiring oil, lard, or other emollient ointment: though, if the inflammation be considerable, a small quantity of oil may be added, to prevent adhesion.

POULTON, a town in Lancashire, with a market on Monday, seated near the mouth of the Wyre, 18 miles S.W. of Lancaster, and 231 N.W. of London. Long. 3. 6. W. Lat. 53. 52. N.

POURSELUC, a town of the kingdom of Siam, 280 miles N. of Siam. Long. 100. 40. E. Lat. 18. 58. N.

PORZAIN, a town of France, in the department of Puy de Dôme, seated on the Sioule, 36 miles N. by E. of Clermont, and 190 S. of Paris. Long. 3. 15. E. Lat. 46. 21. N.

POYANG-HOU, a lake of China, in the province of Kiang-si, formed by the confluence of four considerable rivers. It is 250 miles long.

PRABAT, a town of the kingdom of Siam, 100 miles N. of Siam. Long. 101. 10. E. Lat. 15. 40. N.

PRACHALITZ, a town of Bohemia, capital of a circle of the same name, 66 miles S. of Prague. Long. 13. 55. E. Lat. 48. 56. N.

PRADES, a small handsome town of France, in the department of the Eastern Pyrenæes, seated on the river Tet, in a fine plain, in the middle of mountains, 22 miles S.E. of Mont-louis. Long. 2. 35. E. Lat. 42. 26. N.

PRAGA, or **PRAGUE**, a town of Poland, in the palatinate of Maſovia, seated on the Viſtula, opposite to Warſaw, of which it is considered as a suburb.

PRAGILAS, a town of Piedmont, seven miles W. of Turin. Long. 7. 30. E. Lat. 45. 5. N.

PRATO, a town of Tuscany, seated on the Bifentino, 12 miles N.W. of Florence. Long. 19. 54. E. Lat. 43. 52. N.

PRAYA. See **PORTO PRAYA**, *Supp.*

PRECOP, or **PEREKOP**, a town and fortress of Russia, in the government of Catharinenski, and province of Taurida, seated on the isthmus that joins the Crimea to the continent. Long. 35. 40. E. Lat. 46. 40. N.

PRECOPIA, a town of Turkey in Europe, in Servia, seated on the river Morava, 20 miles W. of Niſſa. Long. 22. 5. E. Lat. 43. 31. N.

PREGEL, a river which issues from a lake in Poland; and crossing East Prussia, falls into the eastern extremity of the Frische Haf (an inlet of the Baltic) below Königsberg.

PREGNITZ, a town of Branconia, in the principality of Calabach, situate on a river of the same name, 10 miles S. of Bareith. Long. 11. 55. E. Lat. 49. 50. N.

PREMESLAW, a populous town of Austrian Poland, with a strong castle, and a Greek and Latin bishop's see. It is seated on the river Sana, 27 miles W. of Lemberg. Long. 21. 0. E. Lat. 49. 0. N.

PRENIO, a town of Germany, capital of the Ucker marche of Brandenburg. It contains six churches, and is seated on the lake and river Ucker, 60 miles N. by E. of Berlin. Long. 13. 52. E. Lat. 53. 25. N.

PRENTICE, or **APPRENTICE** (*Encycl.*). The following extract from an account of a charity for placing out poor children, at Greetham, in the county of Durham, by the Rev. John Brewster, is published by the Society for bettering the Condition of the Poor.

"In November, 1790," says Mr. Brewster, "a fund, arising from a rent charge of 6l. a-year, for apprenticing and placing out poor children at Greetham, fell under my direction. The beneficial effects attending this small institution induce me to make this communication; from which, I trust, it will appear that much good may be done in this way at a small expence.

"The following is a general statement of the trust account for the last seven years.

Receipts from November, 1790, to November, 1797.	
Received the balance remaining in hand, November, 1790	12 10 —
Received rent charge of 6l. a-year for seven years	42 — —
	54 10 —

Payments during the same period.

Paid for putting out nine apprentices, and for clothing two girls for service, at 2l. 19s. 6d. each	32 14 6
Paid for one apprentice, at 7l. 16s. one at 4l. one at 3l. 3s. one at 1l. 14s. 6d. and two at 1l. 1s. each	18 15 6
Paid for clothing one girl for service	1 1 —
Paid for partly clothing one boy for service	10 6 —
	53 1 6
Allowed the overseer of the poor for receiving the rent, at one shilling per annum, for seven years	7 — —
Balance in hand, 7th November, 1797	1 1 6
	54 10 —

"To place the children of the poor, as early as possible, in trades or occupations, answers two useful purposes;—the removing the expence of maintenance from the parent or the parish, and the training of the child in habits of industry and virtue. I have stated the specific sums expended for each child, in order to shew how little is required on such occasions. In one or two instances, the parish added something, to supply the deficiencies of the fund, which could not admit of large deductions; and, with only that aid to this very small fund, fifteen children have been apprenticed, and four clothed for service, in the course of the last seven years.

"Services in husbandry, or menial trades, are the usual destinations of village children. To adapt, therefore, this plan to the use of towns, it will be requisite to enlarge the scale of expence, according to the situation. But, in distributing charitable funds of this nature, it will not be an unnecessary caution, that the overseers of the poor be not entrusted with the *sole* management of them: for though they are often men of real integrity, yet they will sometimes be so far interested, as to wish to confine the effects of the institution to the children of *chargeable* poor only, for the sake of alleviating the burthen of the parish. In all parishes there are many poor persons, who receive no charitable support at all, and yet have large families to send out into the world. These ought to be the first objects of attention: as, in all probability, it is from the exertions of their industry that they have been hitherto enabled to preserve themselves in an independent situation; and with a little aid of this kind, it is most likely that they may be able to go on without any call for parochial relief."

Mr. Brewster, in a subsequent report, transmits an account of the particular trades to which the children were apprenticed; in order that the quantum of apprentice-fee may be better known for different trades calculated for poor children in country situations.

	Sex.	Trade.	Term.	Feet.
No. 1.	male	taylor	6 years	2 19 6
2.	female	service	1 year	2 19 6
3.	male	comb-maker	7 years	2 19 6
4.	female	service	1 year	1 1 0
5.	male	farmer's servant	till 21	2 19 6
6.	ditto	shoemaker	7 years	4 0 0
7.	ditto	ditto	7 years	2 19 6
8.	ditto	{ ditto and farmer's servant }	till 21	7 16 0
9.	ditto	ditto clothed.	ditto	1 1 0
10.	ditto	ditto	7 years	3 3 0
11.	ditto	bricklayer	6 years	2 19 6
12.	ditto	shoemaker	7 years	1 14 6
13.	ditto	tailor	6 years	2 19 6
14.	ditto	stone-mason	7 years	2 19 6
15.	ditto	tailor clothed	ditto	0 10 6
16.	female	service	till 21	2 19 6
17.	male	taylor	7 years	1 1 0
18.	ditto	farmer's servant	7 years	2 19 6
19.	ditto	taylor	till 21	2 19 6

The variation in the apprentice-fee arises from different circumstances; either of health in the child, ability in the parent, or from the nature of the occupation to which the child is placed; and in some instances the child is boarded by the master, and sometimes by the parent.

This plan has been adopted by the trustees of the charity-school at Stockton-upon-Tees; and with good success. The school consists of about forty scholars of different sexes. Seven of these, two boys and five girls, have been discharged in the course of the last year, and placed either at trades or services at an expence of 40s. each: one boy as a writer to an attorney, another as an apprentice to a wool-comber; and one girl as an apprentice to a glover, and four in service.

The adoption of this plan has been attended with the best consequences to the school. It has occasioned a more regular attendance, and better behaviour in the children; as conduct is indispensably necessary, if they expect this reward. The charity-school is, in some measure, supplied with scholars from the Sunday-school; and the master says, this new regulation has a considerable influence even upon that.

In towns, where funds of this nature may be made sufficiently ample, it is likely that the institution may have a further beneficial effect, by relieving from a menial trade or occupation, a child of particular abilities.

PRERAU, a town of Moravia, capital of a circle of the same name. It is 13 miles S.E. of Olmutz, and 126 E.S.E. of Prague. Long. 17. 29. E. Lat. 49. 18. N.

PRESENZANO, a town of Naples, in Terra di Lavoro. It appears by an inscription, that it is the ancient Rufæ, and its territory has the name of Costa Rufaria. It is 28 miles N. of Naples. Long. 14. 20. E. Lat. 41. 20. N.

PRESIDII, STATE OF, a territory of Tuscany, in the Siennese. It includes six fortresses, seated on the coast of Tuscany; and which Spain reserved, when it ceded Sienna

to the grand duke. They were designed to facilitate the communication between the Milanese and the kingdom of Naples. In 1735, they were ceded to the king of the Two Sicilies. Their names are Orbitello, Telemone, Porto Hercole, Porto San-Stephano, Monte Philippo, and Porto Longone.

PRESOVIA, a town of Little Poland, seated on the Vistula, 20 miles E. of Cracow. Long. 20. 16. E. Lat. 50. 10. N.

PRESTIMA, a town of Portugal, in Beira, 11 miles N. of Coimbra.

PRESTON PANS, a village in Haddingtonshire, noted for its salt works, and for the defeat of the royal army by the rebels in 1745. It is four miles W. of Haddington.

PREVESA, a sea-port of Turkey in Albania, with a bishop's see. It stands on the ruins of the ancient Nicopolis, built by Emperor Augustus, in memory of his victory over Antony. It belongs to the Venetians, and was taken by them in 1684. It is seated on a mountain, on the gulf of Larta, 70 miles N.W. of Lepanto. Long. 21. 5. E. Lat. 39. 14. N.

PREUILLY, a town of France, in the department of Indre and Loire. Near it are mines of iron; and to the S.W. is La Haye, a small town on the Creuse, famous as the birth-place of Descartes. Preuilly is seated on the Claise, 18 miles S. of Loches.

PRIAMAN, a sea-port of the East Indies, in Sumatra, where the Dutch have a factory. Long. 98. 0. E. Lat. 1. 0. S.

PRIBODA, a town of Sweden, in the province of Smaland, 16 miles S.S.W. of Carlscrona. Long. 15. 18. E. Lat. 56. 10. N.

PRIEBUS, a town of Silesia, in the principality of Sagan, situate on the Neissa, 15 miles S.W. of Sagan. Long. 15. 12. E. Lat. 51. 32. N.

PRINCE'S ISLAND, a small island on the west coast of Africa, 250 miles S.W. of Loango. Long. 6. 40. E. Lat. 1. 49. N.

PRINCE'S ISLAND, a small island of Asia, at the S.W. extremity of the straits of Sunda, a few leagues from the coast of Java. It is very woody, and not much cleared. The inhabitants are Javanese, whose rajah is subject to the sultan of Bantam; and their customs are very similar to those of the natives about Batavia. The best anchoring place is in long. 105. 17. E. lat. 0. 36. S.

PRINCE OF WALES, CAPE, the most western extremity of all America, hitherto known, discovered by Captain Cook in 1778. Long. 168. 5. W. Lat. 65. 46. N.

PRINCE OF WALES, FORT, the most northern settlement of the Hudson's Bay Company, seated on the west side of Hudson's Bay, at the mouth of Churchill River. Long. 94. 7. W. Lat. 58. 47. N.

PRINCE WILLIAM HENRY'S ISLAND, an island in the Eastern Ocean, lying W.N.W. of Tench's island. It is pretty high, well wooded, and 70 miles in circuit. The natives are quite naked, and seem to be the same sort of people as those on Tench's island, and the canoes of the same construction. It was discovered by Lieutenants Ball and King, in 1750. A high mountain rising in the centre of it, was called Mount Philip. Long. 149. 30. E. Lat. 1. 32. S.

PRINCE WILLIAM HENRY'S ISLAND, an island of the South-Pacific Ocean, discovered by Captain Wallis, in 1767. Long. 121. 6. W. Lat. 17. 0. S.

PRINCESS ANN TOWN, a town of the United States, in Maryland, 114 miles S. of Philadelphia. Long. 75. 48. W. Lat. 38. 10. N.

PRISIDENIA, a town of Turkey in Europe, in Bosnia, with a bishop's see, and a magnificent church. It is seated on the Drin, 32 miles N.E. of Albanapolis, and 195 N. of Belgrade. Long. 21. 3. E. Lat. 42. 0. N.

PRISTINA, a town of Turkey in Europe, in Servia. It was pillaged by the Austrians in 1689; and is seated on the Rufca, 58 miles N.W. of Nida, and 150 S.E. of Belgrade. Long. 22. 5. E. Lat. 42. 43. N.

PRITZWALK, a town of Upper Saxony, in the marche of Prignitz, 44 miles N. of Brandenburg, and 54 N.W. of Berlin. Long. 12. 13. E. Lat. 53. 9. N.

PRIVAS, a town of France, in the department of Ardèche, seated on a hill, near the confluence of three small rivers, 16 miles N. of Viviers. Long. 4. 41. E. Lat. 44. 45. N.

PROCIDA, an island of Italy, in the gulf of Naples, near that of Ichia. It is eight miles in circumference, and very fertile and populous. The capital, of the same name, is a small fortified place, on a high craggy rock, by the sea-side. Long. 14. 8. E. Lat. 40. 43. N.

PRODANO, an island in the Mediterranean, near the west coast of the Morea, formerly called Sphacteria. It is 36 miles S.S.E. of Zante. Long. 21. 24. E. Lat. 37. 15. N.

PROM, a town of the kingdom of Burmah, seated on the Menan, 200 miles N.W. of Pegu. Long. 94. 0. E. Lat. 17. 50. N.

PROSPEROUS, a village of Ireland, in the county of Kildare; it has a considerable manufacture of cotton, and is 16 miles S.W. of Dublin.

PROVIDENCE, an island in the Atlantic, which the English buccaniers fortified, but afterwards abandoned. It is 150 miles E. of the coast of Nicaragua. Long. 80. 44. W. Lat. 13. 25. N.

PROVIDENCE, a river of North America, which rises in the state of Massachusetts, and waters the town of Providence, from whence it is navigable to Narraganset Bay, which it enters on the west side of Rhode Island.

PROVIDENCE, a town of the state of Rhode Island, with a considerable manufacture of cloth, and a large foreign trade. Here is an elegant college, called Rhode Island College. Providence is seated on both sides of a river of the same name, 30 miles N.W. of Newport. Long. 71. 26. W. Lat. 41. 50. N.

PROVINS, a town of France, in the department of Seine and Marne, famous for its mineral waters and excellent conserves of roses. It is seated on the Vouzie, 30 miles S.E. of Meaux, and 47 S.E. of Paris. Long. 3. 22. E. Lat. 48. 34. N.

PRUCK, a town of Austria, seated on the Leita, 22 miles S.W. of Presburg, and 22 S.E. of Vienna. Long. 16. 58. E. Lat. 48. 5. N.

PRUCK, a town of Silesia, seated on the Muehr, 66 miles S.W. of Vienna. Long. 15. 25. E. Lat. 47. 24. N.

PRUTH, a river of Poland, which rises in Red Russia, in the mountain of Crapach, crosses part of the palatinate of Lemberg, runs through all Moldavia, and falls into the Danube.

PSKOF, or **PLESKOF**, a government of Russia, once a republic, subdued by Ivan Vasilvitch, and formerly comprised in the government of Novogorod.

PSKOF, or **PLESKOF**, a lake of Russia, in a government of the same name.

PSKOF, or **PLESKOF**, a town of Russia, capital of a government of the same name, with an archbishop's see, and a strong castle. It is seated on the river Welika, 80 miles S. of Narva, and 150 S. by W. of Peterburg. Long. 27. 52. E. Lat. 57. 58. N.

PUCKHOLI, a town of Hindoostan Proper, in the province of Lahore, 86 miles S.W. of Cathmere, and 145 N.W. of Lahore. Long. 72. 5. E. Lat. 31. 45. N.

PUDDAR, a river of Hindoostan Proper, which rises in the S.W. part of Agimere, divides the provinces of Cutch and Guzerat, and falls into the gulf of Cutch.

PUDOGA, a town of Russia, in the government of Olonetz, situate on the east coast of the lake Oneskoe, 102 miles E. of Olonetz. Long. 36. 30. E. Lat. 61. 36. N.

PUEBLA, a town of Spain, in Galicia, near the Atlantic, 25 miles S.S.W. of Compostella. Long. 8. 7. W. Lat. 42. 34. N.

PUEBLA, a town of Spain, in Extremadura, seated near the Guadiana, 15 miles W. of Merical. Long. 6. 23. W. Lat. 38. 42. N.

PUEBLA DE LOS ANGELOS, a town of New Spain, in the audience of Mexico, and province of Tlaxcala, of which it is the capital, with a bishop's see. It is 62 miles S.E. of Mexico.

PUEBLA-NUOVA, a sea-port of New Spain, in the audience of Guatemala, and province of Veragua. It is seated on a bay of the Pacific Ocean, 200 miles W. of Panama. Long. 82. 28. W. Lat. 8. 48. N.

PUNTE-DEL-ARCOSBISPO, a town of Spain, in Extremadura, which belongs to the Archbishop of Toledo, and is seated on the river Tajo, over which is a handsome bridge, 40 miles S.W. of Toledo. Long. 4. 15. W. Lat. 39. 38. N.

PUEERTO-BELLO, **PUEERTO RICO**, &c. For all names, which, in the Spanish language, signify a port, see **PORTO**; for, although that word is not Spanish, but Italian, it is necessary to adhere to it in this work, in conformity to the English pronunciation.

PUGLIA, the modern name of the ancient Apulia, containing the three provinces of Capitanata, Bari, and Oranto, on the east side of the kingdom of Naples.

PULAON, an island in the Indian Ocean, lying on the west of the Philippines. It is very fertile, and subject to its own king, who is tributary to that of Borneo. Long. 129. 12. E. Lat. 9. 30. N.

PULHELY, a sea-port in Carnarvonshire, with a market on Wednesday. It is seated at the head of an inlet of Cardigan Bay, between two rivers, six miles S. of Newin, and 143 N.W. of London. Long. 4. 15. W. Lat. 53. 52. N.

PULO-CANTON, an island in the Indian Ocean, on the coast of Cochinchina. Long. 109. 35. E. Lat. 15. 10. N.

PULO-CONDOR, the name of several islands in the Indian Ocean, the principal of which is the only one inhabited. It is 13 miles in length, and nine in breadth, but in some places not above a mile over. The soil of these islands is blackish, and pretty deep, but the hills are somewhat stony. The trees are not very thick, but large, tall, and fit for any use. The principal fruits are mangoes, a sort of grapes, and badard nutmegs. The animals are hogs, lizards, and guanas; and there are birds of various kinds, not known in other parts. The inhabitants are small of stature, of a dark complexion, with small black eyes, thin lips, white teeth, little mouths, and black straight hair. Their chief employment is to get tar out of large trees. They are idolaters, and have images of elephants in their temples. Long. 107. 20. E. Lat. 8. 40. N.

PULO-DINDING, an island in the Indian Ocean, on the west coast of the peninsula of Malacca. It belongs to the Dutch.

PULO-TIMON, an island in the Indian Ocean, on the east coast of the peninsula of Malacca. It is often touched at for taking in wood, water, and other refreshments, and there is a great plenty of green turtles. Long. 104. 25. E. Lat. 3. 0. N.

PULO-UBY, an island in the Indian Ocean, at the entrance of the bay of Siam, 20 miles in circumference. It yields good water and plenty of wood. Long. 105. 56. E. Lat. 8. 25. N.

PULO-WAY, an island in the Indian Ocean, near the north point of that of Sumatra. It is the largest of the islands that form the entrance of the channel of Achern, and is peopled by men banished from Achern. Long. 95. 39. E. Lat. 5. 30. N.

PULTAUSK, a town of Great Poland, in the palatinate of Masovia, seated on the Narew, 20 miles N.E. of Warsaw. Long. 21. 47. E. Lat. 50. 30. N.

PULTOWA, a fortified town of the Ukraine, famous for a battle in 1709, between Peter the Great and Charles XII. of Sweden, wherein the latter was totally defeated. It is 100 miles S.W. of Belgorod. Long. 34. 25. E. Lat. 49. 26. N.

PUMP-ENGINE. See **FIRE-ENGINE**; *Supp.*

PUNA, an island in the Pacific Ocean, 35 miles long and 12 broad, lying at the entrance of the bay of Guaiquil, 115 miles N. of Païta. Long. 81. 6. W. Lat. 3. 17. S.

PUNBETE, a town of Portugal, in Estremadura, six miles W.N.W. of Abrantes.

PUNTA-DEL-GUDA, the capital of St. Michael, one of the Azores, with a strong castle, and a harbour. Long. 25. 42. W. Lat. 37. 47. N.

PURBECK, **ISLE OF**, a rough and heathy tract in Dorsetshire, to the south of Poole Bay.

PURCHENA, a town of Spain, in the province of Granada, 60 miles E. of Granada, and 60 W. of Carthagena. Long. 2. 5. W. Lat. 37. 19. N.

PURFLEET, a village in Essex, situate on the Thames, four miles W. of Grays-Thurrock. It has extensive lime-works, and a large magazine of gun-powder.

PURMERENS, a town of North Holland, on a brook of the same name, 10 miles N. of Amsterdarn, and 13 S.E. of Alcmear.

PURRYSBURG, a town of the United States, in Georgia, built by a colony of Swifs. It is seated on the river Savannah, 30 miles N.W. of the town of Savannah. Long. 80. 40. W. Lat. 32. 22. N.

PUSCHIAVO, a town of the country of the Grifons, three miles north from a lake to which it gives name. It is 17 miles W.S.W. of Bormio, and 20 E. of Chiavenna. Long. 9. 40. E. Lat. 46. 20. N.

PUTALA, or **PATELI**, a mountain of Great Thibet, seven miles east of Lassa. On its summit is the palace of the grand lama, the high-priest and sovereign of Thibet.

PUTNEY, a village in Surrey, seated on the Thames, five miles W.S.W. of London. It is the birth-place of the unfortunate Thomas Cromwell, earl of Essex, whose father was a blacksmith here; and of Nicholas West, bishop of Ely, his contemporary, a great statesman, whose father was a baker. On Putney-common is an obelisk, erected in 1786, by the city of London, in commemoration of Mr. Hartley's invention of fire-plates, for securing buildings from fire; and near it is the house in which that gentleman made his experiments, one in particular, in 1776, when his majesty, and some of the royal family, were in a room over the ground floor, perfectly safe, while the room under them was furiously burning.

PUY, a populous town of France, in the department of Upper Loire, seated on the mountain Anis, near the river

Loire. The principal church is famous for a prodigious quantity of relics; and our Lady of Puy is celebrated in the annals of superstition. The late canons of Puy have had kings and dauphins of France at their head. Puy has manufactures of lace and silk stuffs, and is 45 miles N.E. of Mende.

PUYCERDA, a strong town of Spain, in Catalonia, and capital of Cerdagna. It is seated between the Carol and Segra, in a plain, at the foot of the Pyrenées, 53 miles W. of Perpignan, and 67 N.W. of Barcelona. Long. 1. 50. E. Lat. 42. 36. N.

PUY-DE-DOME, a department of France, containing part of the late province of Auvergne, and almost all Limagne, a territory 12 leagues long and six broad, one of the most fertile plains in France. The borders of this circular plain are mountainous, once so many volcanoes, but now covered with habitations, herds, and flocks. Clermont is the capital.

PUY-EN-ANJOU, a town of France, in the department of Maine and Loire, 10 miles S.W. of Saumur, and 160 of Paris. Long. 0. 13. W. Lat. 47. 6. N.

PUYLAURINS, a town of France, in the department of Tarn, eight miles S.W. of Castres, and 23 E. of Toulouse. Long. 1. 57. E. Lat. 43. 35. N.

PUY LEVEQUE, a town of France, in the department of Lot, 14 miles W. of Cahors. Long. 1. 17. E. Lat. 44. 25. N.

PUY MOISSON, a town of France, in the department of Lower Alpes, 15 miles S. of Digne. Long. 6. 10. E. Lat. 43. 55. N.

PUZZOLI, a celebrated, but now inconsiderable town of Italy, on the bay of Naples. Here is a temple of Jupiter Serapis, an interesting monument of antiquity, being quite different from the Roman and Greek temples, and built in the manner of the Asiatics; probably by the Egyptian and Asiatic merchants settled at Puzzoli, which was the great emporium of Italy, till the Romans built Ostia and Antium. The ruins of Cicero's villa, near this place, are of such extent, as to give a high idea of the wealth of this great orator. Puzzoli is 10 miles W. of Naples.

PYRBAUM, a town of the upper palatinate of Bavaria, capital of a lordship of the same name. It is 13 miles S.E. of Nuremberg.

PYRENEES, EASTERN, a department of France, containing the late province of Roussillon. Although great part of the country is mountainous, it is fertile; producing corn, excellent wines, olives, oranges, and leather of a superior quality. Perpignan is the capital.

PYRENEES, LOWER, a department of France, containing the late provinces of Baiques and Bearn. Pau is the capital. See **NAVARRIE**.

PYRENEES, UPPER, a department of France, containing the late province of Bigorre. Here are excellent horses and good partridges. The valleys are very fertile; furnishing rye, millet, Spanish corn, and flax. The mountains have mines of lead, iron and copper, and quarries of slate, marble, and jasper. Tarbes is the capital.

PYRNA, a town of the electorate of Saxony, in Misnia. It has a castle, on a mountain called Sonnenstein, which has been sometimes used as a state prison. Near it is a fine quarry of stone, which is transported to different places by the river Elbe. Pyrna is seated on the Elbe, 10 miles S.E. of Dresden. Long. 13. 50. E. Lat. 51. 6. N.

PYRSTEIN, a town of Bavaria, in the bishopric of Passau, 10 miles N.W. of Linz, and 22 E. of Passau.

PYSECK, a town of Bohemia, in the circle of Prachin, seated on the Attoay, near the Muldaw, 50 miles S. of Prague. Long. 14. 40. E. Lat. 49. 16. N.

of H. R.

Q.

QUACK MEDICINES: vile compounds, calculated to defraud the credulous of their money and health.

By the act 25 Geo. III. c. 79. the quack medicine venders within the limits of the two-penny post are to take out a licence annually, and pay 20s. in any other part of the kingdom, 5s.

And upon every packet, box, bottle, phial, or other inclosure, containing any drugs, oils, waters, essences, tinctures, powders, or other preparation or composition whatsoever, used or applied, or to be used or applied, externally or internally, as medicines or medicaments for the prevention, cure, or relief of any disorder or complaint incident to, or in any wise affecting the human body, which shall be uttered or vended in Great Britain, there shall be charged a stamp duty according to the rates following; (that is to say), where the contents of any such packet, box, bottle, phial, or other inclosure aforesaid, shall not exceed the price or value of 1s. there shall be charged a stamp duty of one penny halfpenny.

Where the contents of any such packet, box, bottle, &c. shall exceed the price of 1s. and not exceed 2s. 6d. there shall be charged a stamp duty of 3d. :—above 2s. 6d. and under 5s. a stamp duty of 6d. :—and if of the price of 5s. or upwards, a stamp duty of 1s.

The above duties not to extend to articles mentioned in the books of rates; nor to unmix'd drugs sold by a surgeon, apothecary, chemist, or druggist, not claiming an exclusive right to the same; and which are not prepared or sold under letters patent, nor by any public notice, or advertisement, or recommended as nostrums.

Persons vending quack medicines without a licence, are to forfeit 5l. Venders are to use stamped labels; and if they vend or expose to sale any medicines without a proper stamp, they are to forfeit 5l. for each box, bottle, or phial. The discount on these stamps, for prompt payment, is, if the duty amounts to 10l. or upwards, 2l. per cent. per annum; and if the duty amounts to 50l. or upwards, 5l. per cent. per annum.

Persons using stamps fraudulently, after they have been once sold or used, forfeit 10l. Buyer or seller may inform. Places of making and of vending are to be entered at the nearest stamp-office, on pain of 10l.

The penalties are recoverable either by action or information in the courts at Westminster, and half are to the informer and half to the king, if the informer prosecutes within six months; afterwards the crown is entitled to the whole, and the informer is to be rewarded at the discretion of the commissioners of stamps, by not exceeding one moiety after deducting the costs.

QUADRA AND VANCOUVER'S ISLAND, an island on the N.W. coast of America, on the W. coast of which Nootka Sound is situate. It was so named by Captain Vancouver in compliment to Senor Quadra, the Spanish commandant at Nootka. It is about 300 miles in length, and 80 in its greatest breadth.

QUADRANT (Enevel). An ingenious paper pointing out an easy and accurate method of adjusting the glasses of Hadley's quadrant on land, for the back-observation, appear in the Transactions of the American Philosophical Society.

"Various methods of adjusting the glasses for the back-observation," says the author of the paper, Mr. Robert Patterson, "have been proposed; but these are either very inaccurate and troublesome, or inapplicable to the common

octant, and require some appendage to the instrument, with which but very few have yet been made.

"The following method of making this adjustment will not, I flatter myself, be found liable to any of the above objections.—It may be made on land, in a few minutes, at any time of the day when the sun shines; requires no additional apparatus; but what any person may readily make for himself; and the adjustment may be relied upon as equally accurate with that for the fore-observation.

"*Description of the necessary apparatus*—Take a piece of plane glass (a piece of looking glass will do very well)—take the polish off one side of it, and cement it, with the rough side down, on the flat side of the segment of a wooden ball. The ball may be about three or four inches in diameter, and the piece of glass of about the same dimensions. Or the glass may be cemented to a piece of board, and this board to a three or four pound shot, or small hand-granade, when either of these may be conveniently had.

"Next take a piece of triangular board, of about four inches on the side. Near the corners of this board let there be inserted three small nails, or pieces of wire, to serve as feet for it to stand on."

Method of making the adjustment, or finding the quantity of the index-error.—"At any time when the sun shines set your triangular board on a table, the sill of a window, or any other convenient stand, exposed to the sun, and place the ball, with the piece of glass, on the triangular mortise; which, touching the ball only in three points, will consequently keep it steady in any position. Turn the ball into such a position that the plane of the glass may be, as nearly as you can judge, parallel to the equator; and then incline this plane, in the direction of the meridian passing through the sun, till the sun be about 45° above it.

"Now take your octant, and, by the fore-observation, bring one of the limbs of the sun's image, seen by a double reflection from the specula of the instrument, exactly into contact with the image of the same limb, seen by a single reflection from the surface of the glass plane, and read off the angle pointed out by the index. Immediately turn round your instrument, and bring the same limbs into contact by the back-observation. If the angle now pointed out by the index be exactly the supplement (to 180°) of the former angle, the horizon-glass for the back-observation will be truly adjusted, or exactly at right angles with the horizon-glass for the fore-observation: but if these two be not equal, then take half their difference, which will be the correction or index-error for the back-observation; supposing the fore-horizon-glass to have been previously well adjusted. This correction will be additive to all angles measured by the back-observation, when the angle pointed out by the index in the first of the above observations is greater than the supplement of the other, and vice versa.

"For the sake of greater accuracy, you may repeat these observations till you have taken two, four, or six sets: observing that if in your first set you begin with the fore-observation, as above directed, then in your second set you must begin with the back-observation; and so on. A mean of the corrections thus obtained may be taken as the true correction of adjustment."

Mr. P. concludes his paper with the following miscellaneous remarks, relative to this subject.

1. "If the arch of excels beyond 90° be but small, as

In some octants is the case, then it may be necessary to place the index one or two degrees before the 0, on the extra arch, and adjust the fore-horizon-glass to this position of the index. You will thus obtain a greater range for the index in adjusting the back-horizon-glass.

2. "When the reflecting glass plane is placed in the position above mentioned, viz. at right angles to the plane of the meridian passing through the sun, then the sun's path in the heavens will, for several minutes, be very nearly parallel to the said plane; and therefore no sensible error is to be apprehended from the increase or decrease of the sun's altitude above this plane during the interval between the first and second observations in the same set. But even if this should be the case, from the glass plane being placed considerably out of the above position, yet, by conducting the observations as above directed, the small errors arising from this source will naturally correct one another.

3. "When the polish is taken off one surface of a piece of glass, then the image of the sun, being reflected only from one surface, will appear single and distinct; whereas the image reflected from both surfaces will, most frequently, appear double or indistinct; arising from the want of parallelism between the surfaces.

4. "The image of the sun seen by a single reflection from one surface of the glass plane, and that seen by a double reflection from the specula of the instrument, will both appear nearly of the same shade or degree of brightness; and this will seldom be so intense as to require any foreign or coloured glass to be interposed between the eye and the image.

5. "In making observations with this instrument, whether for the purpose of adjusting the glasses, or for any other purpose, where great accuracy is required, it is necessary that the point on the index-speculum from which the first reflection is made, that on the horizon-glass from which the second reflection is made, and the eye-hole through which the image is viewed, be all in a plane, parallel to the plane of the instrument. This will be effected by wrapping a piece of tape, or the like, round the index speculum, leaving only a bare strip, of about a quarter of an inch broad, parallel to the plane of the instrument, and at the same height above it as the eye-hole, and transparent part of the horizon-glass.

6. "The eye-hole is generally made too small. In measuring angles on land, as in the practice of surveying (for which purpose this instrument is much preferable to any other in common use), in taking altitudes at sea, in measuring the angular distance of the sun and moon, but especially of the moon and a star, the eye has generally need of all the light that can be admitted from the object seen by direct vision.—The eye-hole, therefore, should, I think, be nearly as large as the ordinary size of the pupil of the eye; nor is any inaccuracy, in this case, to be apprehended from the line of vision not being parallel to the plane of the instrument; the eye being capable of placing itself, with great exactness, opposite the centre of the eye-hole.

"The same objection and remedy are applicable to the slits in the sight-vanes, of the common surveying instruments.

7. "Mr. Maskelyne, and others, recommend the sun itself as the best object by which to adjust the fore-horizon-glass.—There is however considerable difficulty attending this mode of adjustment.—The sun is too bright to be viewed directly without a piece of coloured glass interposed between it and the eye; and even if the eye-piece be furnished with such an appendage (which in the common octant is seldom the case), still the two images will be of very different shades; and either the one seen by direct vision will be too bright, or that seen by reflection will be too faint, for an accurate observa-

tion of their coincidence or contact.—This difficulty may, however, be obviated in the following manner:

"Every octant is furnished with at least two coloured glasses, of different shades:—take the darkest of these out of its frame, and with a thread fasten it on *behind* the horizon-glass, and turn down the other, between this and the index-speculum: the two images of the sun will thus be generally of the same shade, or nearly so, and the adjustment may then be made with the utmost ease and safety to the eye. Or, which is perhaps better, place your eye behind the fore-horizon-glass, and, looking through this towards the centre of the index-speculum, hold the instrument in such a position as that the line of vision may be directed to any point in the heavens, &c. at the angular distance of 90 degrees from the sun; and then, the index being placed at 0, two images of the sun will appear, both by a single reflection, one from the index-speculum, and the other from the back-part of the fore-horizon-glass; and by bringing these images into coincidence or contact, as when you look directly at the sun, the adjustment may be made, or the index-error found, with great ease and exactness. If the images of the sun should be too bright for the eye, one of the coloured glasses belonging to the instrument may be held before the eye. The two images of the sun, thus viewed, will appear nearly of the same shade, since the one, from the index-speculum, which would otherwise appear the brightest, will lose part of its light by passing through the horizon-glass.

"After all, I am of opinion, that this adjustment may be made with equal accuracy, and much more ease, by any well-defined object on land, as the edge of a chimney, the roof of a house, or the like, at a sufficient distance.

"Any one may satisfy himself that this is the case, by repeatedly measuring the error of adjustment in the common way, viz. by moving the index till he produces an apparent coincidence between the object seen directly, and by reflection. If a chimney, or the like, be the object viewed, he will scarce ever find any of these errors to differ from the mean error more than *one minute*; and the difference of such errors, when the sun is used, will not be less, but generally greater.

"If the distance between the index-speculum and the line of direct vision (viz. a line joining the eye-hole and horizon-glass) should not exceed three inches, which it seldom does, then the parallax of the instrument will not amount to a quarter of a minute, and may therefore be safely neglected; provided the object viewed be at the distance of two-thirds of a mile. If a suitable object, at such a distance, cannot be readily found, then you may take one at any given distance, and compute the parallax to be allowed for that distance, thus—multiply the constant number 95 (the nat. tang. of $1'$ to rad. $\frac{1}{2}$) by the distance, in inches, of the centre of the index-speculum above the line of direct vision, and dividing the product by the distance of the object in yards, the quotient will be the parallax of the instrument, or correction of adjustment, for that distance in minutes. For example, if the height of the index-speculum above the line of vision be three inches, and the distance of the object 150 yards:

$$\frac{95 \times 3}{150} = 1.9 \text{ will be the error of adjustment. If,}$$

therefore, you place the index so much behind the 0, on the limb of the instrument, and then adjusting the horizon glass by an object at the above distance, the adjustment will be true for an object considered as at an infinite distance.

"From the above rule it is obvious, that much exactness in measuring or estimating the distance of the object you adjust it by is not necessary, provided that distance be not

very small; for, in the above example, an error in the distance even of ten yards would have produced an error of no more than about $\frac{1}{10}$ of a minute in computing the parallax of the instrument.

8. " In measuring angles by this instrument, when the object seen by direct vision is at no great distance, the parallax of the instrument must be taken into consideration. In such cases it is commonly recommended previously to adjust the horizon-glass by that object; but this, in the back-observation, would be attended with very great difficulty;—it will therefore be best always to keep the back-horizon-glass at the same adjustment, and make the necessary correction, as above directed, for the distance of the object."

QUADRELLA, a town of Naples, in Terra di Lavoro, 20 miles N.E. of Naples.

QUAKENBRUGGE, or **QUAKENBURG**, a town of Westphalia, in the bishopric of Osnaburg, seated on the Hase, 22 miles W. of Osnaburg. Long. 8. 20. E. Lat. 52. 46. N.

QUARTEN, a town of Switzerland, near the lake Walenstadt, five miles E. of Glarus.

QUEAUX, a town of France, in the department of Vienne, 21 miles S.E. of Poitiers. Long. 0. 40. E. Lat. 46. 25. N.

QUENESTADT, a town of Lower Saxony, in the principality of Halberstadt, five miles N.E. of Halberstadt.

QUÉICH, a river of Germany, which passes by Landau, and runs into the Rhine, near Germerheim.

QUENTIN, St. a strong town of France, in the department of Aisne, with a considerable manufacture of lawns and cambrics. Near this place, in 1557, Philip II. of Spain, gained a signal victory over the French, and afterwards took the town by storm. In memory of this, he built the Escorial. The town was restored to France in 1559. It is seated on an eminence, on the river Somme, 21 miles S. of Cambrai, and 83 N. by E. of Paris. Long. 3. 29. E. Lat. 49. 50. N.

QUERFURT, a town of Upper Saxony, capital of a principality of the same name, subject to the Prince of Saxe-Weissenfels. It is 12 miles S.E. of Mansfeldt. Long. 12. 20. E. Lat. 51. 27. N.

QUERGUENECY, an island of the Mediterranean, on the coast of Tripoli. It has a fort and several villages.

QUESNOY, a town of France, in the department of the North, with an old castle. It was taken by the allies in 1711, and retaken the same year. In 1793 it was taken by the Austrians, and retaken the next year. It is seated in an extensive plain, on the little river Ronelle, nine miles S.E. of Valenciennes, and 122 N.E. of Paris. Long. 3. 40. E. Lat. 50. 15. N.

QUIBERON, a peninsula of France, in the department of Morbihan, to the N. of Belleisle. It has a village of the same name, and a fort, on the bay of Quiberon. In July 1795 it was taken by some French regiments in the pay of Great Britain; but owing to the desertion and treachery of some of the soldiers, the republicans retook it by surprise soon afterwards.

QUICARO, an island in the North Pacific Ocean, near the coast of Veragua, in New Spain, about 20 miles long and six broad. Long. 82. 30. W. Lat. 7. 25. N.

QUILLAN, a town of France, in the department of Aude, 11 miles S. of Limoux, and 21 S. of Carcassone. Long. 2. 10. E. Lat. 42. 52. N.

QUILLEBOEUF, a town of France, in the department of Lower Seine, seated on the Seine, eight miles S.W. of Caudebec, and 22 W. of Rouen.

QUILLOTA, a town, and jurisdiction, of Chili. Long. 35. 41. W. Lat. 32. 45. S.

QUILMANCI, a town on the coast of Zanguebar, in the kingdom of Melinda. It is situate at the mouth of a river of the same name, and belongs to the Portuguese. Long. 39. 40. E. Lat. 33. 30. S.

QUILOA, a sea-port on the coast of Zanguebar, with a small citadel. It is tributary to the Portuguese; and is seated in a fertile country, 300 miles N. of Mosambique. Long. 39. 9. E. Lat. 9. 30. S.

QUILON, or **COYLON**, a Dutch factory, on the coast of Malabar, in Travancore, 14 miles N.N.W. of Anjengo. It was taken by the English in 1795. Long. 76. 32. E. Lat. 9. 2. N.

QUIMPER, a town of France, in the department of Finistère, with a bishop's see; seated at the confluence of the Oder and Benaudet, 30 miles S.E. of Brest, and 332 W. by S. of Paris. Long. 4. 2. W. Lat. 47. 58. N.

QUIMPERLAY, a town of France, in the department of Finistère, seated on the Ilotte, seven miles from the sea, and 20. E. by S. of Quimper. Long. 3. 33. E. Lat. 47. 52. N.

QUINGEY, a town of France, in the department of Doubs, seated on the Louve, 12 miles S.W. of Besançon. Long. 6. 5. E. Lat. 47. 5. N.

QUIN-NONG, or **CHIN-CHIN**, a bay on the east coast of the kingdom of Ciampa, much frequented by the vessels of the country, being an excellent harbour. The entrance is very narrow, and ships of burthen can only get in at high water. Long. 109. 15. E. Lat. 13. 52. N.

QUIREÛ, a town of France, in the department of Rhone and Loire, seated on an eminence, near the river Rhone, 12 miles S. of Lyons. Long. 4. 55. E. Lat. 45. 35. N.

QUIRIMBA, the name of several islands on the coast of Zanguebar. They are all fertile in fruits and pastures.

QUIRPON, an island in the North Atlantic Ocean, near the north coast of Newfoundland. Long. 55. 22. W. Lat. 51. 40. N.

QUISAMA, a maritime province of the kingdom of Angola, lying along the river Coanza. It is a mountainous country, and very little cultivated, but the Portuguese get abundance of salt there.

QUITEOA, a town of Morocco, in the province of Drafe, with a castle. Long. 5. 0. W. Lat. 28. 6. N.

QUISTELLO, a town of Italy, in the duchy of Mantua, seated on the Seccia, three miles from its confluence with the Po. It is famous for an action between the French and Austrians in 1733, when Marshal Broglie was surprised in his bed. It is 15 miles S.E. of Mantua. Long 11. 1. E. Lat. 45. 0. N.

QUITO, an audience of Peru, lying between two chains of the high mountains called the Andes. Several districts of this country are occupied almost entirely by Indians; and the city of Quito alone contains between 50 and 60,000 of all the different races. This is the only province in Spanish America that can be called a manufacturing country.

QUIXOS, a province of Peru, in the audience of Quito.

QUIZAMA, a province in the south part of the kingdom of Angola. It is full of mountains, and badly cultivated, but produces honey, wax, and salt. The inhabitants are warlike, and have not submitted to the Portuguese.

QUIZINA, a chain of mountains in the kingdom of Fez, 100 miles in length, extending from the desert of Gret to the river Nocr.

QUOJA, a kingdom on the coast of Guinea, which reaches from Sierra Leone to the Grain Coast.

R.

RAAJEGUR, a town of Hindoostan Proper, in the province of Malwa, 74 miles N.E. of Ougein, and 214 S.S.W. of Agra. Long. 76. 56. E. Lat. 24. 2. N.

RABASTEINS, a town of France, in the department of Tarn, with a decayed castle, seated on the Tarn, 18 miles W. by S. of Alby. Long. 1. 52. E. Lat. 43. 46. N.

RACHORE, or **ADONI-RACHORE**, a city of the peninsula of Hindoostan, capital of a district of the same name, subject to the nizâm of the Deccan. It is seated on the south bank of the Kistna, near its confluence with the Tungabadra, 315 miles N. by . of Seringapatam. Long. 78. 15. E. Lat. 16. 30. N.

RACKERSBURG, a strong town of Austria, in Stiria, with a castle on a mountain. It is seated on an island, formed by the Muehr, 22 miles S.E. of Gratz, and 100 S. of Vienna. Long. 15. 58. E. Lat. 46. 54. N.

RACLIA, a small uninhabited island of the Archipelago, near that of Nio.

RADEBERG, a town of Upper Saxony, in the margravate of Meissen, 10 miles N.E. of Dresden. Long. 13. 56. E. Lat. 51. 5. N.

RADICOFANI, a town of Tuscany, seated on a mountain, and defended by a citadel on an adjacent hill, 56 miles S.E. of Sienna. Long. 11. 40. E. Lat. 42. 42. N.

RADIMPOUR, or **RADUNPOUR**, a town of Hindoostan Proper, in the provinces of Agimere, situate on the Puddar, 175 miles N. of Surat, and 250 S.W. of Agimere. Long. 71. 48. E. Lat. 23. 58. N.

RADMENDORF, a town of Germany, in Carniola, near the source of the river Save, 16 miles West of Crainburg.

RADOM, a town of Little Poland, in the palatinate of Sandomir, capital of a county of the same name. It is seated on a brook that falls into the Vistula, 30 miles N. of Sandomir, and 50 S. of Warsaw. Long. 21. 1. E. Lat. 51. 25. N.

RAGIVOLO, a town of Italy, in the Mantuan, seated between Mantua and Reggio, 42 miles from each.

RAGNITZ, a town of Prussian Lithuania, with a very ancient castle, situate on the Niemen, 56 miles E.N.E. of Königsberg. Long. 21. 30. E. Lat. 55. 30. N.

RAGOOGUR, a town of Hindoostan Proper, in the province of Malwa, 116 miles NE of Oudein, and 256 S. of Delhi. Long. 77. 30. E. Lat. 24. 23. N.

RAGUSEN, or **RAGUSIAN DALMATIA**, a territory of Dalmatia, lying along the coast of the gulf of Venice, about 55 miles in length, and 20 in breadth. It is a republic, under the protection of the Turks and Venetians, to each of whom it pays an annual tribute. Ragusa is the capital.

RAHNIS, or **RANIS**, a town of Upper Saxony, in the circle of Neustadt, 54 miles S.S.W. of Leipsic. Long. 11. 30. E. Lat. 50. 33. N.

RAJAMUNDRY, the capital of one of the Northern Circars, in the peninsula of Hindoostan, 150 miles S.W. of Cicacole. Long. 81. 57. E. Lat. 17. 10. N.

RAJAPOUR, a town of the Deccan of Hindoostan, in

the Concan, seated on a river of the same name, 50 miles N. of Goa. Long. 73. 56. E. Lat. 16. 19. N.

RAJEMAI, a town of Hindoostan Proper, in Bengal, formerly a place of great trade, but now in a ruinous state. It is seated on the west bank of the Ganges, 190 miles N. by W. of Calcutta.

RAIN, a town of Austria, in Stiria, capital of a county of the same name, with a castle. It is seated on the Save, 68 miles S. of Gratz. Long. 15. 32. E. Lat. 46. 20. N.

RAIN LAKE, or **LONG LAKE**, a lake of North America, lying to the east of the Lake of the Woods, with which it communicates by a river, and to the west of the Lake Superior. It is nearly 100 miles long, but in no part more than 20 wide.

RAKESBURG, or **RAKELSPURG**, a town of Austria, in Stiria, which has a considerable trade with Hungary and Croatia. It is situate on an island in the river Muehr, 36 miles S.E. of Gratz, and 90 S. of Vienna. Long. 16. 10. E. Lat. 46. 45. N.

RAKKA, a town of Turkey in Asia, in Diarbek, seated on the Euphrates. It has a castle going to decay, and is an indifferent place; but old Rakka, whose ruins are near it, was a magnificent city. It is 100 miles S.W. of Diarbekar. Long. 38. 55. E. Lat. 36. 1. N.

RAKONITZ, a town of Bohemia, capital of a circle of the same name. It is seated on a river, which falls into the Miza, 30 miles W. of Prague. Long. 14. 5. E. Lat. 52. 4. N.

RAMA, an ancient town of Palestine, now called Ramula by the Turks. The streets are narrow, and the houses contemptible; but there are many fine ruins of Christian churches and other buildings, which shew what it has been formerly. It is 20 miles W. by N. of Jerusalem. Long. 34. 55. E. Lat. 32. 0. N.

RAMADA, a sea-port of New Granada, 100 miles E. of St. Martha. Long. 72. 20. W. Lat. 11. 10. N.

RAMANAD, a town of Hindoostan, in the Carnatic, 54 miles S.W. of Madura, and 88 S. of Tanjore. Long. 78. 56. W. Lat. 9. 20. N.

RAMANANCOR, an island of Asia, lying toward Cape Comorin. It is 23 miles in circumference; is very sandy, and has only a few villages and a temple. Long. 79. 45. E. Lat. 9. 25. N.

RAMBERT-LE-JOUG, St. a town of France, in the department of Ain, seated near a branch of Mont Jura, called le Joug, 18 miles N.W. of Belley. Long. 5. 30. E. Lat. 45. 53. N.

RAMBERVILLIERS, a town of France, in the department of the Vosges, 30 miles S.E. of Nanci. Long. 6. 44. E. Lat. 48. 21. N.

RAMBOUILLET, a town of France, in the department of Seine and Oise. Here was a palace, in which Francis I. died, in 1547, and Lewis XVI. made it a magnificent royal residence; but it was demolished in 1793, by order of the National Convention. It is 27 miles S.W. of Paris.

RAMEHEAD, a promontory of Cornwall, S.W. of

Plymouth, at the entrance of Plymouth Sound. On its summit is a chapel (a sea-mark) belonging to the village of Rame. Long. 4. 20. W. Lat. 50. 18. N.

RAMERA, a town of France, in the department of Aube, seated on the Aube, 18 miles N.E. of Troyes. Long. 4. 30. E. Lat. 48. 32. N.

RAMLA, a town of Palestine, the ancient Arimathea, now in a ruinous state; it is, however, the residence of a Turkish aga, who has about 200 troops under him. Here is a manufacture of soap, which is sent into all parts of Egypt. It is 18 miles N.W. of Jerusalem. Long. 35. 15. E. Lat. 32. 8. N.

RAMMEKENS, a sea-port of the isle of Walcheren, in the Dutch province of Zealand. It was one of the towns put into the hands of the English, as a security for a loan in the reign of Queen Elizabeth. It is four miles S. of Middelburg. Long. 3. 40. E. Lat. 51. 29. N.

RAMMELSBURG, a lofty, steep, and extensive mountain of Germany, in that part of the Hartz Forest which lies within the principality of Grubenhagen. On this mountain are twelve silver mines; and at the foot of it is seated the city of Goslar.

RAMPANO, a town of Turkey in Europe, in the Morea. Long. 20. 17. E. Lat. 36. 54. N.

RANDERAT, a town of Westphalia, in the duchy of Juliers, 10 miles N.W. of Juliers. Long. 6. 30. E. Lat. 51. 5. N.

RANDERSON, or RANDERS, an ancient town of Denmark, in North Jutland, seated near the mouth of the Gude, 25 miles E. of Wiburg. Long. 10. 35. E. Lat. 56. 20. N.

RANNOCH, LOCH, a lake in the north part of Perthshire, 11 miles in length. It receives the waters of Loch Erich, from the north, and communicates with Loch Tummel on the east, and Loch Lidoon on the west. On its south side is an ancient forest of birch and pine.

RANTAMPOUR, a fortress of Hindoostan Proper, in the east quarter of Agimere. It is very celebrated in the Indian histories, and is 120 miles from Agra.

RANTZOW, a town of Lower Saxony, in the duchy of Holstein, 24 miles N. of Lubec. Long. 10. 42. E. Lat. 54. 16. N.

RAOLCONDA, a town of the Decan of Hindoostan, in Golconda, near which is a rich diamond mine. It is 270 miles S.W. of Hyderabad. Long. 76. 40. E. Lat. 14. 30. N.

RAON, L'ETAPE, a town of France, in the department of Meurthe, seated at the foot of Vosges, at the confluence of the Etape and Marte, 30 miles S.E. of Nanci. Long. 6. 47. E. Lat. 48. 26. N.

RAPALLO, a town of Italy, in the territory of Genoa, seated on a gulf of the same name, 20 miles E. of Genoa. Long. 9. 11. E. Lat. 44. 26. N.

RAPÉ (*Encycl.*). The oil which these seeds yield by expression is employed for various useful purposes in domestic life, and particularly for burning in lamps; but, as it is apt to become rancid, M. Thénard has published the following practical method of purifying it. He directs one-half or two parts of concentrated sulphuric acid to be added to 100 parts of oil, and the whole to be perfectly incorporated by agitation: the fluid immediately becomes turbid, assuming a dark green cast; and, in the course of three quarters of an hour, the colouring particles begin to collect in lumps. The agitation must now cease; and double the weight of oil of vitriol, diluted with pure water, should be added;—in order to mingle these different ingredients, the stirring ought to be renewed for the space of half an hour; after which the whole may be left to settle for seven

or eight days. At the end of that time, the oil will be found on the surface; on being gently drawn off, and filtered through cotton or wool, it will be almost entirely divested of colour, smell, and taste; so that it will burn clear, without any interruption. The refuse of rape, after expressing the oil, is known by the name of rape-cake, the economical uses of which are various.

RAPHOE, a town of Ireland, in the county of Donegal, with a bishop's see. The cathedral serves as a parish church. It is eleven miles S.W. of Londonderry, and 2 N.E. of Donegal.

RAPOLLA, a town of Naples, in Basilicata, with a bishop's see, 36 miles W. of Bari, and 70 E. of Naples. Long. 15. 51. E. Lat. 40. 56. N.

RAPPAHANNOCK, a river of Virginia, which rises in the mountains, called the Blue Ridge, and running E.S.E. falls into the Chesapeake, in lat. 35. 30. N.

RARITAN, a river of New Jersey, which, passing by Brunswick and Amboy, enters Arthur Kill Sound, and helps to form the fine harbour of Amboy.

RASEBORG, a sea-port of Sweden, capital of a canton in Nyland. It is seated on the gulf of Finland, 37 miles S.E. of Abo. Long. 23. 18. E. Lat. 60. 16. N.

RASEN. See MARKET RASEN, *Supp.*

RASOCALMO, a cape on the north coast of Sicily, near a town of the same name, W. of Cape Faro, and N. of Messina.

RASTADT, a town of Bayaria, in the archbishopric of Saltzburg, seated on the Ens, 48 miles E. by S. of Saltzburg. Long. 14. 10. E. Lat. 47. 31. N.

RAT (*Encycl.*). Besides the remedies already mentioned, there are many other contrivances for exterminating rats: and, as the subject is of considerable importance to every house-keeper, we shall subjoin an account of some other means, which have been found remarkably successful.

Mr. Charles Taylor, secretary to the Society for the Encouragement of Arts, &c. directs one or two table-spoonfuls of dry oatmeal to be uniformly, but thinly, spread on a tile or plate, in order that the quantity taken away may be more easily ascertained. The rats, if not interrupted, will regularly feed there; and they must be supplied for two or three successive days with fresh meal, when three drops of oil of aniseed are to be mixed with a double portion of oatmeal; and the composition deposited at the usual place, for a similar period of time. On the fourth day, one half only of the usual quantity must be given of the scented preparation, and on the succeeding night, the following mixture must be placed at the hole:—Let four ounces of dry oatmeal, perfumed with six drops of the oil of aniseed, be thoroughly incorporated with half an ounce of carbonated barytes (aerated heavy spar of Derbyshire), which has been previously pulverized, and sifted through fine cambric or muslin. This compound must be spread on the tile or slate, and exposed as usual; all the doors, or other communications, being shut for the space of twenty-four hours, that the vermin may eat it undisturbed by any cats, dogs, or other animals; and also to prevent the possibility of any accident happening to the latter. In the course of a few hours, after the rats have eaten the composition, they will be seen frequently to reel about, as if they were intoxicated, or paralytic; though, at length, they return to their haunts and perish. Mr. Taylor observes that, as they are very cunning, the mixture ought to be left for forty-eight hours, in case a small portion only be eaten; after which time the remainder should be burnt.

Mr. Funke, in his valuable Natural History, calculated for German schools, communicates the following curious

method of expelling, or rather dispersing, rats from dwelling-houses:—Take one or more of these predatory creatures caught alive in a trap, and immerse them to the neck in a mixture consisting of equal quantities of tar and train oil; thus anointed, set the animals at liberty. The offensive smell of this preparation compels them to traverse all the holes of their companions with the most distressing anxiety; in consequence of which they collectively disappear.—Another expedient practised in Germany, is that of confining a live rat in a cage, and feeding it exclusively with living mice or rats. Having been for some time accustomed to such food, the captive animal is, after a short fasting, suffered to return to its former habitation, where it is said to persecute, and indiscriminately devour its own species.

RATENAU, a town of Germany, in the middle marche of Brandenburg, seated on the Havel, 15 miles N.W. of Brandenburg. Long. 13. 49. E. Lat. 52. 46. N.

RATENBURG, a town of Germany, in the Tyrol, with a castle, seated on the river Inn, 15 miles S. by W. of Kufstein. Long. 12. 5 E. Lat. 47. 30. N.

RATINGEN, or **RATTINGEN**, a town of Westphalia, in the duchy of Berg; four miles N.E. of Dusseldorf. Long. 6. 53. E. Lat. 51. 16. N.

RATTENBERG, a town of Germany, in the Tyrol, with a citadel, situate on the Inn, 26 miles E.N.E. of Innspruck, and 44 S.W. of Saltzburg.

RATZIA, or **RASCIA**, the eastern division of Slavonia, subject to the house of Austria. It takes its name from the river Rascia, which falls into the Morave; and its inhabitants are called Rascians.

RAVELLO, a sea-port of Naples, in the Principato Citeriore, with a bishop's see. It has magnificent palaces and fine houses, and is 10 miles W. of Salerno, and 25 S.E. of Naples. Long. 14. 41. E. Lat. 40. 36. N.

RAVENSTEIN, a town of Dutch-Brabant, capital of a county of the same name, with an ancient and strong castle. It belongs to the elector palatinate, but has a Dutch garrison. It is seated on the Maese, 10 miles S.W. of Nimeguen. Long. 5. 35. E. Lat. 51. 46. N.

RAVITZ, a town of Poland, in the palatinate of Posenia, with a considerable manufacture of cloth, 24 miles S. of Posen.

RAUSCHENBERG, a town of Germany, in the principality of Hesse, four miles N. of Marburg, and 32 S.S.W. of Cassel. Long. 8. 46. E. Lat. 50. 32. N.

RAWA, a town of Poland, capital of a palatinate of the same name, 56 miles S.W. of Warsaw.

RAWEE, a river of Hindoostan Proper, one of the five E. branches of the Indus, into which river it falls, about 20 miles W. of Moultan, after having received the united waters of the Chelum and Chunaub. The Rawee is the Hydrates of Alexander.

RAYNAL (Abbé), whose baptismal names were William Thomas, was one of the society of Jesuits, for their extensive learning no less universally known than for the happy talents which its superiors possessed, of assigning to each member his proper employment. Raynal, however, after having acquired among them a taste for literature and science, had probably become refractory, for he was expelled from the order; and the cause of his expulsion, according to the Abbé Barnuel, was his impiety, though our author himself assures us, that he did not utter his atrocious declarations against Christianity till he had ceased to be a member of the order of Jesuits. He then associated himself with Voltaire, D'Alembert, and Diderot, and was by them employed to furnish the theological articles for the *Encyclopédie*. But though his religious opi-

ons were certainly lax, and his moral principles very exceptionable, he could not, even then be what, in a Protestant country, would be deemed a man remarkable for impiety; for he employed the Abbé Yvon, whom M. Barnuel calls an odd metaphysician, but an inoffensive and upright man, to write the articles which he was engaged to furnish. In the conducting of this transaction, he shewed, indeed, that he possessed not a proper sense of honour; for he paid poor Yvon with twenty-five louis d'ors for writing theological articles, for which he received himself six times that sum. This trick was discovered, Raynal was disgraced, and compelled to pay up the balance to Abbé Yvon; but though he had thus shewn himself to be without honour, it is difficult to believe that he had yet proceeded so far as to blaspheme Christ, since he had employed a Christian divine to supply his place in the *Encyclopédie*.

His first work of eminence, and that indeed upon which his fame is chiefly built, is his Political and Philosophical History of the European Settlements in the East and West Indies. That this history is written in an animated style, and that it contains many just reflections, both political and philosophical, is known to all Europe; for it has been translated into every European language. Its beauties, however, are deformed by many sentiments that are irreligious, and by some that are impure. It was followed, we think in 1780, by a small tract, entitled *The Revolution of America*; in which the author pleads the cause of the revolted colonists with a degree of zeal, censures the conduct of the British government with a keenness of asperity, and displays a knowledge of the principles and intrigues of the different factions which at that period divided the English nation, that surely was not natural to the impartial pen of a philosophic foreigner. Hence he has been supposed to have been incited to the undertaking, and to have been furnished with part of his materials, by that desperate faction which uniformly opposed the measures of Lord North, and secretly fomented the rebellion in America. Be this as it may, he propagated, both in this tract and in his history, a number of licentious opinions respecting government and religion, of which he lived to regret the consequences.

A prosecution was instituted against him by the French government on account of his History of the East and West Indies; but it was conducted with so little severity, that he had sufficient time to retire to the dominions of the King of Prussia; who afforded him the protection he solicited, although his majesty's character was treated by the author in his book with no great degree of veneration. Raynal also experienced the kindness of the Empress of Russia: and it is not a little remarkable of this singular personage, that, although he was always severe in discussing the characters of princes, yet the most despotie among these heaped upon him many marks of favour and generosity.

The great trait of Raynal's character was a love of liberty, which, in his earlier writings, he did not properly define; but when he lived to see some of the consequences of this, in the progress of the French Revolution, he made one glorious effort to retrieve his errors. In the month of May, 1791, he addressed to the constituent assembly one of the most eloquent, argumentative, and impressive letters that ever was written on any subject; a letter which, if the majority of them had not been intoxicated with their newly acquired consequence, must have given some check to their mad career. He proved very completely, that it was not the business of the assembly to abolish every ancient institution; that the genius of the French people is such, that they never can be happy or prosperous but un-

der a well-regulated monarchical government; and that, if they wished not the nation to fall under the worst kind of despotism—the despotism of a low faction—they must increase the power of the king. “Alas! (says he) what are my sufferings, when in the heart of the capital, in the centre of knowledge, I see this misguided people welcome, with a ferocious joy, the most criminal propositions, smile at the recital of murder, and celebrate their crimes as conquests!” He had then seen comparatively but little; but he lived to see more—to see his countrymen celebrate, as virtues, crimes, compared with which the atrocities of 1790 appear almost harmless. Being stripped of all his property, which was large, by the robbers of the revolution, he died in poverty in March, 1796, and in the 84th year of his age.

Besides the works which we have already mentioned, he wrote a History of the Parliament of England, and a History of the Stadholderate; but these are both of them more remarkable for a species of style and loftiness of invention than for useful observation or solid argument. He wrote likewise The History of the Divorce of Catharine of Arragon by Henry the Eighth, which is not so much a recital of, and commentary upon, the fact from which he takes the title, as it is an able picture of universal Europe at that period, of the views, interests, and power, of all the different potentates. At the time of his death he was preparing a new edition of all his works, in which were to be made many alterations; and he is said to have left among his manuscripts a History of the Revocation of the Edict of Nantes, in four volumes; but it is very certain, that, during the sanguinary reign of Robespierre, he burnt a great part of his papers.

READING, the capital of the county of Berks, in Pennsylvania, seated on the Schuylkill, 46 miles N.W. of Philadelphia. Long. 75. 54. W. Lat. 40. 22. N.

REALMONT, a town of France, in the department of Upper Garonne, 31 miles N.E. of Toulouse. Long. 2. 0. E. Lat. 43. 50. N.

REALVILLE, a town of France, in the department of Lot, eight miles N.E. of Montauban, and 20 S. of Cahors. Long. 1. 24. E. Lat. 44. 7. N.

REBEL, a town of Lower Saxony, in the duchy of Mecklenburg, seated on the lake Muritz, 30 miles S.E. of Gustrów. Long. 12. 36. E. Lat. 53. 32. N.

REBNICK, a populous town of Turkey in Europe, in Walachia, with a bishop's see, seated on the Aluta, 45 miles S.W. of Targowisco.

RECCANATI, a town in Italy, in the marquisate of Ancona, with a bishop's see. It is a trading place, and has a great fair in September, which continues 15 days. The tomb of Pope Gregory VII. is in the cathedral. It is seated on a mountain, near the river Munsone, 14 miles S. of Ancona, and 110 N.E. of Rome. Long. 13. 34. E. Lat. 43. 24. N.

RECEIPTS (*Encycl.*). The following duties have been laid on receipts by the act 31 Geo. III. c. 25.—For every piece, &c. upon which shall be written, &c. any receipt, discharge, or acquittance for money, amounting to 40s. and not amounting to 20l.—two pence.

Amounting to 20l. and not 50l.—four pence.

Amounting to 50l. and upwards—six pence.

And by 35 Geo. III. c. 55. from and after July 5, 1795, if amounting to 100l. and not amounting to 500l. an additional six pence. Total one shilling. If amounting to 500l. or upwards, a further additional duty of one shilling. Total two shillings. To be paid by the person by whom such receipts shall be required; by salaries, pensions, debts, or

other sums payable from the crown, excepted; in which case the duty shall be paid by the person giving such receipts.

The following exemptions from the above duties are allowed.—Nothing in the above acts shall extend to any receipt for any legacy, or share of a personal estate, or to any receipt given by the treasurer of the navy, for money received for the service of the navy; or to the receipt of any agent for money impressed to him on account of the pay of the army or ordnance; or to any receipt by any officer, seaman, or soldier, for wages, pay, or pension, due from the navy, army, or ordnance; nor to any receipt to be given for the consideration of the purchase of any share in any public stock or fund; or in the stocks of the bank, East-India, or South-Sea companies, or for the dividends thereof; nor to any receipt given for money deposited in the banks of England or Scotland, or in the house of any banker; nor to any receipt on the back of any bill of exchange, promissory or other note; nor to any release by deed.

Nor shall this act extend to any receipt to be given upon any bill or note of the bank of England; or to any letter acknowledging the receipt of any bills, notes, or securities for money; or to any receipt for the consideration of money on or in any deed, bond, mortgage, or instrument; nor to any receipt for drawbacks or bounties; nor to any certificates of over-entry of customs.

The following new regulations respecting receipts have been established by the act 35 Geo. III. c. 55.—The full sum, and the true date, shall be inserted; and all notes, memorandums, or writings whatever, whereby any money shall be acknowledged to have been paid, settled, received, accounted for, balanced, discharged, released, or in any manner satisfied, or which shall in any manner signify such acknowledgment, and whether the same shall or shall not be signed, shall be deemed a receipt, and liable to the duties. *f. 5.*

Every receipt, discharge, or acquittance, note, memorandum, or writing, which shall express any general acknowledgment of any debt, claim, account, or demand, being paid, settled, received, accounted for, balanced, discharged, released, or satisfied, or whereby any money shall be acknowledged to be in full, and whether signed or not, shall be deemed a receipt for 500l. and be liable to the duty of two shillings; and no such receipt, &c. shall be available in law or equity for any other money than the sum therein expressed, unless the same shall be stamped with the stamp of two shillings. *f. 6.*

Every note, memorandum, or writing whatever, which shall signify any acknowledgment of any part of any debt, claim, account, or demand, being paid, settled, received, accounted for, balanced, discharged, released, or satisfied, whether signed or not, shall be deemed a receipt, and liable to duty. *f. 7.*

And every person who shall write or sign, or cause to be written or signed, any receipt, discharge, or acquittance, liable to duty, without the same being first duly stamped, or upon which there shall be a stamp of lower denomination than is charged in respect thereof, shall forfeit 10l. if the sum paid shall not amount to 100l.—and 20l. if it amounts to 100l. or upwards. *f. 8.*

And any person who shall give any receipt, discharge, or acquittance, or any note, memorandum, or writing, acknowledging the payment of money, in which a less sum shall be expressed than the sum actually paid, or who shall separate the sum paid into divers sums with intent to evade the duties, or shall, with the like intent, write off any part

of any debt, claim, or demand, or who shall be guilty of or concerned in any fraudulent contrivance whatever with intent to defraud his majesty of any of the duties, shall forfeit 50*l.* *f.* 9.

Receipts on unstamped paper, brought to the stamp-office within 14 days after given, may be stamped on payment of 5*l.* over the duty; and if brought to be stamped after 14 days, and within one calendar month after given, may be stamped on payment of 10*l.* above the duty; and in that case the parties are not to be liable to any of the penalties above mentioned.

One moiety of all penalties shall, if sued for within three months, be to his majesty; and the other, with full costs, to the person who shall inform, &c. and which may be recovered in any of the courts at Westminster, within England; and in the exchequer at Edinburgh, within Scotland.—But one justice may hear and determine any offence which subjects the offender to any pecuniary penalties—and persons aggrieved may appeal to the quarter-sessions.—The justice may mitigate penalties, not less than one moiety besides costs.—Witnesses refusing to attend the justices, &c. to forfeit 40*s.*—and if the penalties are not prosecuted for within the limited time, they are only recoverable by the crown; and if the whole penalty is recovered by the crown, the informer is to be rewarded by the commissioners of stamps, at their discretion—not exceeding one moiety.

RECHLINGHAUSEN, a town of Germany, in the archbishopric of Cologne, capital of a county of the same name, with a strong citadel, and a chapter of noble ladies. It is seated on the Lippe, 20 miles W. of Ham. Long. 8. 36. E. Lat. 51. 27. N.

RECULVER, a village in Kent, the regulium of the Romans, seated near the mouth of the Thames, 12 miles W. of Margate. It is noted for its church, which was anciently collegiate, and has two spires, which serve for a sea-mark, and are called by mariners the Two Sisters.

RED (*Encycl.*). The following observations on dyeing with madder, followed by a simple and invariable process for obtaining, in its greatest beauty and solidity, the colour known by the appellation of *Levant* or *Adrianople* red, by Citizen Haussman, were sent to the editor of the *Annales de Chimie*, by the celebrated Chaptal, who is minister of the interior of the French Republic.

“I have already shewn,” says Citizen Haussman, “in the *Annales de Chimie* and *Journal de Physique*, that metallic earths and oxids possess neither in a greater nor less degree the property of attracting or retaining the colouring parts of vegetable and animal substances; alum and oxid of iron possess it more powerfully than oxid of tin, the power of attraction of the latter, nevertheless, far surpasses that of other metallic earths and oxids, as far as regards the colouring parts of the said substances.

“Alum, as well as metallic oxids, does not retain with the same power of adhesion the colouring parts of all vegetable and animal substances indiscriminately; those of madder adhere more strongly than of other colouring substances, which may be classed in the following order: grains of kermes, cochineal, campeachy wood, yellow India wood, quercitron, fernambuc wood, red India wood, Avignon nuts, &c. gall nuts, sumach, and other astringent, colouring substances act principally by means of the gallic acid, and may, with regard to their degree of solidity, be placed immediately after madder: it is not the same with Prussian acid, which colours different metallic oxids, from which it may be extracted, when cold, by alkaline liq*ues*.

“To judge of the solidity of the colours produced by Vol. X.

vegetable and animal substances, the best method is to make use of a liq*ue* of oxygenated muriate of pot-ash, or of soda with alkaline carbonate. The longer or shorter resistance which the colours make in this liq*ue* will shew what they will do, if acid, alkaline, soapy and other counter-agents are employed.

“In the art of dyeing and manufacture of printed calico, by staining with madder (*garancage*), is understood the process whereby the colouring particles of the madder are transferred by the alum or oxid of iron, and attached to any kind of stuff by means of water assisted by heat.

“The brightness and solidity of colours obtained from madder, depend not only on the management, but likewise on the state of the purity of the water, as well as of the madder. It is therefore absolutely necessary to avoid or to render inactive every acid, alkaline, or saline substance, that may be contained in the water or madder itself. I have shewn that by means of the addition of carbonate of lime (pulverised chalk) you may correct the madder, which I had imagined contained the gallic acid, but which my friend Charles Bertholdi, professor of the central school of the Upper Rhine, afterwards discovered to be sulphuric acid in conjunction with magnesia.

“The important discovery of this addition of chalk, which I made 25 years ago, has given birth to many fabrics, and has brought to perfection all those established near waters which do not carry with them, or retain in a dissolved state, that earthy salt without which it is absolutely impossible to obtain bright and solid colours from madder. This chalk has, since that period, become a new article of commerce, and as its price is very moderate, I have not yet determined the exact proportion to be used; I usually take one part to 4, 5, and 6 parts of madder.

“In order to obtain the colours of madder of a perfect brightness, it is not sufficient to attend to the quality of the water and of the madder; it is likewise of importance to observe the degree of heat of the bath. A low temperature will retard the extraction and attraction of the colouring particles, whilst, on the other hand, if too high, it at the same time promotes the adhesion of the dark particles of the madder, which tarnish and obscure the tints intended to be produced; black only is improved by augmenting the heat. I have invariably observed, that by taking the fire from under the cauldrons, as soon as one can no longer bear to hold one's hand in the liq*ue* they contain, and afterwards suffering the dye to remain two or three hours, one procures the most satisfactory results: for the copper then retains a sufficient heat to keep the liq*ue* at the same temperature, particularly when, according to custom, large cauldrons are used. It would otherwise be extremely difficult to fix a degree of heat, by means of thermometers, with spacious furnaces.

“The dusky particles of madder, as well as of other colouring substances, are probably only parts of the colouring substances themselves combined with oxygen. The produce of this combination, although it acquires a greater degree of solubility, proves, nevertheless, more difficult to be removed in the finishing, if the heat has not been properly attended to in dyeing. I have frequently observed, that madder and other colouring substances, after being long exposed to the atmospheric air, no longer afforded such deep and bright colours as before, either because these substances absorb the oxygen of the atmosphere, or because this essential is supplied by the water which they attract, or naturally contain as a constituting principle, and which is decomposed by a slow and imperceptible fermentation. A piece of cotton or linen cloth dyed red, heightened with madder, and exposed in a field, may con-

from the idea of its changing to a dusky hue; but this deep colour becomes clearer and clearer, after growing dull, and at length assumes a more agreeable crimson tint in the finishing. I have demonstrated in a Memoir on Indigo, inserted in the *Journal de Physique*, of the year 1788, that the nitric acid changes this blue to a yellowish sediment (see *INDIGO, Suppl.*). A similar change takes place in exposing in a field this same sediment attached to any kind of stuff whatever, and the yellow that results from both methods is more soluble in warm water than in the same liquid when cold. It appears, however, that the combination of the oxygen is not the only cause of the changing of the colours, for curtains of any kind of stuff dyed, or coloured in any manner whatever, by vegetable or animal substances and exposed to the daylight, lose their colour entirely, in process of time, on the side exposed to the rays of the sun, whilst the opposite side preserves the same colour for a great length of time. Although, therefore, the sun's rays give more vigour to the animated bodies of the animal and vegetable kingdom, by disengaging from them the oxygen gas, yet they appear to act destructively on the same inanimate bodies, by decomposing their constituting principles. At any rate, it will be the best way to keep the colouring ingredients in dry places and covered up from the light, which probably acts no otherwise on these bodies, than by decomposing the aqueous constituting part, whose two essential principles may transfer themselves to the carbone, to form carbonic acid, and likewise other resinous and oily substances. These conjectures prove, at least, that the action of the sun's rays, or more properly of light, on bodies in general, presents an extensive field for interesting experiments.

"If, in dyeing with madder, we obtain more lively colours by a careful management of the heat, we, at the same time, sacrifice a small portion of the colouring particles of the madder, which cannot be entirely exhausted, except by adding thereto gall-nuts or sumach, and afterwards augmenting the heat to ebullition; but as the colours obtained by this method fade more or less in proportion to the quantity of the madder, of the gall-nuts, or of sumach, it must not be used but with precaution, and principally for common purposes, for calicoes, cotton yarn, or thread. To prevent, as much as possible, the waste of madder, one might, after having finished dyeing the articles of value, and before the common ones are put into the cauldron, add thereto gall-nuts or powder of sumach, with a fresh and small portion of madder; attention must then be paid not to suffer the ebullition to take place till two hours after.

"I have endeavoured, in various trials, to exhaust the madder by simple ebullition, and without any other addition than that of chalk; but it always appeared to me to be attended with injury to all the colours excepting black; I thought that even the effect of the madder was far superior when the heat was managed with moderation, and that accumulated heat easily decomposed the colouring substance. This tendency to decomposition, and particularly by fermentation, if ever so little damped or diluted with water, has hitherto prevented my obtaining from it a substantial colour, sufficiently deep and solid to be applied to any stuff whatever. I have moreover observed, that too great a degree of heat in the first instance, when the dye is intended to be used a second and third time, not only prevented my obtaining lively and agreeable tints, but also the requisite strength. The aqueous vehicle of the madder at too high a temperature never fails to

weaken the power of adhesion of alum and oxid of iron to stuffs, and to take away a portion of them, which, upon examining the bath, is easily discovered by persons accustomed to the business.

"I repeat, that, for common articles and of little value, it is indispensably necessary to use gall-nuts or sumach, in order to save one-half, or even two-thirds, of the madder; but the colours thus obtained are less brilliant and less solid. The addition of chalk must nevertheless not be forgot; without it the gallic acid would carry away a portion of the alum and coloured oxid of iron, the loss of which would weaken and tarnish the tints; it would likewise injure the white that might have been preserved in the stuffs. Without adding gall-nuts or sumach, I consider it impossible totally to exhaust the madder of colouring particles; whence I presume that their adhesion is promoted by the viscid nature of the tanning principle of those astringent substances, which carries away the colouring particles by its combination with them. I must further observe, that gall-nuts, as well as sumach, lose the quality of staining black, and on the contrary acquire the property of staining or colouring alum yellow, and oxid of iron a green olive, with the addition of chalk, whose calcareous basis unites with the gallic acid. Are these yellow and olive-green colours produced by any particular substance contained in the gall-nuts and sumach, or do they originate in the tanning principle? This question remains to be examined.

"The quantity of madder to be used in dyeing ought not only to be proportionate to the extent of surface to be dyed, but also to the concentration of the liquors of *acétie of alum and iron*, improperly denominated mordants: that is to say, to the greater or less quantity of alum or oxid of iron which these saline liquors, either separate or combined, may have left or deposited by the evaporation of the acetic acid, when drying upon the articles to be coloured. If the articles to be dyed are not very numerous, or particularly if most of them are to exhibit only vivid tints, the madder may be applied but once; but the application of madder may be repeated twice and even thrice, when the articles are numerous, and are intended to present deeper tints. Three quarters of a pound of madder of a good quality are sufficient for dyeing a piece of calico of a white ground, six ells in length (three quarters wide), and which is to contain but few coloured objects: the quantity of this colouring substance will increase in proportion to the mass of alum or oxid of iron, expended on a piece of stuff of the same dimensions: it may be augmented to 6, 8, 10, and even 12 pounds for well covered grounds, of a brilliant colour, and of the utmost deepness. Attention and experience in the management of a dyeing establishment will not fail to point out, with sufficient accuracy, the proper proportions.

"Whatever care may have been taken with the madder, to prevent the adhesion of dusky particles, it requires much more, that the colours obtained may possess all the beauty and solidity they can possibly acquire in the finishing, preceded by a very long ebullition in perfectly clear water. This ebullition alone may be made to answer the purposes of finishing by the addition of bran; the reds will assume a more lively hue by using soap, with or without the addition of bran; carbonate of potash or soda substituted for soap will extract the tints from crimson; but I must observe, that to prevent the danger of turning the reds into brown, and in such a manner as never to be able to recover them, they must, by all means, previous to the application of soap or alkali, be exposed to the action of

the most violent heat that can be given to water; the success of this operation will be the more complete by giving very little vent to the aqueous vapours, and by forming, as it were, a digester with the cauldrons employed. The solidity of the colours will be proportionate to the time they have been exposed to the action of the boiling water. It is needless to mention, that the same risk is not incurred of injuring the colours by soap and alkaline carbonates, when the madder, instead of being kept at a moderate heat, has been made to boil, as is customary in many dye-houses; but in this case the colours obtained are more difficult to be finished.

"As water charged with oxygenated muriatic acid destroys the colouring particles of madder, and also of other vegetable and animal substances by decomposing them, and afterwards more concentrated acids can, in their turn, clear away from the surface of stuffs the colourless alum and oxid of iron, I cannot possibly countenance the idea of a chemical combination of colouring particles with alum and metallic oxids, which, being fixed and coloured upon any stuff whatever, make in my opinion only compound aggregates.

"The finishing of impressions with objects in white, requires modifications, which I shall detail at another opportunity, as soon as I shall find leisure: it will therefore now be sufficient to state, that, after having for some time prosecuted the experiments inserted in the *Annales de Chimie* of the year 1792, I discovered a red infinitely more beautiful and solid than the Levant, by fixing alum on cotton yarn or on thread by an alkaline solution of that earth mixed with linseed oil. The following is the process I employed.

"After having made a caustic lye, with one part of good potash of the shops, dissolved in four parts of boiling water and half a part of quick lime, which I afterwards killed, I dissolved one part of pulverised alum in two parts of boiling water, and whilst this solution of sulphate of alum was still quite hot, I, with all possible expedition, to prevent the recrystallisation, kept pouring into it, and stirring at the same time without intermission, the above caustic lye, till the alum it had at first precipitated after the saturation of the sulphuric acid was re-dissolved. I afterwards suffered this solution of alum to stand; it exhaled ammoniac, and as it cooled formed a precipitate of sulphate of potash in very small crystals; after which I mixed with it a 33d part of linseed oil, with which the alkaline solution of alum forms a kind of milk. As the oil by degrees separates from this mixture under the appearance of cream, it ought to be stirred again before it is used; the skains of cotton or thread should successively be dipped in it, pressed equally, and hung to dry on a line in the order in which they were taken out of the mixture: they must be dried under cover from the rain in summer, and in a warmed place in winter, and remain 24 hours; they should then be washed in clear running water, and again dried; then dipped in the alkaline lye, squeezed and dried a second time, in the same manner as before; taking care, however, to recommence the immersion in the lye with those skains which came last out of the oily composition, because the first invariably take away a greater portion of the oil than the latter: it will be advisable also to use the whole of the mixture at once, that it may not have time to attract the carbonic acid with which the lower region of the atmosphere, particularly of work-shops, is always charged; for the alkali in returning to the state of carbonic suffers the alum to precipitate, and loses the property of commixing with oil.

"Two impregnations of the alkaline solution of alum, mixed with linseed oil, are sufficient to obtain a fine red; but, by continuing to impregnate the skains a third and even a fourth time under the same circumstances as the first, colours of the utmost brilliancy will be obtained.

"The deepness of the red intended to be obtained will be proportionate to the quantity of madder employed in dyeing; by taking the same weight of madder as that of the skains, it will produce a red which the finishing will turn to a roseate tint; on the contrary, you will obtain a more or less lively carmine by using two, three, and even four parts of madder, never forgetting the addition of chalk, if the water employed containeth none; four parts of this colouring substance will produce a red of such beauty and brilliancy, that it could never be brought into circulation in commerce, on account of its high price. By diluting the alkaline solution of oily alum with two or three parts of water, and impregnating the skains twice, thrice, and even four times in the manner mentioned above, bright tints will be produced without using much madder; but they will not be so deep as those produced by means of the same solution concentrated, and as small a quantity of madder.

"The best manner of procuring clear and lively tints at the same time would be to expose, for a sufficient length of time, deep-and-finished reds to the action of the lye of oxygenated muriate of potash or of soda, with the addition of alkaline carbonate to procure such a degree of colour as might be required; but it may easily be conceived that this method would be the most expensive.

"To have the alkaline solution of oily alum always as nearly as possible in the same state of concentration, it will be necessary to use an aerometer, to determine the degree of strength of the caustic lye, before it is employed in the process of the solution of alum. This caustic lye may, at first, be made of the best potash that can be procured in the shops, and the degree it may give to the aerometer should be noticed, that, if afterwards one were obliged to use potash of inferior quality, one might by evaporation bring the lye obtained therefrom to the degree fixed.

"The caustic lye, made with four parts of good potash of the shops [or perhaps soda], cannot contain much extraneous salt. In making a great quantity, and after having poured off the limpid part, it will be necessary to shake the vessel twice every day for some time, in order to be able to pour off the rest of the alkaline liquor; and, that no part of what remains in the vessel may be lost, it should be diluted with fresh water, which may afterwards be used for dipping the cotton, which, before it is subjected to the dye, should be purified and cleaned; which may be done by lie, soap, or simply boiling it in water, and afterwards rinsing and drying it. As squeezing with the hands might derange the filaments of the skains of cotton yarn and thread, and consequently weaken the thread, it will be advisable, in operations on a large scale, to squeeze them by means of a press.

"As to the thread, intended to be dyed a deep, beautiful, and solid red, it should be previously well bleached, and impregnated at least four times successively with the alkaline solution of oily alum; not only because alum and metallic oxids adhere less readily to thread than to cotton, but likewise because these mineral substances, after being coloured, more easily quit thread than cotton in the finishing. It still remains to be examined, whether, between each impregnation of the alkaline solution of oily alum, the cotton yarn or thread requires to be left a longer or shorter time before being rinsed and dried.

"All gross oils may be used for this mixture with proper precaution, but linseed oil mixes best, and remains longest suspended in the alkaline solution of alum; but I never tried fish oil; perhaps it might be preferable. Perhaps, likewise, in processes on a large scale, it might be advisable to diminish the quantity of linseed oil in the mixture with the alkaline solution of alum; for I have frequently had occasion to observe, that too much oil was injurious to the attraction of the colouring parts of the madder: a 33d part of linseed oil always produced the best effect in my experiments on a small scale.

"As to the process of dyeing thread or cotton yarn sufficiently charged with alum by the oily alkaline solution of that earth, the skains must first be cleared from every saline substance, and likewise from superfluous oil, by rinsing them for a considerable time in clear running water; after this they must be arranged, without drying, in a machine that it will be necessary for every one to adapt to the form of the cauldron wherein it is to be placed, so that during the operation of dyeing the skains may be continually moved and turned about, in order to imbibe equally and throughout, the colouring particles. The bath must be composed of madder mixed with a sixth part of pulverized chalk, diluted with about 80 or 40 parts of water. The heat must not be carried beyond such a point that a person might hold his hand in the bath, for an hour, without scalding; and it should be kept at that degree two hours longer, either by taking away the fire, if the furnace preserve sufficient heat, or by supplying it with a little fuel from time to time. Three hours' dyeing are sufficient to exhaust the madder: upon leaving the bath, the skains should be washed in plenty of water to clear them; they must then be submitted to the action of the finishing, which consists in boiling them a long time in water containing a quantity of bran tied in a bag, and adding thereto soap and alkaline carbonate, to give the red a roseate or crimson hue.

"As I never had occasion to dye cotton yarn or thread upon a large scale, I performed the process in a small copper, which served me at the same time for finishing: with regard to the last operation, I confined myself to boiling the skains, after well arranging them, in water, containing a small bagful of bran, for eight hours successively; and, in order not to interrupt the ebullition, I replaced the part evaporated with fresh boiling water. In this finishing I used neither soap nor alkali, and, notwithstanding, I obtained a red surpassing in beauty and solidity that of the Levant, and capable in every respect of standing a comparison with the best dyes of France, or Paul Remy and Son's, of Lausanne.

"For dyeing my red, I used three parts of the best madder to one part in weight of the dry cotton yarn.

"With the precaution I took to obtain an equal colour, I could dye at once; but I would advise this operation to be always performed at twice, taking, each time, half the quantity of madder and chalk, if one cannot continually keep turning the skains in the cauldron; it may likewise serve for finishing, by adapting to it a cover, leaving but a confined passage for the vapours, which one should endeavour to condense as much as possible, because it would be expensive to replace the evaporated part with fresh boiling water. Perhaps, in working upon a larger scale, and by concentrating the heat in cauldrons shut almost close, there might be no necessity to employ eight hours of ebullition to finish and give solidity to the colours. I have every reason to believe, that it was the finishing of Levant red that gave birth to the idea of bleaching with

vapours; it might have been observed, that, in finishing, colours lose considerably in deepness; perhaps, at the same time, it may have been seen, that the pieces of packthread, used to arrange the skains, were bleached in finishing, and particularly by the addition of alkalis.

"A very great variety of colours, and of different tints, may be procured by adhering to the same process as I have detailed for obtaining beautiful and solid reds. For this purpose, the alkaline solution of oily alum must only be made use of, when such a tint of oxid of iron, or indigo blue, has been given as may be thought proper; but, whatever colour or tint may be intended to be given previous to fixing the alum on the skains of cotton, yarn, or of thread, these skains ought always to be first thoroughly boiled and cleansed, the power of adhesion of the sediment of indigo, as well as that of oxid of iron, and likewise of coloured alum, being augmented by the colouring particles of the madder, if they are submitted to the action of the heat of boiling water, before they are impregnated with the alkaline solution of oily alum. The manner of dyeing all kinds of blue tints with indigo being already well known, it is not worth while to detail it; and as to producing a yellow rust colour, which is done with very little expense, it depends only on soaking the skains thoroughly in a solution of sulphate of iron, on pressing them equally, and immersing them afterwards in a caustic lye of potash, which will precipitate and fix the oxid of iron of a disagreeable colour, but which will uniformly assume a yellow tint like rust, by attracting and saturating itself with the oxygen of the atmospheric air: this yellow will be more or less deep, in proportion to the greater or less quantity of iron contained in the solution; one may likewise give more brilliancy, and even more equality, to yellow rust-colour, by soaking the skains a second time in the ferruginous solution, and immersing them in the caustic lye. Care must be taken not to use soda for this operation, as it generally contains sulphur which turns black the oxid of iron by mineralizing it.

"Skains coloured blue and yellow rust-colour, treated with the alkaline solution of oily alum, will procure, with the madder, purple colours, violet, lilac, &c. &c. It may easily be imagined, that if, instead of madder, the same skains prepared for dyeing with madder are coloured with kermes, cochineal, f. rambuc, campeachy wood, Santa Martha wood, woad, yellow wood, Avignon nuts, &c. &c. a vast variety of tints will be obtained: these tints may even be multiplied to infinity, by mixing the colouring ingredients of one, with the other, in various proportions.

The affinity of adhesion of the colouring parts of all these ingredients, varies also in this particular, that the tints produced by a yellow or olive green dye, are changed or totally metamorphosed by a second tincture of madder, kermes, cochineal, or fernambuc; and will furnish orange tints, capuchin, carmelite, brass, &c. &c. As the previous preparation of the skains by the alkaline solution of oily alum, may be too expensive for some of these colours, the process which I detailed in the *Annales de Chimie* of the year 1792, page 250, 17, 18, and 19, may be substituted in its stead, which consists in treating the skains alternately with soap and sulphate of alum, whose excess of acid has been saturated, either with carbonate of alkali or of lime: this process is very expeditious; the skains may be prepared and dyed, on the same day, particularly in summer, red, as well as any other colours, which, for the most part, may be subjected to ebullition; and the operation of finishing with bran, for a quarter of an hour, half an hour, and some even for a whole hour. It must still be observ-

ed, that it is only the colours of madder, whose bases of alum and oxid of iron have been fixed upon stuffs, by means of an alkaline oily solution, that can acquire perfect solidity by the action of the heat of boiling water; and that the solidity is far inferior in all those colours of madder whose earthy and ferruginous bases have been transferred to the stuffs by acid dissolvents.

"Alum, plentifully fixed on cotton or linen stuff, by means of one of the most concentrated alkaline solutions, very readily attracts the colouring particles in dyeing with madder. The effect is not the same, if the same earth is transferred to it by means of the most concentrated acetic solution of alum; it is absolutely impossible to complete dyeing at one single time, even if one were to be so lavish of madder as to take infinitely more than would be required to obtain a satisfactory result, from repeating the process three or four times*. This singularity will give occasion for new and interesting experiments; my observations prove, mean while, that dyeing with madder in general requires to be managed with the most scrupulous attention."

REDHEAD, a promontory in Angushire, on the German Ocean, lying S. of Montrose. Here are the ruins of a castle, almost surrounded by the sea. Till the year 1793, this cape was the point beyond which coal was not permitted to pass without paying a heavy duty, which was taken off by a commutation duty on spirits.

REDON, a town of France, in the department of Isle and Vilaine. It serves as a mart for the commerce of Rennes, and is seated on the Vilaine, 20 miles E. of Vannes, 225 E. by S. of Paris. Long. 2. 10. W. Lat. 37. 48. N. REDONDELLA, a commercial town of Spain, in Galicia, with a castle. It was pillaged by the English in 1702. There is a fishery for anchovies on the coast. It is seated at the bottom of a bay of the Atlantic, eight miles S. of Ponte Vedra. Long. 8. 15. W. Lat. 42. 18. N.

REDONDO, a town of Portugal, in Beira, with a castle. It has a manufacture of cloth, and is seated at the mouth of the Mondego, 17 miles S.W. of Coimbra. Long. 8. 34. W. Lat. 40. 4. N.

REES, a strong town of Germany, in the duchy of Cleves, seated on the Rhine, 10 miles S.E. of Cleves, and 10 N.W. of Wesel. Long. 6. 4. E. Lat. 51. 40. N.

REFINING (*Encycl.*). The following is extracted from the specification of a Patent granted to Mr. Wakefield, of Northwich, in Cheshire, for a new method of refining sugar. It is dated June 2, 1801.

"Pressure is to be applied to the sugar intended to be refined, which may be done by weight, or by rollers, or by the screw or wedge, with the help of a steam-engine, or any engine, mill, or power capable of acting, by way of pressure, with great force. The sugar so to be refined is to be placed in such a situation as to be conveniently acted upon by the pressure to be applied, and is to be contained or inclosed in a cloth, felt, vessel, or covering, either having pores or holes therein, or otherwise so constructed that moisture may be discharged from the sugar through, or out of, the cloth, vessel, or covering; and to such sugar, previously containing moisture in it, or having moisture added or given to the substance thereof, or by such moisture being communicated to the inclosing cloth, felt, or vessel, or other covering, the pressure is to be applied forcibly, so as to make the moisture, or a part thereof, pass from the sugar, and out of, or through, the said covering. And thus a part of the colouring matter, and of the

impurities of the sugar, will be expelled; and the degree of refinement procured will be proportioned to the quantity of pressure applied, and the quantity of moisture expelled or squeezed out of the sugar. From the moisture or substance thus forced out, there may be extracted some sugar, melasses, and rum, or other spirits, by the usual processes. And every sort of sugar, from the lowest to the highest degree in quality and value, will be very much accelerated in the refinement thereof, in several stages of the progress towards refinement, by pressure applied in the manner above described; the pressure being used as often as the workman shall think fit, according to the previous quality and state of the sugar, and the nature of the operations that are to follow."

REFORM, a building or receptacle in the vicinity of London, opened by the PHILANTHROPIC SOCIETY, for the reception of criminal poor children, and for the protection and maintenance of the innocent offspring of persons who have been executed or transported.

"The great object of the society (say the committee in their *address to the public*), which has now been instituted upwards of twelve years, is to unite the purposes of charity with those of industry and police; and thereby, while it affords relief to a description of persons of all others the most to be pitied, to make it the interest of every individual to contribute to the support and extension of this institution.

"Among the calamities to which the children of indigent parents are exposed, the want of moral and religious instruction, with early habits of industry, is the most to be lamented; such wretched objects are not only subjected to the temptations attendant upon poverty, but are without the disposition and ability to gain an honest livelihood. When to these circumstances are added the baneful example of parents, whose crimes have subjected them to banishment, or an ignominious death, the condition of such children is truly deplorable, and demands the benevolence of the Christian, the interference of the statesman, and the exertions of the patriot.

"There are no reflecting minds, or feeling hearts, but must have frequently lamented the fatal depravity which pervades the lower classes of the people, especially in the more populous part of this kingdom; and there are few who have not, at one time or other, trembled for their own safety in consequence of this depravity.

"With the increase of crimes our penal laws have multiplied; but while it is obvious that to prevent crimes is better than to punish them; and while every humane person must view with the deepest compassion and regret the numbers that are annually swept away by banishment, or consigned to an ignominious death, it is worthy of observation, that previous to this institution, the proper remedy for these disorders had not been adverted to, nor any plan of *preventive police* so much as projected.

"No nation has been more distinguished than Great Britain, for its various and excellent charities.—The truth, however, is, that most of our charitable institutions have confined their beneficence to the deserving, but unfortunate part of the community; whilst the offspring of the vicious and dishonest have been unhappily involved in the guilt of their parents. Those who have violated the laws in any instance have been excluded from society, or at least have been treated with extreme severity when received again within its protection; and before this institution, no asylum

* The concentrated acetic solution of oxid of iron is attended with nearly the same difficulties.

was ever opened for the repenting culprit, where the wanderer might be recalled from the error of his way, not by harsh and cruel treatment, but by gentleness and kindness; where he might prove the excellence and benefits of virtue, and contemplate her no longer under an austere and threatening aspect; where, by his own industry, he might contribute to his own subsistence, and be no longer under the necessity of stealing for bread*. It is the peculiar characteristic of this Society, to continue its care and attention till its objects have attained to such a mature age, as to be able to think and act for themselves, and have acquired such habits as will probably ensure their future good conduct through life.

"It is a well-known fact, that of the multitudes who fall victims to the violated laws of their country, the majority are trained and educated by experienced thieves, in a course of dishonesty, and are as regularly brought up to this way of life, as other persons are to common trades and professions. Hence their dexterity and adroitness in all the departments of this dangerous system; hence their union with each other, which renders their attempts so much the more formidable; which frequently eludes the pursuit of justice, and even intimidates those who see the wrong publicly committed.

"To break the chain of these pernicious confederacies, and to cut off all their supplies, is the intention of the Philanthropic Society, which aims at the prevention of crimes, by removing out of the way of evil counsel and example, those children, whose destruction, without their assistance, would be inevitable.

"In order to carry into effect these desirable purposes, the doors of the Reform have been thrown open for the reception of the infant offspring of convicted felons; for although such children may not have begun as yet the criminal practices of their profligate parents, yet it is to be feared, the pernicious sentiments and principles imbibed from those parents, and their wretched connections, will operate so forcibly on their youthful minds, as to render them more open to temptation than the children of parents of an opposite description.

"Another class still more wretched, and the next object of this institution, are those who have already commenced their criminal course by the commission of petty thefts or fraudulent practices, and, in consequence of detection, have been brought before a magistrate and discharged for want of legal evidence to produce conviction, although no doubt remained of their actual guilt; also those who have been tried and convicted; but by reason of their tender years, or some other mitigating circumstances, are recommended by the judges of assize, or other magistrates, before whom such trial took place. Such recommendations are particularly attended to by the committee."

For the employment of the children the REFORM has been erected with suitable workshops, &c. in St. George's Fields, London. There, under the direction of the several master workmen, are carried on the trades of a Printer, Copper-plate Printer, Book-binder, Shoemaker, Taylor, Ropemaker and Twine-spinner; to one or other of which the boys are apprenticed, carefully instructed, and excited to industry by rewards that bear a proportion to their exertions. The girls are educated as menial servants, and have otherwise abundant employment in washting the linen, making their own clothing, shirts for the boys, &c. Several

of them have been placed out in service, and, upon producing testimonials of their good behaviour, have received the rewards which the committee have thought it right to hold out for their encouragement. A steward resides upon the spot to keep the accounts, distribute the provisions, &c. and the whole is under the care of a superintendent, also resident on the spot, who sees that the master tradesmen do their duty, and that the children conduct themselves properly in every respect.

The important task of inculcating religion and morals is assigned to the society's chaplain; and the children are supplied with such books as are likely to promote those salutary ends.

The whole number of children of both sexes that have been received by the society amount to 464, and the number now in the Reform (1802) is 165. Among these were many who, though young in years, were yet old in iniquity. There are amongst them boys who have been guilty of felonies, burglaries, and other crimes: yet, singular as it may appear, these very children are now become no less remarkable for their industry, decency, and obedience, than they formerly were for the opposite vices.

In order to extend its benefits to a still greater number of objects than the funds will enable them to maintain within the Reform, the committee endeavour to obtain masters out of the Reform, for those boys that have become entitled to good characters, by paying an annual sum with each for the two or three first years of their apprenticeship; and propose to distribute rewards to such of those boys who behave well, either at the end of their several apprenticeships, or at any intermediate periods, when they appear to merit them.

It is impossible not to feel interested in behalf of this very superior public charity, which does more than provide for the temporal wants of the objects under its protection. We heartily wish it perpetuity and extension.

REGEN, a town of Bavaria, on a river of the same name, 12 miles N.E. of Deckendorf, and 40 E. of Ratisbon. Long. 13. 2. E. Lat. 48. 50. N.

REGENSTEIN, a town of Lower Saxony, in the bishopric of Halberstadt, six miles S. Halberstadt, and seven W. of Quedlingburg. Long. 0. 41. E. Lat. 51. 26. N.

REGGIO, an ancient city of Italy, in a duchy of the same name, with a citadel, and a bishop's see. It has been ruined several times by the Goths and other nations. In the cathedral are paintings by the greatest masters; and in the square is the statue of Brennus, chief of the Gauls. The inhabitants are about 22,000, who carry on a great trade in silk. It was taken by Prince Eugene in 1706, and by the King of Sardinia in 1742. It is situated in a fertile country, 15 miles N.W. of Modena, and 80 S.E. of Milan. Long. 11. 5. E. Lat. 44. 43. N.

REGINA, a town of Naples, in Calabria Citeriore, 14 miles N. of Cozenza. Long. 16. 21. E. Lat. 39. 34. N.

REGNANO, a town of Italy, in the patrimony of St. Peter, seated near the Tiber, 17 miles N. of Rome. Long. 12. 36. E. Lat. 42. 11. N.

REICHENAU, an island of Suabia, in the Zeller See, or lower lake of Constance. It is three miles long and one broad; contains about 1600 inhabitants, all catholics; three parishes, and a rich abbey, of which the Bishop of Constance is abbot. In this convent was interred Charles le Gros, who was emperor; and king of France, but was

* These unfortunate children are frequently forced on desperate courses; with blasted reputations, with dangerous connections, and coming from suspicious places, what private family will open a door to receive them?

deposed in 887, and died in extreme want and misery. This island is three miles W. of Constance, and belongs to the bishop of that place.

REICHENAU, a town of Switzerland, in the country of the Grisons, seated in a rich and fertile valley, at the conflux of the two branches that form the Rhine. Here are two curious bridges. One of these is thrown across the lower branch of the Rhine, and is 105 feet in length. The other, built across the Rhine, below the point of union, is a wooden one, of a single arch, the span of which is 220 feet. Reichenau is seven miles S.W. of Coire.

REICHENBACH, a river of Switzerland, which has its source at the foot of Mount Wetterhorn, and rolls its numerous cataracts down the steep sides of Mount Scheidec, till it unites with the Aar, near Meyringen. It conveys into the Aar the gold dust that is found in the bed of that river.

REICHENFELLS, a town of Germany, in the duchy of Carinthia, 24 miles N.E. of Clagenfurt, and 24 E. of Muhrau. Long. 14. 4. E. Lat. 47. 9. N.

REICHENHALL, a town of Upper Bavaria, on the Sala, with a rich salt spring, nine miles S.W. of Salzburg, and 64 S.W. of Munich. Long. 13. 2. E. Lat. 47. 28. n.

REICHENSTEIN, a town of Silesia, famous for the silver mines in its neighbourhood. It is 12 miles W. of Grotzkaw.

REICHSHOFEN, a town of France, in the department of Lower Rhine, with a castle, in the neighbourhood of Haguenau.

REID (Thomas) a distinguished moral and metaphysical writer, was the son of the Rev. Lewis Reid, minister of the parish of Strachan, in the county of Kincardine, North Britain. He was born at the parsonage house of Strachan in April 1710, and received the rudiments of his education at the parish school of Kincardine-oniel; and was removed from thence to the Marischal College, Aberdeen, when not more than twelve years of age.

After the usual course of four years employed in the study of Latin, Greek, Mathematics, and Philosophy, he probably took his degree of M. A. which at that period, and for a long time subsequent to it, was the universal practice in the university of Aberdeen, and then commenced the study of theology. In due time he was licensed to preach the gospel according to the forms of the church of Scotland; but continued to reside for some years in Aberdeen, cultivating his favourite science, mathematics.

The mathematical chair in the Marischal College was then filled by Mr John Stuart, a man of great eminence in his profession; but who, like many other profound mathematicians, was not happy in his mode of communicating science, at least to the duller part of his pupils. Mr. Reid occasionally read lectures for the professor, and became very popular with his fellow pupils. He could not however spend his life in the study of mathematics, and in reading barren lectures for other men. He had been educated for the church; and it was in the church only that he had the prospect of gaining a livelihood. He was accordingly presented, we know not in what year, to the church of *New Machar* in Aberdeenshire, at a time when the good people of Scotland were very far from being reconciled to the rights of patronage; and the consequence was, that his settlement met with much popular opposition. Even a little riot took place in the church at his ordination; but he soon gained the affections of his flock by his good sense, his acknowledged worth, and his unwearied attention to all their wants, which he was ever ready to relieve to the utmost extent of his abilities. So deeply rooted indeed was their

regard for him at last, that though it is now almost half a century since his relation to the parish of *New Machar* ceased, his memory continues to be revered in that parish even at the present day.

In the year 1751, about the beginning of the session or annual term, one of the professors of philosophy in King's College, Aberdeen, died; and the late Dr. John Gregory, then professor of medicine, with the Rev. Dr. Macleod, the present sub-principal of King's College, were deputed to visit Mr. Reid, and to request his immediate acceptance of the vacant professorship. He yielded to the request, not without some hesitation, and was admitted professor of philosophy on the 22d of November.

He was now in the very situation for which Nature seemed to have intended him. He had not only an opportunity, but it was his duty to cultivate the science to which his attachment was so strong; and the duties of his office made him turn his attention more closely than he had hitherto done to another science, in which he was destined to make a more conspicuous figure than he ever made even in his favourite mathematics.

It was during his professorship in the university of Aberdeen that he wrote his *Essay on Quantity*, which was published in the 45th volume of the *Philosophical Transactions*, and is perhaps the finest specimen of metaphysical mathematics, if we may use such an expression, that is extant in our own or in any other language. It was during the same period that he published his *Enquiry into the Human Mind on the Principles of Common Sense*; a work of unquestionable merit, which has contributed more than any other work whatever to give a rational turn to metaphysical speculations. It was about this period that the degree of D.D. was conferred upon him by his mother-college,

The well-earned fame of Dr. Reid attracted the attention of the University of Glasgow to him as the fittest person to succeed the celebrated Dr. Adam Smith; and he was admitted professor of moral philosophy in that university on the 11th of June, 1764. There his attention was not distracted by a multitude of sciences, which it was his duty to teach; and he had leisure to improve his metaphysical system, though he continued through life to amuse himself occasionally with mathematical speculations.

In the year 1773 appeared, in Lord Kames's *Sketches of the History of Man*, A brief Account of Aristotle's Logic; with remarks by Dr. Reid. It would seem that he had entered upon this task rather reluctantly, and merely in compliance with the solicitations of his friend, the author of the *Sketches*.

But when it is known that the late Dr. Doig of Stirling, to whom Greek was as familiar as his mother tongue, and an equally learned doctor of Oxford, who has been reading Aristotle ever since he was fourteen years of age, agreed in opinion, that a more accurate view of his logic could not be given in the same compass than had been given by Dr. Reid, we may surely affirm, with some degree of confidence, that this small work adds much to the fame of its author.

Though Dr. Reid's health continued good, and his mental faculties unimpaired, till a very short time before his death, he ceased for some years to read lectures from his professorial chair, employing that time in preparations for eternity, and in fitting his lectures for the press. These were published in two volumes 4to: the first in 1785, under the title of *Essays on the Intellectual Powers of Man*, dedicated to his friends Dr. Gregory and Professor Stewart, both of the University of Edinburgh; and the second in

1788, under the title of *Essays on the Active Powers of Man*, without any dedication or preface. He continued to enjoy the fame acquired by this work, as well as the affection of his friends, and the reverence of the public for eight years, dying at Glasgow in the end of September, or the beginning of October, 1796, in the 87th year of his age. He had been married, and he left behind him one daughter.

To do justice to the biography of such a man as this, we should here attempt to draw his intellectual character, and to appreciate the merits of his works; but to perform this task in a manner at all worthy of him, or we hope of ourselves, would require more room than our limits permit us to allot to any article of the kind; and our readers will be pleased to learn, that they may confidently expect an account of his life, with a critique on his works, by a man better qualified to do justice to both, than the writer of this short sketch pretends to be. His works are in the hands of the speculative public; and by that public will be duly valued, as long as sound sense shall be preferred to impious jargon. How long that may be, God only knows; but if any thing can guard the minds of our youth against that sophistry of which the object is to attribute real agency to material fluids, and to represent the elective attractions of chemistry as perfectly similar to human volitions, it will be the unbiassed study of Dr. Reid's *Essays on the Intellectual and Active Powers of Man*. They will there find metaphysics divested of mystery, and the profoundest speculations rendered intelligible by the constant use of words in one determined sense.

Candour however obliges us to acknowledge, that he has advanced some doctrines which we cannot admit as true. Though not in general partial to Locke, he has adopted his notions respecting our power of abstraction, with hardly any other variation than the substituting of the term *conceptions* for Locke's favourite phrase *ideas*. He has likewise endeavoured to prove, that we may distinctly conceive what cannot possibly exist. These mistakes, however, for such they appear to us, are infinitely more than counterbalanced by his clear, accurate, and satisfactory disquisitions on our notions of *active power*. Had Dr. Reid never written a sentence but the essay which treats of this delicate and important subject, he would have been entitled to a place in the very first rank of useful metaphysicians; for, previous to the appearance of his works, we had nothing written directly on *power*, but contradictory and unintelligible jargon. We recommend the serious perusal of this essay, the first in his second volume, to such of our readers as fancy that they distinctly conceive the powers of chemical agents, and that intelligence and volition may result from mechanical organization, or any combination whatever of matter and motion.

REIFFERSCHIED, a town of Germany, capital of a county of the same name, in the archbishopric of Cologne. It is 32 miles S. W. of Cologne, and 42 W. of Coblenz. Long. 6. 50. E. Lat. 50. 20. N.

REISENBURG, a town of Prussia, in the province of Oberland, anciently the residence of the bishops of Pomerania. Near it is an ancient castle. It is 73 miles S. W. of Königsburg. Long. 20. 5. E. Lat. 53. 52. N.

REMIREMONT, a town of France, in the department of the Vosges. It had lately a chapter of canonesses, who were obliged to prove their nobility, and whose abbess was a princess of the empire. It is seated on the Moselle, at the foot of Mount Vosges, 42 miles S. by E. of Nancy. Long. 6. 47. E. Lat. 48. 3. N.

REMY, St. a town of France, in the department of

the Mouths of the Rhone. A triumphal arch, and a mausoleum, in the neighbourhood, display the taste of the Augustan age: the first is not entire; but the second is in the best state of preservation. St. Remy is 10 miles N. E. of Arles.

RENDSEBURG, a town of Lower Saxony, in the duchy of Holstein, with a castle. It is seated in an island formed by the river Eyder, 12 miles S. E. of Sleswick. Long. 10. 6. E. Lat. 54. 30. N.

RENNEBON, a town of Germany, in the bishopric of Strasburg, 10 miles E. of Strasburg.

RENTI, a town of France, in the department of the Straits of Calais, seated on the River Aa, 12 miles S. W. of Aire, and 50 N. W. of Arras. Long. 2. 20. E. Lat. 50. 36. N.

REOLE, a town of France, in the département of Gironde, seated on the Garonne, 20 miles S. E. of Bourdeaux. Long. 0. 4. W. Lat. 44. 30. N.

REPAILLE, a town of Savoy, in Chablais, seated on a river which falls into the lake of Geneva, and famous for the retreat of Amadeus, duke of Savoy, in 1440, where he went to enjoy the pleasures of a country life. Here is a Carthusian monastery, remarkable for its extensive prospects. It is three miles from Thonon, and 20 N. E. of Geneva. Long. 6. 21. E. Lat. 46. 26. N.

REPEHAM, a town in Norfolk, with a market on Saturday. It has two churches in one church-yard, and is seated in a valley, 15 miles N. W. of Norwich, and 109 N. E. of London. Long. 1. 7. E. Lat. 52. 50. N.

REPOSITORY, a building or apartment destined to receive any collection of curious or valuable articles either for inspection or sale. Thus the collection of models and new inventions at Woolwich (lately destroyed by fire) was called "The Repository." The same appellation is also given to a charitable institution at Bath, where a *Repository for the Benefit of the Poor* has been opened, and is thus described by Mrs. Bernard in the Reports of the Society for bettering the Condition of the Poor.

Towards the end of the year 1796, a Repository was opened at Bath by several ladies, for the reception of works of industry and ingenuity, to be sold for the benefit of the poor. It is supported by subscription, and is conducted by a committee of ladies chosen from among the subscribers; of whom one attends the sale every day from twelve to three, and three or four meet on Saturday, to look over the books, and to pay the poor people. During the two first years articles were sold for the benefit of 200 poor persons, and the receipts amounted to 1133*l.* 11*s.* 4*d.* The last year's receipt was 700*l.*

There are at present sixty-three poor women, who regularly bring their work, and come every Saturday to be paid for such part as is sold; many of them are widows with large families, and some very infirm; particularly one poor woman, who employs herself in making stay-laces, and is paralytic; so much so, as to be unable even to lift her head from the pillow. Her work is remarkably neat, and well done; and she not only earns some addition to her means of subsistence, but relieves herself from the weariness of many painful hours. The articles sold consist of sets of childbed linen for the poor, shifts, shirts, stockings, gloves, garters, laces, purses, rugs, and the like. These are chiefly the work of the poor; besides which there are all kinds of fancy works, contributed by the ladies, and sold for the benefit of particular poor persons, whose names are written on each article, and who attend to receive the money; it being a rule that the poor object, for whose benefit any charitable person may wish to em-

ploy her ingenuity, should be the bearer of the work, his or her name being ticketed upon it by the donor, and should in person receive the money.

The plan is similar to that adopted in London; the substance of its regulations being the same, except where it has been deemed expedient to omit any part, or vary the form of them, from local circumstances, or the relative situation of the two cities. With it is connected a very useful charity, for lending out childbed linen to the poor. The School of Industry at Bath also receives assistance from it, by its affording a vent for the work of the children.

A charity box is placed at the door of the apartment; into which, to prevent the inconvenience that might arise from idle visits of curiosity, sixpence is requested to be put by those who do not purchase any thing.

The object of this institution (to use the words of its conductors) is "the encouragement of industry, in all descriptions of persons reduced to distress; by affording them a ready sale for the articles which are admitted into the Repository, at the price fixed by the owners; the value whereof is paid to them, without any deduction, as soon as they are sold.

This charity is very beneficial; not only in the means of acceptable employment which it offers to the poor, but in the useful occupation that it affords to the rich; converting caprice and fashion into sources of relief, and making the amusements of the idle and the young, contributory to charity and benevolence. Amid the pleasures and dissipation of Bath, it must be no small satisfaction to those parents whose health obliges their families to be occasionally resident there, that a place of amusement of this kind should be opened for their children, and that it should be powerfully recommended by fashion:—a place, where they may, at an early age, be instructed to employ the means, and enjoy the gratification, of being useful to the poor, and of soothing and relieving their distresses. For it must occur to them, before it can be suggested, that habits of this kind, when, at an early and teachable age, they are acquired and enjoyed, will remain through life a blessing, and an ornament, to the possessor.

Particular circumstances, in Bath and London, may make this charity peculiarly proper and commendable; but there is no country town in England, where the rich may not derive pleasure, the poor receive benefit, and society in general be improved, by the imitation of this example.

REPPEN, a town of Upper Saxony, in the new marche of Brandenburg, 16 miles S.S.E. of Custrin. Long. 14. 28. E. Lat. 52. 30. N.

REQUENA, a town of Spain, in New Castile, with a castle. It was taken by the English in 1706, and retaken by the French the next year. It is seated on the Oliana, 40 miles W. of Valencia, and 130 E. by S. of Madrid. Long. 0. 40. W. Lat. 39. 24. N.

REQUESTS, COURT OF (*Encycl.*). By the act called the *London Small Debt Act*, 39 and 40 Geo. III. c. 104. so much of the former acts relating to the Court of Requests within London, viz. 3 Jac. I. c. 15. and 14 Geo. II. c. 10. as restrains the jurisdiction of that court to debts not exceeding 40s. is repealed.

And it is enacted, that it shall be lawful for any person, whether residing within the city of London or elsewhere, and who may have any debt, not exceeding 5l. owing to him from any person residing within the city of London, and the liberties thereof, or keeping any house, warehouse, shop, shed, stall, or stand, or seeking a livelihood, or trad-

ing or dealing within the same city or liberties, to cause such debtor to be summoned before the commissioners of the said Court of Requests, who may order and direct payment, either in one sum, or by instalments at stated periods, and no certiorari is to be allowed to remove the proceedings.

Debts due by persons under age for necessities may be recovered; and servants under age may recover wages: also attorneys are subject to the processes of the court.

But the act does not extend to any debt arising upon title of freehold or leasehold, or to any debt by speciality, which shall not be for payment of a sum certain; nor to any debt concerning testaments, or matrimony, or any ecclesiastical matter, although the same shall not exceed 5l.

And if any action be commenced in any other court than the said Court of Requests, for any debt not exceeding 5l. and the plaintiff obtain a verdict, he shall not be entitled to costs; and if the verdict be given for the defendant, and the judge shall certify that the debt ought to have been sued for in the Court of Requests, he shall have double costs.

But this is not to restrain persons from recovering rents by distress or action, though the rent does not exceed 5l.

And debtors may plead the statute of limitations.

Debtors committed in execution are to remain in custody as follows, and for no longer time, viz: when the debt does not exceed 20s. (exclusive of costs) twenty days; 40s. forty days; 3l. sixty days; 5l. one hundred days.

RESHT, a town of Persia, capital of Ghilan, seated on the S.W. coast of the Caspian Sea, 110 miles N. of Casbin. Long. 52. 16. E. Lat. 37. 18. N.

RETHÉL, an ancient town of France, in the department of the Ardennes, seated on a mountain, near the river Aisne, 20 miles N.E. of Rheims, and 108 N.E. of Paris. Long. 4. 26. E. Lat. 49. 30. N.

RETIMO, a sea-port of Candia, with a bishop's see, and a citadel, where the bashaw resides. It was taken in 1647, by the Turks, who have kept it ever since. The silk, wool, honey, wax, laudanum, and oil, are preferred to all others. It is seated on the N. coast of the island, 45 miles from Candia. Long. 24. 45. E. Lat. 35. 22. N.

REVEL, a town of France, in the department of Upper Garonne, nine miles N. of St. Papoul. Long. 2. 10. E. Lat. 43. 26. N.

REVEL, a government of Russia. See ESTHONIA.

REVELLO, a town of Piedmont, in the marquisate of Saluzzo, near the Po, on the top of a very high mountain, strongly fortified by nature and art. It is three miles N.W. of Saluzzo.

REVERO, a strong town of Italy, in the Mantuan, seated on the Po, opposite Ostiglia, 10 miles N.E. of Mirandola, and 20 S.E. of Mantua. Long. 1. 9. E. Lat. 44. 58. N.

REUS, a town of Spain, in Catalonia. It has a considerable trade in wine, brandy, and nuts, which are carted down to Salo, an open but safe road, five miles off. About 20,000 pipes of brandy are annually exported. It is seated in the middle of a most fruitful plain, 35 miles N.E. of Tortola, and 60 W.S.W. of Barcelona.

REUSS, a river of Switzerland, which rises in the lake of Locendo, between the mountains of Petina and Locendro, flows through the lake of Lucern, and the town of that name, and adjoining the Aar, falls into the Rhine, below Zurzach.

REUX, a fortified town of the Netherlands, in Austrian Hainaut, eight miles N.E. of Mons.

REWAH, a town of Hindoostan Proper, in the province of Allahabad, 57 miles S.S.W. of Allahabad. Long. 81. 36. E. Lat. 24. 35. N.

REYNA, an ancient town of Spain, in Andalusia, seated in a plain, with a castle, built upon an eminence, three miles from Lerna, and in a territory abounding in wine and cattle.

REZAN, a government of Russia, formerly a province of the government of Moscow. It is fertile in corn, and populous; and had anciently its own princes.

RHE, an island on the W. coast of France, in the department of Lower Charente. It is four leagues long and two broad, and very populous. Its products are bitter wine, abundance of salt, excellent brandy, and the liquor called aniseed. It is defended by four forts, and is eight miles W. of Rochelle. St. Martin is the capital.

RHEDA, a town of Westphalia, in the county of Linggen 10 miles N. of Lipstadt. Long. 7. 22. E. Lat. 51. 47. N.

RHEINAU, a town of Switzerland, in Thurgau, with an abbey, on an island formed by the Rhine, between Schaffhausen and Eglisau.

RHEINBACH, a town of Germany, in the electorate of Cologne, 19 miles S. of Cologne, and 53 E. of Liege. Long. 6. 9. E. Lat. 51. 39. N.

RHEINFELDEN, a strong town of Suabia, the best of the four forest-towns, belonging to the house of Austria. It has been often taken and retaken, and is seated on the Rhine, over which is a bridge of several arches, eight miles E. of Basle. Long. 7. 46. E. Lat. 47. 36. N.

RHEINHAUSEN, a town of Germany, in the bishopric of Spire, situate on the Rhine, three miles S.E. of Spire. **RHEINMAGEN**, or **REMAGEN**, a town of Westphalia, situate near the Rhine, 19 miles N.N.W. of Coblenz. Long. 6. 30. E. Lat. 50. 38. N.

RHEINABERN, a town of Germany, in the bishopric of Spire, with a castle, 15 miles S. of Spire.

RHEINTHAL, a fertile valley of Switzerland, lying along the Rhine, which divides it from a territory of Austria, till it reaches the lake of Constance. It belongs to the eight ancient cantons, and to that of Appenzel. The Protestant inhabitants are the most numerous.

RHEINWALD, a large valley in the country of the Grisons; so called from the Hinder Rhine, which takes its rise on Mount Vogelsberg, at the distance of 12 miles, and runs through the valley. Splügen is the capital.

RHENEN, a city of the United Provinces, in Utrecht, seated on the Leck, 20 miles S.E. of Utrecht. It was taken by the French in 1672, and 1795. Long. 5. 22. E. Lat. 51. 59. N.

RHINE, LOWER, a department of France, containing the late province of Lower Alsace. Strasburg is the capital.

RHINE, UPPER, a department of France, containing the late province of Upper Alsace. Colmar is the capital.

RHINE, PALATINATE OF THE, an electorate of Germany, in the circle of the Lower Rhine; bounded on the N. by the archbishoprics of Mentz and Treves, on the E. by Franconia and Suabia, and on the W. and S. by France. It is 100 miles in length, and 70 in breadth, and the principal rivers are the Rhine and Neckar. It has suffered more by the wars with France, than all the provinces of Germany put together; for, in the last century, Lewis XIV. ordered the whole country to be laid waste by fire and sword. Heidelberg is the principal town, but Mannheim is the electorate residence. This electorate is also called the Lower Palatinate, to distinguish it from the Upper Palatinate of Bavaria.

RHODE ISLAND, one of the United-States of Ame-

rica, bounded on the N. and E. by Massachusetts, on the S. by the Atlantic, and on the W. by Connecticut. These limits comprehend what has been called Rhode Island and Providence Plantations. It contains five counties, and 29 townships. It is as healthful as any part of North America, and is principally a country for pasture. Providence and Newport are the chief towns.

RHODE ISLAND, an island of North America, in a state of the same name. It is 13 miles long and four broad, and divided into three townships. This island is a noted resort of invalids from the southern climates, being exceedingly pleasant and healthful, and is called with propriety the Eden of America.

RHONE, MOUTHS OF THE, a department of France, containing part of the late province of Provence. Aix is the capital.

RHONE AND LOIRE, a department of France, including the late provinces of Forez and Lyonnais. The capital is Lyons.

RHYNDS, or **RINNS OF GALOWAY**, the W. division of Wigtownshire, almost cut off from the other parts of the country by Loch Ryan and the bay of Luce.

RIALEXA, a town of New Spain, in Nicaragua, seated on a small river, five miles from the Pacific Ocean, where there is a good harbour. The air is unwholesome, on account of the morasses. It is 60 miles W. of Leon de Nicaragua. Long. 89. 10. W. Lat. 12. 25. N.

RIBADEO, a sea-port of Spain, in Galicia, situate at the mouth of the Eo, with a good harbour, defended by two castles. It is 15 miles N.E. of Mondnedo. Long. 7. 2. W. Lat. 43. 30. N.

RIBAS, a town of Spain, in New Castile, on the river Xarama, eight miles from Madrid.

RIBEIRA GRANDE, a town of St. Jago, the principal of the Cape de Verd Islands, with a good harbour. It is seated between two high mountains. Long. 23. 24. W. Lat. 15. 0. N.

RIBEMONT, a town of France, in the department of Aisne, seated on an eminence, near the river Oise, 10 miles W. by S. of St. Quentin. Long. 3. 21. E. Lat. 49. 48. N.

RIBERAC, a town of France, in the department of Dordogne, 17 miles E. of Perigueux, and 27 S.E. of Angoulesme. Long. 1. 5. E. Lat. 45. 15. N.

RIBNIC, a town of Turkey in Europe, in Walachia, with a bishop's see, 44 miles S. of Hermanstadt, and 130 E.S.E. of Temeswar. Long. 23. 40. E. Lat. 45. 19. N.

RIBNITZ, a town of Lower Saxony, in the duchy of Mecklenburg, with a nunnery for noble women. It is seated on a bay of the Baltic, 12 miles N. of Rostock. Long. 12. 55. E. Lat. 54. 10. N.

RICE (*Encycl.*). The following account of some experiments in cultivating rice in Britain, by Sir Joseph Banks, bart. were communicated in a letter to the President of the Board of Agriculture, dated April 15, 1799. "As I conceive," says Sir Joseph, "the introduction of new esculent vegetables, a matter of material importance to the agricultural interests of this country, and that even an unsuccessful experiment on this subject may be, though not perhaps fitting for publication, a proper document to be lodged in the archives of the Board of Agriculture, I take the liberty of submitting the following remarks to your lordship's better judgment.

"The dry, or mountain rice, which I received last year from the Board of Agriculture, for trial, had been procured at some considerable expence by Sir John Murray, from the neighbourhood of Serinagur, a city in India, situated at the foot of Mount Imaus, where snow lies till

late in the spring; and where the climate has been supposed to resemble that of England, sufficiently to make it probable, that the vegetable productions of the one, would equally succeed in the other country; I consider it as a duty owing to the patriotic exertions of Sir John, to give your lordship and the Board some account of the result of the trial of it, made by me at Spring Grove, near Hounslow, in Middlesex.

"It was not till near the end of May, when the samples, being six sorts, were delivered out by the Board, and they were sown immediately, on the 21st day of that month, on six small beds in a garden, under the shelter of a pale, in a south exposure.

"The grains were sown very thin, in order that the progress of their vegetation might be better noted; in a very few days they appeared above ground. The season being warm, with a moderate supply of rain, it was seldom necessary to water them: however, when they appeared to flag, which generally happened after three or four dry days had taken place, they were well sprinkled with a watering pot.

"In less than a month they had grown several inches high: each sort had acquired an appearance very different from the rest; some were pale green, and had broader blades; some were deeper coloured, and narrower in the blade; and one sort had a brown hue on the whole plant; and the bases of the leaves in this kind were nearly black.

"During the month of August, they tillowed much more than I have observed any other corn to do: so much so, that although they had been sown very thin, they became a dense compact bed of plants; the blades in some of the kinds standing as close or closer to each other, than the thickest sown barley ever does.

"At the close of the month, the blades were from a foot to eighteen inches high; the plants continued to tillow, each root having by this time produced from ten to twenty offsets, but no symptom of a rising stem was at all observable.

"In the middle of September, they had still continued to tillow, and the blades to lengthen, so that some of them were at least two feet long. As the frosts of the autumn were nearly now approaching, it became an object of some importance to examine the state in which the plants really were, in order to ascertain the probability of their having produced ears, or possibly of their having ripened corn, if they had been sown a month or two earlier. The most careful inspection was therefore made by dissection, but no traces could be found of the rudiment of a joint beginning to form itself on the crown of the root, or of the embryo of the glumes of the ear, which in all kinds of corn are first discernible in that part.

"About this period I was taken ill, and obliged to desist from observing their future progress; but a frost soon after followed, which cut the blade down to the earth, and at once destroyed all hopes of these kinds of rice producing grain in our climate: the quantity of the blade was how-

ever so uncommonly great, that it is not impossible it might be advantageous to sow it as food for cattle, for a very large proportion of stock might certainly be maintained upon an acre of it.

"Before the frost set in, I had ordered a tuft of each kind of the rice to be transplanted into a pot, and placed in a hot-house, in order, if possible, to ascertain the natural period of this grain; whether, like winter corn, it requires eight or nine months to come to perfection, or, like our Lent corn, arrives at the same period in five or six; but all of these died, notwithstanding great attention was paid to them: some seed, however, which I had given to Mr. Lambert, succeeded better; it was sown in his hot-house in the month of June, where it threw well, but did not produce ears till near Christmas, a period of seven months; from whence, as it is not probable the grain would have ripened in less than two months from the time when the ear appeared, it is easy to deduce, that in the neighbourhood of Serinagur these kinds of rice are either sown as winter corn, or the climate there is far better suited to promote the quick progress of vegetation, than ours is. It was, when it produced ears, about three feet and a half high, and some of the stems had five joints, including the radical one: had it been in a more suitable climate, it would certainly have grown taller, for the flowers dropped off without producing seed.

"In the course of this spring I have forwarded a few seeds, which were left from Sir John Murray's importation, to Portugal; if they succeed, I shall probably hear of it; and in that case, if your lordship feels interest on the subject, I shall certainly do myself the honour of communicating such information concerning them, as I am able to obtain."

The following extract from an account of the benefit of the use of rice, by the matron of the Foundling Hospital, is published by the Society for bettering the Condition of the Poor.

"During the scarcity of wheat in July, 1795, one of the measures adopted at the Foundling Hospital, with a view of lessening the consumption of flour, was the substitution of rice puddings for those of flour, which, by the table of diet, were used for the children's dinner twice a-week. The flour puddings, for each day, had taken about 168lb. weight of flour; the rice puddings, substituted in their place, required only 21lb. of rice, to make the same quantity of pudding; the result of the experiments being that, in a baked pudding made with milk, one pound of rice will go very nearly as far as eight pounds of flour.

"The use of the puddings has ever since been continued in the Hospital, with this variation, that the quantity of rice has been increased to 24lb. weight for each day's dinner; and it now continues the substitute for near 168lb. of flour before used: the ingredients in the rice puddings at present, being 24lb. of rice, 6lb. of treacle, and 18 gallons of milk; and the produce, upon an average*, 180lb. of

* In order to ascertain correctly the comparative weight of the materials in their liquid state, with that of the pudding after it is baked, the weight has been carefully taken several times. The amount has not always been *precisely* the same, but the average is nearly as follows:

Weight of 18 gallons of milk, being about 1 lb. 3 oz. the pint -	171 lb.
24lb. of rice -	24 lb.
6lb. of treacle -	6 lb.
Total of the ingredients -	201 lb.
Average weight of the rice pudding in a solid state -	180 lb.
Average waste in dressing -	21 lb.

good substantial pudding; a very sufficient dinner for the 170 persons who dine on it.

"The milk is the better kind of London milk; about equal to good skim-milk in the country. The expence of the dinner is as follows:—24lb. of rice, five shillings; 6lb. of treacle, two shillings; and 18 gallons of milk, twelve shillings; the total for 170 persons being nineteen shillings, or rather more than five farthings per head.* The saving to the Hospital, by this use of rice during the year, was something more than 200l. and the national saving in the consumption of flour, from that circumstance only, during the same period of scarcity, being one year ending July 1796, appears to be nearly 17,472lb. weight of flour."

From this account it will appear how much benefit, as well national as individual, may be derived from the general use of rice. There is hardly any way in which it can be stewed down, either with bacon, or with meat seasoned with salt and pepper, and some leeks or onions, or with cheese, in which it will not make a cheap, pleasant, and nutritious dish; and it is particularly proper for poor families, or for workhouses and public charities.

RICHELIEU, a town of France, in the department of Indre and Loire, with a fine palace and extensive park. It was built by Cardinal Richelieu in 1637. The streets are as straight as a line, and it contains a handsome square. It is seated on the Amable and Vide, 27 N. of Poitiers, and 152 S.W. of Paris. Long. 6. 20. E. Lat. 47. 2. N.

RICHMOND, the capital of the state of Virginia. It has an elegant state-house, on a hill in the upper part of the town, and is seated on the north side of James river, at the foot of the falls, 60 miles W. by N. of Williamsburg. Long. 77. 30. W. Lat. 37. 25. N.

RICHMOND, a town of Staten Island, in the state of New York and county of Richmond. Its inhabitants are chiefly Dutch and French. It is nine miles S.W. of New York.

RICHMOND, a borough in the north riding of Yorkshire, with a market on Saturday. It was inclosed by a wall, with three gates, now in ruins; and it has a castle, on an inaccessible mount, and two churches. It sends two members to parliament, is governed by a mayor, and has a manufacture of woollen stockings, caps, &c. It is seated on the Swale, over which is a bridge, 40 miles N.W. of York, and 230 N.N.W. of London. Long. 1. 35. W. Lat. 54. 28. N.

RICHMOND, a village in Surrey, with a stone bridge over the Thames, nine miles west-south-west of London. It was anciently called Bheen; but Henry VII. called it Richmond, on account of his having been earl of Richmond in Yorkshire. Here was a palace, in which Edward III. Henry VII. and Queen Elizabeth, expired. Richmond is still distinguished by its beautiful royal gardens, which, in summer, are open every Sunday; and in these is a noble observatory. Here is an extensive royal park, called Richmond, or the New Park; surrounded by a brick wall, built by Charles I.

RICHMONDSHIRE, a district in the north riding of Yorkshire, formerly a county of itself. It abounds in romantic situations, and is noted for the industry of its inhabitants, who manufacture knit stockings and other coarse goods. Many lead mines are in this district, of which Richmond is the chief town.

RICHTENBURG, a town of Germany, in Anterior

Pomerania, 28 miles E.N.E. of Rostock. Long. 12. 50. E. Lat. 54. 10. N.

RICKMANSWORTH, a town in Hertfordshire, with a market on Saturdays, seated on the Coln, eight miles S.W. of St. Alban's, and 18 W.N.W. of London. Long. 0. 16. W. Lat. 51. 42. N.

RIDLEY (JAMES), the supposed author of the *Tales of the Genii*, under the feigned name of "Sir Charles Morell." This assumed title, with the addition of "formerly ambassador from the British settlements in India, to the great mogul," is annexed to the title pages of the volumes in question, and concurred with the rest of the fiction, viz. the assertion in the same page of the tales being translated from "a Persian MS." to impress the public mind with the idea of their being really of Eastern origin. The name of "Morell" perhaps occurred to the author as a proper name to designate the moral tendency of his writings; he that as it may, the fictitious appellations of Sir Charles Morell have too long usurped the laurels which belonged to our author.

This gentleman was the second son of the Rev. Dr. Gloucester Ridley, well known by his very masterly life of his ancestor, Bishop Ridley, the martyr, who suffered for his attachment to the reformed religion, in the reign of Mary. James Ridley was educated at Winchester school, under Dr. Barton; and, as it is related by a contemporary of Ridley's now living, he then, in his boyish days, shewed a great inclination and talents for theatrical exhibitions. He, at any time, willingly left the play-ground if he could persuade his companions to join him in acting the parts of some favourite dramatic writer. He was, at the usual time, elected fellow of New College, where he staid but a little time, for in the graduate book his name is not inserted; a proof that he did not take the degree generally conferred at the expiration of seven years. Ridley married when very young; and the chaplaincy of Romford was conferred on him by his father, to whom the titles of that parish were let by the New College. About this time, probably, his 25th year, he published his *Tales of the Genii*, but with what success is not apparent; for the *Monthly Review*, the only one which took notice of the publication, considered the volumes worthy only of the nursery; and ranked them with the frivolous productions of fairy tales, &c. This review appeared about the year 1763. So unjust a criticism, on a work of uncommon genius, could have arisen only from the haste or a total want of taste in the writer of that article, which is also unworthily placed in the *Monthly Catalogue*. Neither the *Biographia Britannica*, nor any other biographical publication, has mentioned (as the writer of this article believes) the name of the author of the *Tales of the Genii*. This omission seemed to call aloud for some notices of the author and his work; and the present attempt to bring both before the public in an advantageous light, claims the indulgence of the reader, from the willingness, rather than from the capacity to do justice to the talents of a man who contributed to sink into oblivion his own merits, by too great diffidence. Previous to his great work, Ridley, always ardent in the cause of virtue, determined to stem the torrent of those pernicious writings which endeavour to subvert sentimental feelings for the sound and sacred principles of religion and morality; a proceeding so perverse or so base, that the genius of Fielding or Rousseau can in no degree

* Where skim-milk, as in the country, may be had at 2s. a gallon, the price of this dinner would hardly exceed a halfpenny a head.

compensate for the badness of the design. In the life of James Lovegrove, Ridley portrays a young man without the advantages of personal beauty, but by the mere influence of good principles, aspiring to, and at length obtaining, a lady of beauty and fortune in marriage. Whilst other novelists exhibited their heroes in all the splendor of youth, elegance, wealth, and extraordinary graces, Ridley led his hero to honour and happiness, under the disadvantages of a very moderate share of health, wealth, or beauty; and he also differed essentially from his brother novelists, as Lovegrove was neither exquisitely handsome, nor infamously profligate. He thought with the great poet—

Virtue can see to do what virtue would,

By her own radiant light, &c.

Since the time of the immortal Spenser, the powers of allegorical instruction have never been so nobly and so beautifully exerted. The moral duties are enforced by the profoundest philosophy; and on their personifications all the ornaments of a very rich imagination are most profusely bestowed. The good Genii, according to the mythology of the East, assemble before their king, and, at his command, report by what exertions they rescued Virtue from persecution, supported her under temptations and dangers, and crowned her ardent enterprises with merited success, against the machination of their enemies, the evil Genii. The important lesson, that neither riches, honour, nor pleasure, lead to happiness, is set forth in the very entertaining and variegated History of the Talisman of Orosmandes, or of the Merchant of Abudah. The Adventures of Urad, or the Fair Wanderer, is an impressive and instructive lesson to every beautiful unprotected female. In the words of the author, "to guard the soft female heart from the delusions of the faithless, said Icaragem (the king of the Genii), is worthy of our race; and the sage Honadir (the good Genius and narrator of the tale) has wisely combined chastity and prudence in her delightful instructions: but female delicacy makes an unequal opposition to brutal cunning, unless the protection of the just one overshadow the footsteps of the virtuous maid. Wherefore, Alla is the first and chief supporter of the female sex, who will, assuredly, when requested, confound the vain artifices of man, and exalt the prudent counsels of the modest fair-one;" (end of the Tale of Urad, the Fair Wanderer). The above tales are taken by chance, from the rest, as a specimen of the useful subjects on which they treat, and to obviate any suspicions that they are formed for the meridian of the nursery. Spenser, sometimes, strives to produce very complicated allegories to set off circumstances and reflections of little value; but the author of the Tales of the Genii, has strictly followed the precept of Horace—

Nec Deus intersit nisi dignus Vincide nodus.

No *Genius* is employed to disturb the order of nature, but for some great moral purpose; nor his attributes ostentatiously displayed for the sake of exhibiting the writer's well-known faculty of imagination. In the Tale of the Enchanters, or Misnar, Sultan of India, those potent agents of magic power are described as leaving the divan, after the virtuous sultan had refused their wicked councils, with so much horrible and satanic majesty, that neither Milton, nor Spenser, nor Dante, nor Tasso, would have blushed to own these congenial efforts at ideal character.

A very delightful fiction is introduced in the Tale of Mirgilip, the Dervise of the Groves. The dervise shews his royal pupil his pleasure-grounds: the latter observing various seats disposed in very opposite situations of hill and dale, shade and sun-shine, enquires their purpose of erec-

tion. The dervise here describes his friends; and, in a charming allegorical strain, describes their manners, disposition, and acquisitions, by the peculiar situation and adjunct circumstances which distinguish one seat and situation from another. The names of the persons are anagrammatised thus—Pnesog Enepes, Joseph Spence, &c. The writer of this article apprehends that these valuable fictions are not sufficiently known to men of taste and knowledge. His fears are that the term *Tales of the Genii* may convey to many minds the same opinion of puerile fiction and grotesque imagery, which they appear to have excited in the judgment of the writer of the critique in the Monthly Review before alluded to. But the following sublime and interesting passage alone, that concludes these entertaining volumes, must be sufficient to rescue them from such a sentence. After the author closes his reign of fiction, and acknowledges the regions of his fancy are exhausted, he addresses the reader as follows:—

"Kind reader, the Genii are no more; and Horam, the phantom of my mind, speaks not again. Fiction himself, and fiction all he seemed to write; nor useless shall his life be deemed by those who blush at worse than pagan vices in enlightened climes. In friendly guise, these sheets were written to lead thee unto virtue; and the proud gaudy trappings of the East, with all its wild romantic monsters, have risen far above their usual sphere to serve the cause of moral truth. But then, perchance, you'll ask, what shall that truth avail, now all the beauteous wildness is no more, which was the spring and mover of this pagan virtue? The Genii all are fled, who watched attendant the virtuous mind, and crowned it with success; and the reward ceasing, the incentive to noble actions ceases with it. If, then, you will yet spare a few moments and listen to me, I trust you shall not long lament the loss of Horam and his friendly Genii; for were the foundations of morality laid only in phantom and imagination, persuasion would be so fruitless that every moral writer, dissatisfied with his ill success, might justly cast his works into the flames.

"Prepare, then, for a scene more worthy of your sight than human fancy could conceive. A scene tremendous, wonderful, and great; full of mercy and of truth; where heaven itself inclines to earth, and God becomes an offering to mankind. Behold the moral veil rent in twain, and from thick clouds of darkness the sun of righteousness arise!—Behold death nailed on the cross, and Mercy springing from the grave; redemption brought to man by a heavenly being far superior to angels or ministering spirits; and the voice of God declared to us by his son, whom he hath appointed heir of all things; by whom also he made the worlds; who being the brightness of his glory, and the express image of his person, and upholding all things by the word of his power, when he had by himself purged our sins on the cross, sat down on the right hand of the Majesty on high."

RIESBERG, a town of Westphalia, capital of a county of the same name; situate on the Ems, 12 miles N.N.W. of Paderborn. Long. 8. 50. E. Lat. 51. 55. N.

RIETI, a town of Italy, in the duchy of Spoleto, with a bishop's see; seated on the river Velino, near the lake Rieti, 27 miles S. by E. of Spoleto, and 37 N.E. of Rome. Long. 13. 5. E. Lat. 42. 23. N.

RIEUX, a town in France, in the department of Upper Garonne. Before the revolution of 1789, it was a bishop's see. It is seated on the Rise, 25 miles S.W. of Toulouse, and 83 W. of Narbonne. Long. 1. 17. E. Lat. 43. 16. N.

RIEZ, a town of France, in the department of the Lower Alps. Before the revolution of 1789, it was a

bishop's see. It is populous, though small, but was formerly much larger than at present. It is seated in a plain, abounding with good wine and excellent fruits, 35 miles N.E. of Aix, and 50 N.E. of Toulon. Long. 6. 22. E. Lat. 43. 51. N.

RIMMEGEN, a town of Westphalia, in the duchy of Juliers, seated on the Rhine, and remarkable for several Roman antiquities.

RINCOPING, or RINKIBISE, a town of Denmark, in North Jutland, seated on the west coast, 50 miles N. by W. of Ripen.

RINGLEEEN, a town of Upper Saxony, in the principality of Eisenach, six miles N. of Erfurt, and 26 E.N.E. of Eisenach. Long. 11. 25. E. Lat. 51. 5. N.

RINGSTED, an ancient town of Denmark, in the isle of Zealand, where the kings of Denmark formerly resided and were buried. It is 30 miles S.W. of Copenhagen. Long. 12. 10. E. Lat. 55. 28. N.

RINGWOOD, a town in Hampshire, with a market on Wednesday, and a considerable manufacture of worsted knit hose; seated on the Avon, 50 miles S.W. of Winchester, and 91 W. by S. of London. Long. 1. 41. W. Lat. 50. 49. N.

RINTLEN, or RINTELN, a town of Westphalia, in the county of Schawenburg, with an university. It is subject to the Landgrave of Hesse-Cassel, and seated on the Weser, 15 miles S.E. of Minden, and 35 S.W. of Hanover. Long. 9. 20. E. Lat. 52. 13. N.

RIO-DE-LA-HACHA, a small province of Terra-Firma, in the form of a peninsula, between the gulf of Venezuela on the east, and a bay of the Caribbean Sea on the west. Rio-de-la-Hacha, the capital, is seated at the mouth of a river of the same name, 100 miles E. of St. Martha. Long. 72. 54. W. Lat. 11. 30. N.

RIO-DE-LA-MADALENA, a river in Terra-Firma, which rises in the mountains north of Popayan, and running north, falls into the Caribbean Sea, between Carthagena and St. Martha. It is also called Rio Grande.

RIO-DE-LA-PLATA. See PLATA.

RIO-DE-MIRANDA, a river of Spain, which rises in the mountains of Austrias, and separating that city from Galicia, enters the bay of Biscay at Rivadeo.

RIO-GRANDE, a river of Africa, which runs from east to west through Negroland, and falls into the Atlantic Ocean, 11° N. latitude.

RIONS, a town of France, in the department of Girondet, seated on the Garonne, 18 miles S.E. of Bourdeaux.

RIPA TRANSONE, a populous and strong town of Italy, in the marquise of Ancona, with a bishop's see, five miles W. of the gulf of Venice, and eight S. of Fermo. Long. 13. 50. E. Lat. 42. 59. N.

RIPLEY, a town in the west riding of Yorkshire, with a market on Monday, seated on the Nyd, 23 miles W.N.W. of York, and 221 N. by W. of London. Long. 1. 50. W. Lat. 54. 4. N.

RIPPON, an ancient borough in the west riding of Yorkshire, with a market on Thursday. In its neighbourhood is the celebrated park of Studley, including the venerable remains of Fountain's Abbey. Rippon was once famous for its religious houses, and has now a collegiate church, adorned with three lofty spires. It is noted for its manufacture of hardwares, particularly spurs, and the market-place is one of the finest squares of the kind in England. It is governed by a mayor, sends two members to parliament, and is seated on the Ure, 28 miles N.W. of York, and 218 N.N.W. of London. Long. 1. 29. W. Lat. 54. 11. N.

RIQUIER, an ancient town of France, in the department of Somme, seated on the Cardon, five miles N. of Abbeville, and 95 N. of Paris. Long. 1. 59. E. Lat. 50. 10. N.

RISBOROUGH, a town in Buckinghamshire, with a market on Saturday, 20 miles S. of Aylesbury, and 37 W.N.W. of London. Long. 0. 42. W. Lat. 51. 40. N.

RITBERG, a town of Westphalia, capital of a county of the same name, with a castle seated on the Ems, 12 miles N.W. of Paderborn. Long. 8. 42. E. Lat. 51. 52. N.

RIVA, a strong town of Germany, in the bishopric of Trent. It was taken by the French in 1703, but soon abandoned. It is seated at the mouth of a small river, on the lake Garda, 17 miles S.W. of Trent. Long. 11. 7. W. Lat. 46. 4. N.

RIVADAVIA, a town of Spain, in Galicia, seated at the confluence of the Minho and Avia, in a territory that produces the best wine in Spain, 15 miles W.S.W. of Orense. Long. 7. 55. W. Lat. 42. 13. N.

RIVADEO, a sea-port of Spain, in Galicia, seated on a rock, at the mouth of the Rio-de-Miranda, 45 miles N.N.E. of Lugo. Long. 6. 47. W. Lat. 43. 33. N.

RIVALLO, a town of Naples, in Terra di Lavoro, seated on a mountain, 20 miles from Naples.

RIVALLO, a town of Piedmont, situate on the Sangone, six miles S.W. of Turin, and 19 E.S.E. of Susa.

RIVALTA, a town of Italy, in the duchy of Milan, situate on the Adda, 15 miles E. of Milan.

RIVAROLO, a town of Piedmont, situate on the Orio, 15 miles N. of Turin, and 12 N.W. of Carmagnola.

RIVESALTES, a town of France, in the department of eastern Pyrenes, famous for fine wine. It is seated on the Egly, eight miles N. of Perpignan.

RIVOLI, a town of Piedmont, with a magnificent castle, nine miles W. of Turin. Long. 7. 32. E. Lat. 45. 4. N.

RIVOLO, a town of Italy, in the Veronese, seated on the lake Garda, 20 miles N.W. of Verona. Long. 11. 1. N. Lat. 45. 34. N.

ROA, a strong town of Spain, in Old Castile, with a citadel, seated on the Douero, in a country fertile in corn and wine, 10 miles S.W. of Aranda, and 70 N. of Madrid. Long. 3. 22. W. Lat. 41. 35. N.

ROAD-HARROW (*Encycl.*). Roads being frequently disfigured, and otherwise injured, by the deep ruts which are necessarily made by the continual passing and re-passing of narrow-wheel carriages, various machines have been contrived, with a view to facilitate the repairing of highways, and to fill up such excavations. From these, we shall first communicate the *Road-Harrow*, invented by Mr. Harriott, to whom the Society for the Encouragement of Arts, &c. in 1789, voted a reward of ten guineas. As this machine may not only be employed with great advantage by the surveyors of public roads, but will also be found very serviceable in repairing and improving the private ways, or avenues, belonging to manors, we have given a representation in 2d pl. 43.

The model, from which the figure was taken, is on the scale of two inches to one foot; so that the head of the harrow is three feet wide from one side of the bar to the other externally. These bars are four inches square, five feet long, and, to prevent them from being split, they are contrived lengthwise, instead of being in a transverse direction. The mould-boards are four feet two inches in length, ten inches in depth, and two in thickness: they extend eleven inches beyond the bars, in order that the stones (which are brought to the surface by the teeth of

the harrow) may be drawn into a smaller compass. These mould-boards are, further, shod with an iron bar, and lined with a plate of the same metal, to the height of the spot where they are marked black, in the engraved figure; and such parts of the delineation as are represented of a deeper colour, distinguish the iron from the wood-work. The teeth are one foot in length from the inferior side of the bars to their points, which ought to be steeled; they are $1\frac{1}{2}$ inch square, and are fixed by means of strong nuts and screws, with collars both on the upper and lower side of such bars.

Mr. Harriott's road-harrow is drawn by two horses abreast: the outside animal is led by a boy on that quarter; while the other horse walks in the proper path, and a man keeps the harrow steady by the handles; consequently they take one inside and one outside quarter in their progress, and the remainder two quarters in their return.

By this excellent machine, a man, boy, and two horses, may with ease repair three miles in length in one day; harrowing down the quarters, and drawing the stones together, which are dropped into the ruts, by means of the mould-boards, in a more effectual manner than if they were stubbed in by a man. Lastly, the work is performed not only more expeditiously, but also at one tenth part of the expence incurred, when the roads are repaired by manual labour.

In the 8th volume of the *Repertory of Arts, &c.* we meet with an account of a contrivance for preventing the wheels of carriages from making ruts in roads, by Robert Beatson, esq. This object is effected by fixing between the other wheels a *protector*, or small roller, or broad wheel: the circumference of its upper part should be about $1\frac{1}{2}$ inch beneath the axletree, while the lower one ought to be at a similar distance from the ground. Such roller must be secured to the axletree, so as to be able to support the whole weight of the carriage, in case the principal wheels descend into any deep ruts. The size of the protector varies according to the proportions of these wheels; but Mr. B. observes, that two feet in diameter will be sufficient for single carts; and that double carriages, or waggons, will require it to be rather larger and broader. By thus elevating the roller a little distance above the lower surface of the wheels, the latter will, on good roads, support the weight of the load; and, if the middle or horse-path be firm, they cannot sink into old, or form any new, ruts; because the protector will roll in the middle, and thus afford an easier draught to the cattle. The additional weight of the machine, if it be properly constructed, Mr. Beatson conceives, will be inconsiderable; when compared with the utility of such contrivance, and the great reduction in the expence both of making and of repairing roads. A more comprehensive account of this invention the reader will find in the work above cited.

ROANNE, a populous and commercial town of France, in the department of Rhone and Loire, seated on the Loire, where it begins to be navigable for barks. Hence the merchandise of Lyons, Marseilles, and the Levant, is conveyed down the Loire, and by the canal of Braire, into the Seine, and thence to Paris. Roanne is 50 miles N.E. of Clermont, and 210 S.E. of Paris. Long. 4. 12. E. Lat. 46. 13. N.

ROASTER, a most ingenious kind of oven, lately invented by Count Rumford, by means of which the culinary process of roasting meat is effected in the most complete way, and with the least possible consumption of fuel. Under the article *OVEN*, in this supplement, we have described, from Part II. of the Count's 10th Essay,

an invention little inferior to this as a *roaster*, and more desirable in small families, since it also answers the purpose of *broiling* at the same time.

Count Rumford gives the following account of the *roaster*, and of the principles on which it is constructed: "When I first set about to contrive this machine," says he, "meditating on the nature of the mechanical and chemical operations that take place in the culinary process in question, it appeared to me that there could not possibly be any thing more necessary to the roasting of meat than heat, in certain degrees of intensity, accompanied by certain degrees of dryness; and I thought, if matters could be so arranged, by means of simple mechanical contrivances, that the cock should be enabled, not only to regulate the degrees of heat at pleasure, but also to combine any given degree of heat with any degree of moisture or of dryness required; this would unquestionably put it in her power to perform every process of roasting in the highest possible perfection.

"The means I used for attaining these ends, will appear by the following description of the machinery I caused to be constructed for that purpose.

"The most essential part of this machinery, which I shall call the body of the roaster (see 2d pl. 43. fig. 1), is a hollow cylinder of sheet-iron, which, for a roaster of a moderate size, may be made about 18 inches in diameter, and 24 inches long; closed at one end, and set in an horizontal position in a mass of brick-work, in such a manner that the flame of a small fire, which is made in a closed fire-place directly under it, may play all round it, and heat it equally and expeditiously. The open end of this cylinder, which should be even with the front of the brick-work in which it is set, is closed either with a double door of sheet-iron, or with a single door of sheet-iron covered on the outside with a panel of wood; and in the cylinder there is an horizontal shelf, made of a flat plate of sheet-iron, which is supported on ledges rivetted to the inside of the cylinder, on each side of it. This shelf is situated about three inches below the centre or level of the axis of the body of the roaster, and it serves as a support for a dripping-pan, in which, or rather over which, the meat to be roasted is placed.

"This dripping-pan, which is made of sheet-iron, is about two inches deep, 16 inches wide above, $15\frac{1}{2}$ inches in width below, and 22 inches long; and it is placed on four short feet, or, what is better, on two long sliders, bent upwards at their two extremities, and fastened to the ends of the dripping-pan, forming, together with the dripping-pan, a kind of sledge; the bottom of the dripping-pan being raised by these means about an inch above the horizontal shelf on which it is supported.

"In order that the dripping-pan on being pushed into or drawn out of the roaster may be made to preserve its direction, two straight grooves are made in the shelf on which it is supported, which, receiving the sliders of the dripping pan, prevent it from slipping about from side to side, and striking against the sides of the roaster. The front ends of these grooves are seen in fig. 1, as are also the front ends of the sliders of the dripping-pan, and one of its handles.

"In the dripping-pan, a gridiron (seen in fig. 1) is placed, the horizontal bars of which are on a level with the sides or brim of the dripping-pan, and on this gridiron the meat to be roasted is laid; care being taken that there be always a sufficient quantity of water in the dripping-pan to cover the whole of its bottom to the height of at least half or three quarters of an inch.

" This water is essential to the success of the process of roasting: it is designed for receiving the drippings from the meat, and preventing their falling on the heated bottom of the dripping-pan, where they would be evaporated, and their oily parts burnt or volatilized, filling the roaster with ill-scented vapours, which would spoil the meat, by giving it a disagreeable taste and smell.

" It was with a view more effectually to defend the bottom of the dripping-pan from the fire, and prevent as much as possible the evaporation of the water it contains, that the dripping pan was raised on feet or sliders, instead of being merely set down on its bottom on the shelf which supports it in the roaster.

" A late improvement has been made in the arrangement of the dripping-pan, by an ingenious workman at Norwich, Mr. Frost, who has been employed in putting up roasters in that part of the country: an invention which I think will, in many cases, if not in all, be found very useful. Having put a certain quantity of water into the principal dripping-pan, which is constructed of sheet-iron, he places a second, shallower, made of tin, and standing on four short feet, into the first, and then places the gridiron which is to support the meat in this second dripping-pan. As the water in the first keeps the second cool, there is no necessity for putting water into this; and the drippings of the meat may, without danger, be suffered to fall in it, and to remain there unmixed with water. When Yorkshire puddings, or potatoes, are cooked under roasting meat, this arrangement will be found very convenient.

" In constructing the dripping-pans, and fitting them to each other, care must be taken that the second do not touch the first, except by the ends of its feet; and especially that the bottom of the second (which may be made dishing) do not touch the bottom of the first. The lengths and widths of the two dripping-pans above, or at their brims, may be equal, and the brim of the second may stand about half an inch above the level of the brim of the first. The horizontal level of the upper surface of the gridiron should not be lower than the level of the brim of the second dripping-pan; and the meat should be so placed on the gridiron that the drippings from it cannot fail to fall into the dripping-pan, and never upon the hot bottom or sides of the roaster.

" To carry off the steam which arises from the water in the dripping-pan, and that which escapes from the meat in roasting, there is a steam tube belonging to the roaster, which is situated at the upper part of the roaster, commonly a little on one side, and near the front of it, to which tube there is a damper, which is so contrived as to be easily regulated without opening the door of the roaster. This steam-tube is distinctly seen in fig. 1; and the end of the handle by which its damper is moved, may be seen in fig. 2.

" The heat of the roaster is regulated at pleasure, and to the greatest nicety, by means of the register in the ash-pit door of its fire-place (seen in fig. 2.) and by the damper in the canal, by which the smoke goes off into the chimney; which damper is not represented in any of the figures.

" The dryness in the roaster is regulated by the damper of the steam-tube, and also by means of a very essential part of the apparatus—the blow pipes—which still remain to be described. They are distinctly represented in the figs. 1, 2, and 3.

" These blow-pipes, which lie immediately under the roaster, are two tubes of iron, about 2½ inches in diameter, and 23 inches long, or about one inch shorter than the roaster; which tubes, by means of elbows at their

further ends, are firmly fixed to the bottom of the roaster, and communicate with the inside of it. The higher ends of these tubes come through the brick-work, and are seen in front of the roaster, being even with its face.

" These blow-pipes have stoppers, by which they are accurately closed: but when the meat is to be browned, these stoppers are removed, or drawn out a little, and the damper in the steam-tube of the roaster being at the same time opened, a strong current of hot air presses in through the tubes into the roaster, and through the roaster into and through the steam-tube, carrying and driving away all the moist air and vapour out of the roaster.

" As these blow-pipes are situated immediately below the roaster, and just over the fire, and are surrounded on every side by the flame of the burning fuel (see fig. 3), they are much exposed to the heat; and when the fire is made to burn briskly, which should always be done when the meat is to be browned, they will be heated red hot, consequently the air which passes through them into the roaster will be much heated; and this hot wind, which blows over the meat, will suddenly heat and dry its surface in every part, and give it that appearance and taste which are peculiar to meat that is well roasted.

" When these roasters were first proposed, and before their merit was established, many doubts were entertained respecting the taste of the food prepared in them. As the meat was shut up in a confined space, which has much the appearance of an oven, it was natural enough to suspect that it would be rather baked than roasted; but all those who have tried the experiment have found that this is by no means the case. The meat is roasted, and not baked; and however bold the assertion may appear, I will venture to affirm, that meat of every kind, without any exception, roasted in a roaster, is better tasted—higher flavoured—and much more juicy and delicate, than when roasted on a spit before an open fire.

" In enumerating the excellences of this new implement of cookery, there is one of indisputable importance, which ought not to be omitted. When meat is roasted in this machine, its quantity, determined by weight, is considerably greater than if it were roasted upon a spit before a fire. To ascertain this fact, two legs of mutton, taken from the same carcase, and made perfectly equal in weight before they were cooked, were roasted on the same day, the one in a roaster, the other on a spit before the fire; and, to prevent all deception, the persons employed in roasting them were not informed of the principal design of the experiment. When these pieces of roasted meat came from the fire, they were carefully weighed; when it appeared, that the piece which had been roasted in the roaster was heavier than the other, by a difference which was equal to six per cent, or six pounds in an hundred. But this even is not all; nor is it indeed the most important result of the experiment. These two legs of mutton were brought upon table at the same time, and a large and perfectly unprejudiced company was assembled to eat them. They were both declared to be very good; but a decided preference was unanimously given to that which had been roasted in the roaster; it was much more juicy, and was thought better tasted. They were both fairly eaten up; nothing remaining of either of them that was eatable. Their fragments, which had been carefully preserved, being now collected and placed in their separate dishes; it was a comparison of these fragments which afforded the most striking proof of the relative merit of these two methods of roasting meat, in respect to the economy of food. Of the leg of mutton which had been roasted in the roaster,

Front view of the Roaster and Fire Place.

Fig. 3.

M^r. Harriott's Road-Harrow.

hardly any thing visible remained except the bare bone ; while a considerable heap was formed of scraps not eatable, which remained of that roasted on a spit."

"I believe," adds the Count, "I may venture to say, that the result of this experiment is deserving of the most serious attention, especially in this country, where so much roasted meat is eaten, and where the economy of food is every day growing to be more and more an object of public concern."

We must refer our readers to Count Rumford's Essay for directions respecting the management of this valuable invention, and for various other important particulars relating to it. Many persons of rank have been induced to prefer them in their kitchens ; and they may be inspected at the Royal Institution in London.

Description of the figures in the plate.—Fig. 1. Represents the iron roaster with its materials complete ; *a* is the body of the roaster, of cast-iron ; *b* the hollow door, formed of two circular pieces of plate-iron ; *c* a pipe of sheet-iron for carrying off the steam from the meat, having a small register at *g* ; *d d* two cast-iron blow-pipes, which being placed within the fire-place, transmit *hot air*, when the stopper is drawn forth, for the purpose of *browning* the meat ; *e* the dripping pan, placed on a horizontal shelf, and containing a trivet on which the meat is to be placed ; *f f* the two turn-buckles which fasten the door, seen more distinctly in fig. 2 ; *g* a small wire handle which turns the register within the steam-pipe *c* ; *h* a square frame of iron, through which a small twisted-wire brush may be introduced to sweep the soot, when necessary, from the top and sides of the roaster. The same letters refer to the same parts in the other figures.

Fig. 2. Shews the roaster set in brick-work, with its closed fire-place ; *i* is the double door of sheet iron, more distinctly shewn at *i* ; *m*, in fig. 3 ; *k* the ash-pit door with its register *l*.

Fig. 3. Is a section of the roaster, fire-place, and brick-work ; *n* is the inner plate of the fire-place door ; *a* the grate on which the burning fuel *B* rests above the ash-pit ; *A C D* the open space which surrounds and passes behind the roaster from the fire-place beneath ; *E F* the passages by which the smoke escapes ; *G* shews the inside of the roaster which contains a piece of meat, *o*, supposed to be roasting.

ROBBEN ISLAND, sometimes called Penguin Island, a barren sandy island, near the Cape of Good Hope. Long. 18. 22. E. Lat. 33. 50. S.

ROBIL, a town of Lower Saxony, in the duchy of Mecklenburg, seated on the river Muretz.

ROCAMADOUR, a town of France, in the department of Lot, 23 miles N. of Cahors. Long. 1. 32. E. Lat. 44. 48. N.

ROCCA-D'ANFO, a strong town of Italy, in the Bresciano, seated on the lake Idro, 25 miles S.E. of Trent. Long. 11. 40. E. Lat. 45. 50. N.

ROCCA-ANNONE, and Rocca-d'ABBAZZE, two forts of Italy, in Montferrat, each of which is seated on a mountain, in the road from Asti to Alexandria.

ROCELLA, a town of Naples, in Calabria Ulteriore, near which is a celebrated coral fishery, 10 miles N.E. of Geirace. Long. 16. 47. E. Lat. 38. 20. N.

ROCHE, a town of Switzerland, subject to the canton of Bern, which has here a director of the salt works. Roche is celebrated for the residence of the celebrated Haller, who filled that office from 1758 to 1766.

ROCHE, or ROCHE-EN-ARDENNES, a town of the Netherlands, in the duchy of Luxemburg, with a strong

castle, seated on a rock, near the river Ourte, 22 miles S. of Liege, and 32 N.W. of Luxemburg. Long. 5. 40. E. Lat. 50. 15. N.

ROCHE BERNARD, a town of France, in the department of Morbihan, seated on the river Vilaine, 23 miles E. of Vannes.

ROCHE CHOUART, a town of France, in the department of Upper Vienne, with a castle on the top of a mountain, on the declivity of which the town is seated, near a small river that falls into the Vienne, 60 miles S. by E. of Poitiers, and 189 S. by W. of Paris. Long. 0. 53. E. Lat. 45. 46. N.

ROCHE MACHERAN, a town of the Netherlands, in the duchy of Luxemburg, with a strong castle, 15 miles N.E. of Luxemburg. Long. 6. 25. E. Lat. 49. 46. N.

ROCHE-POSAY, a town of France, in the department of Indre and Loire, remarkable for its mineral waters. It is seated on the Creuse, 25 miles S. of Roche. Long. 0. 50. E. Lat. 45. 46. N.

ROCHE-SUR-YON, a town of France, in the department of Vendee, seated near the Yon, 20 miles N.W. of Luçon, and 202 S.W. of Paris. Long. 1. 31. W. Lat. 46. 40. N.

ROCHEFORT, a town of the Netherlands, in the duchy of Luxemburg, with a castle, said to have been built by the Romans. Here the celebrated general La Fayette was seized and made prisoner by the Austrians. It is surrounded by rocks, 15 miles S.E. of Diant, and 50 N.W. of Luxemburg. Long. 5. 10. E. Lat. 50. 12. N.

ROCHEFORT, a town of France, in the department of Morbihan, 17 miles E. of Vannes, and 40 S.W. of Rennes. Long. 2. 26. W. Lat. 47. 42. N.

ROCHEFOUCAULT, a town of France, in the department of Charente, with a castle. It is seated on the Tardouere, 12 miles N.W. of Angoulême, and 208 S. by W. of Paris. Long. 0. 29. E. Lat. 45. 46. N.

ROCHESTER, a village in Northumberland, on the Watling-street, N.W. of Otterburn, and near the source of the Read. It has some Roman altars, inscriptions, and other antiquities.

ROCHETTA, a town of Italy, in the county of Nice, 16 miles N.E. of Nice. Long. 7. 33. E. Lat. 43. 52. N.

ROCHILZ, a town of Upper Saxony, in the territory of Leipsic, with a castle, copper-mines, and a handsome bridge over the Muldaw, 24 miles S.E. of Leipsic, and 36 W. of Dresden. Long. 12. 46. E. Lat. 51. 10. N.

ROCKBRIDGE, a county in the state of Virginia, between the Allegany Mountains and the Blue Ridge, which receives its name from a curious natural bridge. See CEDAR CREEK.

ROCKINGHAUSEN, a town of Germany, in the palatinate of the Rhine, 26 miles W. of Worms.

ROCKISAW, a town of Bohemia, in the circle of Pilsen, 11 miles E. of Pilsen.

ROCOUX, a village of the Netherlands, near Liege, remarkable for a victory gained by the French over the allies in the year 1746.

ROCROY, a town of France, in the department of Ardennes, seated in a plain surrounded by forests. It is celebrated for the victory which the Prince of Condé, then Duke of Enghien, gained over the Spaniards, in 1643. It is 26 miles N. of Rethel. Long. 4. 27. E. Lat. 49. 56. N.

RODACH, a town of Upper Saxony, in the principality of Coburg, situate on a river of the same name, six miles W.N.W. of Coburg.

RODESTO, *RODOSTO*, or *RUPISTO*, a populous seaport of Turkey in Europe, in Romania, with a Greek

bishop's see. It is seated on the side of a hill, on the sea of Marmora, 62 miles S.W. of Constantinople. Long. 27. 37. E. Lat. 41. 1. N.

RODEZ, an ancient town of France, in the department of Aveyron. Here are four great annual fairs, where mules are sold for Spain; and some manufactures of grey cloths and surges. It is a bishop's see; and the steeple of the cathedral, remarkable for its height, is much admired for its architecture. It is seated in the midst of mountains, on a hill, at the foot of which flows the rapid Aveyron, 30 miles W. by S. of Mende. Long. 2. 39. E. Lat. 44. 21. N.

RODOK, a town of Hindoostan Proper, in the province of Delhi, 50 miles E. of Hissar, and 60 W.N.W. of Delhi. Long. 75. 30. E. Lat. 29. 10. N.

ROER, a river of Westphalia, which rises in the duchy of Juliers, passes by the town of that name, and falls into the Maese above Runemonde.

ROER, a river of Germany, which rises in the circle of Upper Rhine, waters Arensburg, and falls into the Rhine below Duisburg.

ROKUX, a town of the Netherlands, in the Austrian Hainault, eight miles N.E. of Mons. Long. 4. 12. E. Lat. 50. 31. N.

ROGLIANO, a town of Naples, in Calabria Citeriore, nine miles S.S.E. of Cosenza. Long. 16. 23. E. Lat. 39. 15. N.

ROGONATPOUR, a town of Hindoostan Proper, in the country of Bengal, 106 miles S.W. of Moorshebad, and 108 N.W. of Calcutta.

ROHACZOW, a town of Lithuania, capital of a district of the same name; seated at the confluence of the Dnieper and Ordrwa, 37 miles N.W. of Rzezcica, and 158 N. of Kiof. Long. 30. 40. E. Lat. 53. 2. N.

ROHAN, a town of France, in the department of Morbihan, seated on the Aoust, 20 miles N. of Vannes. Long. 2. 42. W. Lat. 48. 0. N.

ROHILCUND, or ROHILLA, a territory of Hindoostan Proper, whose inhabitants are called Rohillas. It lies to the N. of Delhi, and is subject to the nabob of Oude, by whom it was conquered in 1774. Bereilly is the capital.

ROLDUC, a town of the Netherlands, in the duchy of Limburg, capital of a territory of the same name, with a castle, seven miles N. of Aix-la-Chapelle. Long. 6. 6. E. Lat. 50. 55. N.

ROLLRICH STONES, in Oxfordshire, N. of Stanton Harcourt, six miles W. of Oxford. It is a circle of stones standing upright, which the vulgar have a notion were men petrified. Antiquaries disagree with respect to the origin and intention of this ancient monument.

ROM, or ROEM, an island of Denmark, on the E. coast of South Jutland. It is five miles in length, and half as much in breadth, and contains a few villages.

ROMAIN-MOTIER, a town of Switzerland, in Pays de Vaud, capital of a bailiwick, with a castle. It is seated at the foot of a mountain, in a narrow valley, through which flows the river Diaz.

ROMANO, a strong and populous sown of Italy, in Bergamosco. It carries on a great trade in corn, and is seated on a river that runs between the Oglio and Serio.

ROMANS, an ancient town of France, in the department of Drome, seated in a fine plain, on the river Isere, 22 miles S.W. of Grenoble, and 30 S. of Vienne. Long. 5. 12. E. Lat. 45. 2. N.

ROMELIA, the general name given by the Turks to their European dominions.

ROMENAY, a town of France, in the department of Saone and Loire, eight miles S.E. of Tournus, and 15 N.N.E. of Macon. Long. 5. 5. E. Lat. 46. 30. N.

ROMERSTADT, a town of Moravia, in the neighbourhood of which are some iron mines. It is 20 miles N.N.E. of Olmutz. Long. 17. 45. E. Lat. 52. 20. N.

ROMHILDEN, a town of Franconia, with a castle. It belongs to the Duke of Saxe Altenburg.

ROMNA, a town of Russia, in the government of Tchernigof, 28 miles S.S.E. of Tchernigof. Long. 33. 24. E. Lat. 50. 36. N.

ROMONT, or ROPMONT, a strong town of Switzerland, in the canton of Friburg, seated on a mountain, 10 miles from Friburg, and 12 from Bern. Long. 7. 1. E. Lat. 46. 50. N.

ROMSDAL, a town of Norway, capital of a provostship, in the diocese of Dronthheim, 100 miles S.S.W. of Dronthheim. Long. 7. 54. E. Lat. 63. 28. N.

RONCEVALLOS, a town of Spain, in Navarre, situate in a valley to which it gives name, 14 miles N.N.E. of Pampluna. Long. 1. 25. W. Lat. 42. 54. N.

RONDA, a strong town of Spain, in Grenada, with a castle. It was taken from the Moors in 1485, and is seated on a craggy rock near the Rio Verde, 20 miles N.W. of Gibraltar, and 62. S.E. of Seville. Long. 5. 12. W. Lat. 36. 40. N.

RONNEBURG, a town of Upper Saxony, in the principality of Altenburg, 12 miles S.W. of Altenburg, and 60 W. of Dresden. Long. 12. 7. E. Lat. 50. 48. N.

ROOM (*Encycl.*). In June, 1801, a patent was granted to Mr. Winter, of Shacklewell, in Middlesex, for a kind of paper manufacture for covering the floors of rooms, for packing goods, and various other purposes.

"*First*," says the patentee, "I procure from the tanners' yards the waste tan or bark, after it has been used for the purposes of tanning. This I cause to be well washed, and freed from dirt; and the fibrous parts picked and separated from those which are more brittle. The tan or bark so prepared I cause to be boiled for a considerable time until the fibres are so softened as readily to separate, and be bruised. I then bruise this softened tan or bark, either by passing it through large iron or wooden rollers, after the manner of flattening mills, except that the rollers are placed by the side of each other in a horizontal position, in order to their being fed, instead of being placed one above the other; or by large wooden stampers or mallets, shod with iron. When it has been thus bruised, I cause it to be again well washed in large sieves, through which pass the remaining brittle particles, and leave the fibres fit for use.

"*Secondly*, I procure, from the different manufacturers of leather, the shreds, or scrapings, or parings of leather, of any description, which are the refuse of sweepings of their shops or warehouses; which pieces of leather I cause to undergo the same operations of picking, washing, and bruising, as before mentioned, with respect to the tan or bark, until it becomes a pulp; but I do not wash it again after it is reduced into that state.

"*Thirdly*, I procure the short hair of animals, of any description, which I cause to be also well washed, and (when it is dry) separated by being beaten with sticks, so that it may the more completely interweave and unite with the other before-mentioned ingredients of the fibres of the tan or bark, and pulp of the leather.

"My principal ingredients being so prepared, I take a proportionate quantity of each, accordingly as I want my

manufacture to be firm or flexible, fit to be used in the sheathing of ships, covering of floors, for button-boards, or the common packages of merchandize, but generally in the proportion of one hundred weight of the fibres of the tan or bark to half a hundred weight of the pulp of the leather, and one quarter of a hundred weight of the hair; the whole of which I cause to be well mixed together, adding thereto, and straining, as equally as possible, amongst the whole mass, a small quantity (that is, in the proportion of five pounds to one hundred weight of the principal mixture) of refuse tow or wadding, or the sweepings or refuse of wool-chambers, previously cut short and separated. This mixture is then beaten altogether with hammers or stampers, in large mortars, and a little water added to it, as occasion may require, to keep, as much as possible, any particular ingredient from adhering together. After being thus beaten, until the ingredients are fully blended and intermixed, the whole is conveyed into receivers or vats; and warm water (previously made a little glutinous by boiling in it a few pounds of the pieces of pelts or skins from which glue is made, or of the glue itself, in quantity accordingly as I want my water to be of a stronger or weaker gluten, but generally in the proportion of four pounds of the skins, or two pounds of glue, to ten gallons of water, skimming off the fat which arises on the boiling of the pieces of pelts) added by degrees, the whole of the mass being kept constantly stirred until the particles float in the water. In this state it is moulded in frames, similar to those commonly used in the manufacture of paper; from which frames it is turned out and pressed between flannels, till the water has drained from it; and, when nearly dry, it is taken from the flannels, and again put into a press without the flannels; whence it is taken out, and hung up to dry: when dried, it is fit for use."

ROOT-STEAMER, an useful machine, employed in America, for steaming potatoes, carrots, and other roots; with the view of feeding cattle; and which, for the simplicity of its contrivance, and the facility with which vegetables may be thus prepared, deserves to be more generally known in Britain. We have therefore given a representation of it in Pl. 45.

The apparatus there delineated, consists of a brick-stove, in which a pot or kettle is fixed: over this boiler is placed a hogshhead or cask, the top of which is open (we believe it might with more advantage be covered with a wooden lid); while the bottom is drilled with numerous holes, about one inch in diameter; so that the steam may freely pass through the roots. In this vessel, the potatoes, &c. after being washed, are deposited; and, when sufficiently steamed, they afford a more invigorating and fattening food for cattle, than in a raw state.

A root-steamer on an improved construction is sold by the Rev. Mr. Cook, the inventor of the drill machine. This is so contrived as to be easily lifted off the boiler by means of a compound lever, and the roots discharged in an instant by withdrawing a pin which keeps the perforated bottom of the cask in its place.

ROQUE, St. a large village of Spain, in Andalusia, at the entrance of the Isthmus which separates Gibraltar from the continent. It is seated on the top of a hill, overlooking the bay, and has several batteries, and a fort at each end, to defend the lines which run across the isthmus.

ROQUE DE MARSAN, a town of France, in the department of Landes, seated on the Douese, 10 miles N.E. of Monte de Marsan.

ROQUEBRUNE, a town of Italy, in the principality

of Monaco, with a castle, seated near the sea, three miles from Monaco.

ROQUEMAURE, a town of France, in the department of Gard, seated on a craggy rock, near the Rhone, 22 miles N.E. of Nismes. Long. 4. 48. E. Lat. 44. 2. N.

ROQUETAS, a town of Spain, in Granada, on the coast of the Mediterranean, 10 miles S.W. of Almeria, and 52 S.E. of Granada. Long. 2. 3. W. Lat. 55. 51. N.

ROSANA, a town of Lithuania, in the palatinate of Novogrodec, seated near the Zolva, 20 miles S.W. of Novogrodec. Long. 25. 45. E. Lat. 55. 30. N.

RÖSCHAD, a commercial town of Switzerland, in a bailiwick of the abbey of St. Gallen, with a castle on a mountain. It is seated on the lake of Constance.

ROSES, a sea-port of Spain, in Catalonia, with a citadel, seated on the bay of Roses, in the Mediterranean, 15 miles N.E. of Girona. It was taken by the French in 1693, and in 1795. Long. 3. 1. E. Lat. 42. 16. N.

ROSES, OTTAR OF (*Encycl.*). The Royal Society of Edinburgh received from Dr. D. Monro the following account of the manner in which that costly perfume is prepared in the East. It was given him by a gentleman who had actually assisted in making it. A large quantity of the petals of the rose, freed from every extraneous matter, are steeped in pure water, in an earthen or wooden vessel, which is exposed daily to the sun, and housed at night, till a scum rises to the surface. This scum, which is the *ottar*, is carefully absorbed by a very small bit of cotton tied to the end of a stick. The oil, as it is collected, is squeezed out of the cotton into a very diminutive vial, and stopped for use. The collection of it should be continued from time to time whilst any scum is produced.

ROSHAAN, a country of Asia, lying to the W. of the kingdom of Burmah, to which it is subject.

ROSIENNE, a town of Samogitia, seated on the Dubisse, 70 miles S. of Mittau, and 188 N.E. of Warsaw. Long. 23. 45. E. Lat. 55. 30. N.

ROSOY, a town of France, in the department of Seine and Marne, with a magnificent castle, 15 miles S. of Meaux. Long. 2. 59. E. Lat. 48. 40. N.

ROSS, a sea-port of Ireland, in the county of Cork. It is united to Cork as an episcopal see, and is seated on a bay of the Atlantic, 20 miles S.W. of Kinsdale. Long. 8. 58. W. Lat. 51. 32. E.

Ross, New, a sea-port of Ireland, in Wexford, situate on the Barrow, which is navigable for large vessels up to the quay. The town has a considerable trade, and exports a great quantity of butter and beef. It is 11 miles N.E. of Waterford, and 17 W. of Wexford. Long. 6. 58. W. Lat. 51. 22. N.

ROTA, a town and castle of Spain, in Andalusia, at the entrance of the bay of Cadiz, seven miles N. of Cadiz. Long. 6. 16. W. Lat. 36. 35. N.

ROTA, an island of Asia, one of the principal of the Ladrones.

ROTAS, a town of Hindoostan Proper, in the country of Bahar, 65 miles S.E. of Benares, and 85 S.W. of Patna. Long. 83. 50. E. Lat. 24. 50. N.

ROTENBERG, a town of Germany, in Bavaria, the capital of a lordship of the same name, 12 miles N.E. of Nuremberg, and 46 N.W. of Ratisbon. Long. 11. 20. E. Lat. 49. 35. N.

ROTENBERG, a town of Switzerland, in the canton of Lucern, four miles N. of Lucern.

ROTENBURG, a free imperial town of Franconia, seated on the Tauber, 15 miles N.W. of Anspach. Long. 10. 23. E. Lat. 49. 23. N.

ROTENBURG, a town of Suabia, in the county of Hoenburg, with a castle. It belongs to the house of Austria, and is remarkable for its mineral waters. It is seated on the Neckar, seven miles W. of Tubingen. Long. 8. 55. E. Lat. 48. 28. N.

ROTENBURG, a town of Germany, in the langravate of Hesse-Cassel, with a castle, seated on the Fulde, 25 miles S. of Cassel. Long. 9. 30. E. Lat. 50. 55. N.

ROTTERDAM, one of the Friendly Islands, in the S. Pacific Ocean, discovered by Tasman. Long. 174. 30. W. Lat. 20. 16. S.

ROTTINGEN, a town of Franconia, in the bishopric of Wurtzburg, situate on the Tauber, nine miles N.E. of Mergentheim, and 18 W.N.W. of Rottenburg. Long. 8. 55. E. Lat. 49. 35. N.

ROTHWEIL, a free imperial city of Suabia, in alliance with the Swiss cantons since the year 1513. A mile and a half from this place is a famous abbey, where they receive none but noble women. It is seated on the Neckar, near its source, and also near the Danube, 27 miles S.S.W. of Tubingen. Long. 8. 44. F. Lat. 58. 9. N.

ROVERBELLA, a town of Italy, in the duchy of Mantua, 12 miles N.N.W. of Mantua. Long. 10. 42. E. Lat. 45. 18. N.

ROUBLE. See *St. George, Supp.*

ROUSSELTART, a town of France, in the department of the north, 10 miles N.E. of Ypres, and 20 S.E. of Ostend. Long. 3. 0. E. Lat. 50. 58. N.

ROXBURGH, a town and castle of Scotland, which gives name to a county. It is situate near the Tiviot, 19 miles S.W. of Berwick, and 32 S.E. of Edinburgh. Long. 2. 47. W. Lat. 55. 46. N.

ROYAN, once a large town of France, in the department of Lower Charente, famous for a siege maintained by the Huguenots against Lewis XIII. in 1622. It is now almost in ruins, and is seated at the mouth of the Garonne, 30 miles S. of Rochelle. Long. 0. 57. W. Lat. 45. 38. N.

ROYES, a strong town of France, in the department of Somme. Some mineral waters were discovered here a few years ago. It is 12 miles N.W. of Noyon, and 60 N. by E. of Paris. Long. 2. 31. E. Lat. 49. 46. N.

RUATAN, an island of New Spain, in the bay of Honduras, 10 miles from the coast, with a good harbour.

RUBIERA, a small but strong town of Italy, one of the keys of the Modenese, seated on the Secchia, eight miles N.W. of Modena. Long. 11. 14. E. Lat. 44. 39. N.

RUDAW, a town of Prussia, remarkable for the victory obtained by the knights of the Teutonic order in 1370, over Kingdard, great- duke of Lithuania; in memory of which a stone pillar was erected, which is still remaining. It is 12 miles N.N.W. of Königsberg.

RUDDER (*Encycl.*). The following is extracted from the specification of a patent granted to Capt. Bolton, of the Royal Navy, for an improved rudder, and the means of preserving the rudder of a vessel: it is dated June 23, 1801.

His invention consists in fixing the rudder, so that when the vessel touches the ground, it will rise of itself, or it may be lifted at will by any of the ordinary mechanical powers, as screws, lever, tooth and pinion, &c. This is effected by hanging the rudder on a metal bar, bolt, or slide, passing through the braces, or a solid frame fixed to

the stern-post; those braces on the aft side being made to correspond to the bar, bolt, or slide. In Pl. 41. fig. 1, A is the rudder; B the bar, bolt, or slide, to which the rudder is hung; C, Braces corresponding to B, and which confine it to the stern-post; D, the stern-post; E, screw-bolt, passes through the head of B (which is tapped), by turning the lever *d*, raises the rudder; F, iron tiller, which spars the rudder-head, and through which the rudder and B slide when lifting, *a*, pintles; *b*, goodings, cast solid with B. Capt. Bolton's improved rudder consists of the means of enlarging its size whenever it may be necessary. The rudder is slit down, or it may be made in two parts, in which is inserted a piece of wood, or metal plate, similar to A, fig. 2, the upper end of which is circular, and furnished with teeth, and turns on its centre. A bolt, B, passes through, or at the back of the rudder, and either throws out or draws in A, by turning to the right or left. In order to strengthen the rudder, either screw or shoulder-bolts, as *b*, *b*, may be fitted, and grooves, as *a*, *a*, will traverse over them.

RÜDKIOBING, a sea-port of Denmark, in the island of Langeland, which has a considerable trade in corn and provisions. Long. 10. 45. E. Lat. 55. 1. N.

RUDOLFWERD, a strong town of Germany, in Carinola, with an abbey. It is seated on the Gurck, in a country fertile in good wine, 45 miles S.E. of Laubach. Long. 15. 20. E. Lat. 46. 8. N.

RUFFAC, a town of France, in the department of Upper Rhine, seated on the Rotbach, seven miles S. of Colmar, and 17 N.W. of Basle. Long. 7. 27. E. Lat. 47. 58. N.

RUFFEC, a town of France, in the department of Charente, seated on the Anche, 27 miles N. of Angoulême.

RUGBY, a town in Warwickshire, with a market on Saturday, and a famous free-school. It is 11 miles S.E. of Coventry, and 85 N.N.W. of London. Long. 1. 12. W. Lat. 52. 24. N.

RUGLEY, a town in Staffordshire, with a market on Tuesday, seated on the Trent, 10 miles S.E. of Stafford, and 126 N.W. of London. Long. 1. 48. W. Lat. 52. 57. N.

RUGENWALD, a town of Prussian Pomerania, the chief place of the duchy of Wenden, with a castle, seated on the Wipper, eight miles from the Baltic, and 35 N.E. of Colberg. Long. 16. 27. E. Lat. 54. 35. N.

RUMFORD, a town in Essex, with a market for hogs on Tuesday, and for corn on Wednesday, 12 miles E.N.E. of London. Long. 0. 13. E. Lat. 51. 36. N.

RUMILLY, a town of Savoy, seated on an elevated plain, at the confluence of the Seram and Nepha, five miles from Annecy. Long. 6. 10. E. Lat. 45. 56. N.

RUMSEY, a corporate town in Hampshire, with a market on Saturday. It is governed by a mayor, has a manufacture of shalloons, and several paper and corn mills. It is eight miles N.N.W. of Southampton, and 74 W. by S. of London. Long. 13. 1. W. Lat. 51. 2. N.

RUNGPOUR, a town of Hindoostan Proper, in Bengal, 73 miles N.E. of Mauldah, and 106 N.N.E. of Moorshedabad.

RUNKEL, a town of Westphalia, situate on the Lahn, with a citadel, on a high hill, formerly the residence of the counts, 14 miles E. of Nassau. Long. 8. 5. E. Lat. 50. 23. N.

RUNNYMEAD, a celebrated mead, near Egham, in Surrey, where King John was compelled to sign Magna Charta and Charta de Foresta. See *WRAYSBU*.

RUPEL, a river of the Austrian Netherlands, formed by the junction of the Senne and Demer, below Mechlin. After

receiving the canal from Brussels, it joins the Scheldt, at Rupelmonde.

RUPELMONDE, a town of Austrian Flanders, seated on the Scheldt, opposite the mouth of the Rupe, eight miles S.W. of Antwerp, and 22 N.E. of Ghent. Long. 4. 23. E. Lat. 51. 7. N.

RUPERDORF, a town of Bohemia, in the circle of Koenigsgratz, four miles N.N.W. of Braunau.

RUPERT, FORT, a fort belonging to the Hudson's Bay Company, seated on the E. side of the S. end of Hudson's Bay. Long. 80. 0. W. Lat. 51. 3. N.

RUREMONDE, a strong town of Austrian Guelderland, with a bishop's see. It suffered greatly by fire in 1665, and has been taken and retaken several times; particularly in 1793, by the French, who were obliged to evacuate it soon after, but took it again the next year. It is seated near the confluence of the Maefe and Roer, 12 miles S. of Venlo, and 70 N.E. of Mechlin. Long. 5. 50. E. Lat. 51. 8. N.

RUSS, a town of Prussian Lithuania, and principal place of a district, situate at the mouth of the river Russe, 20 miles N.W. of Tilsit. Long. 21. 50. E. Lat. 55. 20. N.

RUSSELSHEIM, a town of Germany, in the principality of Hesse Darmstadt, situate on the Main, six miles E. of Mentz, and 13 N.W. of Darmstadt. Long. 8. 16. E. Lat. 49. 55. N.

RUSTGADEN, a town of Sweden, in the province of Dalecarlia, 23 miles S.S.W. of Fahlun. Long. 16. 30. E. Lat. 60. 18. N.

RUTCHESTER, a village in Northumberland, the Vindebol of the Romans. Severus' wall runs on the middle of the E. rampart, and Adrian's vallum passes about the distance of a chain to the S. of it. This fort has been very considerable, and the ruins of it are remarkable. It is six miles N. of Hexham.

RUTHIN, a town in Denbighshire, with a market on Monday. It is seated in a vale, on the river Clwyd, and had a strong castle, now in ruins. It is 15 miles S.W. of Holywell, and 206 N.W. of London. Long. 3. 30. W. Lat. 53. 7. N.

RUTLAM, a town of Hindoostan Proper, in the pro-

vince of Malwa, 48 miles W. of Ougein, and 136 E. of Amedabad. Long. 74. 58. E. Lat. 23. 25. N.

RUTIGLIANO, a town of Naples, in Terra di Bari, five miles S.E. of Bari.

RUTTUNPOUR, a city of the peninsula of Hindoostan, in Orissa, and the capital of one of the Western Maharrata chiefs. Long. 82. 36. E. Lat. 22. 16. N.

RUVO, a populous town of Naples, in Terra di Bari, with a bishop's see, 16 miles W. of Bari. Long. 16. 44. E. Lat. 41. 26. N.

RUZA, a town of Russia, in the government of Moscow, 48 miles W.N.W. of Moscow. Long. 36. 2. E. Lat. 55. 46. N.

RYACOTTA, a town of Hindoostan, in the Mysore country, 75 miles S. of Seringapatam, and 85 W.S.W. of Arcot. Long. 76. 45. E. Lat. 30. 15. N.

RYAN, Loch, a lake in the N.W. angle of Wigtonshire. The sea flows into it through a narrow pass; and it was formerly crowded, in the season, with shoals of herrings.

RYDAL-WATER, a lake in Westmoreland, a little to the W. of Ambleside. It is one mile in length, spotted with little islands; and communicates, by a narrow channel, with Grasmere-water to the W. and, by the river Rothay, with Windermere-water to the S.

RYDROOG, a town and fortress of Hindoostan, in the Mysore country, 128 miles N. of Seringapatam. Long. 76. 52. E. Lat. 14. 40. N.

RYEGATE, a borough in Surrey, with a market on Tuesday. It had a castle, some ruins of which are still to be seen; particularly a long vault, with a room at the end, large enough to hold 500 persons, where (according to tradition) the barons, who took up arms against King John, held their private meetings. It is seated in a valley, called Holmesdale, 16 miles E. of Guilford, and 21 S.W. of London. Long. 0. 15. W. Lat. 51. 16. N.

RYMENAUT, a town of Brabant, situate on the Dyle, five miles E. of Mechlin.

RZECZICA, a town of Lithuania, capital of a territory of the same name. It is seated at the confluence of the Wyedszweck and Dnieper, 125 miles N. of Kiof. Long. 31. 5. E. Lat. 50. 32. N.

S.

S A A D A H, a strong and populous town of Arabia Felix, where much Turkey leather is made. It is 140 miles W.N.W. of Sanaa. Long. 44. 55. E. Lat. 17. 50. N.

S A A L E F E L D, a town of Upper Saxony, in the principality of Altenburg. Here are manufactures of cloth and silk stuffs: it is likewise the mint-town for the circle of Upper Saxony. It stands on the Saal, 20 miles N.N.E. of Coburg, and 46 S.W. of Altenburg. Long. 11. 22. E. Lat. 50. 21. N.

S A A T Z, or **Z A T T C**, a town of Bohemia, which gives name to a circle. It is situate on the Eger, 25 miles S.W. of Leutmeritz, and 44 S. of Dresden. Long. 4. 15. E. Lat. 50. 16. N.

S A B A, a town of Persia, in Irac-Agemi, on the road from Sultania to Kom. Long. 52. 15. E. Lat. 34. 56. N.

S A B A N D G E, a town of Turkey in Asia, in Natolia. Here all the roads from Asia to Constantinople meet. It is situate on a lake which abounds in fish, 60 miles E.S.E. of Constantinople. Long. 29. 40. E. Lat. 40. 30. N.

S A B A T Z, or **S A B A C Z**, a town and fortrefs of Turkey in Europe, in Servia. It was taken by the Imperialists in 1789. It is situate on the Drave, 22 miles S. of Peterwardin, and 28 W. of Belgrade. Long. 20. 2. E. Lat. 45. 5. N.

S A B I A, a kingdom on the E. coast of Africa, bounded on the N. by Sofala, on the E. by the Mosambique, on the S. by unknown regions, and on the W. by Manica. It has mines of gold, and many elephants. Manbone is the capital.

S A B I A, a cape of Africa, in the kingdom of Tripoli, at the bottom of the gulf of Sidra.

S A B I E, a sea-port of Denmark, situate on the E. coast of N. Jutland, at the mouth of a river of the same name, 23 miles N.N.E. of Alburg. Long. 10. 18. E. Lat. 57. 20. N.

S A B I O N C E L L O, a peninsula of Dalmatia, to the S. of the gulf of Narenta, and to the N. of a chanel which separates the islands of Curzola and Melida.

S A B I O N C E L L O, a town of Dalmatia, in the republic of Ragusa, situate on the peninsula of the same name, 45 miles N.W. of Ragusa. Long. 17. 40. E. Lat. 43. 20. N.

S A B I O N E T T A, a strong town of Italy, in the Milanese, capital of a duchy of the same name, with a castle. It belongs to the house of Austria, and is 20 miles E. of Cremona. Long. 10. 30. E. Lat. 45. 0. N.

S A B L E, an ancient and populous town of France, in the department of Sarthe, with a castle. In the neighbourhood are some quarries of black marble. It is seated on the Sarthe, 25 miles N.E. of Angers, and 135 S.W. of Paris. Long. 0. 24. W. Lat. 47. 50. N.

S A B L E S D' O L O N N E, a commercial town of France, in the department of Vendée, with a port capable of containing vessels of 150 tons. It is seated on the bay of Biscay, 31 miles W. of Luçon. Long. 1. 36. W. Lat. 46. 30. N.

S A C C A I, a strong city and sea-port, one of the most famous in Japan, with several castles, temples, and palaces. It is seated on the sea, and has a mountain on one side, which serves as a rampart, 300 miles S.W. of Jedo. Long. 134. 5. E. Lat. 35. 0. N.

S A C C H A R O M E T E R, an instrument contrived by Mr. Richardson of Hull, upon the principle of the **HYDROMETER**, for measuring the *sweetness* of WORTS, or malt infusions; by comparison with the specific gravity of the water employed in the process. The principle is well known, and the making of such an instrument is in every one's power without any precise instructions.

S A D D L E (*Encycl.*). The following is the specification of a patent granted to Mr. Inglis, of Chelmsford, in Essex, for a saddle upon a new construction, the stirrup-bars of which are so contrived that should the rider, by accident, be thrown off, or fall from, his horse, he will immediately upon falling be disengaged. It is dated May 21, 1801.

"The nature of my invention," says Mr. Inglis, "is to give elasticity to the seat of the saddle, and consequently ease to the rider, by means of a spring introduced into the long straining web; and to attach the stirrup-bar to the saddle by means of a bolt or fastening, connected with the rider in such a manner, that on falling off, or by being thrown, he draws the bolt or fastening, and detaches the stirrup from the saddle. The manner in which this is performed is as follows: Take a common fiddle-tree, and being provided with a strong spring of steel, or other metal (see Pl. 44. fig. 2), instead of fixing the long strained web in the usual manner, take a piece, of a sufficient length, when doubled, and put over one arm of the spring, as at *a*, and nailed to the head of the tree in the usual manner, will just suffer the spring to clear the head, and work free; the other part of the web is to go over the other arm of the spring at *b*, and instead of being nailed down on each side upon the bar of the fiddle-tree, within side the cantle, is to be passed through two slits, to-be cut in the two sides of the cantle, about three quarters of an inch above the bar, and nailed on the lower part of the outside of the cantle, as described in fig. 3. By the web being thus elevated, and passed through the cantle, it will be allowed to play with the elasticity of the spring without being pressed down upon the tree, and in fixing this part of the long web, care must be taken that the spring be not stretched in doing it, nor the web left slack; but it must be drawn and fixed in a workman-like manner; the spring will then rest in a horizontal position over the gullet of the saddle, immediately behind the head, and the long web will receive its elastic effect therefrom. The saddle in this state is represented in the drawing fig. 1. The steel spring, as seen naked in this drawing, is then to be covered with two pieces of web, each three quarters of an inch broader than the distance between the parts of the web already on the spring at *a* and *b*, and of sufficient length to nail on each side on the bar of the tree. One of these pieces must be strongly sewed underneath the spring to each part of the web at *a* and *b*, and the other piece over the spring to the web in the same manner, which will not only prevent the spring being over stretched, but will also prevent the stuffing of the saddle from interfering with it. Then sew a piece of small, but strong, cord or string round and over the spring, through the parts of the web, drawing the string or cord tight, and fasten both ends on the under side of the web, which will prevent the spring from

Mr Inglis's Patent Saddle and Stirrup.

being stretched during the cross-frainings. Then cross-frain the long web to a proper form, in the usual manner, except that the cross-fraining must not be brought quite so forward as the spring, but must be sewed behind, and not upon the spring, so as not to interrupt its motion. Then proceed to finish the saddle, as usual; and immediately previous to putting in the pannel, remove the cord or string from the spring, and suffer it to have its freedom. This description is equally sufficient to enable a workman to make a lady's saddle, as the furring is to be fixed in the same manner.

"The stirrup-bar consists of three parts. Fig. 4, is an open box, riveted on the bar of the saddle-tree, a little higher than the bar, on a common tree. Fig. 5, is the stirrup-bar, which supports the stirrup, with a short shank to be introduced into the box, where it is bolted by a double spring bolt, fig. 6; the two prongs of which pass through two corresponding holes in the bar and box, and thus attach the bar and stirrup to the saddle: to this bolt, fig. 6, a small strap is sewed. The rider being then seated, is to button the straps round his thighs a little above each knee; or should he fall, or be thrown from his horse, the straps will draw the bolts, and the stirrups will immediately drop from the saddle. Before he dismounts he must unbutton the straps; or, if he wish to try the effect of the invention, he may dismount with the straps on, when the spring bolts will be drawn, and the stirrups disengaged from the saddle. Instead of the straps going round the thighs, they may be attached to the body in any other manner, so as to draw the bolts on falling or being thrown."

SAFFI, a trading town of Morocco, with a castle. The Portuguese were long in possession of it, but they forsook it in 1641. It is surrounded by several eminences, which command the town. Long. 8. 58. W. Lat. 32. 28. N.

SAGAN, a town of Silesia, capital of a principality of the same name, belonging to Prince Lobkowitz. It has double walls, a castle, and a priory of the Augustine order. By permission of the emperor, in 1709, a Lutheran school was founded here. It is seated on the Bober and Queis, 62 miles N.W. of Breslaw. Long. 15. 22. E. Lat. 51. 42. N.

SAGREZ, a strong town of Portugal, in Algarva, with a harbour and a fort, four miles W. of Cape St. Vincent, and 125 S. of Lisbon. Long. 9. 4. W. Lat. 37. 4. N.

SAGUR, a town of Hindoostan Proper, in the province of Malwa, situate near the Bunnais River, 87 miles N.W. of Gurrak, and 112 S. of Agra. Long. 78. 53. E. Lat. 23. 45. N.

SAID, a town of Upper Egypt, seated on the Nile, 150 miles S. of Cairo. Long. 31. 20. E. Lat. 27. 32. N.

SAL, one of the Cape de Verd Islands; 42 miles in circumference, lying to the E. of St. Nicholas. It has its name from the great quantity of salt made here from the sea water, which overflows part of it, from time to time. It is 300 miles W. of the coast of Africa. Long. 22. 56. W. Lat. 16. 38. N.

SALA, or **SALBERG**, a town of Sweden, in Westmania, near which is a very large ancient silver mine. This town was first built by King Gustavus Adolphus in 1624, and destroyed by fire in 1736. It is seated on a river, 30 miles W. of Upfal, and 50 N.W. of Stockholm. Long. 17. 45. E. Lat. 59. 50. N.

SALARANO, a town of Italy, in the Milanese, situate on the Lambro, five miles W.S.W. of Lodi, and 15 S.E. of Milan. Long. 9. 22. E. Lat. 42. 44. N.

SALECTO, a town of the kingdom of Tunis, near which are the remains of a large castle. It is seated near the Mediterranean, 22 miles S.S.E. of Monaster. Long. 11. 3. E. Lat. 35. 13. N.

SALEM, a sea-port of the state of Massachusetts, capital of the county of Essex. It is the oldest town in the state, except Plymouth, and carries on a large foreign trade. It is 15 miles N.E. of Boston. Long. 71. 30. W. Lat. 42. 16. N.

SALEM, a sea-port of the state of New Jersey, 37 miles S.S.W. of Philadelphia. Long. 75. 32. W. Lat. 39. 37. N.

SALEM, a town of North Carolina, in the county of Surry. It is the principal settlement of the Moravians in this state, and 170 miles W. of Edenton. Long. 80. 21. W. Lat. 36. 2. N.

SALERS, a town of France, in the department of Cantal, seated among the mountains, nine miles N. of Aurillac.

SALIES, a town of France, in the department of Lower Pyrenees, remarkable for its springs of salt water, from which the white salt is made. It is seven miles W. of Orthea.

SALIGNAC, a town of France, in the department of Upper Vienne, 10 miles S. by W. of Limoges. Long. 1. 18. E. Lat. 45. 42. N.

SALIGNAS, a town of Spain, in Biscay, seated on the Deva, at the foot of a mountain, eight miles N. by E. of Vittoria, and 28 S.S.E. of Bilbao. Long. 2. 54. W. Lat. 43. 5. N.

SALINAS, a town of Spain, in Guipuscoa, near Mount St. Adrian, 16 miles N.E. of Vittoria, and 28 S.S.W. of St. Sebastian. Long. 2. 45. W. Lat. 43. 5. N.

SALINS, a considerable town of France, in the department of Jura, with a strong fort. It is remarkable for its salt-works, the largest of which is in the middle of the town, and is like a little fortified place. It is seated in a fertile valley, on a stream that has its source in the town, 29 miles S. of Benafcon, and 200 S.E. of Paris. Long. 6. 5. E. Lat. 46. 56. N.

SALM, a town of Germany, capital of a county in the duchy of Luxemburg, 11 miles S.S.E. of Spa, and 38 N. of Luxemburg. Long. 5. 55. E. Lat. 50. 25. N.

SALM, a town of France, in the department of Meurthe, with a castle, seated at the source of the Sar, 20 miles W. of Strasburg, and 55 S.E. of Nancy. Long. 7. 15. E. Lat. 48. 34. N.

SALO, a town of Italy, in the Bresciano; taken by the French in August, 1796. It is seated on the lake Digarpa, 17 miles N.E. of Brescia. Long. 10. 49. E. Lat. 45. 38. N.

SALOBRENA, a sea-port of Spain, in Granada, with a castle. It carries on a great trade in sugar and fish, and is seated on a rock, near the mouth of a river of the same name, 12 miles E. of Almuñecar, and 36 S. of Granada. Long. 3. 30. W. Lat. 36. 31. N.

SALON, a town of France, in the department of the Mouths of the Rhone, seated on the canal of Craponne, 20 miles N.W. of Aix. Long. 5. 5. E. Lat. 43. 38. N.

SALONE, a town of Livadia, with a bishop's see. The inhabitants are Christians and Turks, pretty equal in number; and Jews are not suffered to live here. It is seated on a mountain, on the top of which is a citadel, 20 miles N.E. of Lepanto. Long. 23. 1. E. Lat. 38. 50. N.

SALPE, a town of Naples, in Capitanata, near which are some saltworks. It is situate on a lake, near the sea, 23 miles S. of Manfredonia, and 92 E.N.E. of Naples. Long. 16. 10. E. Lat. 41. 12. N.

SALSONNA, a town of Spain, in Catalonia, seated on the Llobregat, 44 miles N.W. of Barcelona. Long. 1. 38. E. Lat. 41. 56. N.

SALT (Encycl.). To remove and lessen the known inconveniences in the manufacture of salt, Mr. Manley, of

Great Budworth in Cheshire, invented and adopted the following apparatus, and processes, for which he has obtained a patent.

"My first head of improvement (says he in his specification) consists in adding to the common apparatus for salt-making another pan, which I call a heating cistern, or preparing-pan. This is placed contiguous to the common salting-pan, and is heated by an extension of the flues from the said salting-pan, and therefore without requiring any additional fuel. The preparing-pan may be made of iron, or any other suitable material, and of a form the best adapted to different salt-works, and either with or without a cover. It should hold at least as much brine as will serve for one charge of the salting-pan.

"The construction of the pans will be explained by a reference to the drawing hereto annexed or subjoined. In Plate 44. fig. 1, is the ground plan of a salting-pan, of the usual form, with a preparing-pan adjoining to it. *a, a, a, a*, is the salting-pan; *b, b, b, b*, the preparing-pan; *c, c, c, c*, flues which convey the flame from beneath the salting-pan to the preparing-pan; *d*, the chimney; *e*, a damper; *f, f, f, f*, fire-doors; *g, g, g, g*, grates. The arrows shew the course of the flame through the flues.

"These pans may be used in the following manner: (allowing for such variations as may be found advisable from occasional differences in the quality of the brine, or the particular convenience of the manufacturer). The rough brine, in the state in which it is pumped out from the well, or drawn from the reservoir, is to be lent directly to the preparing-pan, instead of going at once into the salting-pan, which is done in the present method of manufacture. The rough brine is then heated in the preparing-pan, by means of the same fire which is heating the brine already in the salting-pan. The rough brine, by being thus heated in the preparing-pan, is brought, without expense of fuel, to the degree of heat requisite for depositing the earthy and metallic impurities separable from it by mere heat. These impurities subside to the bottom, leaving the brine above them clear and hot, ready to be afterwards evaporated in the salting-pan before used, as soon as this pan is able to receive it, or in any contiguous salting-pan. The clarified brine may be drawn off from the sediment by a siphon, or by any other suitable method; after which the sediment is to be let off through a waste-pipe at the bottom of the preparing-pan, and the whole well washed out. The preparing-pan is then to be filled with fresh brine, and heated as before, by the same fire which is supplying the salting-pan, so as to prepare a charge of clear and hot brine for a subsequent evaporation.

"The improvement in the process of salt-making, which I have here specified, will save a considerable quantity of fuel, inasmuch as the brine may be brought in the preparing-pan, without any additional expense of fuel, to the same state, for which in the usual mode of manufacture a fire must be kept up for several hours under the salting-pan.

"The above improvement will likewise save much of the time necessary to the process of evaporation, as well as much of the time and labour now employed in clearing out the sediment, and it will contribute to lessen the quantity of the pickings, and consequently the frequency of their removal.

"My second head of improvement in the manufacture of salt, which is quite distinct from the first, is to add to the brine a certain quantity of fixed alkali, especially of barilla, or any other species of the mineral alkali, whereby several of the earthy salts contained in the brine, and not separable from it by mere heat, are decomposed, and the earth precipitated in the form of a sediment, which may be removed without much difficulty. The quantity of the alkali, and the time at which

it should be added, must depend on the degree of concentration of the brine, and especially on the nature and proportion of its contents; and as these differ much in different springs, and even in the water of the same spring at different times, they must therefore be left to the manufacturer to determine for himself according to circumstances.

"My third head of improvement in the manufacture of salt, which is quite distinct from the two former, consists of a peculiar method of constructing the flues for conveying the flame and heated air of the furnaces beneath the pans, so as to lessen the requisite consumption of fuel. Many attempts have been made at various times to increase or retain the heat under salt-pans by means of circuitous, angular, or otherwise lengthened flues, all of which attempts have been frustrated by the heaving or rising of the pan, when the liquor which it contains is fully boiling, which has allowed the flame to pass directly over the cross and midfeather walls to the chimneys, instead of circulating through the flues.

"To remedy this inconvenience, let flue-plates be formed of plates of iron bent to an angle lengthwise, in order to afford a face or flanch part, to be rivetted, or otherwise fastened, to the bottom of the boiler, whilst the other part of the width of the plates project downwards from the bottom of the pan, and is either to be received loosely in a groove of the cross and midfeather walls, or else to hang down for some inches beside them. By this method the flame and heated air will be kept within the flues, notwithstanding the rise and fall of the pan, and the advantage in saving fuel which is derived from the circuitous course of the flues will be secured.

"Figure 2, exhibits one of the methods* of applying these plates. *a, a, a, a*, is the salt-pan; *b, b, b*, grates; *c, c, c*, flues; *d*, the chimney; *e, e, e*, dampers; *f, f, f*, fire-doors. The dark lines represent the iron plates, and the lighter parts on each side represent the brick partition walls of support, between which the plates are received loosely. The arrows shew the course of the fire through the flues.

"The above construction may be applied both to salt-pans and to pans of any description which are intended to bear the fire."

SALTZA, a town of Lower Saxony, in the duchy of Magdeburg. It takes its name from the salt-pits, and is 12 miles S.S.E. of Magdeburg. Long. 11. 54. E. Lat. 52. 3. N.

SALTZWEDDEL, a town of Upper Saxony, in the old marche of Brandenburg, formerly reckoned one of the Hanse towns. Here are flourishing manufactures of cloth, serge, and stockings. It is situate on the Jetze, 20 miles N.N.W. of Gardeleben, and 48 E.N.E. of Zell. Long. 11. 30. E. Lat. 52. 55. N.

SALVADOR, Sr. the capital of the kingdom of Congo, with a large palace, where the king and a Portuguese bishop reside. It is seated on a craggy mountain, 240 miles E. by S. of Loango. Long. 15. 39. E. Lat. 4. 50. S.

SALVADOR, Sr. a populous city of Brazil, with an archbishop's see, and several forts. It contains many religious houses, and carries on a considerable trade. The houses are two or three stories high, and the walls thick and strong, being built of stone. The principal streets are large, and there are many gardens, full of great variety of fruit-trees, herbs, and flowers. The chief commodities are sugar, tobacco, wood for dyes, raw hides, tallow, and train-oil. It is seated on an eminence, on the bay of All Saints, 120 miles S.W. of Sergippy. Long. 40. 10. W. Lat. 13. 30. S.

SALVATERRA, a town of Portugal, in Estremadura, with a royal palace, seated on the Tajo. Long. 7. 51. W. Lat. 38. 59. N.

SALVATERRA, a strong town of Portugal, in Beira. It

was taken by the French in 1704, and by the allies in 1705. It is feated on the Elia, 12 miles N.E. of Alcantara. Long. 6. 14. W. Lat. 39. 30. N.

SALVATIERRA, a town of Spain, in Galicia, feated on the Minho, 56 miles S. of Compostella. Long. 8. 16. W. Lat. 41. 48. N.

SALVATIERRA, a town of Spain, in Biscay, feated at the foot of Mount St. Adrian, 30 miles E. by S. of Vittoria. Long. 2. 17. W. Lat. 42. 54. N.

SAMARAND, a populous town on the eastern part of the island of Java.

SAMARCAND, an ancient and populous city, in the country of the Ufbeck Tartars, with a castle and a university. It was the birth-place and feat of Tamerlane the Great. It carries on a trade in excellent fruits, and is feated near the Sogde, which runs into the Amo, 138 miles E. by N. of Bokhara. Long. 65. 15. E. Lat. 39. 50. N.

SAMATHAN, a town of France, in the department of Eure, with a strong castle on a mountain. It is feated in a valley, on the river Save, five miles N. of Lombez. Long. 1. 0. E. Lat. 43. 34. N.

SAMBAS, a town of the island of Borneo, capital of a kingdom of the same name, near the W. coast. In its vicinity diamonds are found. Long. 109. 0. E. Lat. 2. 20. N.

SAMBRE, a river of the Netherlands, which rises in Picardy, and passing by Landrecy, Maubeuge, Thun, and Charleroy, falls into the Maese, at Namur.

SAMOGITIA, a province of Poland, 175 miles long, and 125 broad; bounded on the N. by Courland, on the E. by Lithuania, on the W. by the Baltic, and on the S. by Western Prussia. It is full of forests and high mountains, which feed a great number of cattle, and produce abundance of honey. Here are also very active horses, in high esteem. The inhabitants are clownish, but honest; and they will not allow a young woman to go out in the night without a candle in her hand, and two bells at her girdle. Rofienne is the principal town.

SAMSO, or **SAMSOI**, an island of Denmark, on the E. coast of North Jutland. It is eight miles long, and three broad, and very fertile. Long. 10. 33. E. Lat. 56. 2. N.

SAMSON, Sr. a town of France, in the department of Eure, feated on the river Rille, five miles from Pontaudemer.

SANA, or **ZANA**, a town of Peru, and capital of a jurisdiction in the bishopric of Truxillo. It is situate in a charming valley, fertile in fruit and corn, and adorned with the most beautiful flowers, whence it has been sometimes called Miraflores. It is 90 miles N. of Truxillo. Long. 78. 30. W. Lat. 40. 35. N.

SANCERRE, a town of France, in the department of Cher. The wines produced in its environs are scarcely inferior to those of Burgundy. It is feated on a mountain, near the river Loire, 22 miles N.W. of Nevers, and 110 N. of Paris. Long. 2. 59. E. Lat. 47. 18. N.

SANCIAN, an island of China, on the coast of Quan-tong, 40 miles in circumference, and famous for being the burying place of St. Francis Xavier, whose tomb is to be seen on a small hill.

SANCOINS, a town of France, in the department of Cher, feated on the Argent, 15 miles S.W. of Nevers.

SANDECZ, a strong town of Little Poland, in the palatinate of Cracow. There are mines of gold and copper in its territory, and it is feated at the foot of Mount Krapack, 32 miles S.E. of Cracow. Long. 20. 32. E. Lat. 49. 43. N.

SANDERSLEBEN, a town of Upper Saxony, in the principality of Anhalt Dessau, situate on the Wipper, 26 miles

S.E. of Quedlingburg, and 31 S.W. of Dessau. Long. 11. 22. E. Lat. 51. 38. N.

SANDHAMN, a sea-port of Sweden, in the province of Upland, where all vessels on their passage to and from Stockholm are examined. It is 10 miles E. of Stockholm. Long. 18. 20. E. Lat. 59. 20. N.

SANDO, an island of Japan, on the N. coast of Nippon; with a town of the same name. It is 87 miles in circumference. Long. 139. 30. E. Lat. 38. 35. N.

SANDUGAL, a town of Portugal, in Beira, feated on the Coa, 12 miles S.E. of Guarda.

SANDVLIET, a town of Brabant, on the river Scheldt, 12 miles N.W. of Antwerp. Long. 1. 12. E. Lat. 51. 22. N.

SANDY HOOK, a small island of the United States, near the coast of New Jersey. It was formerly a peninsula, but the sea broke through the isthmus and formed it into an island in the winter between 1777 and 1778. It is seven miles S. of Long Island.

SANEN, or **GESSENAY**, a town of Switzerland, in the canton of Bern, situate on a river of the same name, 24 miles S. of Friburg, and 25 E.S.E. of Lausanne.

SANGUESA, a town of Spain, in Navarre, feated on the Arragon, 20 miles S.E. of Pampeluna. Long. 1. 17. W. Lat. 42. 34. N.

SANORE-BANCABOUR, a town of Hindoostan, in the kingdom of Myfore, 117 miles E. by N. of Goa. Long. 75. 44. E. Lat. 15. 39. N.

SANTA CLARA, an island of Peru, in the bay of Guayaquil, 90 miles W. of Guayaquil. Long. 82. 36. W. Lat. 2. 18. S.

SANTA FE, the capital of New Mexico, feated among mountains, near the Rio-del-Norte, 950 miles N. of Mexico. Long. 106. 35. W. Lat. 35. 32. N.

SANTORINI, an island of the Archipelago, to the N. of Candia, and to the S. of Nio. It is eight miles in length, and nearly as much in breadth; and near it are three or four other small islands, each of which bears evident marks of a volcanic origin. It produces plenty of barley, cotton, and wine, in which, and the cotton manufactures, its trade consists. Fruit is scarce, except figs, and it has neither oil nor wood. The inhabitants are all Greeks, about 10,000 in number, and though subject to the Turks, they choose their own magistrates, Pyrgos is the capital. Long. 26. 1. E. Lat. 36. 10. N.

SAONE AND LOIRE, a department of France, including part of the late province of Burgundy. Macon is the capital.

SAOIGIS, a town of Piedmont, in the county of Nice, situate on the summit of a rock. It was taken by the French in 1794. It is 17 miles N.E. of Nice. Long. 7. 33. E. Lat. 36. 38. N.

SAPIENZA, three small islands, and a cape, near the S. coast of the Morea. The largest island was anciently named Sphacteria. The pirates of Barbary conceal themselves behind it, to surprize vessels which come from the gulf of Venice, or the coast of Sicily. Long. 21. 35. E. Lat. 36. 50. N.

SARATOF, a government of Russia, formerly a province of Astracan. It is divided into 12 districts, of which that of the same name is the principal.

SARATOF, a town of Russia, capital of the government of that name. It is feated on the side of a mountain, near the river Volga, 220 miles S. of Kasan, and 300 N.W. of Astracan. Long. 49. 25. E. Lat. 52. 4. N.

SARATOGA, a fort of the state of New York, memorable for the surrender of an army of British and Hessians, under the command of General Burgoyne, to the Americans, in 1777. It is feated on the E. side of Hudson's River, 50 miles N. of Albany.

SARBOURG, a town of Germany, in the electorate of Treves, seated on the Sare, eight miles S. of Treves. Long. 6. 40. E. Lat. 49. 37. N.

SARBOURG, a town of France, in the department of Meurthe, seated on the Sare, at the foot of a mountain; 15 miles E. of Marfal, and 50 S.E. of Metz. Long. 7. 9. E. Lat. 48. 46. N.

SARBRUCK, a town of France, in the department of Moselle, seated on the Sare, 14 miles E.S.E. of Sarlouis, and 40 E. by N. of Metz. Long. 7. 2. E. Lat. 49. 14. N.

SARDAM, a sea-port of North Holland, where there are vast magazines of timber for building ships, and naval stores, with a great number of shipwrights; and here is seen the hut in which Peter the Great resided, while he worked as a shipwright in this town. Sardam is seated on the Wye, seven miles N.W. of Amsterdam. Long. 4. 45. E. Lat. 52. 28. N.

SARDO, a town of Turkey in Asia, in Natolia. It was formerly called Sardis, and was the capital of Lydia, under the famous King Cræsus. It was afterwards one of the seven churches of Asia, celebrated in the book of Revelation, but was destroyed by an earthquake in the reign of Tiberius. It now contains only a few wretched huts. However, here is a large caravanserai, where there are handsome lodgings for travellers, it lying in the great road from Smyrna to Aleppo; and the Turks have a mosque, formerly a christian church. The inhabitants are now almost all shepherds, who feed their flocks in the neighbouring plains. There are also a few Christians, who employ themselves in gardening, but they have neither church nor priests. It is 70 miles E. of Smyrna. Long. 28. 30. E. Lat. 38. 44. N.

SARGANS, a town of Switzerland, capital of a county of the same name, in the canton of Zurich, with a castle on a rock, where Andrew Doria was defeated by Barbarossa. It is seated on the top of a hill; and near it are mineral springs.

SARGEL, a large and ancient sea-port of Africa, in Tremesen, with a castle, seated on the sea-coast, 25 miles S.S.W. of Algiers. Long. 2. 15. E. Lat. 36. 30. N.

SARGUEMINE, a town of France, in the department of Moselle, seated on the Sare, nine miles S. by E. of Sarbruck. Long. 7. 6. E. Lat. 49. 8. N.

SARK, a little island belonging to Great Britain, lying between Guernsey and Jersey, on the coast of Normandy.

SARK, a river of Scotland, which rises in the E. part of Dumfriesshire, and for many miles forms the boundary with England.

SARLAT, a town of France, in the department of Dordogne. It was lately a bishop's see, but is a poor place, seated in a bottom, surrounded by mountains; 27 miles S.E. of Périgueux, and 87 E. by N. of Bourdeaux. Long. 1. 19. E. Lat. 44. 5. N.

SARLOUIS, a strong town of France, in the department of Moselle, seated on the isthmus of a peninsula formed by the river Sare, 20 miles E. of Thionville, and 32 N.E. of Metz. Long. 6. 48. E. Lat. 49. 21. N.

SARNEN, a town of Switzerland, in the canton of Underwalden, near a lake to which it gives name. It had formerly a strong castle, and is nine miles S. of Lucern. Long. 8. 7. E. Lat. 46. 55. N.

SARNO, a river of the kingdom of Naples, which rises near Sarno, and falls into the bay of Naples.

SARNO, a town of Naples, in Principato Citeriore, with a bishop's see. It is seated on the Sarno, near its source, 12 miles N.E. of Salerno, and 20 S.E. of Naples. Long. 14. 49. E. Lat. 40. 46. N.

SARP, or **SARPEN**, a town of Norway, in the province of Christianland. Near it is a great cataract, the noise of which

may be heard to the distance of 20 miles. It is ten miles W.S.W. of Fredericstad. Long. 10. 47. E. Lat. 59. 9. N.

SARREAL, a town of Spain, in Catalonia, seated on the Francoli, in the neighbourhood of which are quarries of alabaster, so transparent that windows are glazed with it. Long. 2. 0. E. Lat. 41. 30. N.

SARTE, a department of France, including the late province of Maine. It takes its name from a river which joins the Maine and the Loire, above Angers. The capital is Mans.

SARVERDEN, a town of France, in the department of Moselle, seated on the Sare, 18 miles S. of Sarbruck. Long. 7. 7. E. Lat. 48. 58. N.

SARWAR, a town of Lower Hungary, capital of a county of the same name, seated on the Raab, 50 miles W. by N. of Buda. Long. 16. 48. E. Lat. 47. 30. N.

SARZANA, a strong town of Italy, in the territory of Genoa, with a bishop's see. It was given to the Genoese, by the Great Duke of Tuscany, in lieu of Leghorn. It is seated at the mouth of the Magra, 50 miles S.E. of Genoa. Long. 9. 52. E. Lat. 44. 8. N.

SASERAM, a town of Hindoostan Proper, in Bengal, seated at the foot of a mountain, near a great lake, in the middle of which is an island with the magnificent mausoleum of the Emperor Shere Shah, which had a fine bridge leading to it; but both are greatly decayed. It is 50 miles S.E. of Benares. Long. 86. 44. E. Lat. 26. 10. N.

SASSARI, a city of Sardinia, capital of the territory of Lugari, with a castle and an archbishop's see. It contains 30,000 inhabitants, and is famous for a fountain called Roffè, which is said to be more magnificent than the best at Rome. It is seated in a plain, six miles N. of Alger. Long. 8. 39. E. Lat. 40. 46. N.

SASSEBES, a strong town of Transylvania, capital of a county of the same name; seated at the confluence of two rivers, which fall into the Maroch. Long. 26. 40. E. Lat. 46. 26. N.

SAS VAN GHENT, a strong town of Dutch Flanders. It has fine sluices, and is seated on a canal, which communicates with Ghent, about eight miles N. from it. It was built by the inhabitants of Ghent, as a bulwark to that town, but was taken, in 1644, by the Dutch, from whom the French took it in 1794. Long. 3. 49. E. Lat. 51. 11. N.

SATALIA, a strong sea-port of Natolia, on the coast of Caramania. It is divided into three towns, and has a superb mosque, which was formerly a church. The country around is very fertile; and the citrons and oranges are extremely fine. It is 150 miles W. by S. of Cogni, and 265 S. by E. of Constantinople. Long. 32. 21. E. Lat. 37. 1. N.

SATGONG, or **SATAGONG**, a village of Hindoostan Proper, in Bengal. In the 16th century it was a large city, in which the European traders in Bengal had their factories. It is seated on a creek of the Hoogly River, four miles N.W. of Hoogly.

SATTARAH, a town of the Deccan of Hindoostan, in the province of Visapour, formerly the capital of the Mahrattah state. It is situate near the source of the Kistnah, 50 miles S. of Poona, and 77 W. of Visapour. Long. 74. 8. E. Lat. 17. 45. N.

SAVENAY, a town of France, in the department of Lower Loire, 18 miles N.W. of Nantes, and 32 W. of Ancenis. Long. 1. 55. W. Lat. 47. 23. N.

SAVENDROOG, a strong fortress of Hindoostan, in the kingdom of Myfore. It is situate on the top of a vast rock, rising half a mile in perpendicular height, from a base of above eight miles in circumference, and divided at the summit by a chafin, that forms it into two hills; these having each its

peculiar defences, serve as two citadels, capable of being maintained, independently of the lower works, which are also wonderfully strong. Notwithstanding this, it was taken by the English, in 1791, after a siege of seven days. It is 18 miles W. of Bangalore.

SAVERDUN, a town of France, in the department of Arriège, seated on the Arriège, 25 miles S.S.E. of Toulouse. Long. 1. 36. E. Lat. 43. 14. N.

SAVERNE, a town of France, in the department of Lower Rhine, with a palace, the occasional residence of the late archbishops of Strasbourg. It is seated at the foot of Mont Voiges, in a fertile country, which produces plenty of wine, 18 miles N.W. of Strasbourg, and 120 E. of Paris. Long. 7. 35. E. Lat. 48. 41. N.

SAVGILIANO, a strong town of Piedmont, capital of a territory of the same name, with a rich Benedictine abbey. It is seated on the Maira, five miles W. of Fossano, and 26 S. of Turin. Long. 7. 44. E. Lat. 44. 30. N.

SAULGEN, a town of Suabia, capital of a county of the same name, which belongs to the Baron of Walburg.

SAULIEU, a town of France, in the department of Côte d'Or. Here was anciently a college of the Druids, and a wood in which they performed their sacrifices, and where the ruins of a druidical temple are still visible. It is seated on an eminence, 25 miles W. of Dijon, and 142 S.E. of Paris. Long. 4. 7. E. Lat. 47. 17. N.

SAVOLAX, a district of Sweden, in the province of Finland, about 200 miles in length, and 100 in breadth, bordering on Russia.

SAVONIERS, a town of France, in the department of Indre and Loire, five miles from Tours. Near it are caverns, famous for their petrifications.

SAURUNGPOUR, a town of Hindoostan Proper, in the province of Malwa, 42 miles N.N.E. of Indore, and 43 N.E. of Ougain. Long. 76. 32. E. Lat. 23. 35. N.

SAUVES, a town of France, in the department of Gard, seated on the Vidoure, 12 miles S.W. of Alais.

SAUVETERRE, a town of France, in the department of Lower Pyrénées, with an old ruined castle, 20 miles W.N.W. of Pau.

SAUVETERRE, a town of France, in the department of Aveyron, 12 miles S.E. of Villefranche.

SAVU, an island in the Indian Ocean, to which the Dutch have a kind of exclusive trade, having entered into an agreement with the rajahs that their subjects shall trade with no ships, but those of the Dutch East-India Company. Long. 122. 30. E. Lat. 10. 35. S.

SAXENBURG, a town of Germany, in the duchy of Carinthia, situate on the Drave, 38 miles W. of Clagenfurt. Long. 13. 40. E. Lat. 46. 52. N.

SAXENHAGEN, a town of Westphalia, in the county of Schwabenburg, 20 miles N.W. of Hanover. Long. 9. 36. E. Lat. 52. 30. N.

SAXMUNDHAM, a town in Suffolk, with a market on Thursday, seated on a hill, 29 miles N.E. of Ipswich, and 89 N.E. of London. Long. 1. 40. E. Lat. 52. 18. N.

SAYBROOK, a town of the United States, in Connecticut. It is the most ancient town in the state, and situate on Connecticut River, 18 miles W. of New London. Long. 73. 2. W. Lat. 41. 16. N.

SAYCOCK, one of the islands of Japan, divided from Nippon by a narrow channel. The Dutch factors are permitted to reside in the little island of Difunia, which is on the W. side of this. Long. 132. 28. E. Lat. 34. 0. N.

SAYPAN, one of the Ladrone Islands, larger and pleasanter than that of Tinian; lying between 140 and 150° E. long, and in 15. 22. N. lat.

SCALE-BEAM. Under the article BALANCE we have spoken fully on the construction of scale-beams. To what we have there said we purpose to add the description of a *Band* or *Support* applicable to scale-beams of every size, and calculated to render the operations, for which these instruments are used, more expeditious and convenient, without diminishing their accuracy. This account is the production of Citizen Prony, member of the National Institute of France, and published in the *Annales de Chimie*.

"Several experiments," says he, "in which I was engaged during the course of the last winter, put me under the necessity of contriving a support, which might be applied promiscuously to every kind of balance, whether provided with a suspending handle or not, and which, without detriment to its accuracy, should afford me commodious means of successively raising and lowering it. It is well known how embarrassing and laborious the operation of weighing is, when performed with balances supported by the hand; though this is often only the least inconvenience with which their use is attended.

"Various artists have contrived supports, commodious in their use, and ingenious in their principle; but as each of these supports can only be adapted to a single balance, they become so expensive as to be out of the reach of the majority of artists and experimentalists. I think, therefore, I shall do them an acceptable service, by publishing, in compliance with the request of several eminent chemists, the description of a support, which, besides the advantage of being adapted for all kinds of balances, possesses that of being constructed, at a small expense, either in wood or metal.

"It was my intention to have added to this description some views relative to the theory and construction of balances, of which I conceived that artists, acquainted with the elements of geometry and arithmetic, might avail themselves for perfecting the machines used for weighing; but as this part of my labour has extended itself to a greater length than I had at first imagined, I shall publish it separately.

"A triangular foot of copper A, *a*, *a* (figs. 1 and 2, Plate 45. representing the elevation and section of my apparatus), has its three extremities *a*, *a*, *a*, firmly screwed down upon a table or horizontal plane. Into the part A of this foot is screwed a cylindrical rod A B, which may be of any arbitrary length: it may even be convenient to have two of these of different lengths, in order that they may be changed, when we wish to employ the machine for very large balances. Those which I have made use of are, the one half a metre, and the other one metre, in length.

"A vertical pulley, P, is placed at the top of the stem A B, in such a manner that the same vertical plane passes through the axis of the rod, and through the horizontal axis of the pulley; the block or collar C D of this pulley has at its lower part a tube C B, into which enters, with a gentle friction, the superior extremity of the rod A B; a screw E serves to keep the pulley in a fixed position.

"Another pulley P is fixed at the bottom of the rod A B, in such a position, that the tangent of the pulleys P and *p* is parallel with the axis of the rod A B.

"A cord K *t* p H G P F, to the end of which is suspended, on the outside of the vertical table K, a small weight *k*, passes through a hole *t* made in the foot *a*, rolls over the pulleys *p* and P, and is attached at F to a piece *m m' n q*, which has the form of a fork, and to which are suspended (as I shall shortly explain) the balance, the weights, and the substances that are to be weighed. F *m* is a button, which being screwed at the top of the fork, receives the end of the cord, and by means of a knot made on it sustains the fork.

"The tail or handle of this fork is of a prismatic form at the part *m' n*; this prismatic part enters a groove *f f'* made at

the extremity N of the horizontal piece N O, so that it can slide freely in this groove either upwards or downwards, its course being however limited at m' , where it is stopped by the enlarged handle of the fork, and at n by the greater width produced by the separation of the two branches of the fork.

"The piece N O, which is hollow, and intersected at O, by the stem A B, can slide along and turn round this stem: when it is brought to its proper height, it is secured by means of the screw V, and it is then necessary, first, that it should be at such a height that, when the stop m rests on the side of the groove $f f$, or when N O can move no further down, the scales of the balance shall be in contact with the table or horizontal plane, in order that we may afterwards be able to raise it the whole height of $f n$; secondly, that the cord F F be in one and the same vertical plane with H G.

"The groove at T ought to be situated in such a manner that the axis of the prismatic part of the tail of the fork, and the cord F F, shall always be in the same vertical plane, or in a parallel line with the axis of the stem A B.

"These dispositions being made, let us imagine the two branches $n g$ of the fork to be perforated with holes of different diameters, in order to receive horizontal pins ($g g$) of different sizes; and we shall have all that is requisite for the ordinary operations of weighing, performed in the air, with balances, the beams of which are suspended from above.

"In fact, whatever kind of balance we use, we are to introduce the extremity of its suspending handle into the fork $n g$, and insert into the round hole, which the handle of the balance always has at its superior extremity, any one of the pins that will enter with ease; we then apply the piece O N, in such a manner as to fulfil the conditions above laid down for the position of this piece; after which, it is to be fixed by the screw V. This being done, the scales of the balance are to be charged, which being in contact with the table, or horizontal plane, can have no motion. When the scales are charged, we lay hold of the small ball k , and draw the cord which suspends it so as to raise the balance very slowly: if the scales be not in equilibrium, the cord is to be loosened till they rest again upon the table, and so successively.

"A counterpoise Q, suspended to the cord F G, ought to preserve the equilibrium with the weight of the balance. By means of this precaution, it comes to pass, that the common centre of gravity of all the forces supported by the pulley P falls in all cases upon the axis of the stem A B, which thus has no tendency to bend.

"If we wish now to use a hydrostatic balance, we adapt to the stem A B a small board O N', fig. 3, which, by means of a cylindrical hole at O, may slide along the rod A B, and be fixed at any arbitrary height by a screw at V. Another piece, or board, K' K', is placed upon V' N', in such a manner that the holes T T correspond with the centre of the scales, under which are placed the hooks intended for holding the substances suspended in the water, and K' K' is fixed upon V' N' by means of screws V'.

"These arrangements being made, let the piece N' O' and the board K' K', be placed in such a manner that, first, the whole height of the balance be placed between this piece and the board, and that the scales L L be in contact with the board K' K', their centres corresponding with holes made in T T. Secondly, that K' K' be sufficiently elevated to enable us to place under it the vessels W W, filled with water, and conveniently to immerse, in one of these vessels, the substances which we wish to weigh hydrostatically.

"According to the common practice, these substances are suspended by a very thin wire; but by placing, after my method, two vessels, and suspending to the two scales wires of equal diameter, the one of which supports the substance that is

to be weighed, and the other merely in part immersed, the magnitude of the diameter will have no influence upon the accuracy of the operation; for, let us suppose the apparatus to be adjusted in such a manner, that at first the two wires were in equilibrium with each other (which may easily be obtained by varying the height of the water in the vessels), these two wires will still be in equilibrium, when the beam F F, being elevated, will remain in its horizontal position: whence it follows, that if one of the wires have suspended to it a substance immersed in the water, and we place in the opposite scale, and consequently out of the water, a weight adequate to keep the equilibrium with the immersed substance, for a horizontal position of the beam, the equilibrium will still be maintained, whatever may be the elevation or depression of the beam, provided it continue in a horizontal position; for the lengths of the wires, either above or below the surface of the water, being equal, the difference between the specific weight of the water and that of the metal will operate equally upon both extremities of the beam. It is evident that this advantage will not be obtained if we employ only the wire to which the substance is suspended, and that the equilibrium, established for a certain elevation and a horizontal position of the beam, will not apply to other elevations of the beam by preserving it in the horizontal position.

"It is to be remarked, that my method compensates not only for the excess of the specific weight of the wires over that of the water, but also for that which depends upon the adhesion of the fluid to the wires, and the covering of water which they carry along with them.

"All that has been said hitherto applies only to balances that are provided with suspending handles; but, in order to render this support absolutely universal in its use, it was necessary that it should be possible to adapt it to a beam which had nothing but its centres; for which purpose I contrived an apparatus, which is suspended, like those of a common balance, to the fork $n g$, and which may receive the centres of any beam. The engraved plates of my machine represent it provided with this apparatus, the construction of which is as follows.

"A piece $s s'$ has a screwed hole bored into it at s' , into which the screw $d d$ is inserted half its length. Another hole, made at s , in a perpendicular direction to the first, receives the pin $g g$, to which all the inferior apparatus is suspended. This hole s supplies the place of that which is found at the upper extremity of the suspending handles of balances.

The two other vertical pieces $r r$, fig. 4, have at their upper part cylindrical holes not screwed, in which the screw $d d$ can turn freely. These superior parts are placed at an arbitrary distance, and retained in their situation by means of four nut-screws u, u, u, u , each of the pieces being fastened between two of these nut-screws. A cylindrical rod $h h$ traverses the inferior parts of these pieces $r r$, and is fixed there by means of nut-screws, in such a manner that the superior and inferior points of the pieces $r r$ are invariably at the same distance.

"Each of these pieces $r r$ has, upon the surface which is perpendicular to the direction of $d d$ and $h h$, a groove $e e$, and a circular aperture X, having at its lower part a small bracket of polished steel $a a$, intended to support one of the centres of the beam. Into the upper part of the grooves $e e$ a rule $e' e'$ is introduced, which must enter with tightness, and which, with the pieces $d d$ and $h h$, give such a solidity to the apparatus, that the adjustment of its parts cannot be in the smallest degree deranged. The remainder of the groove, which is not occupied by $e' e'$, ought to be of a length somewhat greater than that of the largest cock or index adapted to the beams which we shall have to use.

"The method of using the apparatus which I have just de-

scribed, is very simple. The beam which we intend to employ is placed between the two branches $r r$, which are removed from each other till the centres can be brought opposite to the circular holes X ; the pieces r, r , are then brought together in such a manner that the centres enter these holes X , and so as still to leave some room for motion between these pieces and the body of the beam, in order that the oscillations of the balance may be perfectly free. The pieces r, r , are brought parallel with each other, and the adjustment of the apparatus is rendered perfectly firm, by means of nut-screws, by the small cylindrical rod $h h$, and by the rule $e' e'$. The apparatus being adjusted in this manner, it is suspended to the fork $n q$, by inserting the pin $g g$ into the hole s , and the balance is used in the manner that has already been explained.

We know the equilibrium to be established, and the beam to be horizontal, when the index $y y$ divides the breadth of the space $e e$ into two equal parts; but, in order to ascertain the circumstance with greater accuracy, I have suspended to the rule $e' e'$ a plummet $e' i$, by means of which we may distinguish the slightest deviations of the index from the perpendicular direction."

Such is the description and use of Cit. Prony's support for the scale-beam, which, in practice, he says, perfectly answered his expectations.

SCALITZ, or **SCALA**, a town of Upper Hungary, in the county of Poson. There is a very advantageous passage by it, from Moravia to Hungary, and it is seated on the March, 50 miles N. of Preburg. Long. 17. 17. E. Lat. 49. 4. N.

SCHAGEN, or **SCAGERIE**, a promontory of North Jutland, in Denmark, at the entrance of the passage out of the ocean into the Categate. Long. 10. 6. E. Lat. 57. 16. N.

SCHAMACHIE, a town of Persia, capital of Schirvan. It was formerly very large, but is now decayed, above 6000 houses having been thrown down by an earthquake. It has manufactures of silks and cottons, and is seated on the W. side of the Caspian Sea, 250 miles N.E. of Taurus. Long. 37. 5. E. Lat. 40. 50. N.

SCHANTZ STERNEY, a fortress in the Russian government of Wiburg, seated on the Neva, a little E. of Peterburgh. Long. 37. 15. E. Lat. 60. 0. N.

SCHARNITZ, a fortified town of Germany, in the Tirol. It is a passage of great importance, on the confines of Bavaria, 12 miles N. of Innsbruck.

SCHAUENBURG, a territory of Westphalia, 22 miles long, and 10 broad, belonging to the landgrave of Hesse Cassel.

SCHAUMBURG, a town and castle of Germany, which give name to a lordship, in the circle of Lower Rhine, 23 miles N.N.W. of Mentz, and 25 W.S.W. of Wetzlar. Long. 8. 2. E. Lat. 50. 10. N.

SCHLESTADT, a strong town of France, in the department of Upper Rhine, seated on the river Ill, 20 miles S.W. of Strasburg. Long. 7. 40. E. Lat. 48. 17. N.

SCELLENBURG, a fortress of Bavaria, remarkable for a victory obtained here by the allies, over the French and Bavarians, in 1704. It is 22 miles W. of Ingolstadt. Long. 10. 58. E. Lat. 48. 46. N.

SCELLING, an island of the United Provinces, in Friesland, lying at the entrance of the Zuider-Zee. Long. 5. 10. E. Lat. 53. 20. N.

SCHENCK, a fortress of Dutch Guelderland, seated on the point where the Rhine divides into two branches, the Rhine and the Wahal. It is of great importance, as the centre of communication between Holland and Germany, and is 13 miles E. of Nimeguen. Long. 5. 26. E. Lat. 51. 55. N.

SCHENINGEN, a town of Lower Saxony, which gives

Vol. X.

name to a district, in the principality of Wolfenbüttele. It is 16 miles N. of Halberstadt, and 18 E.S.E. of Wolfenbüttele. Long. 11. 25. E. Lat. 52. 22. N.

SCHIEDAM, a town of the United Provinces, in Holland, seated on a canal, which communicates with the Maefe, four miles E. by S. of Rotterdam. Long. 4. 30. E. Lat. 51. 54. N.

SCHILTA, a strong town of Upper Hungary, in the county of Neitra, seated on the river Waag.

SCHINTZNACH, a town of Switzerland, in the canton of Bern, remarkable for its agreeable position on the Aar, and its tepid mineral waters. Near it, on a lofty eminence, are the ruins of the famous castle of Hapzburg.

SCHIRVAN, a province of Persia, bounded on the N. by Daghestan, on the E. and S.E. by the Caspian Sea, on the S.W. by Erivan, and on the W. by Georgia. It is about 150 miles in length, and 90 in breadth. Schamachie is the capital.

SCHLEUSSINGEN, a town of Franconia, in the county of Henneburg, seated on the Schleus, 10 miles S.E. of Smalkald, and 19 N.N.E. of Schweinfurt. Long. 11. 2. E. Lat. 50. 43. N.

SCHLEYDEN, a town of Westphalia, in a county of the same name, annexed to the county of Mark. It is 40 miles N. of Treves. Long. 6. 40. E. Lat. 50. 45. N.

SCHLITZ, a town of Suabia, which gives name to a county. It is situate on a small river that runs into the Fulda, seven miles N.N.W. of Fulda, and 33 E. of Giefen. Long. 9. 40. E. Lat. 50. 45. N.

SCHLUSSERBURG, a town and fortress of Russia, situate on the Neva, near lake Ladoga. The fortress stands on an island in the river, and has frequently been used as a state-prison. It is 36 miles E. of Peterburg. Long. 30. 55. E. Lat. 50. 55. N.

SCHMIDBERG, a town of Silesia, in the duchy of Jauer. Almost all the inhabitants are smiths, whence the place takes its name. It is seated at the foot of a mountain, near the source of the Bauber.

SCHNEEBERG, a town of Upper Saxony, situate on an eminence near the Mulda. Here are manufactures of thread, silk, gold, and silver-lace; and in the neighbourhood are silver mines, which formerly were very productive. It is seven miles N.W. of Schwartzburg.

SCHOMBERG, a town of Germany, in the electorate of Treves, seated on a mountain, 15 miles from Limbourg.

SCHONECK, or **SCHOENECK**, a town of Germany, in the electorate of Treves, with a castle, seated on the Eym, 27 miles N. of Treves. Long. 6. 26. E. Lat. 50. 12. N.

SCONEN, **SCANIA**, or **SKONE**, a province of Sweden, bounded on the W. by the Sound, which separates it from Zealand; on the N. by Halland and Smoland; and on the E. and S. by Blekingen and the Baltic. It is 58 miles long, and 40 broad, and is a fertile country. Lunden is the capital.

SCHONGAW, a town of Upper Bavaria, seated on the Lech, 30 miles S. of Augsburg.

SCHOOL (*Encycl.*). We have given an account of various schools established in Britain already; but some more recently established must not be overlooked. The following is extracted from an account of two schools founded by the Rev. Mr. Gilpin at Boldre in Hampshire; published by the Society for bettering the Condition of the Poor.

Two schools at Boldre in the New Forest, Hants, were established and opened on the first of July, 1791, by the Rev. Mr. Gilpin; one for twenty boys, the other for twenty girls, to be selected from the children of the day-labouring poor of the parish; a preference being given (in order to encourage reading) to children who have learnt to read a chapter in the

Testament: but, if the prescribed number of such scholars cannot be found, the deficiency is supplied by such children as cannot read.

Sixty-three boys and fifty-nine girls have already been admitted, including those at present in the schools. Their attendance commences at nine o'clock, when all the scholars are assembled for prayers. From twelve to one is allowed for dinner, which the children bring with them to school; they are dismissed in summer at five, and in winter at four o'clock; except on Saturdays, when the school breaks up at twelve. If any one is absent, or is beyond the fixed time, without a proper excuse, such child is punished by an hour's confinement and employment, at noon in winter, and in the evening in summer: and if the children have been kept at home, so as to continue absent, without leave (which leave is to be entered in a book for the inspection of the visitors), they are usually dismissed from the school, and their places filled up by such as will attend and make a better use of their time. As to vacation, a week is allowed at Whitfuntide, a fortnight at Christmas, and a month at harvest, in order to give them an opportunity of benefiting by harvest work.

The girls are taught to read, knit, spin, sew, and mend their own clothes, so as to fit them to be useful daughters, and good wives: the boys (besides being improved in their reading), are instructed in writing and arithmetic; in the first, so far as to write a legible hand, for which one copy a day is thought sufficient; and in arithmetic, so far as the four first rules, and particularly in the tables that belong to those rules.

No precise time is fixed for admission: in order that the children in the parish may be encouraged to an early proficiency in reading, as the qualification for a place in the school: nor is any precise time fixed for the removal of either the boys or girls; as it is presumed that as soon as they are made *really useful*, their parents will wish to take them away, and thereby room will be left for the admission of other children. They usually come from seven to nine years of age, and quit the school at thirteen or fourteen. As an incitement to industry, a separate account is kept of the produce of each girl's sale-work; and such produce is laid out for them in clothes and necessaries, at the end of the year. Petty offences are punished by a little extra confinement in play-hours; but no corporal correction is allowed, except for lying, swearing, stealing, indecent language, or immorality.

At the end of November, the annual account of the work of the girls is made up; and from thence to Christmas, their working hours are employed *gratis*, in making up shirts and shifts for the children in the school, and in knitting stockings (a pair each for the boys and girls) the worsted for which is given them.—At the end of the year all the children attend at the vicarage; where their clothes are examined: if there has been neglect on their part, it is noticed: and additions are, at the same time, made to their clothing.

The great object of the founder of these schools is to promote in these children the *knowledge and practice* of religion; in order that they may be able therein to instruct their own children, when they have families; an instruction, that, from local circumstances, is much wanted in the neighbourhood of the New Forest. For this purpose, Mr. Gilpin has drawn up an easy explanation of the duties of religion, by way of question and answer. This the children are taught to repeat, as well as their catechism, and are examined in it on Tuesday and Friday after dinner, and on Sunday afternoon.

The annual expence of this useful establishment does not exceed 40 guineas a-year. The master, who lives in the house, has for salary, and finding fuel, &c. 21l. year, and the habitation and garden. The mistress lives in the village; she has ten guineas a-year: and Mr. Gilpin's donations of cloth-

ing to the children, and some other incidental expences, amount to nearly ten guineas a-year more.

The school-house is a neat brick building, with the boys' school at the end next the road; and, at the other, the dwelling house, comprising the school of the girls, and looking into the garden. It is built on a healthy and beautiful situation, with a gradual descent to Lymington river. It cost 210l. On the walls of the school rooms are various texts of scripture inscribed in tablets. The children stand round the table at particular times, and read them over, with a view of imprinting on their memory some of the most useful precepts in the Testament.

For the permanent endowment of these schools after his death, Mr. Gilpin purposed to provide by the sale of his drawings and sketches, which, as we have been told, he has formed for that purpose into eighty-nine lots, each lot containing several drawings. How valuable an addition they will make to the collections of the artist, the connoisseur, and the lover of the fine arts, it will be unnecessary and presumptuous in us to endeavour to explain. The value of the drawings, enhanced by the object to which the produce is destined to be applied, must render them an enviable possession to every one, whenever (in consequence of that event which the friends of humanity hope may be long delayed) they shall be offered to the public.

The benefit of such schools, as those founded by Mr. Gilpin at Boldre, is important in every situation, and at all times; but, in the New Forest, where the children of the poor have too much disposition to partake of the natural wildness of the place, they are peculiarly necessary and beneficial.

To this we shall add the *Rules of a Spinning School* at Oakham, in the county of Rutland, published by Lord Winchelsea in the same work, with the hope of encouraging the establishment of similar institutions in other parts.

1st, All inhabitants of the parish shall be admitted.

2d, No persons to receive relief from the parish upon account of their families, who refuse to send their children to the school: unless they can prove, to the satisfaction of the overseers, that they can employ them to more advantage elsewhere.

3d, They are to be instructed gratis in spinning jersey, and linen, and in knitting: those who choose it, in reading; and those who can bring work with them, in sewing.

4th, The hours of work to be from eight to one, and from two to seven; from one to two, dinner and rest. No work after dinner on Saturdays.

5th, A dinner to be provided for those who choose to dine at the school on the working days: for which they are to pay each 6d. per week.

6th, In case of illness, the dinner may be sent for to their homes.

7th, The portions, if the dinner is sent out, to be as follows:

One pint and half of peas porridge.

ditto ditto of rice milk.

One pint and half of rice broth.

One pound and half of potatoe pudding.

Those who dine at the school, to have as much as they choose to eat, and a quarter of a pound of bread each: except on the pudding and rice milk days, when no bread is allowed.

8th, The *whole of the earnings* to belong to the children.

A spinning school had been established at Oakham, in 1787: but, till this arrangement took place, the children used to go home to their dinner; which was attended with great inconvenience in wet and bad weather, and with loss of time; as, frequently, when the weather was very

bad, they did not return after dinner; and sometimes did not go at all.

In order to establish the present system, the dinners, for the first fortnight, were given gratis, and the parents invited to taste them; after that they were informed, that the children of those who approved of the plan, *might* dine there, upon paying *fixpence a-week*; and those whose parents preferred their dining at home, *might* continue to do so. The whole of the parents approved much of their dining at the school; and the whole number, which amounts to between sixty and seventy, dine there, and pay their money. They do more work in the week by these means, and get a much better dinner than they could at home. Several children come there, whose parents do not receive relief.

By purchasing the different articles wholesale, by the use of barley bread (which is customary at that place), and by means of a Rumford copper, the expence for the dinners and fuel has never exceeded the *fixpence per head*. The peas porridge, and pudding, are those recommended in Count Rumford's essay.

Lord Winchelsea conceives, that the success, which has hitherto attended this plan, is owing to its having been left to the *option* of the parents, whether their children should dine there or not.

SCHOONHOVEN, a strong town of the United Provinces, in Holland, with a commodious haven, seated on the Leck, 14 miles E. of Rotterdam. Long. 4. 54. E. Lat. 51. 68. N.

SCHORNDORF, a town of Suabia, in the duchy of Wirtemberg, with a strong castle. Here are salt springs, from which a great deal of salt is made. This place was possessed by the French in August, 1796. It is seated on the Rems, 11 miles N.E. of Stuttgart. Long. 8. 54. E. Lat. 48. 56. N.

SCHWALBACH, a village of Germany, in the circle of Upper Rhine and county of Nassau, frequented for its mineral waters, which are of a similar nature to those of Spa. It is seated on the river Aa, nine miles N. of Mentz.

SCHWARTZ, a town of Germany, in the Tirol, famous for its mines of different metals. It is seated on the river Ill, 14 miles N.E. of Inspruc. Long. 11. 42. E. Lat. 47. 19. N.

SCHWELM, a town of Westphalia, in the county of Mark. Near it are some medicinal springs. It is 22 miles N.E. of Cologne, and 22 E. of Dusseldorf. Long. 7. 25. E. Lat. 51. 10. N.

SCHWERIN, a town of Lower Saxony, capital of the duchy of Mecklenburgh Schwerin. It is divided into four parts; namely, Schwerin, the New Town, the island of Schelf, and the Moor, which are all nearly encircled by a beautiful lake. The cathedral is a fine Gothic pile, with a lofty spire. The ducal palace and gardens are on an island in the lake, and have a communication with the town by a drawbridge. It is 33 miles W. by S. of Gustrów. Long. 11. 48. E. Lat. 53. 48. N.

SCIATI, an island of the Archipelago, near the coast of Janna, 20 miles to the N. of Negropont, and almost at the entrance of the gulf of Salonichi. It is 22 miles in length, and eight in breadth. Long. 23. 40. E. Lat. 30. 26. N.

SCOPELO, an island of the Archipelago, five miles E. of Sciati, and 17 N. of Negropont. It lies at the entrance of the gulf of Salonichi, and is 10 miles long and five broad. It is very fertile, produces plenty of good wine, and contains 12,000 inhabitants, who are almost all Greeks.

SCOPIA, or **USCAPIA**, a town of Turkey in Europe, in Bulgaria, with an archbishop's see. It is seated on the Vardar,

over which is a bridge of 12 arches, 67 miles W.S.W. of Sofia. Long. 22. 25. E. Lat. 42. 10. N.

SCUTARI, a strong town of Turkey in Europe, capital of Upper Albania, with a bishop's see. It is seated on the lake Zeta, at the mouth of the river Bocana, 20 miles N.E. of Antivari, and 47 N.W. of Albanopolis. Long. 10. 25. E. Lat. 42. 35. N.

SCUTARI, a town of Turkey in Asia, in Natolia, with a good harbour, seated on the E. side of Constantinople, of which it is considered as a suburb, being directly opposite. It contains a handsome mosque, and is built on the side of a hill. Long. 29. 4. E. Lat. 41. 0. N.

SCYTHE, or **SITHE**, an instrument of husbandry, employed for the purpose of cutting grass, and also for the mowing of corn.

Before we attempt a description of the latest improvements on this rural instrument, we shall briefly observe, that the well known *Hainault*, or *French scythe*, for reaping wheat, has of late years met with many advocates in Britain. It consists, according to the description given by Dr. Templeman, of a short blade, being one-third of the length of those commonly used in England; with a wooden handle to be held in the right hand, having a bend and a broad rounded piece at the upper end, for the support of the arm. Further, an iron hook is fixed to a staff, four feet in length, made of oak or ash, to be used with the left hand, with a mortise near the end, for the convenience of the husbandman's carrying the scythe on his shoulder. On the handle of the scythes, and staff of the hook, at about half a yard from the bottom, are placed leather loops for the fingers, to keep the two grasps at proper distances from the ground.

Having already stated the disadvantages, which cannot be avoided in the use of *fickles* for cutting corn under the head of husbandry, and likewise pointed out the superior utility of scythes, we shall now give a description of *two* instruments, which are eminently calculated for both purposes. These scythes were first introduced to public notice by the Patriotic Society of Milan, in one of the earlier volumes of their Transactions. Convinced of the inconveniences arising from the use of the common instruments, they procured a model of a *Silesian scythe*, with which the corn of that country is uniformly mown. Having caused a similar instrument to be constructed, it was accordingly tried; and, notwithstanding its imperfect manufacture, as well as this circumstance, that the labourer had never used a scythe on such principles, it was fully proved, that *nearly half the usual time was saved*, and the fatigue or labour was considerably lessened. Further, the corn was thus cut without receiving any injury from the concussion in falling to the ground, on which it was spread in a regular manner, so that it could be easily formed into sheaves. The Milanese Society was afterwards presented with an Austrian implement, different from the Silesian in a few respects, which will be noticed in the subsequent account.

Figure 1, Pl. 46. represents the *Silesian scythe*, which varies little from that commonly employed for mowing grass: the blade, however, is somewhat smaller, and has four wooden teeth which are fixed parallel to it, with a view to prevent the grain from being scattered, when it is cut: so that the labourer is enabled to lay it on the ground in an even and regular way. *a, b*, the handle, which is two Milanese braccia and nine inches and a half, or about four feet and four inches English measure, in length. *b, c*, represents the blade, being one braccia, and three and a half Milanese inches, or about two feet one inch long.—The piece of wood, in which the teeth are inserted, is one braccia, one inch and a half, or nearly two feet in length.

The *Austrian scythe* greatly resembles the instrument above delineated, excepting that the blade is larger, and the number of wooden teeth is increased to five, which are consequently longer.

The Patriotic Society of Milan observe in their Memoir, that the difference in the construction of these two implements, will render it necessary to employ each of them in a peculiar manner, which can only be acquired by practice. They further remark, that though, in mowing grass, the feet are kept in a direction nearly parallel to each other, it will be advisable to place them, when corn is reaping, in a line, one behind the other, the right foot being thrust forward, and the left drawn towards it; because, in the latter case, if they were advanced in a parallel manner, the labourer would be obliged to turn and bend his body in a very inconvenient posture.

Such of our agricultural readers as are accustomed to the use of the common scythe, will easily ascertain the most suitable and advantageous mode of employing the instrument now described: and, before we complete the history of the new implements, it will not be too great a digression from the subject to give (from the *Domestic Encyclopædia*) the manner of reaping wheat in Flanders, by means of a very simple scythe, greatly resembling that above explained by Dr. Templeman; and a model of which is preserved in the Repository of the "Society for the Encouragement of Arts, &c." in London. Another account, as well as a representation of this useful implement, was communicated to the public by Mr. Adam Walker, in 1788, and inserted in the 9th volume of *Annals of Agriculture*, where he observes, that corn, thick clover, and vetches, are thus cut down with great regularity, and such expedition, as to surpass the sickle, in the proportion of three to one.

After the above-given descriptions, and observations, relative to the *Silesian scythe*, had been published, the Milanese Patriotic Society made additional experiments, from which it appeared, that when the stalks of corn are bent down in consequence of heavy rains, the wooden teeth are apt to catch some of the ears, to the stalks of which the blade does not extend; and this not being cut below, the ears are pulled down and the grain is scattered. This accident happens principally, when the labourers, not being sufficiently acquainted with the use of the scythe, are unable to adapt it to particular circumstances.

To remedy these inconveniences, it occurred to an ingenious blacksmith, to add a collector or gatherer, made of cloth, the construction of which is represented in the plate at fig. 2. *a, b, c*, is a common scythe. *c, d, m, l, o, f, n*, &c. The gatherer; which at *c, d, e*, is composed of a thin iron plate; having a cavity at its extremity, for receiving the point of the blade. At *e, d*, are holes for sewing in the cloth, which is light, coarse, and cheap: it is likewise fixed to two thick iron wires, the upper of which is continued to *f*, where it terminates in a hole, in the handle:—the other is secured to the back of the blade. The method of fixing the gatherer to such blade, will be more clearly understood by referring to the figure, delineated in the plate, fig. 2. and representing one of the irons, which are secured by means of screws to the back of the scythe. These irons proceed from, and constitute a part of, the upright irons, *m, n, l, o*, that serve to keep the gatherer extended.

This contrivance is very simple and cheap; an attempt, however, has been made to simplify it still further, by substituting for the gatherer two iron hoops, represented in the figure last referred to, by the dotted lines, marked *h, g, k, i*, with a cross-piece that serves to connect them; thus saving the cloth and iron plate before described.—Experiments, how-

ever, have been made with both these implements; from the result of which it appears, that the gatherer is, upon the whole, preferable to the hoops, as no ears of corn are left behind; and that the latter alteration promises to be most serviceable, when there is no short corn, that can insinuate itself between such iron hoops.

SEAFORD, a borough and sea-port in Suffex, which sends two members to parliament, but has no market. It is eight miles S.E. of Lewes, and 59 S. by E. of London. Long. 0. 10. E. Lat. 50. 50. N.

SEATON, or PORT SEATON, a sea-port, in Haddingtonshire. Here is a ruinous palace, in which Mary queen of Scots occasionally kept her court, after her return from France. In the chapel are several curious monuments of marble. Seaton has a considerable trade in salt and coal, and is situate on the Frith of Forth, nine miles E. of Edinburgh. Long. 2. 54. W. Lat. 56. 0. N.

SEBASTIA, a town of Turkey in Asia, in Palestine, the remains of the ancient city of Samaria. It is 34 miles N.N.E. of Jerusalem. Long. 35. 40. E. Lat. 32. 15. N.

SEBASTIAN, St. a large city of Brasil, capital of the province of Rio Janeiro, and a bishop's see. It has a very extensive and commodious harbour, defended by numerous forts. The city stands on low ground, which was formerly swampy, and is surrounded by high hills, which exclude the benefit of the refreshing sea and land breezes; so that it is suffocatingly hot, and unhealthy, in the summer. The different mechanics carry on their business in distinct parts of the town; particular streets being set apart for particular trades. On the S. side of a spacious square is the palace of the viceroy; and there are several other squares, in which are fountains, supplied with water by an aqueduct, of considerable length, brought over valleys by a double row of arches. A Benedictine convent and a fort are on the extreme point, jutting into the harbour, opposite to which is Serpent Island, where there are a dock-yard, magazines, and naval store-houses. In another part of the harbour, at a place called Val Longo, are the warehouses for the reception, and preparation for sale, of the slaves imported from Africa. St. Sebastian is seated near the mouth of the Rio Janeiro, in the Atlantic. Long. 42. 44. W. Lat. 22. 54. S.

SEBASTOPOLIS, or SAGATOPOLI, a town of Mingrelia, on the Black Sea. It was put under the protection of Russia, in 1783. It is 220 miles W.N.W. of Teflis, and 260 N.N.W. of Erivan. Long. 55. 15. E. Lat. 46. 10. N.

SEBOURG, a town of France, in the department of the North, 12 miles E. of Valenciennes, and 12 S.E. of Condé. Long. 3. 50. E. Lat. 50. 22. N.

SECHURA, a town of Peru, in the bishopric of Truxillo, situate near the mouth of a river of the same name, 30 miles S.S.E. of Païta, and 180 N.N.W. of Truxillo. Long. 81. 10. E. Lat. 5. 55. S.

SECKAU, a town of Germany, in Upper Stiria, with a bishop's see; seated on the Gayle, nine miles N. of Judenbourg, and 90 S.W. of Vienna. Long. 14. 27. E. Lat. 47. 10. N.

SECKENHEIM, a town of Germany, in the palatinate of the Rhine, near which the elector, Frederic I. gained an important victory in 1462. It is four miles E. of Mannheim.

SECKINGEN, a town of Suabia, one of the forest towns. It belongs to the house of Austria, and is seated on an isle, formed by the Rhine, six miles S.E. of Rheinfelden, and 27 W. of Scaffenhausen. Long. 7. 57. E. Lat. 47. 34. N.

SECKINGTON, a village in Warwickshire, near Tamworth; famous for a battle, fought in 757, between Cuthred, king of the West Saxons, and Ethelbald, king of the

Well-Tube.

Scythe.

Fig. 1.

Fig. 2.

Time-Keeper.

Mercians. On the north side of its church are the ruins of a fort, and near it an artificial hill, 45 feet high.

SEECHING, a town in Norfolk, with a market on Tuefday, feated on a fmall navigable river, four miles S. of Lynn, and 93 N.E. of London. Long. 0. 24. E. Lat. 52. 44. N.

SEER, a town of Arabia, capital of a principality, in the province of Oman. It is 108 miles W.S.W. of Julfar. Long. 54. 38. E. Lat. 25. 10. N.

SEEZ, an ancient and confiderable town of France, in the department of Orne, with a bifhop's fee; feated in a fine country, near the fource of the Orne, 12 miles N. of Alençon, and 102 W. by S. of Paris. Long. 0. 15. E. Lat. 48. 36. N.

SEGESTAN, a province of Perfia, bounded on the north by Korafan and Balck, on the eaft by Candahar and Sableftan, on the S. by Mackerran, on the S.W. by Kernan, and on the W. by Covheftan and Pariftan.

SEGESWAR, a town of Tranfylvania, capital of a county of the fame name. It is built in the form of an amphitheatre, on the fide of a hill, near the river Kokel, 47 miles north of Hermanftadt. Long. 24. 55. E. Lat. 47. 4. N.

SEGRA, a river of Spain, which rifes in the Pyrenées, and runs S.W. through Catalonia, paffing by Puy-Cerda, Urgel, Belaguer, Lerida, and Mequinenza, where it falls into the Ebro.

SEGURA, a town of Portugal, in Beira, with a caftle on a mountain. It is near the rivers Elia and Tago, eight miles S.E. of Caftel-Branco, and 30 N.W. of Alcantara.

SEGURA, a town of Spain, in New Caftile, and territory of La Mancha, feated among the mountains of Segura, 35 miles N.E. of Baeza. Long. 2. 39. W. Lat. 37. 56. N.

SEGURA, a river of Spain, which rifes in the mountains of Segura, in New Caftile, and croffing Murcia, and the fourth part of Valencia, falls into the Mediterranean.

SEHARANPOUR, a town of Hindooftan Proper, capital of a diftrict of the fame name, between the Jumna and the Ganges, in the country of Delhi. It is 86 miles N. of Delhi. Long. 77. 15. E. Lat. 30. 4. N.

SEINE, a river of France, which rifes in the department of Côte d'Or, and flowing by Troyes, Melun, Paris, and Rouen, falls into the Englifh Channel, at Havre de Grace.

SEINE, Lower, a department of France, including part of the late province of Normandy. Rouen is the capital.

SEINE AND MARNE, a department of France, including part of the late province of the Ifle of France; Meux is the capital.

SEINE AND OISE, a department of France, including part of the late province of the Ifle of France. Verfailles is the capital.

SEINSHEIM, a town of Franconia, with a caftle, 33 miles N.W. of Nuremberg. Long. 10. 28. E. Lat. 49. 40. N.

SEIR, or **HOR**, a mountain in Arabia Petrea, from which formerly bounded Judea on the S. and feperated it from Idumæa. It is now called Sardeny, and is 140 miles E. of Cairo, in Egypt.

SELAM, a town of Mexico, in the province of Jucatan, fuate near the fea-coaft, 45 miles N.W. of Merida. Long. 90. 28. W. Lat. 39. 12. N.

SELBY, a town in the Weft Riding of Yorkfhire, with a market on Monday, feated on the Oufe, 12 miles S. of York, and 182 N. by W. of London. Long. 1. 2. W. Lat. 53. 47. N.

SELESHTIA, anciently **SELEUCIA**, a town of Turkey, in Afia, in Caramania, 10 miles from the fea, and 58 W. of Terafto.

SELIGENSTADT, a town of Germany, in the electorate Vol. X.

of Mentz, formerly imperial. It is feated at the confluence of the Gernpentez and Maine, 14 miles E. of Francfort, and 27 E. of Mentz. Long. 8. 32. E. Lat. 49. 54. N.

SELIVREA, a town of Turkey in Europe, in Romania, with an archbifhop's fee. It was a large place, but is now much decayed. It is feated on the fea of Marmora, 35 miles W. of Conftantinople. Long. 28. 12. E. Lat. 41. 4. N.

SELLES, a town of France, in the department of Loir and Cher, with a caftle, over which is a bridge, 12 miles S.E. of Blois, and 105 S.S.W. of Paris. Long. 1. 56. E. Lat. 47. 25. N.

SELTZ, a town of France, in the department of Lower Rhine, feated on the Rhine, 270 miles E. of Paris. Long. 8. 12. E. Lat. 48. 53. N.

SEMENNUD, a town of Egypt, on the E. branch of the Nile, eight miles S.S.W. of Manfoura, and 53 N. of Cairo. Long. 31. 30. E. Lat. 31. 5. N.

SEMIGALLIA, the E. part of the duchy of Courland, feperated by the river Mafza, from Courland Proper. Mittau is the capital.

SEMINARI, a town of Naples, in Calabria Ulteriori, 22 miles N.E. of Reggio. Long. 10. 21. E. Lat. 38. 20. N.

SEMINOLAS, a divifion of the Creek Indians, which inhabit a fertile country on the rivers Appalachikola and Flint, in the ftate of Georgia, in North America.

SEMLIN, a town of Sclavonia, on the W. fide of the Danube and Save, oppofite Belgrade, and 70 miles S.E. of Eick. Long. 21. 0. E. Lat. 45. 20. N.

SEMPACH, a lake of Switzerland, in the canton of Lucern, three miles long and one broad. The banks on each fide flope gently to the edge of the water, and are checkered with wood.

SEMPACH, a town of Switzerland, in the canton of Lucern: celebrated for the battle which eftablifhed the liberty of the Swifs, and in which Leopold duke of Auftria was defeated and flain. The anniversary of this battle, which happened July 9, 1386, is commemorated with great folemnity, both at Sempach and Lucern. Sempach is feated on a lake of the fame name, feven miles N.W. of Lucern. Long. 7. 57. E. Lat. 47. 10. N.

SEMUR, a town of France, in the department of Côte d'Or, with a caftle. It has a manufacture of cloth, and is feated on the Armançon, over which are two bridges, 37 miles N. of Autun, and 135 S.E. of Paris. Long. 4. 19. E. Lat. 47. 28. N.

SEMUR-EN-BRIENNOIS, an ancient town of France, in the department of Saone and Loire, 40 miles N.W. of Lyons, and 175 S. of Paris. Long. 4. 22. E. Lat. 46. 14. N.

SENA, or **MARZALI**, a town of Monemotapa, on the river Zambeze, where the Portuguefe have a factory. Long. 32. 3. E. Lat. 18. 2. S.

SENEFFE, a town of Aufrian Brabant, four miles S. of Nivelle; famous for a battle gained by the French over the Prince of Orange, in 1674.

SENEZ, a town of France, in the department of Lower Alps, feated in a rough barren country, 46 miles N.E. of Aix, and 49 N.W. of Nice. Long. 6. 40. E. Lat. 43. 59. N.

SENLS, an ancient town of France, in the department of Oife, lately a bifhop's fee. The cathedral has one of the higheft fteeples in France. It is feated on the fide of a hill, on the river Nonette, almoft furrounded by a large foreft, 20 miles N.W. of Meaux, and 27 N.E. of Paris. Long. 2. 40. E. Lat. 49. 12. N.

SENS, an ancient town of France, in the department of Yonne, with a bifhop's fee. The metropolitan church is a handfome Gothic ftructure. The dauphin and dauphinefs, parents of Lewis XVI. were interred in this church; and here was lately their monument, a mafter-piece of Couffon's,

crowned by two urns united, expressive of the unalterable affection of this virtuous pair. It was the last request of the unfortunate monarch, their son, to the National Convention, that his remains might be interred with theirs; a request which they refused. Sens is seated in a fertile country, at the confluence of the Vanne with the Yonne, 25 miles N. of Auxerre, and 60 S.E. of Paris. Long. 3. 22. E. Lat. 48. 12. N.

SERA, a town of the peninsula of Hindoostan, in the Mysore country, 55 miles N. of Seringapatam, and 58 N.W. of Bangalore. Long. 75. 54. E. Lat. 13. 28. N.

SERAI, a town of Turkey in Europe, capital of Bosnia, 110 miles S.W. of Belgrade. Long. 18. 5. E. Lat. 44. 24. N.

SERAMPOUR, a town of Hindoostan Proper, in Bengal, seated on Hoogly River, a small distance above Calcutta. It is a Danish settlement, and carries on a considerable trade.

SERAVALLE, a town of Italy, in the duchy of Milan, 24 miles N. of Genoa. Long. 8. 36. E. Lat. 44. 44. N.

SERCELLI, a sea-port of the kingdom of Algiers, a little to the W. of Algiers. Long. 2. 20. E. Lat. 36. 50. N.

SERDOBOL, a town of Russia, in the government of Wiburg, situate on the lake Ladoga, 60 miles N.N.E. of Wiburg. Long. 30. 15. E. Lat. 61. 45. N.

SERFO, or SERFANTE, an island of the Archipelago, 50 miles N.W. of Naxia. It is eight miles long and five broad, and full of mountains and rocks, in which are mines of iron and loadstone. The inhabitants are all Greeks, and have but one town, called St. Nicholo, which is a poor place. Long. 25. 10. E. Lat. 37. 19. N.

SERGAG, a town of Russia, in the government of Niznei Novogorod, 48 miles S.E. of Niznei Novogorod. Long. 45. 20. E. Lat. 56. 25. N.

SERGIPPY, a sea-port of Brazil, capital of a government of the same name. It is seated at the mouth of the Rey, 120 miles N.E. of St. Salvador. Long. 39. 46. W. Lat. 31. 30. N.

SERPA, a strong town of Portugal, in Alentejo, seated on a rugged eminence, with a castle, three miles from the Guadiana, and 83 S.E. of Lisbon. Long. 7. 45. W. Lat. 37. 47. N.

SERRES, a town of France, in the department of Upper Alps, 15 miles S.W. of Gap.

SERVULO, a castle of Austrian Istria, seated on a high mountain, four miles from Trieste. Near it is a famous cavern, in which the sparry exudations have formed various figures of blue and white colours.

SESSA, an ancient town of Naples, in Terra di Lavoro, with a bishop's see. It was formerly very considerable, and is 30 miles N. of Naples. Long. 14. 19. E. Lat. 41. 20. N.

SESTRI-DI-LEVANT, an ancient town of Italy, in the territory of Genoa, 30 miles W. of Genoa. Long. 9. 28. E. Lat. 44. 23. N.

SE-TCHUEN, a province of China, bounded on the N. by Chen-fu, on the E. by Hou-quang, on the S. by Koei-tcheou, and on the W. by Thibet. It is watered by the great river Yang-tie-king, and is rich, not only on account of the great quantity of silk it produces, but its mines of iron, tin, and lead, as well as its amber, sugar-canes, and lapis lazuli. It likewise abounds in mulk, rhubarb, &c. Tching-tou fou is the capital.

SETIMO, a town of Piedmont, seated on the Po, eight miles N. of Turin. Long. 7. 47. E. Lat. 45. 14. N.

SETLEGE, a river of Hindoostan Proper, the most easterly of the five eastern branches of the Indus. About midway

between its source and the Indus, it receives the Beyah, and joins the Indus a great way to the S. of Moultan.

SETTENIL, a town of Spain, in Granada, eight miles N. of Ronda, and 38 N.W. of Malaga. Long. 5. 10. W. Lat. 36. 48. N.

SETTIA, a town of the island of Candia, with a Greek bishop's see, 48 miles E.S.E. of Candia. Long. 26. 2. E. Lat. 35. 3. N.

SETTLE, a town in the West Riding of Yorkshire, with a market on Tuesday. It is seated on the Ribble, over which is a bridge, 28 miles E. by N. of Lancaster, and 235 N.N.W. of London. Long. 2. 15. W. Lat. 54. 6. N.

SEVEN ISLANDS, islands to that number, in the Frozen Ocean, lying in long. 18. 48. E. Lat. 80. 31. N. Among those islands Captain Phipps, with the Race-horle and Carcais, were surrounded by the ice, from the 31st of July to the 10th of August, 1773, when a brisk wind at N.N.E. effected their deliverance.

SEVENOAKS, a town in Kent, with a market on Saturdays. It obtained its name from seven large oaks which were near it when it was first built. Here is an hospital for the maintenance of aged people, with a free school, first erected by Sir William Sevenoaks, lord mayor of London in 1418, who is said to have been a foundling, charitably educated by a person of this town. Queen Elizabeth having augmented the revenues of the school, it was called Queen Elizabeth's School; and the whole was rebuilt of stone in 1727. Near this town is Knole, an ancient palace of the see of Canterbury, which Archbishop Cranmer exchanged with the crown for other lands, and Queen Elizabeth gave to Thomas lord Buckhurst, afterward earl of Dorset, from whom it descended to the present Duke of Dorset. In 1450, the rebel John Cade defeated the royal army near this town. It is six miles N.W. of Tunbridge, and 23 S.E. of London. Long. 0. 18. E. Lat. 51. 19. N.

SEVER, St. a town of France, in the department of Landes, seated on the Adour, 20 miles E. of Dax, and 65 S. by E. of Bourdeaux. Long. 0. 35. W. Lat. 43. 45. N.

SEVERNDROOG, an island of Hindoostan Proper, 60 miles S. of Bombay. Here was a strong fort that belonged to Angria the pirate, which was taken by Commodore James, in 1756.

SEVERO, a town of Naples, in Capitanata, with a bishop's see, seated in a plain, 75 miles N.E. of Naples. Long. 15. 34. E. Lat. 41. 40. N.

SEVRES, Two, a department of France, including part of the late province of Poitou. It is so named from two rivers, one of which flows W. by St. Maxient and Niort, into the bay of Biscay, opposite the isle of Rhé, and the other takes a N.W. direction, passes by Clisson, and enters the river Loire, opposite Nantes. St. Maxient is the capital.

SEWALICK, MOUNT, a chain of mountains that borders on the level country, on the N. of the province of Delhi, in Hindoostan Proper. At Hudwar, the Ganges forces its way through this ridge into the plains of Hindoostan.

SEYSSSEL, a town of France, in the department of Ain. It is divided by the Rhone, which here begins to be navigable, into two parts; of which the eastern was ceded to the King of Sardinia, by the treaty of Turin, in 1760. It is 14 miles N.E. of Belley. Long. 7. 45. E. Lat. 46. 6. N.

SEZANNE, a town of France, in the department of Marne, seated on a little river, 27 miles N.W. of Troyes, and 65 S.E. of Paris. Long. 4. 10. E. Lat. 48. 41. N.

SEZZA, a town of Naples, in Terra di Lavoro, with a bishop's see, 29 miles N.N.W. of Naples, and 72 S.E. of Rome. Long. 13. 45. E. Lat. 41. 11. N.

SHABUR, a town of Egypt, on the W. branch of the

Nile, 48 miles S.E. of Alexandria, and 50 N.N.W. of Cairo. Long. 30. 58. E. Lat. 30. 47. N.

SHAHJEHANPOUR, a town of Hindoostan Proper, in the province of Malwa, 20 miles N.E. of Ougain, and 196 S. of Agimere. Long. 76. 18. E. Lat. 23. 26. N.

SHEFFORD, a town of Bedfordshire, with a market on Friday, feated between two rivulets, which unite their streams below the town, and fall into the Ouse. It is eight miles S.E. of Bedford, and 41 N. by W. of London. Long. 0. 21. W. Lat. 52. 8. N.

SHEFNAL, a town in Shropshire, with a market on Friday, nine miles N.E. of Bridgenorth, and 136 N.W. of London. Long. 2. 23. W. Lat. 52. 42. N.

SHELburne, a town of Nova Scotia, situate at Port Rowley. It extends two miles on the water side, and one mile backward, with wide streets crossing each other at right angles. The harbour is deep, capacious, and secure. About a mile from Shelburne, and separated from it by a small river, is the Black Town, containing about 1200 free blacks, who served on the royal side during the American war. Shelburne is 100 miles S.W. of Halifax. Long. 65. 0. W. Lat. 43. 46. N.

SHELLA, a town of Morocco. It is considered as a sacred asylum, and none are allowed to enter it but Mahometans. It is four miles E. of Sallee.

SHENAN (*Encycl.*). The note referred to in that article is to the following effect. Shenan, an eastern dyeing-drug, may be procured at any of the ports in the Levant. It is the *Salicornia*—the eastern jointed-kali, and grows in that part of the world plentifully. The lesser species of *salicornia* found on the coasts of Britain is not found to equal the foreign in the process of dyeing; though the experiments yet made towards ascertaining the fact are by no means decisive.

SHEPTON MALLET, a town in Somersetshire, with a market on Friday, and a considerable manufacture of second cloths, the principal material of which is fine English wool. It is feated under Mendip Hills, 17 miles S.W. of Bath, and 114 W. of London. Long. 2. 30. W. Lat. 51. 9. N.

SHERBORN, a town in Dorsetshire, with a market on Thursday and Saturday. It was formerly a bishop's see, and had three churches, though now but one, which was the cathedral, and in it are interred the Saxon kings Ethelbald and Ethelbert. It had also a castle, now in ruins. Here is a famous free-school, founded by Edward VI.: two large silk mills; and a conduit of excellent water, which is continually running. It is 16 miles N. by W. of Dorchester, and 113 W. by S. of London. Long. 2. 41. E. Lat. 50. 54. N.

SHEVAGUNGA, a town of the peninsula of Hindoostan, in the Myfore country, 25 miles N.W. of Bangalore. Long. 77. 18. E. Lat. 13. 20. N.

SHIPPENSBURG, a town of Pennsylvania, in Cumberland County, 21 miles N.E. of Chambersburg. Long. 77. 35. W. Lat. 45. 50. N.

SHIPTON, an ancient town in Worcestershire, though surrounded by Warwickshire, with a market on Saturday. It is feated on the Stour, 14 miles W. of Banbury, and 83 N.W. of London. Long. 1. 25. W. Lat. 52. 5. N.

SHOALEs, ISLES OF, in North America, on the coast of New Hampshire. They lie conveniently for the cod fishery, which was formerly carried on here to great advantage; but the inhabitants are now few and poor.

SHOGLE, a town of Syria, feated on the Asi, anciently called Orontes, over which is a bridge of 13 arches. It is 18 miles S. by E. of Antioch, and 45 S.W. of Aleppo. Long. 36. 40. E. Lat. 35. 20. N.

SHOOMSKA, one of the Kurile Islands, three leagues S. of Cape Lopatka, in Kamtschatka. Its inhabitants consist of a mixture of natives and Kamtschadales.

SHOP, the lower front apartment of a house in which goods are displayed for sale by retail. Shops of this description are too generally known to require particular notice; but the following extract from an account of a *Village shop* at Greenford, in Middlesex, by the Rev. Dr. Glasse, will shew that some recent establishments useful to the poor have been opened under the appellation of shops.

"In January, 1800," says Dr. Glasse, "I resolved to open a village shop at Greenford, as nearly as possible on the plan of that at Mongewell: for this purpose I fitted up a room near my house, and appointed an intelligent young woman, one of my servants, to the office of shop-keeper; the time of sale being limited to the hour between twelve and one o'clock; which I knew would not be inconvenient to those for whom the shop was intended, as they almost all live near to my house. I proposed to supply them with bacon, cheese, butter, rice, soap, sugar, and tea. We had no difficulty in conducting the sale of any of these articles, except the last, which, being a subject of excise, could not be dealt in without a licence specially taken out for that purpose. This I thought at first might be dispensed with; but the excise-man is obliged, by his oath, to require it. Accordingly a licence was obtained, at the expence of only a few shillings; and the young woman's name, as a dealer in tea, &c. was written on the door of her shop.

"The principal objection to a village-shop, was, in this instance, removed by an established shop-keeper in the village having just left off business; there being only one remaining, the keeper of which had other sufficient means of support. I was therefore doing no material injury to any one, in the service which I was endeavouring to render to many.

"I determined to lay in every article for sale of the best kind, and to sell it at the prime cost; and the poor, in consequence of an arrangement, which had their comfort and advantage for its sole object, were immediately supplied for ready money only with the necessaries of life; at a price, which, on comparison with what they had been accustomed to pay, appeared to them to be extremely moderate and reasonable. It is true, however, that, at the best, every article which they now purchase, must come to them exceedingly dear.

"Whoever deals at the shop, is supplied with a card or ticket, inscribed with his or her name; which is to be given to the parish clerk, in church, by some one grown up person of the family, after morning or evening service. This ticket the clerk is to bring to the shop on Monday: and if by the absence of any ticket it appears that the owner was absent from church on the preceding day, such owner, unless a satisfactory reason can be given, is deprived of the advantages of the shop for the ensuing week.

"The receipts, in six months, are rather better than 150*l.* and the savings, to the poor, beside the prevention of frequent journeys to Brentford (four miles), and that chiefly on Sunday morning, are different on different articles; on none less than 15 per cent.; on some, 20 per cent. and on others, 25 per cent.

"I should have mentioned, that, although the hour of applying to the shop is limited on other days, to between twelve and one, yet on Saturdays it is open from six till nine in the evening. The labourers have prevailed on their employers to lay aside the practice of paying wages on Sunday; and urge, as an argument, the necessity of their carrying money in their hands when they go to this shop, to purchase the necessary supplies for their families, on Saturday evening. I hope I shall be able to continue this mode of affluence to the poor, and to extend it with effect to other articles; particularly to those of coals and potatoes; the latter of which

we are now selling to the poor, at one halfpenny a pound; but they are small, though of the best sort. Our price for coals never exceeds one shilling a bushel; which, at the present cost of the article, will require a subvention to support it: as, if the demand were great, the deficiency would be too considerable to be conveniently supported by an individual.

"It is but too obvious, how much the poor are imposed upon by the petty shopkeepers, in the necessaries which they are enabled to purchase. The quality of the goods is not the best: the price is extravagantly high; and the quantity is reduced by deceitful weights, and a scanty measure. This is so often the case, as to call for a particular attention to two recent acts of parliament for the inspection of weights and balances: and I cannot help considering those officers who undertake this enquiry, when they faithfully discharge their duty, as public benefactors.

"One great advantage, which I hope my poor neighbours will derive from my shop, will be an established habit of *paying ready money*; for we have no book debts. In too many cases, the ready cash used to go *à l'eschère*, doing no good, but much harm: while the poor shopkeeper was the principal creditor, and thought himself justified in charging an extravagant price, to make himself amends for long credit, and frequent losses of the whole debt.

"There is another benefit much more important, which, I hope, will arise from this little institution: and that is, that the poor will acquire a habit of attending public worship on the Lord's day. By the church ticket, required to be delivered to the clerk, the congregation is greatly increased; the habit of indolence, perhaps, rather than downright irreligion, which kept them from church, is overcome, and an improvement in the morals of my customers may reasonably be expected."

A shop of this kind had been opened, in 1794, at Mongewell in Oxfordshire. An account of its beneficial effects is related in the Reports of the Society for bettering the Condition of the Poor by the Bishop of Durham.

SHOREHAM, a borough in Sussex, with a market on Saturday. It sends two members to parliament, and is commonly called New Shoreham, to distinguish it from the Old, which lies near it, and is now of little account. It is seated on an arm of the sea, which makes it a place of some trade, and many small vessels are built here. It is 16 miles N.W. of Newhaven, and 56 S. by W. of London. Long. $0^{\circ} 15'$ W. Lat. $56^{\circ} 54'$ N.

SIARA, a town of Brasil, capital of a captainship of the same name, which lies between those of Maraguan and Rio-Grande, on the N. coast. In the neighbourhood is a fort, on a mountain, near the river Siara. Long. $39^{\circ} 35'$ W. Lat. $3^{\circ} 15'$ S.

SIASKOI, a town of Russia, in the government of Peterfborg, near the lake Ladoga, 24 miles N.E. of New Ladoga. Long. $30^{\circ} 47'$ E. Lat. $60^{\circ} 16'$ N.

SICAL, a town of Mexico, on the N. coast of the province of Jucatan, 70 miles N.W. of Merida. Long. $90^{\circ} 30'$ W. Lat. $30^{\circ} 30'$ N.

SICHEM, a town of Austrian Brabant, to the S. of which is a celebrated monastery. It is seated on the Demer, 18 miles E. of Mechlin. Long. $5^{\circ} 0'$ E. Lat. $51^{\circ} 6'$ N.

SIDAYE, a strong town on the N. coast of the island of Java, with a harbour. Long. $113^{\circ} 15'$ E. Lat. $6^{\circ} 40'$ S.

SIDEROCAPSA, a town of Turkey in Europe, in Macedonia, famous for a gold mine in its neighbourhood. It is five miles from the gulf of Contessa. Long. $13^{\circ} 44'$ E. Lat. $40^{\circ} 30'$ N.

SIDRA, an island of the Archipelago, between the gulf of Napoli and that of Engia. Long. $24^{\circ} 0'$ E. Lat. $37^{\circ} 0'$ N.

SIDRA, a spacious gulf on the coast of Barbara between

Tripoli and Barea, which takes its name from a small island at the bottom of the gulf.

SIEDENBERG, a town of Westphalia, in the county of Hove, nine miles S.S.W. of Hove.

SIEGBURG, a town of Westphalia, in the duchy of Berg, subject to the elector palatine. It is seated on the Sieg, 15 miles S.E. of Cologne. Long. $7^{\circ} 22'$ E. Lat. $50^{\circ} 43'$ N.

SIEGMARINGEN, a town of Suabia, capital of a county of the same name. It is 26 miles N. of Constance, and 44 S. of Stuttgart. Long. $9^{\circ} 10'$ E. Lat. $48^{\circ} 2'$ N.

SIEGSTADT, a town of Norway, in the province of Aggerhuys, 58 miles N. of Christiania. Long. $10^{\circ} 55'$ E. Lat. $60^{\circ} 0'$ N.

SIENNOI, a town of Russia, in the government of Mohilef, 60 miles N.N.W. of Mohilef. Long. $29^{\circ} 45'$ E. Lat. $54^{\circ} 30'$ N.

SIGNAU, a town of Switzerland, and principal place of a district, in the canton of Bern, 12 miles S.E. of Bern. Long. $7^{\circ} 18'$ E. Lat. $46^{\circ} 44'$ N.

SIGNET (*Encycl.*). All the supreme courts of Law in Scotland have seals or *signets* proper to their several jurisdictions. The courts of session and judiciary formerly used the same signet, which was called the king's, because the writs ran in his name; and though the judiciary at last got a separate signet, yet that of the session is still named the king's signet. In the signet office are sealed summonses of citation, letters of executorial diligence, or for staying of diligence; and, generally, whatever passes by warrant of the session, and is to be executed by officers of the court. All, before sealing, must be signed by the writers or clerks of the signet. But letters of diligence, where they are granted in a depending process, merely for probation, though they pass by the signet, must be subscribed by a clerk of session. The clerks of the signet also prepare and subscribe all signatures of charters, or other royal grants, that pass the exchequer.

SIGTUNA, an ancient town of Sweden, in Upland, seated on the lake Maeler, between Stockholm and Upsal.

SIGUENZA, a town of Spain, in New Castile, with an archbishop's see, a university, and a castle, in which is an arsenal. The university consists of several colleges; but the most considerable structure is the cathedral. It is seated on a hill, at the foot of Mount Atienza, 60 miles N.E. of Madrid. Long. $2^{\circ} 41'$ W. Lat. $41^{\circ} 6'$ N.

SILHET, a town of Hindoostan Proper, capital of a district of the same name, in the country of Bengal. It is 100 miles N.E. of Dacca, and 200 E.N.E. of Moorshedabad. Long. $91^{\circ} 57'$ E. Lat. $24^{\circ} 52'$ N.

SILISTRIA, or **DORESTRA**, a town of Turkey in Europe, in Bulgaria, with a citadel, and an archbishop's see. It is seated near the confluence of the Milovo and Danube, 97 miles N.E. of Nicopoli, and 170 N.E. of Adrianople. Long. $27^{\circ} 31'$ E. Lat. $45^{\circ} 0'$ N.

SILKEBURG, a town of Denmark, in N. Jutland, with a castle, which was formerly of great strength. It is 18 miles W. of Arhusen. Long. $9^{\circ} 30'$ E. Lat. $56^{\circ} 3'$ N.

SILLEBAR, a sea-port on the W. coast of Sumatra, a little S. of Bencoolon. Long. $101^{\circ} 0'$ E. Lat. $4^{\circ} 0'$ S.

SILLE-LE-GUILLAUME, a commercial town of France, in the department of Sarthe, 20 miles N.E. of Mans.

SIMANCAS, a town of Spain, in Leon, with a castle, in which, on account of its strength, Philip ordered the archives of the kingdom to be kept. It is situate on the Deuro, eighty miles S.W. of Valladolid. Long. $4^{\circ} 30'$ W. Lat. $41^{\circ} 45'$ N.

SIMBRISK, a government of Russia, formerly a province of the kingdom of Kafan. The capital, of the same name, is seated on the Volga, 100 miles S. by W. of Kafan. Long. $48^{\circ} 34'$ E. Lat. $54^{\circ} 22'$ N.

SIMI, the ancient Syme, an island in the Mediterranean, between the island of Rhodes and the continent of Asia, six miles N. of Rhodes. Long. 27. 33. E. Lat. 36. 35. N.

SIMMEREN, a town of Germany, in the circle of Lower Rhine, capital of a duchy of the same name, with a castle. It belongs to the elector palatine, and is seated on the Simmeren, 26 miles W. of Mentz, and 35 E. of Triers. Long. 7. 41. E. Lat. 49. 51. N.

SIMOGU, a town of the peninsula of Hindoostan, in the Mysore country, situate on the Tumbadra, 93 miles N.W. of Seringapatam. Long. 75. 30. E. Lat. 13. 21. N.

SIMONS, St. an island of North America, on the coast of Georgia, opposite the mouth of the Altamaha. It is fifteen miles long and four broad, and has a good town called Frederica.

SIMONTHORNA, a strong town of Lower Hungary, in the county of Tolna, with a castle. It was taken from the Turks in 1686, and is seated on the Sarwege, eight miles from Tolna. Long. 18. 16. E. Lat. 46. 40. N.

SINCAPOUR, an island and town at the most southern extremity of the peninsula of Malacca, from which it is separated by the strait of Singapore. It is 100 miles S.E. of the city of Malacca. Long. 104. 10. E. Lat. 1. 10. N.

SINDELFINGEN, a town of Suabia, in the duchy of Württemberg, six miles S. W. of Stuttgart, and 30 E. of Baden. Long. 9. 5. E. Lat. 48. 45. N.

SINES, a town of Portugal, in Estremadura, 40 miles S. of St. Ubes. Long. 8. 55. W. Lat. 37. 40. N.

SING, a strong town of Dalmatia, built by the Turks in opposition to Clissa. It was taken by the Venetians in 1686. It is eight miles N. of Clissa, and 16 N. of Spalatro. Long. 17. 30. E. Lat. 47. 10. N.

SINGAN-FOU, a city of China, capital of the province of Chen-si. It is one of the largest and most beautiful in the empire next to Peking. In its territories (which contain six cities of the second and thirty-one of the third class) bats of a singular species are found; they are as large as domestic fowls, and the Chinese prefer their flesh to that of chicken. It is 48 miles S.W. of Peking. Long. 108. 43. E. Lat. 34. 16. N.

SINGILIES, a town of Russia, in the government of Simbirsk, situate on the Volga, 24 miles S. of Simbirsk. Long. 48. 34. E. Lat. 54. 1. N.

SINGO, a town of Turkey in Europe, in Macedonia, on the gulph of Monte Santo. Long. 24. 0. E. Lat. 40. 13. N.

SINGOR, a town in the peninsula of Malacca, seated at the mouth of a small river, in the bay of Patan. Long. 101. 25. E. Lat. 6. 40. N.

SINGAGLIA, a strong town of Italy, in the marquise of Ancona, with a castle and two harbours. It is seated at the mouth of the Nigola, in the gulph of Venice, 17 miles S.E. of Pesaro, and 30 E.S.E. of Urbino. Long. 13. 29. E. Lat. 43. 45. N.

SINCUB, or **SINOPE**, a decayed sea-port of Turkey in Asia, in Natolia, surrounded by walls, with double ramparts; but the castle is much neglected. The inhabitants are Turks, who will not admit any Jews, and the Greeks are obliged to live in the suburbs. It is the birth-place of Diogenes the cynic philosopher, and seated on the isthmus of a peninsula in the Black Sea. Long. 33. 55. E. Lat. 41. 5. N.

SINOBU, a town of the peninsula of Hindoostan, in the Mysore country, 50 miles S.E. of Bednore, and 90 N.W. of Seringapatam. Long. 75. 30. E. Lat. 13. 30. N.

SINTZHEIM, a town of Germany, in the palatinate of the Rhine, seated in a morass, 12 miles S.E. of Heidelberg. Long. 9. 0. E. Lat. 49. 15. N.

SION, an ancient town of Switzerland, capital of the Valais, and an episcopal see, whose bishop is a prince of the empire. It is situate near the Rhone, at the foot of three insulated rocks, that rise immediately from the plain. The highest, called Tourbillon, supports the old ruinous and deserted episcopal palace. On the second, denominated Valeria, are the remains of the old cathedral, and a few houses belonging to the canons. On Mayorja, the third rock, stands the present episcopal palace, an edifice of stone, built in 1547; the apartments furnished with great plainness and simplicity. Sion was formerly the capital of the Seduni, and some Roman inscriptions still remain. It is 50 miles E. of Geneva. Long. 7. 12. E. Lat. 46. 6. N.

SIOUT, one of the largest and most populous towns in Egypt. It has several mosques, and is the see of a Coptic bishop. Here are the ruins of an ancient amphitheatre, and some sepulchres of the Romans. It is surrounded by fine gardens, and palm-trees that bear the best dates in Egypt. This place is the rendezvous of those who go in the caravan to Senar, in Nubia. It is a mile from the Nile, and 185 S. of Cairo. Long. 31. 24. E. Lat. 27. 2. N.

SIRADIA, a town of Great Poland, capital of a palatinate of the same name, with a castle. It is seated in a plain, on the river Warta, 62 miles N.E. of Breslaw, and 105 N.W. of Cracow. Long. 18. 55. E. Lat. 51. 32. N.

SIRAF, a town of Persia, in the province of Laristan, situate on the Persian Gulf, 30 miles S.W. of Lar. Long. 52. 25. E. Lat. 35. 20. N.

SIRAVAN, a town of Persia, in the province of Kufistan, 48 miles N.N.E. of Sufter. Long. 51. 5. E. Lat. 31. 50. N.

SIRGIAN, a town of Persia, in the province of Kirman, celebrated for its beautiful pottery, and a manufacture of fluffs. It is 180 miles E. of Schiras.

SIRHIND, an ancient city of Hindoostan Proper, in the province of Delhi. Procopius takes notice, that in the time of Justinian (the sixth century) silk was brought from *Serinda*, a country in India. Sirhind is 195 miles N.W. of Delhi. Long. 75. 35. E. Lat. 30. 15. N.

SIRIK, a town of France, in the department of Moselle, with a castle, on a neighbouring hill. It is seated on the Moselle, 23 miles N. of Metz. Long. 6. 38. E. Lat. 49. 36. N.

SIRINAGUR, a large rugged country of Asia; bounded on the N. and N.E. by the Thibetian mountains, on the S.E. by Napaul, on the S. by Rohilla, on the S.W. by Delhi, and on the N.E. by Lahore. The capital, of the same name, is 160 miles N. of Delhi. Long. 77. 38. E. Lat. 30. 59. N.

SIRIUS ISLAND, an island of the Pacific Ocean, about 18 miles in circuit, discovered by Lieutenant Ball, in 1790. Long. 162. 30. E. Lat. 10. 52. S.

SIRMICH, or **SIRMIUM**, a town of Slavonia, capital of a county of the same name, with a bishop's see. It is seated on the Bosworth, near the Save, 42 miles S.E. of Eiseck. Long. 20. 19. E. Lat. 45. 13. N.

SIRONG, or **SERONG**, a town of Hindoostan Proper, in the province of Makra, celebrated for its manufacture of painted cottons and chintzes. It is 120 miles N.E. of Eugene. Long. 78. 4. E. Lat. 24. 4. N.

SILIZAN, a sea-port on the E. coast of Luconia, one of the Philippine Islands. It is situate almost immediately opposite to Manila, and in the vicinity of very high mountains, which render the air extremely moist. Long. 123. 45. E. Lat. 14. 20. N.

SISSAC, a town of Switzerland, in the canton of Basil, capital of the province of Sigow. It is 17 miles S.E. of Basil.

SISSEG, a town of Austrian Croatia, with a monastery.

feated on the Save, 28 miles S.E. of Zagrad, and 42 E. of Carlstadt. Long. 16. 17. E. Lat. 46. 6. N.

SIŠSEK, a strong town of Croatia, situate at the confluence of the Save and Kulpa, 40 miles E. of Carlstadt. Long. 22. 10. E. Lat. 45. 48. N.

SISSOPOLI, a town of Turkey in Europe, in Romania, with an archbishop's see; seated on a peninsula of the Black Sea, 25 miles S. of Mefembria, and 97 N.W. of Constantinople. Long. 28. 9. E. Lat. 42. 30. N.

SISTERON, a town, and late episcopal see, of France, in the department of Lower Alps, with a citadel on the top of a rock, which was the prison of Casimir V. king of Poland. It is seated on the Durance, 45 miles N. E. of Aix, and 407 S.E. of Paris. Long. 6. 1. E. Lat. 44. 11. N.

SITIA, a town on the N. coast of the isle of Candia, near a bay of the same name, 58 miles from Candia. Long. 26. 29. E. Lat. 35. 0. N.

SITTARD, a town of Westphalia, in the duchy of Juliers, seated near the Maefe, 10 miles S. of Ruremonde. Long. 5. 50. E. Lat. 50. 58. N.

SIVRAI, a town of France, in the department of Vienne, seated on the Charante, 25 miles S. of Poitiers, and 100 S.S.W. of Paris. Long. 0. 23. E. Lat. 46. 16. N.

SKAITING (*Encycl.*). It is well known that Norway is, during four or five months, covered with snow, which, at some distance from the sea coast, is so deep that it becomes impossible for the traveller to quit the beaten road either on horseback or on foot. Even the road itself must be new beaten after each new fall of snow: and that operation is performed by means of a machine somewhat resembling a plough, pointed before, and gradually widening behind, which, being drawn by horses, cuts its way through and levels at the same time.

Notwithstanding the difficulties which the Norwegian winters thus naturally present, the chase has ever been a favourite exercise with the inhabitants of the country, which formerly abounded with fierce animals, besides deer and smaller game. To make the most of the short days in that climate by traversing the forests with increased celerity, the Norwegian devised the use of skais, very different however from those which we use in our more southern lands for the purposes of amusement. The Norwegian skais are a pair of boards, about four or five inches broad, from half an inch to an inch thick, slightly hollowed in the middle underneath, to prevent unsteadiness, and to advance in a straight line. The board for the left foot is ten feet long, the other only about six. They are both bent a little upward at the extremities, but higher before than behind. They are tied to the feet with thongs fastened in the middle, where they are left higher and thicker than in the other parts. The skait for the right foot is often underlaid with rein-deer skin or seal skin, which glides very smoothly along when the skaiter moves forward in the direction agreeing with the grain of the hair, but which presents a resistance when he presses his foot in a backward direction causing the hair to bristle.

It is an ascertained fact that a good skaiter, when the snow is tolerably firm, can travel more rapidly over a level country, and continue his rapid march for a longer time, than the best horse trotting on the finest road.

If he has to descend a mountain, he moves with such impetuosity, that he is obliged to moderate his first effort in springing forward, lest he should lose his breath in the descent. He ascends more slowly, and not without some difficulty, because he is obliged to mount in a zig-zag direction. Nevertheless he reaches the summit in as short a time as would suffice for the best foot-man. And, if the snow have acquired any small degree of consistency, he never sinks into it.

Experience having proved, that, in spite of the multiplied obstacles arising from the severity of the winter, Norway had been repeatedly attacked by the enemy during that season—and this mode of performing long excursions being in general use among the inhabitants—it was natural that the idea should occur of forming a military corps of skaiters.

Accordingly such a plan has been adopted; and the corps, consisting of 560 men, is divided into two battalions, one for the northern part of the country, the other for the southern.

Their present uniform consists of a short green jacket, a grey furtout with a yellow cape, grey pantaloons, and a black leathern cap.

Their arms are a carabine hung with a sling which passes over the shoulder, a broad cutlass, and a staff three yards and half long, an inch and quarter thick, having at the end an iron point, and, at some distance from the extremity, a circular piece of iron. The principal use is to check the excessive rapidity of the skaiter's motion in descending heights. On these occasions he places it between his legs, and drags it after him, or he drags it by his side. On other occasions he makes use of it to push himself forward in ascending: in short he variously employs it according to circumstances. This staff serves him also as a support for his carabine when he wishes to fire a shot; though indeed the Norwegian peasants in general shoot very well without any such aid, and seldom miss their aim.

To the exercise of skaiting, this corps unites also that of the ordinary chaffeurs or light troops, of which it is to be considered as constituting a part: it performs all the same functions as they, nor differs from them except in the circumstance of marching on skais, which gives it a great advantage over the others. The skaiters, moving with great agility, and being secured by the depth of the snow from all pursuit either by infantry or cavalry, may safely hover round a hostile army on its march, may watch all its motions, harass and gall it on each side of the road, without incurring any danger. Even discharges of cannon would produce little effect on a number of skaiters scattered at two or three hundred yards distance from each other, and whose movements besides are so rapid, that, at the moment while the cannoniers fancy they still have them in sight, they have already vanished, to make their appearance anew when least expected.

If the enemy halt, that is the time when the skaiters enjoy their full superiority over them. Whatever precautions the hostile army may have adopted, they are momentarily exposed to the attacks of men who do not stand in need of either roads or paths, but indiscriminately traverse morasses, lakes, and rivers, provided they only be covered with snow. Even though the ice beneath should be too weak to bear either horse or man, the skaiter is safely wafted over it by the rapidity of his motion. Indeed there is not any corps better calculated, in the winter-season, for the service of reconnoitring, carrying intelligence respecting the enemy; or performing the office of couriers.

It may, however, be supposed that they find a difficulty in turning round, on account of the great length of their skais: but that is not the case. The skaiter draws back his right foot, to which is fastened the shorter skait, places it vertically to the left, then raises the left, and, placing it parallel to the right, he is turned. If he wishes to turn completely back, he has only to repeat the manœuvre.

In their ordinary winter exercises, the skaiters form themselves in three ranks, at eight paces distance between the ranks, and three between the files; and, unless when they designedly scatter themselves, they exactly observe those distances, that they may not impede each other in the use of their skais.—When they have occasion to fire, the middle and

rear ranks advance close to the front; each file thus forming a little body apart.

The baggage and camp-equipage of this corps are conveyed in sledges placed on skits. A fingle man easily draws one of these sledges by means of a leathern thong, which passes over his right shoulder and crosses to his left side, like the sling for the carbine.

An improvement on this plan has been suggested—that of attaching to the corps a few pieces of light artillery, to be drawn upon skits in the same manner as the baggage.

SKARA, a town of Sweden, in West Gothland, with the ruins of an ancient palace, the residence of the Gothic kings. It is seated on the Lida, in a morass, 17 miles N.E. of Falköping. Long. 14. o. E. Lat. 58. 16. N.

SKEEN, a town of Norway, in the government of Agderhus, remarkable for its mines of iron and copper. It is seated near the Categate, 40 miles W. of Fredericstadd.

SKIDDAW, a mountain in Cumberland, one of the most remarkable in England, being above 1000 yards perpendicular height from the surface of the lake of Derwent-water, to the north of which it is situate. Here eagles and other birds of prey resort. This mountain is not difficult of access, and is almost covered with grass, which gradually grows coarser in the ascent. The whole top is covered with a loose brown slaty stone.

SKILSKOER, a town of Denmark, in the island of Zealand, situate on a bay, 48 miles S.W. of Copenhagen. Long. 11. 27. E. Lat. 55. 16. N.

SKIPTON, a town in the West Riding of Yorkshire, with a market on Saturday; seated among hills, near the river Aire, 41 miles S. by E. of Richmond, and 231 N. by W. of London. Long. 2. 42. W. Lat. 53. 55. N.

SLAGELSE, a town of Denmark, in the island of Zealand, 42 miles W.S.W. of Copenhagen. Long. 11. 29. E. Lat. 55. 26. N.

SLATINA, a town of Turkey in Europe, in Moldavia, 18 miles N.W. of Niemez. Long. 26. 5. E. Lat. 47. 10. N.

SLAUGHTERING, a term used to denote the killing of calves, oxen, or other horned cattle.

The instrument at present generally employed for this purpose, is a common *axe*; by which the animal is at least stunned, in case he does not fall after one or two blows; yet, as the *knocking down* of cattle carries with it an idea of ferocity, a milder and more humane method of terminating their existence ought to be substituted for that practice. Such desirable object may be attained by adopting the mode of slaughtering which prevails in Portugal; namely, the “laying down cattle,” by separating the spinal marrow with a peculiar knife; in consequence of which, the animal is *unversed*, and falls instantaneously: in Plate 44. we therefore give a representation of the instrument employed in that kingdom.

The whole knife is eleven inches in length; the handle being 4½, and the blade 6½ inches. In order to use it, the person who is about to “lay down” an animal, must place himself in front of the latter, holding it by the horn in the left hand; and passing the knife over its brow, through the vertebrae of the neck, into the spinal marrow.—For the knowledge of this practice, we are indebted to the humane Lord Somerville; who, during his late residence in Portugal, caused a person to be instructed in the use of the knife above described. His lordship has liberally offered to comply with the request of those whose business is to slaughter cattle, and who may be desirous of additional information. He further observes (in *The System followed during the two last Years by the Board of Agriculture, &c.*) that the man alluded to, has laid

fifteen oxen in a row “with more regularly and expedition than would at first, perhaps, be credited.”—Lord S. likewise is of opinion, that if the practice of carters *head-lining* or walking at the heads of oxen, were adopted in Britain, the animals would probably be induced to stand more quietly; in consequence of which the operation will become “as safe as it is easy.”

SLAWKAW, or **AUSTERLITZ**, a town of Moravia, capital of a circle of the same name. It is 10 miles E. of Brinn. Long. 16. 57. E. Lat. 49. 5. N.

SLEAFORD, a town of Lincolnshire, with a market on Monday. It had formerly a castle, now in ruins, and has a large market-place, in the form of a parallelogram. It is seated on the Slea, which is navigable hence to the Witham, 18 miles S. of Lincoln, and 115 N. of London. Long. o. 21. W. Lat. 53. 1. N.

SLONIM, a town of Lithuania, in the palatinate of Novogrodeck, with a castle, seated on the Sezraa, 40 miles S.W. of Novogrodeck, and 60 S.E. of Grodno. Long. 23. 57. E. Lat. 53. o. N.

SLOOTEN, or **SLATEN**, a town of the United Provinces, in Friesland, seated on a lake called Slooten-mere, three miles from the Zuider Zee, and 18 N.W. of Steenwick. Long. 5. 26. E. Lat. 52. 55. N.

SMITH'S ISLAND, an island in the Pacific Ocean, discovered by Lieut. Ball, in 1790. Long. 161. 54. E. Lat. 9. 44. S.

SMOLAND, or **SMALAND**, a province of Sweden, in Gothland, 112 miles long and 62 broad. It has immense forests of pine and fir; and the approach to the villages is announced by groves of oak, beech, and birch, and numerous plots or parterres of arable land among pastures and rocks. An acre of land has been frequently observed to be laid out with alternate slips of rye, barley, flax, and hemp; the intervals between and around, sown with grass: In many parts, the trees are cut down, and burnt in order to manure the soil. Calmar is the capital.

SMOW, a noted cavern, on the N. coast of Sutherlandshire, between Cape Wrath and Loch Eribol. It runs so far under ground, that is extremity, it is said, could never be explored.

SMYNHUSEN, a town of Lower Saxony, in the duchy of Holftein, six miles E. of Lunden.

SNACKERBURG, a commercial town of Lower Saxony, in Bruntweck Lunenburg, seated at the confluence of the Ucht with the Elbe, 35 miles E. by S. of Danneberg. Long. 12. 22. E. Lat. 53. 10. N.

SNEECK, a town of the United Provinces, in Friesland. It is called Snitz by the natives, and is seated on a lake of the same name in marshy land, eight miles S. of Franeker. Long. 5. 26. E. Lat. 53. 2. N.

SNEIRNE, a town of Persia, in the province of Irac, 57 miles W.N.W. of Amadan. Long. 46. 24. E. Lat. 35. 45. N.

SNETHSHAM, a town in Norfolk, with a market on Friday, seated on a small inlet of the sea, 12 miles N.N.E. of Lynn, and 111 N. by E. of London. Long. o. 32. E. Lat. 52. 55. N.

SNIATIN, a trading town of Little Poland, capital of Poketia, seated on the Pruth, eight miles E. of Coloni, and 45 S.E. of Halitz. Long. 26. 7. E. Lat. 48. 44. N.

SOANA, or **SUANE**, an ancient town of Tuscany, in the Siennese, with a bishop's see. The badness of the air has caused it to be almost deserted, and it is now no more than a village. It is seated on a mountain, near the river Fiora, 30 miles S.E. of Sienna. Long. 11. 46. E. Lat. 42. 40. N.

SOCIETY, a class of Hindoostan Proper, which rises on the S. confines of Aulhawal, rising from the same lake, which is the source of the Nerbudda; and flowing in an opposite direction to that river, 1500 miles, it falls into the Ganges, above Patna.

SOCIETY (Engel). Among the most important of the various associations for charitable and benevolent purposes in Britain, is the formation of a society in London, for encouraging the industry, and promoting the welfare of the poor, instituted in 1790, under the name of a Society for bettering the Condition and increasing the Comforts of the Poor; an establishment which has been the means of adding much to the physical state of national happiness. Its objects are described to be—every thing that concerns the happiness of the poor—every thing by which their comforts can be increased. To remove the difficulties attending parochial relief, and the discouragement of industry and economy, by the present mode of distributing it; to correct the abuses of workhouses; and to assist the poor, in placing out their children in the world—in this, and in the improvement of their habits and gardens; in assistance and information as to the use of fuel, so as to give them more benefit from it; and in adding to, and in meliorating their means of subsistence, by public kitchens, and by other means. In these respects it has been proved that much may be done by the action of liberal and benevolent mind—much by the circulating of information, and by personal assistance and advice.

It must afford a strong additional inducement to efforts of this nature to consider, that, in proportion as we can multiply domestic comforts, in the same degree we may hope to promote the cause of morality and virtue. For a very gratifying illustration of this, as well as for the most important improvements in fuel, food, and in the mode of assisting the poor, the world is indebted to the philanthropy and abilities of Count Rumford. (See the articles COAL, FUEL, STOVE, &c. *supra*.)

It is not, however, merely the increase of the comforts and morals of the poor, great as that benefit may be, that this society has in a great measure effected: its improvements and experiments apply more or less to farms, manufactories, private families, and to every situation of life.

His majesty, the ready patron of every useful undertaking, when informed of the plan and object of the society, was graciously pleased to take it under his protection, and at a subsequent meeting the society came to the following resolution:

"That the general object of the society be to collect information respecting the circumstances and situation of the poor, and the most effectual means of meliorating their condition; in order that any comforts and advantages which the poor do now actually enjoy in any part of England, may eventually be extended to every part of it, with as much improvement and additional benefit as may be to the poor; and with a tendency, gradually to diminish parochial expences. For the attainment of these ends, it appears to the society, that the circulation of useful and practical information, derived from experience, and stated briefly and plainly, so as to be generally read and understood, may be of very great national and individual benefit; and may induce and enable all well disposed persons to unite in the prosecution of an object so important to the happiness and welfare of the community at large, and particularly of that valuable branch of it, the labouring poor."

"The following are selected as the subjects of informa-

tion, upon which the Society is desirous of obtaining and circulating hints:

1. *Parish Relief*—how it may be best directed for the benefit of the poor.
2. *Friendly Societies*—their good effects, and how they may be best encouraged.
3. *Parish Workhouses*—the amendment of them.
4. *Cottages*—the increasing the comfort and neatness of them.
5. *Cottage Gardens*—and the means of enabling the cottager to keep a cow, or of supplying him with milk.
6. *Parish Mills* for corn; and parish ovens.
7. *Village Shops*, for better supplying the poor with the necessaries of life.
8. *Village Kitchens*, and *Soup Shops*.
9. *Cottage Fire-places*, and *chimneys*—the improvement of them.
10. *Fuel*—how the poor may be better supplied with it.
11. *Apprentices* to manufacturers, and all parish apprentices.
12. *Country fairs*—the means and effects of reforming them.
13. *Beggars*—the least exceptionable modes of assisting them.
14. *Public Rooms* for the resort of the industrious poor in cold weather.

For proofs of what has been effected by the Society already, see the several heads in this SUPPLEMENT. We shall now introduce to the reader's observation the institution of the kind, namely, the *Society for bettering the Condition of the Poor at Clapham*, established in 1799. It consists both of ladies and gentlemen, willing to take an active part in promoting the welfare of the poor. The objects of this society, are the discovery and relief of cases of real distress, the assisting and rewarding of honest industry, the detection of fraud and imposture, the discouragement of idleness and vice, and the employment of children at an early age, &c. as to improve both the condition and the morals of the poor.

The members of the society meet at each other's houses, in winter, one evening in the month, and in the summer once in two months, for the purpose of conversation and communication on the preceding subjects. They have divided the parish of Clapham into eight districts, and have appointed four or more ladies and gentlemen, as visitors for each district. The duty of the visitors is to inform themselves of the circumstances and character of every poor person within their district; and to meet for the purpose of acting in concert, and of becoming more acquainted with the real state of the poor; so as to report at the general meeting every peculiar case of distress: with their opinion, as to the means of improving the conduct, and bettering the condition, of the objects of their attention. A journal was agreed to be kept of the observations of the Society, and of the effects produced by its labours; and a correspondence has been opened with the officers of the parish, so as to form a channel for the mutual communication of intelligence.

The first act of the society was to draw out an accurate list of all the poor of the parish of Clapham; distinguishing each individual's respective occupation, family, residence, and place of legal settlement.—From this account, two distinct lists have been made out: one in the order of residence—the other in an alphabetical order: and a list of the allowances granted by the parish has been obtained of the overseers. It appeared by the return, that there were in the whole 348 families in the parish, which were likely to become objects of charitable assistance; viz.

In the 1st district	=	46 families.

348

Of these 61 were single persons; 50 had wives, but no children; and the remaining 287 had wives and children; the number of children being, upon an average, not more than two to each family.—There were in all 572 children, and the total amount of poor was 1207 persons.

For each district, a lady was appointed as sub-treasurer; whose office it was to keep the accounts of the district, and to call meetings of the visitors; no visitor having a power (except in cases of emergency) to give any material relief, but what shall be directed at a district meeting. Their accounts are passed at the general meeting. The measure of sub-dividing the districts among the visitors was soon after adopted, in some instances, with very good effect.

The rector, with the concurrence of the churchwardens and vestry, added the sacrament money, about 100*l.* a year, to the funds of the society.—In case of application for relief, it was recommended to the visitors to take the opportunity of gaining information respecting the character of the person applying; as to regular attendance on public worship, the care and schooling of their children, and the industry and earnings of every branch of the family. This information is useful to direct both the kind and the quantity of relief, so as to assist and encourage virtue and industry.

In case of any infectious disorder, the treasurer is directed to consult with the medical gentlemen of the society, concerning the most effectual means of preventing the danger of communication; and he has the authority immediately to take the necessary steps, at the expense of the society. Of the benefit of this regulation several instances have appeared. The small-pox has attacked several poor families with much violence; some of the children, yet uninfected, were successfully inoculated at the expense of the society. A dangerous species of putrid and scarlet fever had broken out at different periods, in some of the houses of the poor; it was prevented from spreading beyond the families in which it originated. A putrid and scarlet fever, in a neighbouring parish, was at the same time extremely fatal to the children of the poor; and three months had elapsed, before its ravages ceased.

There is hardly any thing for the improvement and benefit of the poor, that may not be adopted and effected by such a society as that of Clapham. They came to very early resolutions to furnish the poor *gratis*, with unlaid line to white-wash their cottages; to provide beds of the poor in the different districts; to furnish grown-up persons with suitable employment; and to place children at school, and from thence in service; to establish in the village a friendly society, under their own care and patronage; to purchase blankets to lend the industrious poor in winter;—and that whenever a poor married woman should deposit a weekly sum in the hands of the visitor to provide for her confinement, the society would repay it, with the addition of as much more, at the time of her lying-in.

In order to provide for the sick poor such refreshments as might be ordered by the visitors or medical attendants, the society engaged an apothecary at 2*l.* a week. She is a middle-aged woman, not burthened with a family, not going

out to washing for her livelihood; and a person in whose cleanliness, industry, integrity, and skill in cookery, they and the poor can place a confidence. To her care are intrusted the stores for the relief of the sick; consisting of sage, wine, oatmeal, &c. and also the materials for work, she has been furnished with a book of receipts for preparing refreshments for the sick; to be lent by the order of any of the visitors, the keeping a regular account of the same. It is her duty to register the names of the nurses and charwomen in the parish, who are deserving of recommendation, in order that those who want employment may have an opportunity of stating that they are unoccupied; and that housekeepers, who want a nurse or helper in the house, may know who is disengaged. It is also her office, upon reference from the visitors, to make enquiries respecting the character of any person, when the visitors do not succeed in procuring satisfactory information upon the subject.—Three ladies of the society undertook to purchase for her the necessary utensils and stores, to furnish her with sufficient information and instructions, and to superintend her in the execution of her office.

For the desirable object of forming early habits of attention and industry (there being already at Clapham, schools for children of riper age), a knitting and reading school for boys and girls under six years of age was established under the care of one of the ladies, at the request and expense of the society. An industrious woman, who had a comfortable room adapted to the purpose, agreed to take any number of children, and at any hour that might be thought proper, to instruct them in knitting and reading; and, on Sunday, to open it as a Sunday school. For this, and her firing and all expenses, she was to be allowed five shillings a week. The school was opened in the beginning of December last with fifteen boys, whose number was soon increased to twenty-one, and the monthly account of whole work already makes an article in the minutes of the society.

In the early part of the winter the society provide blankets, to be numbered, marked, and lent to the poor, under the following regulations: 1*st*, That a note should be given with them, expressing the day on which they were lent, and that on which they were to be returned. 2*d*, That an account should be kept by the society's agent, in her book, of the number of each blanket, the person to whom lent, and the time when lent, and when returned. 3*d*, That the blankets lent to any poor family for the winter season, should be returned on the first of May, clean washed if required. 4*th*, That in cases where any infectious disorder might have prevailed in the family to which they have been lent, a discretionary power be given to the visitor to permit them to be kept. And 5*th*, That all the blankets, upon being returned to the society, should be baked, in order to purify them, before they are laid up in the society's store.

It is difficult to say what may not be done for the poor, or in what degree their religious and moral habits, and their domestic comfort and enjoyments, may not be increased, by the formation, in every large parish in England, of societies like that at Clapham; societies which, without the incumbrance of an establishment, give to the rich all the power and effect of co-operation; which offer to the poor every incitement to virtue and industry; and, while they relieve the distressed and unfortunate, while they educate the young and comfort the aged, imprint on the minds of all a just sense of the value of character, and of moral and religious habits, and render them useful to themselves and to the community.

It is no small merit in the society at Clapham, that it has afforded satisfactory evidence that the system of dividing

the poor into districts, and of thereby diminishing labour by arrangement of attention (a system recommended by the precepts of Count Rumford, and by the example of Hamburgh), is applicable and practicable in every parish in England. However the mind may be intimidated by the difficulties which must embarrass the attempt of an individual, to improve the habits and increase the comforts of a whole parish, or of a larger district; there are very few of our countrymen, and still fewer, we trust, of our fair countrywomen, who would, at any period, shrink from the duty of occasionally visiting their eight or ten adjoining cottagers; and of attending a sociable monthly meeting of their friends and acquaintance, in order to consider how their poor neighbours might be made more happy and virtuous in themselves, and more useful to the neighbourhood.

This mode of keeping down the poor-rates, of preventing crimes, and of encouraging honesty, industry, and economy, will never be very irksome in the detail, while it only occasionally occupies a tedious hour, and promotes a pleasant and satisfactory monthly meeting of the neighbourhood. This, when directed "to the discovery and relief of cases of real distress,—to the assuaging and rewarding of honest industry,—to the detection of fraud and imposture,—to the discouragement of idleness and vice,—to the employment of children in early habits of industry,—and to what ever has a tendency to improve the condition and morals of the poor" (and these are the declared objects of the society at Clapham), must, except in a very debased state indeed, afford satisfactory occupation to every human being;—to the miser, in the improvement of his property,—to the anxious mind, in the security of it,—to the sensualist, in enjoyment,—and to the pious and benevolent, in the promotion of the virtue and happiness of their fellow-creatures.

This society is directed by principles different from those which too frequently actuate the parochial overseer. The great object of the society is the improvement of the poor. They apply leisure, talents, information, and every power which they derive from instruction, situation, and property, for the assistance of those who do not possess the same advantages; not with the petty and unstable object of affording capricious or momentary relief; but in the well-founded hope of conferring permanent benefit, by increasing their resources, by improving their principles, and encouraging them in habits of industry, sobriety, and frugality.

Charity of this kind has not only the advantage of increased effect by co-operation, and of impartial benevolence in embracing all objects within the district, in proportion to their claims and necessities; but also of acting upon collective information, and of directing joint exertions systematically, and to the proper end. The enquiry respecting the industry, economy, and character of the poor, must necessarily increase the value and prevalence of those virtues, at the same time that it enables the individual to direct his relief most effectually to the advantage of the sufferer,—if it is temporary distress occasioned by sickness, provision is made for their immediate comfort and speedy recovery; and, while the ordinary parochial fund is resorted to in the usual way, the society adds the lesser comforts, and those aids to the recovery, which parish relief can never completely afford: such is a nurse, whose employment may perhaps be as much charity to her, as to the sick on whom she attends; whose care, where quiet is peculiarly necessary, may remove some of the children during the day, and place them with a neighbour or friend; and whose attention may prevent the patient from returning to hard labour, before his strength is sufficiently recruited and confirmed.

In checking the progress of infectious disorders, a society like that of Clapham may be of infinite service. It is

the duty of the visitor in that case immediately to inform the treasurer, who is authorized to take medical advice, as to the most effectual means of stopping the contagion. A very trifling sum, seasonably expended in the removal and care of the infected person, and in purifying and white-washing his habitation, may save thousands of useful lives, and prevent an irretrievable loss, and insupportable expense to the parish. (See HOUSE OF RECOVERY, and WHITE-WASH, *Supp.*)

For a period when the weaker and more helpless sex stand in great need of kindness and assistance, the society has made a very acceptable provision, by doubling the sum which may be deposited for the assistance of any poor woman at her lying-in. Besides this, the placing, at such a time, some of their children at school, and providing a nurse, may be at times an act of very useful and necessary charity.

The forming of children to early habits of industry, is another primary object of this society; which adopts the principle that every child, above mere imbecility, should produce something towards its own support. If what it can produce is *only a penny a week*, even that ought not to be neglected. The habit of saving small sums is the foundation of economy; and constant occupation is one grand preservative from vice. For this purpose, it is of great moment to find regular employment for the poor; and it is much to be regretted that processes for the abridgment of labour have, in many parts of the kingdom, deprived the poor of the means of industry.

The habit of cleanliness, producing as it does many valuable moral virtues, is an important effect of this society. Another is, the institution of friendly societies under their immediate care and patronage; and particularly such a one as may afford relief to women as well as to men; and, with the contributory aid of the rich, secure liberal and certain advantages to the members. Besides this, the encouraging of the poor to buy for ready money, and the donation of rewards to cottagers for the support of large families, and for the degree of industry and sobriety they may possess, and for other commendable points of character, may, with attention and discretion, be of the greatest use in improving the condition, not only of the poor, but of the neighbourhood and of the community at large.

Whatever have been the advantages to the poor, the beneficial effects produced by such a society upon the rich, are likely to be equally great. Ladies who have not been accustomed to enquire personally into the state of their necessitous neighbours, may thus be excited to be extremely active in assisting them, and in devising the best methods of doing them good. When the rich are induced to visit the families of labourers, and to make the comparison between their own comforts and those of others, they receive from such occupation much mental improvement, and become properly grateful for their own benefits and situation in society. It may then become necessary to caution them against too warm and liberal an application of their charity, and against that degree and species of benevolence, which, instead of aiding and instructing the poor to help themselves, render them more helpless and hopeless. It is then very important to hold up to constant view the wise and excellent maxims adopted at Hamburgh; *that if the manner in which relief is given be not a spur to industry, it becomes in effect a premium to sloth and profligacy*; and that if the charitable or parochial support of an idle person exceeds what any industrious person in the same circumstances can earn, idleness will become more profitable than industry, and beggary a better trade than the work-shop.

Philanthropic SOCIETY. See REFORM, Supp.

SOCONUSCO, a province of New Spain, in the audience of Mexico, 88 miles long and nearly as much broad; bounded on the N. by Chiapi, on the E. by Guatimala, on the S. by the Pacific Ocean, and on the W. by Guaxaca. It is sheltered from the north winds by high mountains, which renders the air exceeding hot; and the soil is not very fertile. There are few Spaniards settled here.

SOCONUSCO, or **GURVETLAN**, a town of New Spain, capital of a province of the same name, 440 miles S.E. of Mexico. Long. 98. 16. W. Lat. 15. 42. N.

SOCZOWA, a town of Turkey in Europe, in Moldavia, seated on the Seret, 32 miles S.W. of Jassy. Long. 26. 20. E. Lat. 47. 16. N.

SODBURY, or **CHIPPING SODBURY**, a town in Gloucestershire, with a market on Thursday, and noted for its fine cheese. It is seated in a bottom, near the towns, 15 miles E.N.E. of Bristol, and 112 W. of London. Long. 2. 15. W. Lat. 51. 36. N.

SOEBORG, a town of Denmark, in the island of Zealand, nine miles W.N.W. of Elsinore.

SOEST, a large town of Westphalia, in the county of Marck, formerly free and imperial, but now belongs to the King of Prussia. The streets are watered with streams that proceed from a lake, and the inhabitants are generally Papists. It is 12 miles S.W. of Lipstadt, and 30 S.E. of Munster. Long. 8. 11. E. Lat. 51. 41. N.

SOFFA, or **SOPHIA**, a town of Turkey in Europe, capital of Bulgaria, with an archbishop's see. It is seated at the foot of the mountains of Argentaro, on the river Bogana, 135 miles W.N.W. of Adrianople, and 155 E. of Scutari. Long. 23. 58. E. Lat. 42. 36. N.

SOFROY, a town of the kingdom of Fez, noted for a very handsome mosque. It is seated on a hill, at the foot of a mountain of the same name, part of Mount Atlas, and between two rivers, 12 miles E. of Fez. Long. 4. 48. W. Lat. 33. 40. N.

SOONO, a town of the kingdom of Congo, in a province of the same name, which is a dry sandy country, but yields a great deal of salt. The inhabitants are said to be Christians, converted by the Portuguese, and the Capuchins have a church here. It is seated on the Zaire, near its mouth, 185 miles W.S.W. of St. Salvador. Long. 13. 15. E. Lat. 5. 50. S.

SOHAGEPOUR, a town of Hindoostan Proper, capital of a district, in the province of Allahabad, 120 miles S. of Allahabad, and 230 S.W. of Patna. Long. 82. 20. E. Lat. 23. 50. N.

SOHAM, a town in Cambridgeshire, with a market on Saturday, seated on a fen of the same name, near Sohammere, which takes up 1000 acres of land. It is five miles S.E. of Ely, and 70 N. by E. of London. Long. 0. 14. E. Lat. 52. 21. N.

SOHO, a village in Staffordshire, two miles N.W. of Birmingham. It was recently founded by Mr. Boulton, as a manufacture for every article common to the Birmingham trade, the plated ware usually made at Sheffield, and of elegant pieces of silver both light and massive. Here also are made the improved steam engines, now adopted in numerous concerns throughout the kingdom. In 1797, an ingenious apparatus for coining and stamping was employed here by government, on a copper coinage of penny and two-penny pieces; and in 1799, halfpenny and farthing pieces were likewise coined at this mint.

SOIGNIES, a town of Austrian Hainault, seated near a forest of the same name, on the river Senne, eight miles N.E. of Mons, and 17 W. of Brussels. Long. 4. 14. E. Lat. 53. 29. N.

SOLDANIA BAY, a bay on the S.W. coast of Africa, a little to the N. of the Cape of Good Hope. Long. 18. 4. E. Lat. 38. 10. S.

SOLENHOFEN, a town of Franconia, in the principality of Anspach, 29 miles S. of Anspach. Long. 10. 45. E. Lat. 44. 36. N.

SOLFATARAS, a mountain of Naples, in Terra di Lavoro, surrounded by other mountains, in the form of an amphitheatre. It has a kind of cavity, above a mile in diameter, which was no doubt the crater of a volcano at present extinct. The earth here is warm and white; and if opened to some depth is insupportable from the heat and exhalations. The ground is almost every-where hollow, and is supposed to have a subterraneous communication with Mount Vesuvius. Here are manufactures of sulphur and alum, from which the King of Naples derives a considerable revenue. Near it is a small lake full black thick water, which seems to be always boiling.

SOLFWITZBORG, or **SYLVISBORG**, a town of Sweden, in the province of Blekinge, 33 miles W.S.W. of Carlscrona. Long. 14. 31. E. Lat. 56. 2. N.

SOLIHUL, a town in Warwickshire, near which, to the W. is a triangular Danish camp, on an eminence, containing about nine acres. It is 12 miles W. of Coventry, and 107 N.W. of London.

SOLINGEN, a town of Westphalia, in the duchy of Berg, seated near the river Wipper, 15 miles S.E. of Dusseldorf. Long. 7. 10. E. Lat. 51. 10. N.

SOLKAMSK, a town of Russia, in the government of Perm, famous for its salt-pits and good horses. It is seated on the Ussilka, which falls into the Kama, 430 miles N.E. of Kasan. Long. 57. 26. E. Lat. 5. 16. N.

SOLMS, a town of Germany, capital of a county of the same name, in the circle of Lower Rhine. It has a strong castle, belongs to a branch of the house of Nassau, and is seated on a hill, 10 miles S.E. of Herborn. Long. 8. 31. E. Lat. 50. 35. N.

SOLOK, an island in the Indian Ocean, to the S. of Celebes, governed by its own king. Long. 123. 55. E. Lat. 9. 0. S.

SOLSERINA, a town of Italy, in the duchy of Mantua, 17 miles N.W. of Mantua. Long. 10. 40. E. Lat. 45. 20. N.

SOLTAU, a town of Lower Saxony, in the principality of Luneburg Zell, 29 miles N.N.W. of Zell, and 29 W.S.W. of Luneburg. Long. 10. 2. E. Lat. 53. 10. N.

SOLTWELD, a town of Germany, in the old marche of Brandenburg, seated on the Jetze, 45 miles N.W. of Stendal. Long. 11. 36. E. Lat. 53. 6. N.

SOLWAY FRITH, an arm of the sea, between Cumberland in England, and Kircudbrightshire in Scotland.

SOMBREIRO, a cluster of uninhabited islands in the West Indies, belonging to the English. The most remarkable of them is a league long, and consists of an eminence, to which the Spanish discoverers, finding some resemblance to a hat, gave the name of *Sombreiro*. It is 80 miles N.W. of St. Christopher. Long. 63. 37. W. Lat. 18. 38. N.

SOMMA, a town of Naples, in Terra di Lavoro, near which is annually produced between 7000 and 8000 pounds weight of silk of the best quality. It is 10 miles E. of Naples.

SOMME, a department of France, including the late province of Picardy. It takes its name from a river which rises in the department of Aisne, and watering St. Quentin, Peronne, Amiens, and Abbeville, enters the English channel. Amiens is the capital.

SOMMERFELD, a town of Upper Saxony, in the

duchy of Croffen, 15 miles S. of Croffen, and 72 S.E. of Berlin.

SOMMIERES, a town of France, in the department of Gard. It has a manufacture of thick ferges, which bear its name; and is seated on the Vidourle, 10 miles W. of Nîmes. Long. 4. 11. E. Lat. 43. 48. N.

SONCINO, a strong town of Italy, in the Cremonese, seated on the Oglio, 30 miles N.W. of Cremona. Long. 9. 44. E. Lat. 45. 24. N.

SONDERBORG, a seaport of Denmark, in the island of Allen. It has one of the best harbours in Denmark, and a royal palace in which Christian II. king of Denmark, was confined as a prisoner 13 years. It is 16 miles E.N.E. of Flendburgh. Long. 9. 49. E. Lat. 54. 57. N.

SONDERSHAUSEN, a town of Upper Saxony, situate on the Wipper, 30 miles N.E. of Mulhausen, and 26 N. of Erfurt. Long. 11. 5. E. Lat. 48. 25. N.

SONDRO, a town of the country of the Grisons, capital of the Valtelline. It is built in a very romantic situation, at the extremity of a narrow valley, and occupies both sides of the Malenco, a furious torrent, which frequently overflows its banks. Sondrio is 34 miles N.E. of Como. Long. 9. 40. E. Lat. 46. 11. N.

SONERGON, or **SUNNERGAUM**, a village of Hindoostan Proper, once a large city, the provincial capital of the eastern division of Bengal, before Dacca was built, and famous for a manufacture of fine cotton cloths. It is seated on a branch of the Burrampooter, 13 miles S.E. of Dacca.

SONG-KIANG-FOU, a city of China, in the province of Kiang-nan. It is celebrated for the prodigious quantity of cotton cloth which it exports to foreign countries, but has only four cities in its district.

SONORA, a province of New Navarre, extending along the E. side of the gulf of California, in about 26° N. long, and 69° N. lat. It lies in the most delightful part of the temperate zone; and all its productions, whether animal or vegetable, are perfect in their kind. Some rich mines of gold and silver were discovered here by the Spaniards, in 1771, in an expedition against some fierce tribes of hostile and predatory Indians.

SOOLOO, an island of the Eastern Ocean, situate S.W. of Mindanao, almost midway between that island and Borneo. It is 30 miles long and 12 broad, and contains about 60,000 inhabitants. It is governed by a king or sultan, and the natives are Malays, and consequently Mahometans. The populousness of this little spot is caused by its advantageous situation, which renders it a great mart. The English East-India Company have a resident here. Long. 121. 25. E. Lat. 5. 51. N.

SOPELANIA, a town of Persia, in Aderbeizan, seated in a valley, 25 miles N.W. of Tauris. Long. 47. 25. E. Lat. 38. 25. N.

SOPHLENBERG, a town of Denmark, in the island of Zealand, with a royal palace, 13 miles N. of Copenhagen. Long. 12. 40. E. Lat. 55. 54. N.

SOPRA SELVA, a valley of Switzerland, in the country of the Grisons. It extends from Mount St. Gothard to Reichenau, and is the most populous valley of the Grey League.

SOPRON, a strong town of Lower Hungary, capital of a county of the same name, seated on a small river, 27 miles S.W. of Presburg, and 30 S.E. of Vienna. Long. 17. 0. E. Lat. 47. 46. N.

SORA, a town of Naples, in Terra di Lavoro, with a castle and a bishop's see; seated on the Garigliano, 65 miles N.W. of Naples. Long. 14. 4. E. Lat. 41. 34. N.

SORA, a strong town of Denmark, in Zealand, with a

college for the nobility, nine miles W. of Ringsted. Long. 11. 53. E. Lat. 55. 26. N.

SORAW, a town of Germany, in Lusatia, seated near the Hober, 25 miles S. of Croffen, and 32 N.E. of Gorlitz. Long. 15. 48. E. Lat. 51. 40. N.

SORIA, a town of Spain, in old Castile, built on the ruins of the ancient Numantia, near the source of the Douero, 74 miles S.E. of Burgos. Long. 2. 2. W. Lat. 41. 48. N.

SORIANO, a town of Naples, in Calabria Ulteriore, 17 miles K.N.E. of Nicotera.

SOROCK, a town of Poland, seated on the Dnieffter, with a strong castle. The Turks were obliged to raise the siege of this place in 1608.

SOROE, a town of Denmark, in the island of Zealand, surrounded by three fresh-water lakes. Here is a royal academy, endowed with the revenues of a rich convent which was dissolved at the revolution. It is 25 miles S.W. of Copenhagen. Long. 12. 15. E. Lat. 55. 5. N.

SOSPETTO, a town of Piedmont, in the county of Nice. It has a trade in dried fruits, particularly figs; and is seated at the foot of three very high mountains, on the river Bevera, 15 miles N.E. of Nice. Long. 7. 34. E. Lat. 43. 52. N.

SOVANO, a town of Tuscany, in the Siennese, with a bishop's see, 25 miles W. of Orvieto. Long. 11. 48. E. Lat. 42. 48. N.

SOULLIAC, a town of France, in the department of Lot, seated on the Horefe, 35 miles N. of Cahors. Long. 1. 21. E. Lat. 44. 55. N.

SOUND, a strait between Sweden and Denmark, through which ships usually fall from the Categate into the Baltic. It is about four miles broad, and here the Danes take toll of all merchant-ships that pass into the Baltic.

SOUP (*Esopé*). The following extract from an account of the manner and expence of making stewed ox's head for the poor, by Mrs. Shore of Norton-hall, in Derbyshire, is published by the Society for bettering the Condition of the Poor.

"One of the members of the Society having requested the particulars of the ox-head stew, which is given away at Norton-hall," says Mrs. Shore, "I have prepared the following account.—The whole is divided into fifty-two messes; each mess containing a piece of meat, a piece of fat, and a quart of soup. The distribution of it has been continued since October, 1793, once a-week, and sometimes oftener, from October to May. The poor people receive it very thankfully, and generally reserve part of the mess for the second day.

"The manner of preparing it is as follows:—Wash the ox's head very clean and well, and then put it into thirteen gallons of water; add a peck and a half of pared potatoes, a quarter of turnips, half a quarter of onions, a few carrots, a handful of pot-herbs, and the liquor of any boiled meat of the family, in which no vegetable has been boiled; thicken it with two quarts of oatmeal, and add pepper and salt to your taste;—for it to stew with a gentle fire, early in the afternoon, allowing as little evaporation as may be, and not skimming off the fat; but leaving the whole to stew gently over the fire, which should be renewed and made up at night. Make a small fire under the boiler at seven o'clock in the morning, and keep adding as much water as will make up the waste by evaporation, keeping it gently stewing till noon, when it will be ready to serve for dinner. The whole is then to be divided into fifty-two messes; each containing (by a previous division of the meat and fat) a piece of meat and fat, and a quart of savoury nourishing soup.

"The expence of the materials in the northern counties, where it has been tried, may be thus stated:

An ox's head	s. d.
A peck and a half of potatoes	1 6
Onions, turnips, &c.	0 7½
	0 4½
	2 6

"This amounts, exclusive of fuel and trouble, to rather more than a halfpenny for each mess, or not quite two pence halfpenny a gallon; but in the dearer parts of England, the articles being purchased by retail, the messs may cost as much as three farthings or a penny.

"The beef and other bones, and crusts of bread, of the family, may be added to the stew; and will improve the soup, without any additional expence.

"The above is submitted to the consideration of those house-keepers who have not yet adopted a similar charity, as a cheap and useful mode of relieving their poor neighbours, and of gradually teaching them a better system of diet than they at present possess. The sum of *£s. 6d.* a-week for seven months (amounting to *£s. 15s.* a-year) in the cheap parts of England, and a few shillings more in the others, is the expence of a charity which may retain on its lists fifty-two poor persons, and supply them with the comfort of two meals a-week."

This receipt was tried in Auckland workhouse; and was extremely liked by the poor. Though the expence was very small, yet the quantity produced being a great deal more than the people of the workhouse could use, the cottagers near the workhouse were desired to send for messes of it; and had, in consequence, the benefit of a plentiful and unexpected meal. It is now inserted in their table of diet, to be made once a-week for the benefit of the poor, both in and out of the workhouse.

Count Rumford, in his valuable essays, has demonstrated the practicability of making soup abundantly equal to human sustenance, under all circumstances of bodily exertion, of vegetable ingredients only, without a particle of animal matter. On this he fed the soldiery and poor of various descriptions, in Bavaria, for a long time; and those who partook of this excellent cookery were unable to distinguish it from the soup composed of animal broth, except from its superiority in flavour and effect.

SOUP-HOUSE, a recent kind of charitable institution, found necessary for the poor in Britain, during the late scarcity. The following is extracted from an account of the soup-house, in West-street, St. Giles's, by Sir Frederick Morton Eden, bart.

The soup-house in West-street, Seven Dials, was opened on the 10th of January, 1800, upon the plan of giving general relief for all applicants, from any part of the metropolis. The quantity of soup sold there in three months, between the middle of January and the middle of April, 1800, amounted to 118,457 quarts; for which the sum of *£493. 11s. 5d.* was received from the applicants. From that time to the 25th of July, it was conceived that the individuals would be more relieved, and with more benefit to the public, by a supply for their families of potatoes and pork; and of savoury rice, prepared according to the receipt of the society for the poor. The latter, they had the pleasure to find, was very acceptable to the applicants; particularly to those who had several small children. In one week above 4,400 quarts of savoury rice were purchased by the poor; and during the period from the 28th of April to the close of the season in July, the following articles were sold at the soup-house:

66,370 pounds of potatoes,
81,600 herrings,
14,842 quarts of savoury rice,
1,988 pounds of boiled pork.

By these means, during the winter of 1800, many thousand persons, who had no other means of support, received occasional relief; and it was a very gratifying circumstance to the committee which conducted the soup-house, that in many instances persons, who had at first come dirty and negligent in their apparel, became in a short time decent and neat in their persons, and regular and orderly in their behaviour.

The liberal and well-directed assistance of the Committee at Lloyd's, encouraged the exertions of the Committee of the soup-house in West-street; and on the 4th of December, 1800, when it appeared that the general pressure would continue another season, the Committee of Management for the soup-house renewed their labours with increased activity. It is the peculiar misfortune of the poor, who constitute a very considerable part of the neighbouring population of St. Giles's and St. Ann's Soho, that, generally speaking, they are unknown to the subscribers; being resident in streets or courts entirely occupied by the poor, and being mostly engaged in occupations which do not afford them means of access to those who could recommend them as objects of relief. Many families, not having the means of procuring recommendations from the subscribers, applied at the soup-house, in consequence of an instruction given them; and the gentlemen concerned in the management of that trust, visited personally above a hundred families in the greatest distress; and, by enquiry, ascertained the description of the rest. In consequence of information so affecting, they thought it their duty to extend the relief of the charity, not merely to persons recommended by the subscribers, but also to the other distressed families, who had not the ordinary means of procuring tickets of recommendation.

Notwithstanding the time lost in attendance (an inconvenience which at first appeared to be indissolubly connected with this species of charity, but which, in this soup-house, has since been in a great measure remedied), the number of adults and children, receiving relief at the soup-house, amounted to about 14,000 individuals; who, at a time of scarcity, have thus been furnished with wholesome food, and with coals, at a reduced price.—Of the latter article, 250 chaldrons, in the course of this winter, have been laid in the vaults under the adjoining chapel, and have been sold in small quantities to the poor, four days in the week, at the hours most convenient to them, at one shilling a bushel.

The establishment of soup-houses has afforded unequivocal proof, if proof were wanting, that the prejudices of the indolent classes respecting diet, are not inveterate.

That, on a subject so important to the labourer as the daily supply of his family with the principal necessary of life, and the mode of preparing his food, he should feel disposed to abide by the decision of his forefathers, and to think the general practice the best, because it is the general practice, might reasonably be expected. He has not leisure, nor can he afford, to risk experiments to mend the meal, which he must procure from the sweat of his brow. It is not from his manufacturing skill that his mess can be improved, or from his architectural knowledge that his dwelling can be rendered more comfortable. While he labours for others, merchants, manufacturers, and philanthropists, must plan for him. Visionary projects may often disgust him, and render him averse to innovation; but he is sel-

dom so ignorant of his true interest as not to adopt improvements, which have been fairly tried, and satisfactorily explained to him. In truth, the changes which have taken place in the domestic economy of the great mass of the people are not inconsiderable. In the middle of the seventeenth century, tea, sugar, and potatoes, and even wheaten bread (articles which now constitute a great part of the subsistence of the labouring classes) were almost wholly unknown to them; and the experience of very modern times has shewn that good meat, fowl, fish of various kinds, and savoury rice, prepared at a fourth part of the expence of less palatable food, may be introduced at the tables of the poor. To familiarize them, however, to judicious and economical cookery at home,—wealth, science, and benevolence, must continue their exertions. The poor of the metropolis, more particularly, not only want clear and explicit directions how their food may be prepared to the best advantage; but cheaper fuel than they can in general procure, and an improved kitchen apparatus. These, however, are objects which do not fall within the scope of a soup establishment.

Various are the advantages which have resulted from institutions of this nature. They are usually opened in winter, a period of the year in which relief is most acceptable to the poor. They, probably, not only benefit the immediate applicants, but eventually others, to whom habit and local circumstances still render bread a principal article of subsistence. While the scarcity of corn continues, those who will make white bread the great article of their subsistence, will be benefited by those who can be satisfied with substitutes; and it is to be hoped that cheap and nutritious food may be thus brought into general use, by the extension of the knowledge of those culinary processes, which are necessary for preparing it.

It should, however, be remembered that soup-houses are extraordinary resources, only to be used in times of difficulty and distress; when there is a deficiency of food, or when the regular exertions of industry are impeded by an unforeseen pressure or calamity. In a well-ordered state, the permanent welfare of the labouring classes must be the result of their own energies. To open the doors of a soup-house, as well in summer when work may easily be had, as in winter when it cannot,—in years of plenty, as in years of scarcity,—is an indirect assurance to the labourer that the difference between the produce of his industry and the price of provisions shall always be equalized from the contributions of the opulent. Such attempts may be partially made; but in their effects they must be often pernicious: as a general system, they are impracticable.

Soup-houses hitherto have been supported by liberal subscriptions, and managed at a moderate expence. The active zeal of the first promoters has, in most instances, rendered their administration pure and disinterested; but this active zeal has been excited, because the pressure of the present period is considered as extraordinary. In ordinary seasons the subscriptions would be less liberal, and the management less gratuitous, and perhaps less disinterested. A mixture of evil will blend itself with every human contrivance. In order to distribute food with order and economy, soup-houses require the personal attendance of applicants. Hence arises a loss of time, the most valuable property of the poor. He who carries his corn to a parish mill to be ground, instead of purchasing his flour from a neighbouring baker, and he who waits his turn to be supplied with a cheap meal from a soup-house, must deduct from the money price of the article thus bought, the time lost in purchasing it. The benefit in both cases may be

considerable; but in both cases the loss of time must be calculated, and allowed as a draw-back.

It may be doubted whether the morals of the lower classes, particularly of children, are not injured, by their being brought together in great numbers. Whatever pains may be taken to exclude improper objects, it is almost impossible for a soup-house to relieve several hundred families, without often obliging the modest and industrious poor to associate with the idle and the profligate. An establishment of this kind must be content not to scrutinize the merits of applicants "too curiously;" it must forget "their vices in their woe," and not refuse a meal to fix starving children, because the father is idle, or the mother is dissolute.

It is a considerable objection to the permanency of soup-houses, that a charitable fund raised for supplying articles of subsistence, at reduced prices, to industrious persons who are not absolutely paupers, may lessen the distinction between independence and poverty; and gradually obliterate that spirit of independence, which is the chief motive for personal exertion.

SOUR, or **SUR**, a sea-port of Turkey in Asia, in Syria, where stood the famous city of Tyre, of which there is now nothing remaining but ruins. Long. 35. 50. E. Lat. 33. 18. N.

SOUR, or **SUR**, a river in the Netherlands, which runs from W. to E. through Luxemburg, and falls into the Moselle, a little above Treves.

SOURI, a town of Persia, in Laristan, situate on the Persian Gulf, 110 miles S.W. of Ormus. Long. 55. 30. E. Lat. 26. 18. N.

SOUSA, or **SUSA**, a strong town of the kingdom of Tunis, capital of a province of the same name, with a castle and a good harbour. It is a place of some trade, and seated on a high rock, near the sea, 65 miles S.E. of Tunis. Long. 11. 15. E. Lat. 35. 52. N.

SOU-TCHOU-FOU, a city of China, the second in the province of Kiang-nan. It is so intersected by canals of fresh water, that Europeans compare it to Venice; and the country round it is so delightful, that the Chinese call this city the paradise of the world. The brocades and embroideries made here are esteemed throughout the whole empire. Its population is prodigious; but its jurisdiction extends over only one city of the second, and seven of the third class. Long. 112. 20. E. Lat. 38. 40. N.

SOUTERRAINE, a town of France, in the department of Creuse, 24 miles N. of Limoges.

SOUTHAM, a town in Warwickshire, with a market on Monday, and noted for its cider. It is 13 miles S. of Coventry, and 83 N.W. of London. Long. 1. 23. W. Lat. 52. 36. N.

SOUTHEND, **NEW**, a village in Essex, seated at the mouth of the Thames, 44 miles E. of London. Being the nearest place to the metropolis, for sea-bathing; it is much resorted to, and has handsome accommodations for the company.

SOUTHWELL, a town in Nottinghamshire, with a market on Saturday. It is an ancient place; and has a collegiate church. It is 10 miles N.E. of Nottingham, and 130 N.N.W. of London. Long. 0. 51. W. Lat. 53. 6. N.

SOUTHWOLD, a corporate town and sea-port in Suffolk, with a market on Thursday. It is seated on a cliff, near a fine bay, with a harbour to the S. and the river Blythe, and a drawbridge on the W.; so that it is almost surrounded with water, especially at every high tide. Here a much esteemed salt is made, and it has also a trade in corn, beer, and herrings. It is commonly called **SOULS** or **SOLZ**,

and its bay is named **SOLERAY**. In this bay was the great sea fight between the Dutch admiral De Ruyter, and James duke of York, in which the victory was undecided. Southwold is 20 miles S. of Yarmouth, and 10½ S.E. of London. Long. 1. 54. W. Lat. 52. 24. N.

SOUTO MAJOR, a town of Portugal, in Beira, 14 miles N.W. of Pinnel. Long. 6. 48. W. Lat. 41. 5. N.

SOVIGNY, a town of France, in the department of Rhone and Loire, seated on the Queune, 50 miles S.E. of Bourges, and 167 S. of Paris. Long. 3. 21. E. Lat. 46. 39. N.

SOWING-MACHINE. A patent was granted, in 1784, to Mr. Wright, of Cranage in Cheshire, for a machine upon an entirely new principle, for sowing wheat, beans, peas, and other grain, and seeds; which may be fixed to a plough. The drawing, marked A, in Pl. 47. represents this machine as fixed to a plough-beam; and on one side of the box or case is taken away, for the purpose of displaying as much as possible the mechanism of it, and the way in which it works: and it may be fixed to the beam of any plough, and this is the way in which it should be used when it is meant to sow only one row under furrow; or the machine may be so varied as that the motion may be communicated to more feed-plates than one, and these being fixed to a drilling instrument, may be contrived to sow two or four rows at once; but the account here intended to be given is of that intended to sow only one row: the feed-plates, so called because they are the means of sowing and distributing the seed, must be adapted to the nature and magnitude of the seed, or grain, intended to be sown, and they may be easily and soon changed at the pleasure of the user to sow different kinds of seed or grain, as will hereafter appear: the seed or grain is to be put into a box, canister, or hopper, B, at the upper part of the machine, and the feed-plates, which are round, flat, and made of brass, receive their motion from a wheel passing upon the ground; these feed-plates turn horizontally between the bottom of the box B in which the seed is put C, and the top of the lower box or case D; the channels or apertures in them are so ordered as to dispense a limited and certain quantity of the seed or grain intended to be sown, which quantity may be increased or diminished, upon any given space or length of furrow, by changing the pinion-wheel, and adding another with a greater or lesser number of teeth, whereby the plate moves quicker or slower with relation to the movement of the plough. A block of wood E, which is the basis or foundation of the machine, is fixed on the under side of the plough-beams; by means of two long iron bolts, these pass through the block and through the plough-beam, and are screwed together on the upper side of the plough-beam: this wooden block should be seventeen inches long, three inches broad, and three inches deep. To this block of wood E, on the left hand, is fixed an iron frame F, which projects about six inches; the two strong iron arms G, which support this frame, are shouldered, and pass through the arms of an iron plate, and then through the block of wood E. The frame F is the segment of a circle, the radius of which is about six or seven inches; and the cheeks of it are connected together at top and bottom by two thin iron bars, rivetted into the two cheeks: the open space between the two semi-circular cheeks is about three inches, and the range between the cheeks is about seven inches; on the left-hand side this block of wood, and close upon it, there is an universal joint H, in the iron axis I; from this joint to the left hand, for six inches, the axis I is perfectly round, and about three fourths of an inch diameter; on this part of the axis there is a wooden roller K, bushed with brass,

about five inches long, and three in diameter at the larger or outer end, and one inch and a half at the smaller: this roller plays up and down the open range in the iron frame, and effectually prevents the wheel upon the ground from having any movement sideways, which it otherwise would have. From the round part of the axis upon which the roller plays, the axis is continued square for two inches and a half more, with a further allowance of half an inch, which is formed into a screw; the large wheel upon the ground L, which moves the whole machine, has a square mortise in its centre, which exactly corresponds with the square part of the iron axis I; when this is put on and fixed by the nut, the wheel and axis turn together: this wheel gives movement to the feed-plates. Though fixed on twenty-one inches diameter for the large wheel on the ground, as the most convenient height for the ploughs commonly used in Cheshire, it may be made more or less, and constructed of wood hooped with iron, or of cast-iron; the wheel, when fixed to work, will be distant from the plough-beam, on the left-hand or land side, about ten inches. By the contrivance of the universal joint and the roller, the wheel, in its circular motion on the ground, rises and falls, and passes over stones, or any other irregularities, without affecting the movement of the plough, or straining the inside, or other movements of the machine; from the universal joint on the left side, the block of wood before mentioned, the iron axis I is continued through the block; and, about two inches and a half to the right-hand side of it, there is a perpendicular plate of iron, about one inch and a quarter broad, three inches long, and a quarter of an inch thick; on each side the block of wood these are let in, and bushed with brass, or these plates may be formed of cast-iron; and through these the spindle or axis from the great wheel passes: it is here half an inch diameter, and perfectly round for three inches in length; the other two and a half square; on this square part of the axis is fixed the pinion M, with eight leaves or bars: this pinion must be made of hardened steel; or it may be made of cast-copper, with a small allowance of tin to harden it; the pinion must be nearly two inches long, and one inch and a quarter diameter, with a square mortise through it, corresponding with the square of that part of the axis I, upon which it is fixed. Betwixt the pinion and the plate, on the right-hand side the block of wood, there must be put a collar of brass, to make up the whole length of two inches and a half: a broad-headed screw, at the extremity of the iron axis I, fixes all this work; and, when it is necessary to repair, clean, or oil any part of the movement, this broad-headed screw being taken out sets all at liberty: the pinion and collar come off on the inside the box N; and the round spindle, or axis I, comes out on the outer, or other side; the long pinion M is essentially necessary, as it admits of pinion wheels O, of different diameters, with any number of teeth, from sixteen to forty-eight, to work upon it, from one common centre, as will appear afterwards; the block of wood before mentioned forms the left-hand side of the box N; two boards, three quarters of an inch thick, form the front and back part of the box; a board, three quarters of an inch thick, forms the bottom; and on the right-hand side is a door that opens outwards; the top, or cover, is a brass plate, about seven inches square, and a quarter of an inch thick; when the whole is put together, it forms a cube of near six inches within side. In or near the centre, in the bottom of the box, is a round hole, three quarters of an inch diameter; on the outside of the bottom is fixed a brass plate, let in level with the surface, about four inches long, by one inch and a quarter broad, with a hole three quarters of an inch diameter;

by means of two staples, rivetted into this plate, a flat double iron bolt P, with a spring upon it, slides into a rebate, turned out of the upright iron shaft, or spindle, Q, as will be seen in the drawing of the separate parts; by flipping the bolt back, the upright spindle Q is readily taken out, and by pulling it forwards it confines the spindle from rising or sinking, and to all intents answers the purpose of a stop for the spindle to turn upon: the upright shaft, or spindle, Q, is about eight inches long, the lower part projecting under the bottom of the box, through the bolt P, about an inch; then a circular groove for the bolt P to slide into; this is turned out of the iron about one eighth of an inch deep, and as much wide; the shaft is round at the lower end, and three quarters of an inch diameter; at two inches from the circular groove it becomes square: on this square part the different pinion-wheels O are fixed; the upper part is again turned round; this upper round part passes through a round hole in the brass top D of the box N, corresponding with the diameter of the round part of the spindle; the spindle rises one quarter of an inch above the upper surface of the brass top D; and here it is again formed into a square of half an inch; on this square shoulder the different feed-plates are put, by a square mortise, in their centres, corresponding with this square upper projecting part of the upright spindle Q; in order the better to shew, this iron spindle, a separate drawing of it is added, marked Q q. The feed-plates for different seeds differ somewhat, but are all round, flat, and made of brass, as they cannot be seen in the place where they work between C and D, separate drawings of them are therefore added. That for wheat, R, is something more than six inches diameter, and rather more than one eighth of an inch thick; two open channels or circles are cut through it, near the circumference; these are connected by bars alternately disposed, so that there is little or no interruption to the feed dropping, as the plate turns round; these open spaces, with the interposing rim, are about an inch wide. In the plate for beans or peas, S, there is only one open circle, about an inch wide, with sixteen thin partitions, to connect the rim with the body of the plate; this is brass, nearly half an inch thick, and of the same diameter as the other; the partitions are flush with the bottom of the plate, but do not rise more than half-way up the rim on the upper side; this will better appear from the drawing S. The plate for turnips, rape, lucern, or other smaller seeds, T, must be about six inches diameter, something thicker than the diameter of a turnip seed, but not equal to two; the holes must be made as appears in the drawing, and to open successively upon the opening in the brass table D, upon which all the feed-plates turn, and made large enough to contain four or five seeds, more or less, as they are ordered; for in this article persons differ about the quantity of seed they think necessary to be sowed in a given space. In order to connect the feed-box B with the lower box N, between which two the feed-plates move, as above described, there must be fixed, near the four corners of the brass plate D, on the top of the box N, four round upright pillars; these are about one quarter of an inch diameter, and about an inch and a half long; they may be made of brass, or iron, or may be rivetted into the four corners of the brass top of the box N. Four round mortises are to be made in the bottom of the feed-box B, corresponding with these upright pillars; the feed-box must be put on these pillars, and slipped down, and then, by means of four thumb-screws, which screw into the bottom of the box B laterally and horizontally, and act against the upright pillars, the box may be kept in its position: the bottom of the feed-box B is a square piece of

wood (beach, mahogany, or other close-grained wood, is what I have used), nearly seven inches square, and one inch and a quarter thick, perfectly smooth and level; this has four holes through it, corresponding with the four upright pillars before mentioned, and likewise a large femicircular opening, five inches long, and an inch wide; through part of this opening the feed descends from the box above, and part of it is occupied by the brushes, hereafter mentioned; but, as this cannot appear in the machine when it is together, a separate drawing is made of it U, which represents the under-side of it, with the brushes that act upon the feed-plates: this wooden table forms the bottom of the feed-box or hopper B; this hopper may be formed of wood, tin, copper, or rolled iron, and made to contain from one gallon to two; a triangular piece of wood or brass is fixed, by a screw, near the centre of this wooden table U, and is made to slide and cover the opening in it, towards the right-hand of it, for about half-way, and under the bristle-bar τ , and the brush ν , hereafter mentioned, are placed: it is made to slide, for the purpose of taking out, repairing, or changing the brushes, and a separate drawing is made of it U u, which represents the upper-side of the bottom, and the triangular sliding cover: when the feed-plate is put upon the square shoulder of the upright spindle Q, which projects above the brass top D of the lower box N, then the feed-box or hopper B must be put on, and fixed by the lateral horizontal thumb-screws, and the feed-plate will then, by the action of the great wheel L, by means of the pinion M and the pinion-wheel O, turn horizontally upon the brass table D, without any resistance but what is occasioned by the feed passing under the bristle-bar; there must be a femicircular opening in the brass table D (of which, as it cannot be seen in its place in the drawing, a separate drawing is made of it V), about two inches long, and one inch wide; this must be to the right of the bristle-bar τ , in the table C or U, that nothing may fall through it from the opening in C or U, till it has passed under the bristle-bar τ ; and the opening in the table C or U, being to the left of the bristle-bar τ , no feed can escape when the feed-plate stands still; but so soon as this is put in motion, whatever is received from the feed-box into the open channels of the feed-plate, as they pass under this opening, is forced by the divisions in the feed-plate under the bristle-bar τ ; and so soon as they pass under that bar, they drop through the opening in the brass table D or V into a perpendicular conducting pipe W, which conveys them downwards to the moveable conducting pipe X, and that deposits them upon the ground; this pipe W is made of tin, and joins close under the opening in the table D or V, and is as wide at top as that opening, narrowing as it descends through the box N, and is fastened against the inside of the front of that box; on the under or outside of the bottom of the box N, is fixed an oblique flat conducting pipe, made of strong tin, or thin iron, or copper, X; this comes immediately under, and receives the feed from the pipe W; this pipe X turns on a round iron rod or swivel, that is passed through a hole in a flat piece of copper, projecting from the bottom of the box N, and is fixed on the fore-part of the box N on the outside; and by means of a strong spring acting against this rod or swivel, in a groove turned out of it near the top, and the upper end of the rod being confined in a round iron staple that will admit it to turn round in it, the rod and pipe are kept from slipping down, and may be turned to the right or left under the bottom of the machine, to drop the feed in what part of the furrow the user thinks fit; but, as this pipe, and the rod and spring, cannot be seen in the machine as put together, a separate drawing of the pipe and rod are

M. Wrights Sowing Machine.

*The Key to Screw
on the Nuts with.*

made Y, of the front part of the box, with the spring and staple which confine it, Z; the feed-plates are put in motion by the motion of the wheel upon the ground L, which is communicated to them when they are put on the spindle Q, by means of the pinion M acting upon the pinion-wheels O; these pinion-wheels O may be made of brass, or cast or forged iron, and in size may be from two inches diameter to five, with any number of teeth required. What Mr. Wright has used have been wheels with twenty-four, thirty-two, and forty teeth; the rim of the wheels is about half an inch deep, and a quarter of an inch thick; on the upper side of the centre there is a collar, which rises about an inch above the upper side of the wheel: there is a square collar through this mortise, corresponding with the square of the upright spindle Q, upon which it is put, lodging upon that part of the spindle towards the bottom where it is round; on the collar, on the upper part, all round, is a shoulder projecting horizontally a quarter of an inch, under which comes the end of the horizontal arm of a lever of iron of this form L, fixed to the inside of the box N, on that side that is next the ploughman, by means of a strong wire passing from the top of the upright arm of the lever L through the box N, towards the ploughman, and a cord from the wire to the ploughman; he can at any time raise up the pinion-wheel O, so as to clear it from the pinion M, and stop it from working or moving the feed-plate as long as he pleases, though the plough be going on, and the wheel on the ground L in motion all the time; and again, by letting go the cord the wheel O will fall immediately down upon the pinion M, and instantly renew its work; and by this means turnip, rape, lucern, and other smaller seeds, may be sown in drills or rows, in what intervals the user thinks proper. As the lever is fixed on the side of the box N, which in the drawing is taken away to shew the mode in which the machine works, a separate drawing is made, A 2; which represents the situation and operation of the lever upon the pinion-wheel. The operation of this lever gives the machine several conveniences, particularly in going to the field, or returning; it likewise gives the ploughman a perfect command over the instrument. If intervals are required between the rows, as in sowing peas, beans, or wheat, this is soon effected by raising the pinion-wheel out of work, at the user's discretion; when it is kept in constant movement, and sows the seed in every furrow, it is then the same as broad-cast sowing; with this difference, that one-half the quantity of seed may be saved, or in other words, the farmer may sow what number of grains in every yard-length of furrow he thinks proper. The wheat feed-plate used by Mr. Wright delivers out, every revolution it makes, three drams in weight, with little or no variation; this weight, in counting, amounts to 300 grains, or thereabouts. The first or large wheel on the ground is nearly sixty-five inches in circumference. When the pinion-wheel, with twenty-four teeth, is in work, the plough will open a furrow 195 inches, or nearly five yards and a half, for one revolution of the feed-plate, and the machine drop about fifty grains of wheat every yard. When the pinion-wheel with thirty-two teeth is at work, the plough will go something more than seven yards: there would then drop something more than forty seeds every yard. When the forty-toothed wheel is at work, the plough will go nine yards; and in that compass about thirty-four seeds would drop every yard. Mr. Wright has not computed the distance the plough goes, nor the number of grains dropped in a yard, with a mathematical exactness, because, in an operation of this kind, it is not necessary: by making the channels in the feed-plates greater or lesser, by changing the

pinion-wheels for others with more or less teeth, the machine may be made to drop precisely any quantity named. When it is necessary to change the pinion-wheel O for a different one, it is done immediately by drawing back the bolt P under the bottom of the machine, which lets the upright spindle Q fall down; the pinion wheel is then taken off, another put on the spindle, the spindle replaced, with the upper end in the brass-top of the box; and the bolt P sliding upon the circular groove, in the lower end of the spindle, fastens and fits it for work immediately: a separate drawing of the bolt is added, marked B 2. What remains to be described are the brushes or bars of hogs' bristles. These are let into the large open space in the wooden table C or U, before mentioned, under the triangular sliding cover above described, and stand perpendicular to the horizontal feed-plates: they are readily taken out to be repaired, and as soon replaced again. Their elasticity prevents their injuring the corn, in passing under them. They are the only part of the machine that can fairly be injured by use; and, as these may require renewing, it will be necessary to be particular in describing the manner of making them. The brash frame consists of two parts: the first a strong plate of brash, about one inch and a half long, and three quarters of an inch broad; upon this are riveted two cheeks of brash, about the eighth of an inch thick, and a quarter of an inch broad, so as to leave an open space between the cheeks an inch wide; the cheeks must be in length the thickness of the wooden table before mentioned. When these are riveted together, they may be called one part of the frame; the other part consists of a strong brash plate, one inch and a half long by three quarters; two holes must be drilled through the former part, to admit two screws; and this last must have two female screw holes. Fill the vacancy in the first part mentioned with the best Russia bristles; dust some powdered rosin among them; fill it as full as it will contain; then apply the other part, and pass two wires through the screw-holes, to preserve the communication; then put the whole into a hand-vice, and screw it hard; apply the upper part to a hot iron, burn off the redundant bristles, and continue the heat till the rosin is melted, and the whole cemented together; when it is cool, take out the wires, and put in the screws; the bristles below the cheeks must be cut off level with the cheeks, by a broad chisel; this brush or bar is fixed even with the upper surface of the feed-plate, and a separate drawing is made of it, C 2. The second brash, to the right of this, is made in the same manner; only a piece of brash is rivetted in the middle space, between the two cheeks, to divide the brush into two parts; the bristles here are left longer than the cheeks, by the eighth of an inch. The use of this brush is to sweep out any grain that may accidentally lodge in the open channels of the wheat feed-plate, and force them back again down the conducting pipe: a separate drawing is made of this brush, D 2. The brush for beans and peas is made exactly in the same manner; only the bristles must not be cut off square with the cheeks of the brash frame, but left a quarter of an inch longer than the cheeks of the frame; when the bean-plate is intended to be used, the former brush for wheat, marked in the separate drawing C 2, must be taken out, and this put in its place; the second, or double brush, D 2, need not be removed, as it does not act in that case: a separate drawing of this brush for beans and peas is added, marked E 2.

SPA, a town of Germany, in the bishopric of Liege, famous for its mineral waters. That called the Old Spa consists of miserable cottages, and is properly nothing but the suburb to the other. The houses of the New Spa are

all wood, dark, and small, and yet it is affirmed they can make 1200 beds for strangers. The church of the capuchins, and the parish church, are both seated upon eminences. The inn called the Court of London, is very large, the best in the place, and most frequented. The names of the five principal wells are Pouhon, Geronfard, Saviniere, Watpotez, and Tunnelet. The inhabitants are employed in making toys for strangers. Spa was taken by the French in 1794. It is seated in a valley, surrounded by mountains, 17 miles S.E. of Liege. Long. 5. 50. E. Lat. 50. 30. N.

SPAITLA, a town of the kingdom of Tunis, near which are extensive and magnificent ruins. It is 90 miles S.W. of Tunis, and 100 S.S.E. of Bona. Long. 9. 15. E. Lat. 35. 40. N.

SPALDING, a town in Lincolnshire, with a market on Tuesday. It is seated near the mouth of the Welland, and from its neatness, and the canals in the streets, resembles a Dutch town. It has a good carrying trade in corn and coal; and much hemp and flax is grown in its neighbourhood. Near it is the greatest heronry in England, the herons building together on high trees like rooks. It is 14 miles S. by W. of Boston, and 100 N. of London. Long. 0. 2. E. Lat. 52. 45. N.

SPALLANZANI (Lazarus), a distinguished philosopher and physiologist, was born at Scandiano, in the department of Crostolo, in Italy, on the 10th of January, 1729; he was the son of John Nicholas Spallanzani, a counsellor of great repute, and of Lucia Zigliani: he commenced his studies in his own country, and at the age of fifteen went to Reggio de Modena, where he prosecuted them with the utmost assiduity. The Jesuits, who initiated him into the study of polite literature, and the Dominican friars who heard of his vast improvements, were desirous of attaching him to their orders; but his passion for knowledge led him to Bologna, where his relation, Laura Bassi, a lady deservedly celebrated for her genius, her eloquence, and her knowledge of natural philosophy and mathematics, was, at that time, one of the most illustrious professors of that university, and, indeed, of all Italy. Under the direction of this enlightened guide, Spallanzani learned to prefer the study of Nature to that of her commentators, or to estimate the real value of the commentary in proportion to the comparison it bore with the original; he soon perceived the wisdom of her instructions, and ere long experienced their happy effects.

Spallanzani's taste for philosophy was by no means exclusive; he studied his own language with peculiar attention, made a considerable proficiency in the Latin, and more particularly applied himself to the French and Greek. Spallanzani, in conformity to the inclinations of a father who loved him, applied to the study of jurisprudence; he was even on the point of being admitted a doctor, when Anthony Vallinieri, professor of natural history at Padua, induced him to renounce that intention, by promising the consent of his father, who was so sensibly affected at his thus devoting himself to his will, that he left him at liberty to pursue his own inclinations: from that moment he addicted himself to the study of mathematics; but without discontinuing that of the ancient and modern languages.

Spallanzani was soon well known in Italy; and his own country was the first to do homage to his talents. In the year 1754, the university of Reggio chose him professor of logic, metaphysics, and Greek; he continued to deliver his lectures there for six years, consecrating to physical researches those intervals of leisure which his vocation admitted. Some new discoveries excited his passion for natural

history, which was continually augmented by the success of his early efforts. His observations upon the animalcula in infusions, attracted the attention of Haller, and of Bonnet, who pointed out the path by which he himself had ascended to such a degree of eminence, and already proclaimed him to the learned world as Nature's interpreter.

In 1760, Spallanzani was invited to the university of Modena: though his interest might have prompted him to accept the advantageous offers of the respective universities of Coimbra, Parma, and Cefena, yet his patriotism and attachment to his family decided him in the resolution of limiting his exertions to the service of his country. The same considerations induced him to reject, some years after, the proposals of the academy of Peterburgh. He resided at Modena till the year 1768, and had the satisfaction of seeing that his own unaided powers had created a race of illustrious men, who still shine forth the glory of Italy. In the number of these must be reckoned Venturi, professor of natural philosophy at Modena; Belloni, bishop of Carpi; Lucchesini, ambassador of the late King of Prussia; and Angelo Massa, the poet of Parma.

During his residence at Modena, Spallanzani published, in 1765, a treatise, entitled, *Saggio di Osservazioni Microscopiche concernente il Sistema di Needham Buffon*. In this pamphlet he established, upon the most ingenious and well-founded experiments, the animality of microscopic animalcula. He sent his work to Bonnet, who formed his judgment of the author by this production, and who lived to see the accomplishment of the favourable prediction which he then pronounced. From that moment the closest intimacy was cemented between these two philosophers; which continued to the end of their lives.

In the same year Spallanzani produced a dissertation truly original; *De Lapidibus ab aqua Resilientibus*: he there demonstrated, by the most striking experiments, contrary to the received opinion, that the phenomenon which, in the style of infantine recreation, is termed ducks and drakes, is not produced by the elasticity of the water; but by the change of direction which the stone undergoes in its motion after having struck upon the water when it ascends the inflexion of the cavity indented by the shock.

In 1768, Spallanzani prepared the philosophers for the surprising discoveries with which he was to present them in the course of his life, by publishing his *Prodromo di un'Opera da Imprimerfi sopra le Riproduzioni Animali*. He there sketched the plan of a work which he was composing on this important subject: but this simple prospectus revealed more sources of philosophical information than all the books which had hitherto appeared; because it pointed out the method which must be pursued in those mysterious enquiries, and collected, under one view, many unexpected facts; particularly the existence of tadpoles, anterior to the period of fecundation, in many species of toads and frogs; the regeneration of the head in decapitated bodies of snails, which he had already communicated to Bonnet in the year 1766, and which was, for a short time, disputed, notwithstanding the repeated confirmation of this phenomenon by Herissant and Lavoisier; he also finally demonstrated it some time afterwards, in a work entitled *Memoire della Societa Italiana*; by the instance of the reproduction of the tail, legs, and jaws, in the mutilated aquatic salamander. These facts astonished to this day, when reflected on, though time may have rendered them familiar to our senses; and it is not easy to decide which presents greater claims to admiration, the ability of Spallanzani in affording such incontestible proofs, or the indefatigability and undaunted boldness which he manifested in pursuing and demonstrating the results of his

arduous and surprising experiments. It will ever be a subject of regret, that the project of his great work was not realised; but a variety of circumstances prevented him from yielding to the solicitations of his friends in that particular.

The physiology of Haller, which Spallanzani was studying, fixed his attention on the circulation of the blood, in which he discovered many remarkable phenomena. In 1768, he published a small work, *Dell' azione del cuore ne' vasi sanguigni nuove Osservazioni*; and he reprinted it in 1773, with three new dissertations; *De' Fenomeni della Circolazione osservata nel giro universale de' Vasi*; *de' Fenomeni della Circolazione Languente*; *de moti del sangue indipendente dell' azione del cuore e del pulsare delle Arterie*. This book, little known, comprises a series of the most refined and delicate observations and experiments upon a subject of which our knowledge was before extremely superficial.

When the university of Pavia was re-established upon a more extensive plan, the Empress Maria-Theresa, through the medium of the Count de Firmian, invited Spallanzani to fill the place of professor of natural history. His great reputation obtained him this distinction, which was solicited for him by many celebrated men.

On his arrival at the university, Spallanzani selected Bonnet's *Contemplation de la Nature* for the subject of his lectures: he supplied its deficiencies, developed the ideas, and illustrated the justness of its theory by his own experiments; he translated it into Italian, and enriched it with notes: he likewise added a preface, where he took occasion to remark the subjects of animal and vegetable economy; which more especially merited the attention of his pupils, as it sometimes pointed out to them the means of succeeding in these researches. He published the first volume of his translation in 1769, and the second in 1770.

Spallanzani's intimacy with Bonnet, influenced his genius, which insensibly adopted the severe methodical manner of the Genevan philosopher; he gloried in being his pupil, and employed his meditations upon his admirable productions with ever new delight; whence it happened that he was powerfully incited to search in nature the proofs of Bonnet's opinion upon the generation of organic bodies; a subject which, for a considerable time, engrossed his whole attention. In the year 1776, he published the two first volumes of his *Opuscoli di Fisica Animale e Vegetabile*; they consist of illustrations of a part of the microscopic observations which had already appeared. Wholly absorbed by the great phenomenon of generation, he examined the opinion of Needham, in order to demonstrate its impossibility.—Needham, dissatisfied with Spallanzani's microscopic observations, which invalidated his doctrine of an imaginary vegetable power imparting motion to matter, challenged the professor of Reggio to revise what he had published; but he avoided a formal reply by publishing a series of new facts and experiments.

He demonstrated that the animalcula of infusions are produced by germs; that there are some, e. g. certain species of eggs and seeds, which are equally proof against the severity of the most intense cold and the heat of boiling water. On this occasion he treated of the influence of cold upon animals, and proved, that the lethargic numbness of some during winter does not at all depend upon the impression which the cold makes upon the blood, since a frog, deprived of its blood, becomes lethargic when it is chilled in ice, and then swims as usual when it has recovered its natural warmth. He demonstrated, in the same manner, that odours, various liquors, and a vacuum, act upon ani-

malcula as upon other animals; that they are oviparous, viviparous, and hermaphrodites.

The second volume of this work is a voyage into regions still more unknown. A sublime pencil had already delineated them; but the picture was not finished from nature. Spallanzani gives a history of spermatie animalcula, which their eloquent historian invariably confounds with the animalcula of infusions. One cannot but admire the modest diffidence of this new philosopher, struggling almost always against the conviction of his own senses, and the authority of Buffon; and he appears to admit, with much reluctance, the result of these observations, multiplied and varied in a thousand different ways, which expose the weak foundations upon which the system of organic molecules is erected.

Spallanzani afterwards describes the wheel-animal and the sloth, two species of animalcula, the monsters of the microscopical world, singular from their figure and organization, but still more so from their faculty of refusing life after a total suspension of all its apparent acts during many years: it is this phenomenon which he more especially considers in order to ascertain the limits and conditions of it, to enable him to investigate its causes, and connect them with others to which they are analogous. He annexed to this collection an account of that appearance on certain bodies which is called mould; he shewed that its seeds float in the air; and he remarked, that these microscopic fungi were distinguished from other plants by their tendency to grow in all directions, without being subjected to the almost universal law of the perpendicularity of the stem to the soil.

Spallanzani was entrusted with the cabinet of natural history in the university; but he found himself almost the nominal depository of a treasure which did not exist: he himself laid the foundations of it; and it is become, by his endeavours, one of the most valuable and useful.

He enriched it by his repeated travels both by sea and land, into Europe and Asia, across the Appennine mountains, the Alps and Krakacks, to the bottom of mines, amidst the ruins of volcanoes, and on the brink of their craters: by these means he completed that vast collection of curiosities, which all the world's wealth could never have purchased; because wealth can never supply the place of genius and discernment.

In 1779, Spallanzani traversed Switzerland and the Grison territories. He proceeded to Geneva, where he rested a month with his friends; who were no less charmed with his conversation than with his writings. He then returned to Pavia, and published, in 1780, a new work in two volumes, entitled *Dissertazioni di Fisica Animale e Vegetabile*. Some of Spallanzani's experiments upon digestion, which he made for the improvement of his pupils, led him to study that mysterious operation. He repeated the experiments of Reaumur upon gallinaceous fowls; and observed, that trituration, which is, in this case, an assistant to digestion, is, nevertheless, not the efficient cause of it. He discerned, that the gizzard of these birds, which, equal in sharpness to the keenest lancet, pulverises nuts and silberts, does not digest the powder which it forms; but that the nutritious matter thus reduced to powder undergoes a new transformation in the stomach, in order to render it an aliment congenial to the nature of the blood and the humours of the body. He laid it down as an established principle, that digestion operates in the stomach of a great number of animals by the active energy of a certain juice, which dissolves the aliments received; and with a view to render his demonstration more incontestable, he

had the courage to try some experiments upon himself, and the address to complete his proofs by artificial digestions made, in glasses upon his table, effected from mixing the masticated nutriment with the gastric juice, which he found means to extract from the stomachs of animals.

This work gave offence to John Hunter. He published, in 1785, some observations upon digestion, where he took occasion to make very severe animadversions on Spallanzani, who revenged himself by publishing this work in Italian, and addressing to Caldani, in 1788, *Una Lettera Apologetica in risposta alle Osservazioni del Signor Giovanni Hunter*.

The second volume treats of the propagation of animals and plants. Spallanzani proves, by experiments equally new and surprising, the existence of the germ before fecundation; he demonstrates the existence of tadpoles in the females of five different species of frogs, toads, and salamanders, before fecundation; he relates the success of fecundations effected by art upon the tadpoles of these five species, and even upon a quadruped; he shews, in the same manner, the feed in flowers, before the emission of their prolific powder; and, by a nice and delicate anatomy, of which, perhaps, an idea can hardly be formed, he shews, in the *spermium junceum*, the lobe as well as the seeds in their integuments; he traces them through their different stages of budding, before and after the possibility of being fecundated, and leaves not the shadow of a doubt, but that the seed and its integuments exist a long time before the flower begins to bud, and consequently, a long time before the prolific power can exist. He repeated his observations upon many species of plants, with the same results; in short, he raised some individual plants from female flowers, which contained fruitful seed, though there cannot be even the slightest suspicion of their having any communication with the prolific powder of the male flowers. Spallanzani, as was customary with him, took the opportunity presented by the academic vacations of the year 1781, to make a tour abroad, the principal object of which was to increase the collection of curiosities in the cabinet of Pavia. He set out in July for Marseilles, where he commenced a new history of the sea, which, though incomplete, would furnish an infinite number of new and curious facts, relating to several inhabitants of the waves. He afterwards proceeded to Massa and Carrara, in order to observe the quarries of that marble in such great esteem among statuaries; he returned to Spezzia, and brought back to Pavia an immense collection of fishes, both of the testaceous and crustaceous description, which he deposited in this cabinet, of which his travels had rendered him the worthy trustee. With the same views, and with similar success, he visited the coasts of Istria in 1782, and the Appennine mountains in 1783, where he had an opportunity of observing the dreadful storms and the singular vapour which have rendered that year famous in meteorology. His fame daily increased: the Emperor Joseph II. knew him when he was in Lombardy; from the very first he sought the conversation of Spallanzani, and testified the great esteem which he entertained for his talents, by presenting him with his own portrait set in gold.

The university of Padua made him an offer, in the year 1785, of the professorship of natural history, then vacant by the death of Anthony Vallisneri, promising him, at the same time, more considerable perquisites than those which he enjoyed at Pavia; but the archduke doubled his salary, and permitted him to accompany to Constantinople the Chevalier Zuliani. He set out on this journey the 21st of

August; on his road he made many observations upon the marine productions which he met with in those latitudes, as well as upon the meteorological events daily occurring. He touched at several islands in the Archipelago, which he surveyed with a philosophical eye; he descended towards Troy, in order to visit those romantic abodes so beautifully described by the bard whom he most admired, and, slowly moving through those poetical recesses, he made some geological observations truly original.

Spallanzani arrived at Constantinople on the 17th of October, and continued there eleven months. The physical and moral phenomena of this country, hitherto unknown to him, rivetted his attention; he travelled the shores of both the seas, climbed the neighbouring hills, and visited the island of Chalki, where he discovered to the Turks a coppermine, of which they were before entirely ignorant. He proceeded to the island of Priopici, some miles distant from Constantinople, where he discovered an iron mine wholly unknown. He set out on his return to Europe the 16th of August, 1786, loaded with oriental spoils, composed of animals peculiar to those regions.

A sea voyage was, in every respect, the safest as well as the most convenient; but Spallanzani regarded with an eye of perfect indifference the dangers attending long journeys by land, when he entertained any hopes of meeting with new instruction; he boldly confronted all the perils of these desert regions destitute of civil government. Having reached Bucharest, he was detained there nine days by the celebrated and unfortunate Mauroceni, hospodar of Wallachia: this prince, justly renowned for his liberal patronage of the sciences, received him with the most flattering marks of distinction; made him a present of several rarities of his country, and provided him with horses, and an escort of thirty soldiers through the whole extent of his dominions. Spallanzani passed through Hermanstadt to Transylvania, and arrived at Vienna on the 7th of December, after having visited the numberless mines of Transylvania, Hungary, and Germany.

Spallanzani remained five days in the metropolis of Austria, held two conferences of considerable length with the Emperor Joseph II. was entertained by the principal noblemen of the court, and visited by all men of literature. At length he arrived at Pavia; the students came out of the city gates to meet him, and accompanied him to his house, in all the rapturous ardor of unfeigned joy, and, by the most irresistible compulsion, dragged him to the auditory. Impelled by their desire to hear him, they compelled him to ascend the chair, whence he was accustomed to deliver his lectures. Spallanzani, sensibly affected by this conduct, painted to them, in the most eloquent and animated manner, his gratitude and attachment: kind wishes, cries of joy, and shouts of applause, were renewed with more ardor, and he was compelled to request them to restrain their satisfaction, and to permit him to retire to his own house, that he might obtain that repose of which he found himself so much in need. He had, at this time, more than 500 students.

The cabinet of Pavia was always the dear object of Spallanzani's thoughts; among the numerous rarities which he had there collected, his mind was only intent on those which were still wanting. He was struck with its deficiency in volcanic substances, of which a few only were collected, without order, uninteresting, and uninformative, though Italy was the theatre where the volcanic fires, for so many ages, had displayed their desolating energy. He resolved to instruct his disciples, his country, and himself, on these phenomena, so important and so little known, and to collect

the documents of their history on the spot where they are the incessant terror of the surrounding inhabitants; and the useless subject of philosophical observations; he prepared himself for this important undertaking by a laborious course of study. He set out for Naples in the summer of 1788; and, in the course of a dangerous voyage, examined, with minuteness and undaunted courage, the terrible phenomena of Vesuvius, Lipari, Etna, Sylla, and Charybdis. By these means, at the age of sixty, he amassed that invaluable collection of anecdotes comprised in his work entitled *Voyages dans les deux Siciles*, where he embraces the opportunity of comparing the descriptions which Homer, Pindar, Virgil, Diodorus Siculus, and Strabo, have given of those celebrated places, with what he himself saw.

In the travels of Spallanzani is found a new volcanology; he teaches the mode of calculating the degree of intensity in the heat of volcanic fires, as well as of investigating its cause. He has, by analysis, almost ascertained that peculiar species of gas, which, like a strong lever, tears from the earth's entrails, and hurls, even to the summit of Etna, those torrents of melted pumice stone which are disgorged by that volcano. He discloses the nature of pumice stones, which he has since demonstrated in some of artificial fabrication. He proves that the burning of these mountains proceeds from the inflammation of hydrogen carbonic gas; and this solution equally applies to the phenomena of Barizzo, and several other places, some of which were then burning in secret. He found means to render those fires serviceable in making lime, and they are still made use of for this purpose. Spallanzani concludes this excellent production with some interesting researches relative to swallows, taking occasion to describe, under the impulse of a refined imagination, the amiable manners, and the rapidity of flight for which this species of birds are distinguished; the useful hints which they furnish to an observer for the invention of an aerial post; their migrations regulated by the temperature of the air, and its propitiousness to the birth of certain insects; lastly, he discusses the celebrated problem of their state of torpor during winter, and he proves that an artificial cold, more intense than that of our climates, does not render these birds lethargic. He then treats of the owl species; and, in conclusion, speaks of eels and their mode of generation, which still remains a problem to be solved; but he gradually conducts the reader through his researches, to the very step which promises complete solution.

Spallanzani anxiously observed the progress of French chemistry, which he adopted without the least hesitation; it was formed for a judicious mind like his, which delighted to account for the phenomena which it observed. When Götting published his experiments upon the combustion of phosphorus in azote, Spallanzani wished to try the solidity of these arguments which were brought against his favourite system, and, therefore, published in 1797 his *Chémico esame degli Esperimenti del Signore Götting, Professore a Iena*, where he refuted the conclusions of that chemist, by disproving the facts which had produced them.

Spallanzani frequently discovered what before would have been considered impossible. In 1793 he again made a display of this kind, which he published in his *Lettere sopra il sospetto d'un nuovo Senso nei Pipistrelli*; he there informed the world that bats, deprived of sight, act in every respect with the same precision as those who possess that sense; that they avoid equally well the slightest obstacles, and know exactly the proper places to perch, when their flight is at an end. These extraordinary experiments were confirmed by several of the most distinguished naturalists, and made Spallanzani suspect a new sense in these birds, because he thought he had

demonstrated, by exclusion, that their other senses were not able to supply the defect of sight; but the anatomical details of Professor Jurine, upon the organ of hearing in this singular bird, made him incline to the opinion that the ear might serve instead of the eye, as in all those cases where bats are in the dark.

Spallanzani terminated his literary career by a letter addressed to the celebrated chemist, Gioberti; *Sopra le piante che vive nel vasi dentro l'acqua e l'aria, e posse l'immediata lume solare e l'ombra*. It is a melancholy event for this department of science, that his death deprived it of the discoveries which he was on the point of effecting.

All these productions, though printed and generally applauded, still did not form the sum of Spallanzani's labours. He had for a long time employed his studies on the phenomena of respiration, upon their resemblances and differences through the extensive and various circle of animated nature; and he endeavoured to reduce to some certain method his researches on this subject, which must still excite astonishment by a number of facts but little known. He left a valuable collection of experiments and observations upon animal reproductions, upon sponges, the nature of which he defines, and upon a thousand interesting phenomena, which he knew how to draw from the obscurity which enveloped them. He had almost finished his travels to Constantinople, and had collected a stock of materials for the history of the sea.

Spallanzani's reputation was equal to the number, extent, and difficulty of his labours. France, Germany, and England, were all eager to possess his works in their respective languages. He was admitted into the academies and learned societies of London, Stockholm, Göttingen, Holland, Lyons, Bologna, Turin, Padua, Mantua, and Geneva. He maintained a correspondence with the academic societies of Paris and Montpellier; he received from the great Frederic himself the diploma as member of the academy of Berlin, and maintained a direct correspondence with him. Salicetti, while commissioner in the French army of Italy, offered him the professorship of natural philosophy at Paris, which he refused, on account of his advanced age; and the college of physicians at Madrid received him into their body.

In person, Spallanzani was rather tall; his aspect serene, yet noble; his forehead large; his eyes black and sparkling; his complexion dark, and his constitution robust. During the whole course of his life he was afflicted with no disorders, if we except a fit of the ague, which he caught in the mines of Schemnitz, at a time when the season was intensely cold. In the year 1795 he was attacked by a slight retention of urine, and several fits of the gout, which, however, did not suspend, in the least degree, his scientific pursuits.

He was generally esteemed; his virtues, untinctured by austerity, displayed themselves in all the circumstances of his life. He was beloved by all his relations, whom he inspired with his own taste; his brother Nicolas, a doctor of laws, assisted him in his experiments, and continued them, when he returned to Pavia; his sister is an eminent naturalist, perfect mistress of her brother's cabinet of natural history, acquainted with the most abstruse properties of every piece, and all the refined inductions which may be drawn from them.

Spallanzani paid great attention to the education of his nephews, and had the pleasure of seeing the eldest titular professor of physic at Padua.

On the 3d of February, 1799, Spallanzani had some returns of his urinary disorder; he passed the night restless, and in the morning became delirious. His intimate friends, Tourdes, a French physician, and the celebrated Professor

Scarpa, exerted every effort that genius, knowledge, and friendship, could inspire, to save him; but he died on the 6th, edifying with his piety those who were standing round his bed. His death penetrated his whole family with grief, drew tears from all his friends, filled his pupils with the deepest affliction, and depressed with sorrow a nation proud of having given him birth. The 13th, his colleague, Professor Gregorio Fontano, made an eloquent motion in the Legislative Assembly at Milan, to erect a monument to Spalanzani by the side of those of Frisi, Beccaria, and Verri.

SPANDAU, a town of Germany, in the middle marche of Brandenburg, surrounded on all sides by morasses, and close to it is a fine fortress. The arsenal is in subterranean vaults, and there is a prison for state criminals. It is seated on the Havel, 8 miles N.W. of Berlin, and 17 N.E. of Brandenburg. Long. 13. 23. E. Lat. 52. 36. N.

SPARTEL, CAPE, a promontory on the coast of Barbary, at the entrance of the straits of Gibraltar. Long. 5. 56. W. Lat. 35. 40. N.

SPARTIVENTO, CAPE, a promontory of the kingdom of Naples, at the S.E. extremity of Calabria Ulteriore. Long. 16. 40. E. Lat. 37. 50. N.

SPEIGHTS TOWN, a sea-port of Barbadoes, formerly much frequented by the Bristol traders, and thence called *Little Bristol*. It is situate on the N.W. coast of the island. Long. 58. 31. W. Lat. 13. 15. N.

SPELLO, a town of Italy, in Umbria. Here are the ruins of a theatre, and other remains of antiquity. It is seated on a hill, 3 miles N.W. of Foligno, and 13 N. of Spoleto. Long. 12. 24. E. Lat. 42. 40. N.

SPEZZIA, OF SPERTIA, a town of Italy, in the territory of Genoa, with a good harbour. It is seated at the foot of a hill, at the bottom of a gulf of the same name, 47 miles S.E. of Genoa, and 65 N.W. of Florence. Long. 9. 37. E. Lat. 44. 10. N.

SPIELBERG, a town of Suebia, in the principality of Oettingen, 8 miles N.E. of Oettingen, and 13 S.S.E. of Aispach.

SPIGELBURG, a town of Westphalia, capital of a county of the same name, 22 miles S.W. of Mülheim. Long. 9. 46. E. Lat. 51. 56. N.

SPIGNA, a town of Italy, in Monterrat, with a castle, 15 miles N. by W. of Savona, and 40 S.E. of Turin. Long. 8. 26. E. Lat. 44. 45. N.

SPILEMBURGO, a town of Italy, in Venetian Friuli, 37 miles N.W. of Aquileia, and 47 N. by E. of Venice. Long. 12. 15. E. Lat. 46. 10. N.

SPINALONGA, a sea-port of the island of Candia, with a good harbour and a citadel. It is situate near a cape of the same name, 30 miles E. of Candia. Long. 25. 48. E. Lat. 35. 20. N.

SPIRE, a bishopric of Germany, in the circle of Upper Rhine, 50 miles in length, and 30 in breadth, where broadest. It is divided into two parts by the Rhine, and is a fertile country.

SPIRE, a free imperial city of Germany, capital of a bishopric of the same name. It was burnt by the French in 1689; and, in 1693, the imperial chamber, which was in this city, was removed to Wetzlar. It was taken, in 1794, by the French, who evacuated it the next year, but re-entered it in 1794. It is seated on the W. side of the Rhine, 7 miles N. of Philippsburg. Long. 8. 32. E. Lat. 49. 19. N.

SPIREBACH, a town of Germany, in the palatinate of the Rhine, seated on a river of the same name, 8 miles N. of Landau. Long. 8. 12. E. Lat. 49. 20. N.

SPIRITU-SANTO, a sea-port of Brasil, capital of a

government of the same name, with a castle. Long. 41. 0. E. Lat. 20. 10. S.

SPIRITU-SANTO, a town of the island of Cuba, 155 miles S.S.E. of Havannah. Long. 79. 47. E. Lat. 22. 15. N.

SPTAL, a town of Germany, in Carinthia, with a castle, seated on the Lifer, near the Drave, 30 miles W. of Clagenfurt. Long. 13. 37. E. Lat. 46. 53. N.

SPTAL, an ancient village in Lincolnshire, 11 miles N. of Lincoln. It was part of the Roman causeway, leading from London, by Lincoln, to the Humber. Here are two springs, one called Julian's Well, and the other Castleton Well. Great numbers of Roman coins have been dug up in this village.

SPLUGEN, a town of the country of the Grisons, capital of the valley of Rheinwald, seated near the source of the Hinder Rhine, 42 miles S.W. of Coire.

SPONHEIM, a town of Germany, capital of a county of the same name, in the circle of Upper Rhine, 27 miles W. of Mentz, and 46 E. of Treves. Long. 7. 21. E. Lat. 49. 54. N.

SPRELE, a river of Germany, which rises in the mountains of Bohemia, and passing through Lusatia, into the marquisate of Brandenburg, runs by Berlin, and falls into the Havel, opposite Spandaw.

SPRINGFIELD, a town of Massachusetts, in the county of Hampshire, seated on the E. side of Connecticut river, 96 miles W. of Boston.

SPROTtau, a town of Silesia, in the duchy of Glogau, with walls flanked by towers, and a strong castle. It is seated at the confluence of the Bober and Sprotta, 20 miles S.W. of Glogau. Long. 15. 18. E. Lat. 51. 40. N.

SQUILACE, a town of Naples, in Calabria Ulteriore, with a bishop's see. It was formerly famous, but is now a small place, seated on the Favellone, near a gulf of the same name, 30 miles S.W. of St. Severino. Long. 16. 40. E. Lat. 40. 3. N.

STABLO, or STAVOLO, a town of Germany, in the bishopric of Liege, with a celebrated abbey, whose abbot is a prince of the empire. Here is a manufacture of leather, which is sent to foreign parts. It is seated on the Recht, 9 miles S. of Limburg. Long. 6. 5. E. Lat. 50. 20. N.

STADE, a town of Lower Saxony, in the duchy of Bremen, with a fortress, a college, and three churches. It is the principal town of the duchy, subject to the elector of Hanover; Bremen, the capital, being a free imperial town. It is the seat of the regency and chief courts of justice of the duchies of Bremen and Verden; and is seated on the Swinge, near its confluence with the Elbe, 22 miles W. of Hamburg, and 45 N.E. of Bremen. Long. 9. 17. E. Lat. 53. 26. N.

STADTHAGEN, a town of Westphalia, in the county of Schauenberg. Here is a palace belonging to the Prince of Schauenberg Lippe, in the garden of which is a mineral spring. It is 8 miles E. of Minden. Long. 9. 14. E. Lat. 53. 24. N.

STAFARDA, a town of Piedmont, in the marquisate of Saluzzo, seated on the Po, with a rich abbey. It is famous for a victory gained by the French, in 1690, over the Duke of Savoy. Long. 7. 25. E. Lat. 44. 34. N.

STAFFELSTEIN, a town of Franconia, in the bishopric of Bamberg, situate on the Lauter, 16 miles N.N.E. of Bamberg. Long. 11. 12. E. Lat. 50. 15. N.

STAFFURTH, a town of Upper Saxony, in the principality of Anhalt Bernburg, 9 miles N.W. of Bernburg, and 21 S.S.W. of Magdeburg. Long. 11. 40. E. Lat. 51. 55. N.

STAGIRA, a town of Turkey in Europe, in Macedonia, seated on the gulf of Contessa. It is remarkable for being the birth-place of Aristotle, whence he is called the Stagirite. It is now called Lyba Nova, and is 16 miles from Contessa. Long. 22. 48. E. Lat. 41. 15. N.

STAGNO, a sea-port of Ragusan Dalmatia, with a bishop's see, seated on a peninsula in the gulf of Venice, 30 miles N.W. of Ragusa. Long. 17. 50. E. Lat. 43. 12. N.

STAIN, a town of Austria, seated on the Danube, over which is a toll-bridge, 65 miles W. of Vienna. Long. 15. 0. E. Lat. 48. 11. N.

STALERIDGE, a town in Dorsetshire, with a market

on Tuesday, and a manufacture of stockings. Here is an ancient cross of one stone, 21 feet high, on a base of eight feet. It is 20 miles N. by E. of Dorsetshire, and 111 W. by S. of London. Long. 2. 18. W. Lat. 50. 57. N.

STAMPALIO, an island of the Archipelago, 60 miles W. of Rhodes, and 37 from the coast of Naxos. It is 15 miles long and 5 broad, almost without inhabitants, and wants fresh water.

STAMPS (*Encycl.*). The following rules for stamping executed deeds and instruments, we apprehend will prove useful: they are published in KEARSLEY's useful "*Tax Tables*," for 1802.

Definition of Instruments, and where to be brought.	Within what Time.	Penalties payable.	Regulations, and under what acts.
Agreements, Head Office or Country	21 Days	None	23 G. 3. c. 58.
Receipts for money, head office	14 days	5l.	{ Applicable to unstamped receipts as well as those put on wrong stamps, 33 G. 3. c. 55.
Ditto, country	1 Calend. Month	10l.	
Receipts for legacies or personally, head office or country	21 days	None	{ Country distributors to transmit receipts to the head office within 21 days, 36 Geo. 3. c. 52.
Ditto, head office	3 calend months	10l. per cent.	
Bills, notes, drafts, and orders, for money, head office or country	before payable	2l.	{ Confined to bills, &c. on wrong stamps of equal or superior value to the proper ones. 37 G. 3. c. 136.
	after payable	10l.	
Deeds and bonds (for excess of words), head office or country	1 calend. month	None	{ The first class to be transmitted by country distributors to the head office, within 21 days, and certified there only. Action brought for penalty on not duly ingrossing, not to abate if the instrument be not stamped within a month, though it should afterwards be stamped. 37 G. 3. c. 19, as to Deeds and Bonds. 37 G. 3. c. 90, as to Agreements and attested Copies.
Agreements (for ditto), head office	6 calend. months	10l. only	
Attested copies (for ditto), ditto	any time after	10l. per skin, &c.	
Single res. deeds, head office or country	60 days	None	{ Country distributors to sign receipts for the duty, and deliver deeds to the bringer thereof to get stamped. 37 Geo. 3. c. 111.
Ditto, head office	any time after	10l. only	
All instruments, matters, and things (except bills, notes, drafts, and orders*)			{ If it appear to the commissioners on oath or affirmation, made before any one of them, or otherwise to their satisfaction, that any instrument has been ingrossed or written on parchment, or paper, not duly stamped, either by accident or inadvertency, or from urgent necessity, or unavoidable circumstances, and without any fraudulent intention, they may stamp the same within sixty days, and remit the penalty. 37 G. 3. c. 136.
1. On wrong stamps of equal or superior value to proper ones, head office or country	60 days, or any time after, at the option of the parties	5l. only	
2. Unstamped, or on stamps of less than legal value, and liable to accumulated penalties exceeding 10l. head office	Ditto	10l. per skin, &c.	

Apprentices' Indentures and Articles of Clerkship come under the description of Deeds, in respect to the original stamp duty; but the statute of 8 Anne, c. 9. requires a further stamp to be impressed on these proportioned to the amount of the premiums, for which purpose the instruments are to be produced, and such duty paid at the head office within one calendar month, or in the country within two calendar months, from the date and execution.

Assignments of Bail Bonds by 4 Anne, c. 16. and of Replevin Bonds, when the distress is for rent, by 11 G. 2. c. 19. may be stamped on payment of the single duty at

any time before action brought.—Postea are also allowed to be stamped after being indorsed on the Record.

In all cases the New Stamp is to be paid for, exclusive of the penalty, and without any allowance for the stamp misused.

STANCHIO, a fertile island of the Archipelago, near the coast of Naxos, 12 miles N.E. of Stampello, and 40 N.W. of Rhodes. It is the ancient Cos, the birth-place of Hippocrates and Appelles; and is 25 miles long and 10 broad. The capital, of the same name, is seated at the foot of a mountain, at the bottom of a bay, and near a good harbour. Long. 26. 54. E. Lat. 36. 45. N.

* Agreements and Receipts for Money, and Legacies, do not come within this exception, being specially provided for.

STANDON, a town in Hertfordshire, with a market on Friday, eight miles N. of Hertford and 27 of London. Long. 0. 5. E. Lat. 51. 56. N.

STANMORE, a dreary district in the East angle of Westmoreland. Here is a fragment of Rerecros, fet up as a boundary between England and Scotland, when Cumberland belonged to the latter.

STANTON, a town in Lincolnshire, with a market on Monday, 16 miles E. of Lincoln, and 129 N. of London. Long. 0. 2. W. Lat. 53. 18. N.

STANTZ, a town of Switzerland, capital of the canton of Unterwalden, seated in a plain, at the foot of the Stanzberg, and near the lake of Lucern, 29 miles S. of Zurich. Long. 8. 22. E. Lat. 46. 51. N.

STANWIX, **FORT**, in the state of New York, seated on Mohawk river, near its source, 60 miles N.W. of Albany. Long. 75. 15. W. Lat. 43. 15. N.

STARAJA RUSSA, a town of Russia, in the government of Novogorod, seated on the river Polih, not far from the lake Ilmen, 40 miles S. by E. of Novogorod. Long. 33. 2. E. Lat. 57. 40. N.

STARGARD, a town of Upper Saxony, in Prussian Pomerania, with a college, and the ruins of a castle. It has manufactures of ferges, thaloons, tannies, druggets, &c. and is seated on the Ihna, 18 miles S.E. of Stetin, and 37 N.W. of Landsberg. Long. 25. 8. E. Lat. 53. 32. N.

STARGARD, a town of Germany, in Mecklenburg Strelitz, 30 miles S. of New Brandenburg.

STATEN ISLAND, an island of North America, which forms the county of Richmond, in the state of New York. It is 18 miles long and six broad, and contains upward of 3000 inhabitants. On the S. side is a considerable tract of level land; but, in general, this island is rough, and the hills high. Richmond is its only town of any note.

STATEN LAND, a barren craggy island, on the S.E. side of the islands which form the straits of Magellan, in 55° S. lat. Between this island and Tierra del Fuego is the strait of Le Maire.

STAVANGER, a sea-port in Norway, in the province of Bergen, capital of a territory of the same name, with a bishop's see. It is seated on a peninsula, near the fortrefs of Dofwick, 75 miles S. of Bergen. Long. 5. 45. E. Lat. 59. 6. N.

STAVEREN, an ancient sea-port of the United Provinces, in Frieland, formerly a considerable town, but now much decayed, the harbour being choked up with sand. It is seated on the Zuider-Zee, eight miles W. of Slooten, and 15 N.E. of Enchuyfen. Long. 5. 13. E. Lat. 52. 54. N.

STAUBBACH, a celebrated cataract of Switzerland, near the village of Lauterbrunn, in the canton of Bern. It rushes down a precipice 930 feet high with such impetuosity, as to resolve itself into a fine spray, which, viewed in some particular situations, resembles a cloud of dust. Hence it derives its name: the word Staubbach, in German, signifying a spring of dust. The roaring noise it makes is accompanied by a tempest, occasioned by the violent agitation of the air, excited by the rapidity of the fall. The brook which forms this torrent is named the Kupfer-Bachlein, or Rivulet of Copper.

STAUFFEN, a town of Austrian Suabia, in the Brisgau, situate on the Mehbach, eight miles S. of Faiburg, and 24 N.N.E. of Baile. Long. 7. 44. E. Lat. 48. 55. N.

STAUFFENBURG, a town of Germany, in the principality of Upper Hesse, five miles N.N.E. of Gießen, and ten N.E. of Wetzlar.

STAVROPOL, a town of Russia, in the government of

Simbirsk, situate on the Volga, 42 miles S.S.E. of Simbirsk. Long. 28. 58. E. Lat. 53. 44. N.

STAVROPOL, a town of Russia, in the government of Caucasus, situate on the Volga. Long. 41. 50. E. Lat. 44. 56. N.

STAUNTON, a town of Virginia, on the river Potomac, 30 miles W.N.W. of Charlottesville.

STEAM-ENGINE (*Encycl.*). We have already spoken at great length on the construction of these important machines; but various improvements having since been suggested, we think it indispensable, in the supplement of a work of this sort, not to omit the descriptions given by their different inventors.

The following is extracted from the specification of a patent granted to Messrs. James and John Robertson, of Tradetown, Glasgow, engineers, for a method of applying steam in the working of steam-engines, by which a very great saving of that vapour is effected, and a proportional saving of fuel in raising and applying steam for the use of steam-engines; and a method of constructing furnaces for the application of fire to steam-engine boilers, and boilers of various descriptions; and also for the application of fire to many other purposes by means of a furnace. These gentlemen assert, that, by their invention, a very considerable saving of fuel is effected, from the immediate conversion of the whole, or very near the whole, of the smoke arising from the fuel, into flame. This patent is dated August 13, 1800. See Pl. 48 and 49.

"In the best-constructed steam-engines there is a considerable quantity of steam which escapes past the sides of the piston in time of working, and is lost without producing any mechanical effect whatever; so the principle of the said invention of a new and improved method of applying steam in the working of steam-engines, by which a very great saving of that article is effected, and a proportional saving of fuel in raising and applying steam for the use of steam-engines, consists in preventing so great a quantity of steam from escaping, and in making the steam, which actually does escape, act on another piston, and add to the power of the engine. In all forms of the engine after specified and described in the drawings hereto prefixed, to which reference is had, it is to be observed, that there are two steam-cylinders, with pistons fitted to each, the one cylinder of a lesser, and the other of a larger size: these act together in producing the effect. To these cylinders are annexed a condensing vessel and air-pump, as in many others, or varied in this, as circumstances or inclination require. The other parts of this engine, in its various forms, are either pointed out, or correspond with many engines in use, which are well known, and require no explanation. But the ground on which the patentees' claim of preference is founded is the mode of conducting the steam on and between the pistons, as formerly mentioned, and more fully explained in the practical description of the engine.

"Fig. 1 (Plate 48). First form differs little in construction from many other engines, except that in place of one working cylinder in these, there are two in this (see fig. 1), the lesser (a) being placed on the top of the larger (m), and made fast to it. To each cylinder there is a piston fitted, which are connected together by a cylinder D; or this cylinder is so made as to have the pistons in one piece with it. This cylinder is made so that it may nearly fill the small cylinder n; that is, that it may work up and down so that the external surface of the one may not rub on the internal surface of the other. The steam and conducting pipes, with the valves, are explained in the following description of the operation of the engine:

" Let the working handles, with the valves, be placed in such a manner that steam from the boiler may have free access through the pipes and cylinders into the condensing vessel, to free the whole of the air, as in the usual manner. When this is done, the engine is set to work by the valves *b* and *c* being shut, and by that of *a* left open, and water let into the condensing vessel *C*, when a vacuum takes place in it by means of the condensation of the steam, and also in the under part of the large cylinder *m*, below its piston (there being a communication from it to the condensing vessel by the pipe *F*): at the same time the steam from the boiler has free access through the pipe *A*, and valve *a*, into the small cylinder *n*, above its piston *h*, and exerts its force upon it, and presses it downwards with as much force as in the usual manner. But as it is found, from experience, that a considerable quantity of steam escapes past the piston, this steam is in part detained by the secondary piston *g*, and exerts its force on that part or annular section *s s* that is contained betwixt the cylinder *m* and *D*, and assists in forcing the whole downwards; while at the same time the steam which is lodged in this annular space *s s*, and around the cylinder *D*, prevents so great a quantity from escaping past the first piston as would otherwise be the case were there no secondary piston, and the vacuum much more complete below the first piston, consequently there is a greater power produced from a smaller quantity of steam than with a single piston. During the time of the piston's descent the steam valve *a* is shut, and the elasticity of the steam within the cylinders carries the pistons forward to near the bottom of their cylinders, when the valves *b* and *c* are opened by the handles and plug-work admitting the steam to pass from the upper sides of both pistons through the pipes *B* and *E* to the condensing vessel *C*, while the counter weight at the other end of the beam, or this connected with a fly-wheel, raises the pistons again when the valves *b* and *c* are shut, and that of *a* opened by the plug-work, when the engine makes another stroke as before. The piston rod *R* joins the working-beam in any of the usual modes, and in other respects the engine is much the same as in common practice; to this form of the engine, a considerable improvement takes place by means of another valve, and which constitutes the second form of the engine (see fig. 2); the form differs little from the last; but in admitting the steam from the upper cylinder below the piston of the larger, and assisting the returning stroke, and consequently producing a still greater effect from the same quantity of steam than in the first form; it may be understood from the following description of the operation of the engine in this state: let the working-handles be placed so that steam from the boiler may have free access through the pipes and cylinders into the condensing vessel, to free them of air as in the usual manner; when this is done, the engine is set to work by the valves *b* and *c* being shut, and *a* and *d* left open, and water let into the condensing vessel *C*; when a vacuum takes place by means of the condensation of the steam, and also in the under part of the larger cylinder *m* below its position *g* (there being a communication betwixt them through the valve *d* and pipe *F*), and the steam from the boiler having free access through the pipe *A*, the valve *a* will exert its force on the piston *h* of the small cylinder, pressing it downwards with as much power as in the usual manner, but as a quantity of steam escapes the piston, it produces the same effect as mentioned in the first form; during the time of the piston's descent, the steam valve *a* is shut, and the elasticity of the steam within the cylinders carries the pistons forward to near the bottom of the cylinders, when the valve *d*, which admits the steam from the lower part of the large cylinder *m* to the condensing vessel, is shut, while the valves *b* and *c* are opened; by this means the steam

which remains above the piston *h*, in the small cylinder, having free access through the pipe *B* to the bottom of the large cylinder *m*, below its position *g*, exerts its force equally on equal areas, as of each piston; and the annular ring, or section *s s*, being exhausted by the valve *c* being open, this admits the steam to pass through it, and the pipe *E*, to the condensing vessel *C*; this steam therefore which remains above the small piston, and below the large piston, will force the pistons upwards in proportion to the steam's density, and the difference of the areas of the piston, that is, a force in proportion to the density of the steam, and the excess of the area of the large piston to that of the small one, when the pistons arrive at the top of the cylinders, the plug-tree turns the handles of their position for another stroke, &c. It would be needless to describe any more of the practical part of the engine, as it may be seen from inspection of the draught, and corresponds with many of those in common use, and which are well known. In this state of the engine, there are three circumstances take place, which renders the engine more powerful with the same quantity of steam than those with a single piston; the first is, the steam which escapes the first piston acts on the annular ring of the second piston, and increases the power; the second is, the steam which escapes and is detained in the annular space or section *s s*, acts against the steam which passes the first piston, and prevents it to great a quantity from escaping as would take place were there no secondary pistons; the third is, the quantity of steam which remains in the upper cylinder being let into the lower, and assisting the ascent of the piston. In this and the first form, it is necessary to have a small pipe with a cock in it, to connected with the upper part of each cylinder, that a little steam may be made to pass through it by opening the cock a little when the pistons are newly packed, and so admitting a small quantity of steam to act upon the secondary piston at this time, when little escapes the first, and when the friction of the pistons is greatest.

" Third form of the engine (see fig. 3) consists of two cylinders, a larger and smaller, placed 'along side' of each other vertically, and which may be placed so that a line joining their centres may be either in the direction of the working-beam, or at right angles to it, the operations being the same in both cases, but the last is preferable; the other parts of the engine are obvious, from the drawing and the following explanation. The steam is admitted from the boiler by the pipe *A*, and at the valves being kept open, and the whole cleared of air, as mentioned in the former cases, the valves *b d* and *e* are shut, while those of *a c* and *f* are left open, and water let into the condensing vessel *C*, and a vacuum takes place, as also in the large cylinder *m* below its piston (there being a communication to the condensing vessel *C* through the valve *f* and the pipe *F*), and there being a communication from the bottom of the small cylinder *n* to the top of the large cylinder *m* (through the pipe *B* and valve *c*), the steam in the cylinder *n*, below its piston, the steam in the pipe *B*, and that which is above the piston *g* of the large cylinders *m*, will exert their force in pushing the piston forward, and resisting the descent of the small piston *h*; but the superior strength of the steam from the boiler exerting its power on the top of piston *h* of the small cylinder, will cause it to descend; as the pistons go forward in their respective cylinders, the strength of the steam above the piston *g* of the large cylinder, and under the piston *h* of the small cylinder, will diminish, but the superior strength of the steam above the piston *h* to the small cylinder will cause a quantity of the steam to pass it, which will in part exert its force on the piston *g* of the large cylinder, and assist in forcing it down in the cylinder; indeed, what steam remains betwixt the two pistons exerts

equal forces on equal areas of each piston, but the piston of the large cylinder, being of greater area than that of the small cylinder, will be forced down with a power as much greater (as it retards the piston of the small cylinder) as its area is greater than the other. During the descent of both pistons (which move in the same direction in the same time) the valve *a* is shut, which admits the steam into the small cylinder, and the elasticity of the steam which remains above the piston *h* of the small cylinder, together with the less dense steam between the pistons, carries both pistons forward to near the bottom of the cylinders, when the returning stroke begins by the valves *b* *d* and *e* being opened, and the valves *c* and *f* shut (the valve *a* being shut during the descent of the pistons). By such means, the steam above the piston *h* of the small cylinder has free access below it, through the valve *b* and pipe *B*, also to the under side of the large piston through the valve *e*. In this state, the steam is equally strong on the top and bottom of the piston *h* of the small cylinder; but the steam below the piston *g* of the large cylinder exerting its force against it whilst there is a vacuum made in the upper side of the cylinder above the piston (the steam having free access through the valve *d* and pipe *E* *F* to the condensing vessel), this piston will therefore be forced upwards, and as two pistons are fastened by their rods to the beam in such a manner as to move together, they will both ascend together to near the top of their cylinders, when the plug-tree turns their handles and valves for another stroke. The valves *a* *c* and *f* being opened, and those of *b* *d* and *e* shut, and the steam from the boiler exerting its force on the piston *h* of the small cylinder, while the steam which remained at the last stroke below the said piston, and of less density, together with what passes the piston *h*, exerts its force on the bottom of the piston *h* of the small cylinder, and on the top of the piston *g* of the large cylinder, and the work goes on as aforesaid. In this form of the engine, there are three circumstances take place which render it more powerful, with the same quantity of steam, than those with a single piston; the first is, the steam which is lodged between the pistons, together with what passes the first piston, acts on the second piston with a power much greater, as it retards the first, as the second piston is longer in area than the first; the second is, the steam, which remained above the piston of the small cylinder, after its descent, acts upon the piston of the large cylinder, in the time of its ascent; and the third is, what steam remains in the small cylinder, after its ascent, contributes, along with the steam which escapes the piston of the small cylinder, to prevent so great an escape of steam past it, as would otherwise be the case, were there no secondary pistons; the other parts of the engine may be seen from inspection of the draught, and correspond with what is in common use.

"Fourth form of the engine (see fig. 4.) consists of two cylinders, a lesser and a larger, the piston rods of which are connected by a toothed wheel, or short beam placed betwixt them, which gives motion to the machinery by a crank, or otherwise; by this method, the piston of the one cylinder ascends, while the other descends; the operation of the steam in these cylinders and pistons is directly the same as the last, only the pistons move contrary to one another, the steam being directed on the pistons so as to produce this motion, though the acting principle is directly the same; the same description as the last will fully explain it, and the same letters of reference serve, only, that the steam acts on the top of the piston of the large cylinders in the same way as it acts on the bottom of it in the former case. These cases may still be varied by placing the small cylinder in the first case undermost, and admitting the steam from below, and in the two last cases by admitting the steam into the small cylinder

below; but the principle, or mode of action, will still be the same; indeed, the same principle may be varied many ways, but, perhaps, in none better than the following:

"Fifth form (see fig. 5, No. 1 and No. 2.) consists also of two cylinders, as before, and larger, which are placed alongside of each other, as in the third form. Fig. 5, No. 1, is a side view or section of the engine; but the large cylinder, which stands immediately behind the small one, is not seen as well as many of its parts. In fig. 5, No. 2, is an upright section of the cylinders and pipes, as the face, the framing or body of the engine. In this draught, the cylinders, pipes and valves, and condensing vessel, are laid open in so plain a manner, that, with the explanation, an idea of the engine may very easily be conceived; the letters of reference are chiefly applicable to No. 2; but when the letters are placed on No. 1, they refer to the same as on No. 2. The operation and explanation are as follows: the steam is admitted from the boiler into the small cylinder *n*, through the pipes *A* *A*, and valves *a* and *e*, both above and below the piston *h*, of the small cylinder, all the valves being kept open, and the handles wrought in the usual manner, to drive the air out of the cylinders, communicating pipes, and the condensing vessel; the handles are set to their due working posture, that is, the valves, *b*, *c*, and *e*, are shut, while those of *a*, *d*, and *f*, are opened, and water let into the condensing vessel, when a vacuum takes place in the large cylinder *m*, below its piston *g* (the steam having free access through the valve *f*, and pipe *F*, to the condensing vessel), and the steam which remains above the said piston, together with that which is under the piston *h* of the small cylinder, and communicating pipe *D*, exerts its force in pushing down the piston *g* of the large cylinder, there being a communication for the steam between them, through the valve *d* and pipe *D*. The steam from the boiler exerts its force on the top of the piston *h* of the small cylinder, and, as the pistons move forwards in their cylinders, the density of the steam under the piston *h*, and above the piston *g*, will diminish, being expanded to a larger space; but the superior density of the steam from the boiler, acting on the top of the piston *h*, of the small cylinder, will cause a quantity of steam to pass it, which exerts its force in part on the piston *g*, of the large cylinder; indeed, what steam is lodged between the two pistons exerts equal forces on equal areas of each piston, but the piston *g*, being of larger area than the piston *h*, will therefore be forced down with a power as much greater as it retards the piston in the small cylinder, as the area of the large piston is greater than that of the lesser; at the same time the steam which remained beneath the piston of the small cylinder, prevents so much steam from escaping past its sides, as it would do were there only a single piston, and the vacuum below it much more complete during the descent of the pistons (which move in the same direction, in the same time); the valve *a*, which admits the steam from the boiler, from the top of the lesser cylinder, above its piston, is shut, and the elasticity of the steam which remains above the piston *h* of the small cylinder, together with the less dense steam above the piston *g* of the large cylinder, carries both pistons forward to near the bottom of their respective cylinders, when the returning stroke begins by the valves *a* and *f* being shut (the valve *a* being shut during the pistons' descent), and the valves *b* and *e*, opened by the plug-work. When the large cylinder is exhausted above its piston, the steam having free access through the pipes *D* and *E*, and the valve *e*, to the condensing vessel, while the steam from the boiler having free access through the pipes *A* *A*, and valve *a*, to the bottom of the piston *h*, of the small cylinder, and the steam of less density, from the last stroke of the engine, which remains above the said piston,

together with what escapes past its sides, in time of its ascent, having free access through the valve *b* and pipe *B* to the under side of the large cylinder *m*, and below its piston *g*, and exerts its force, in pressing it upwards, with a power as much greater as it retards the piston of the other, as the piston of the large cylinder is greater than the other; then the piston *h*, of the small cylinder, will be pressed up with a force in proportion to the difference of the density of the steam above and below it; at the same time, the steam which remains above the piston prevents so much of it from escaping past the small piston, as would be the case were the vacuum more complete: during the ascent of the pistons, the valve *c* is shut, and the elasticity of the steam which remains below the piston *h*, of the small cylinder, carries it forward, as doth also the less dense steam of the piston *g* of the large cylinder; indeed, the operation of the steam is the same, both in the ascent and descent of the pistons.

" Sixth form (see fig. 6) consists also of two cylinders, the lesser and larger, the piston-rods of which are, as in the fourth form, connected by a toothed wheel, or short beam placed betwixt them, which gives motion to the machinery by a crank; or otherwise the operation of the steam in this form is directly the same as in the last, or fifth form, except that the steam is so conducted as to make the one piston ascend while the other descends; the explanation of the last follows this also, and letters of reference are placed so, only where the top or bottom of the large piston is mentioned; the contrary must be understood for the explanation of this form: in all forms of the engine in time of working, the density of the steam, on the secondary piston, is never allowed to be near its natural state (namely, that density it hath at coming from the boiler, or nearly the same with that of the atmosphere), the other end intended would be in a great measure frustrated, as the quantity which escaped the secondary piston in that state would be attended with as bad effect as that purposed to be remedied by the patentees. It will be observed, that this is effected by shutting the valve which admits the steam from the boiler before the piston has moved through the whole length of the cylinder; though the preventing the waste of steam is the main thing intended, yet the construction of the engine is such, that the elasticity of the steam is carried a great length, and usefully employed, before it gets into the condensing vessel; these forms of the engine may be applied either to the raising of water, or driving machinery, the same as those in common use. The patentees do not pretend to fix upon any exact ratio betwixt the size of the two cylinders: experience and motives of economy may cause a variation in this.

" Specification and description of the nature of a new and improved method of constructing furnaces, for the application of fire to steam-engines and boilers of various descriptions, and also to the application of fire to many other purposes and branches of manufacture where heat is applied by means of a furnace, by which invention and improvement a very considerable saving of fuel is effected, from the immediate conversion of the whole, or very nearly the whole, of the smoke arising from the fuel into flame: first, the said invention in principle consists in supplying the burning fuel more fully with air, having this fuel more in a body together, and a less quantity in combustion, at the same time, than what usually takes place in other furnaces, which are applied to the same uses; in applying the fuel with a portion of fresh air, admitted from an opening made for that purpose, and directed in such a manner as it may come in contact with the smoke from the kindling coal and great heat of the furnace together, and the fuel being more fully supplied with air, and con-

sequently a greater degree of heat taking place, and the smoke and fresh air uniting in the great heat, the smoke is enflamed, and rendered useful in adding to the heat of the furnace; besides, this portion of fresh air is so conducted as to act partly on the kindling or kindled fuel, and raising it to a greater degree of heat, after it has served its purpose by uniting with and enflaming the smoke; and therefore is employed, in some measure, usefully, even after the coal has ceased to smoke: secondly, to the above may be added, the form of the furnace, which is so constructed, that the full kindled fuel is kept backward in the furnace, while the fresh coal lies before, and is more gradually kindled than if introduced further among the full kindled fuel, while the heat of the furnace is little injured or damped by the introduction of fresh coal, as is more fully described in the practical description of the furnace. The coal is admitted into the furnace by a hopper, feeder, or mouth-piece, *A* (fig. 7 and 8), made of cast-iron (but which may be made of other materials), and inclined to the horizon, as in fig. 7; so that the coal in it may, in some measure, fall into the fire-place, above the bars, as the fuel is spent: in the upper part of this hopper, feeder, or mouth-piece, is a plate, *a* (fig. 7 and 8), placed at a small distance, or from about three eighths to three fourths of an inch from the upper side of the hopper, betwixt which plate, and upper plate, or side of the hopper, a stream of air rushes downward on the fire, at about half a right-angle to the horizon, which stream of air assists in consuming the smoke, as formerly mentioned, and more fully described hereafter. *B*, fig. 7, is a section of the bars, which are, in general, a little inclined to the horizon, as in the figure, that the fuel may more easily fall, or be pushed backwards, in the furnace; at *c*, is an opening above the bars, and below the lower end of the hopper, which is in general fitted with a grated door or doors, which open for the more convenient cleansing of the furnace, and the grated form of the doors is also designed for admitting air into the fuel, as well as at the bars, consequently the air is more concentrated in the middle of the burning fuel, and produces a greater heat than if admitted only betwixt the bars; this grated form of the doors is also convenient for the admission of a poker or instrument for pushing backward the kindled fuel, while the fresh coal, or that which is not so well kindled, falls down to supply its place: in some others of these furnaces, the opening below the lower end of the hopper, and above the fore end of the bars, is left without doors at all; at this opening, it is convenient, when the fire is mended, to push the coal from the fore side backward, as mentioned above, or it may be pushed backward with a hooked poker, *P*, by applying the hooked part of it through the furnace bars below; by either of which means, the kindled coals are put backwards, while the fresh coal, or that which is not so well kindled, falls down to supply their place; that is, the coals in the situation *c* are pushed towards *d*, while those in the situation *f* fall down to supply the place of those which were driven from *c* towards *d*; by such means, the strength or heat of the fire is not much damped by the introduction of fresh coal, and the coals which have fallen from *f* towards *c*, are not so rapidly kindled as if introduced above the burning fuel, same time the smoke which arises from these newly-introduced coals, passes partly through the full-kindled coal and partly over, and in contact with the great heat of the burning fuel, and, meeting at the same time with the current of fresh air coming downwards, and tending also to drive the smoke still nearer to the bright kindled fuel, does in general completely inflame the smoke, and render it useful in adding to the heat of the furnace. Another end obtained by the stream of fresh air, is to keep in some measure the great heat of the furnace from acting so

violently on that part of the hopper which is nearest it, and mostly exposed to its heat, and liable to be damaged thereby, which it does by the continual current of fresh cool air that is in contact with those parts; the construction of the furnace may be much varied, but the chief improvements are, that the fuel in combustion is supplied with air by the forefide as well as by the bars, the hopper is placed in such a situation that the kindled or unkindled coal may in part fall to the forefide of the furnace above the bars, as the other fuel is pushed backward in the furnace, and the admission of fresh air to pass over the burning fuel by means of a definite space or spaces, opening or openings, made for that purpose; so that this stream, current, or currents of air, partly come in contact with the burning fuel itself, forcing also the smoke with more immediate union with the burning fuel and great heat of the furnace. The patentees do not pretend any claim to the admission of fresh air as a new principle, as they are sensible that this has been known long ago, and practised by admitting it at the furnace door, shutter, or mouth-piece, and at the opening the coals are admitted into the furnace; their claim rests upon what has been formerly stated, together with the form of the furnace, and its variations after mentioned; the success of the furnace depends also in a considerable degree on what is called the draught of the furnace; that is, the chimney and flues so constructed, as a sufficient current of air may pass through the fire to bring it to a proper degree of heat; also, that the current of fresh air may have such force as to come pretty much in contact with the burning fuel, and to convey the smoke along with it through the hottest of the flame; if this is not the case, the smoke will not be so completely consumed in these furnaces. The hopper is allowed to be kept as full of coal as possible, and either wholly or in part small coal, so as to prevent air as much as possible getting in by that passage; this must be attended to when the furnace is in its ordinary working state; yet, sometimes, it is necessary to keep this opening of the hopper, either wholly, or in part, open, when there is little heat wanted.

The following is a description and reference to the draughts in Pl. 49; fig. 7, is a side view, or section of the furnace, as if applied to a boiler, and cut through the middle. Fig. 8, is a front view of the furnace in perspective, the hopper having a division in the middle, and two regulating plates for the admission of fresh air. Figs. 7 and 8, A, the hopper into which the coals are put to supply the furnace, *a* the regulating plate; above which and below the higher plate *b* of the hopper, a stream of fresh air is admitted to this plate; *a* is made to turn on a pin pivot or centre, so that it may be brought nearer to, or recede further from the uppermost at the point *n*, fig. 7, for regulating the quantity of air admitted between the plate as occasion requires; this plate is sometimes made fast, or kept so, after adopting a space which is judged sufficient for the quantity of fresh air, but on other occasions, as in steam-engines, it is advisable to give it less or more opening according to the state of the fire, that is, when coals are newly introduced into the fire-place, to give the greatest quantity of fresh air, and when they are pretty well kindled to give less air. FFF, fig. 7, the flues beneath and round the boiler; that round the boiler may be in any of the present well-constructed forms; that beneath the boiler, as in the drawing, with a breast D, to prevent the coal getting so far backward in the furnace, and also to direct the flame on the bottom of the boiler; this breast is also necessary for the more complete combustion of the smoke, as by that means, the fresh air, smoke, and flame, are more completely combined than if the breast were wanting, or ill-formed: at *r* is represented a shutter, which is sometimes used in steam-engine

boilers for the purpose of getting the refuse of the fuel taken from the furnace by opening the said shutter; in other cases, the breast of the furnace D coincides with *d* at the ends of the bars. G, figs. 7 and 8, the grated doors, or opening into the fire-place; I, the ash-pit below the furnace; L, fig. 8, a catch, or bar, which slides along the bottom plate of the hopper for keeping the grated doors shut: HHH, &c. the brick-work for furnace and boiler. K, fig. 7, a piece of cast-iron in a horizontal position, which joins the under plate of the hopper, for the more ease and convenience in putting in the coals, the hopper may be made in one or more pieces, as inclination or choice may direct, or of any materials which it may be thought prudent to adopt, but they are usually made with five plates of cast-iron; M representing one of the side plates, N the uppermost, O the undermost, and P the regulating-plate; the side plates having tenons which fit into mortises in the top and bottom plate, which may easily be conceived; on the side plates are detents or abutments, which serve as a centre for the regulating-plate to turn upon; on this plate are also two abutments which rest on the other abutments of the side plates when this plate is put into its place; this plate by such means may be taken out, or put in at any time it is found necessary, without meddling with any other part of the hopper: another method is to have the bottom plate to come out, and in the same manner as the regulating plate; also, that it may fold up or down to any inclination; this form is very commodious for allowing access into the fire-place to get it repaired, or the like, or for having the fire quickly taken from it altogether, for by folding the plate to a level as represented by the dotted line, fig. 9, the coal which is in the hopper is prevented from falling into the fire-place, and there is a greater space left to get into it; this form may either admit or not of the grated doors; indeed the simple opening does very well. Fig. 9, is a representation of the side of the hopper, in this form: another method of the hopper and letting in of air, is by making the underfide of the top plate with cheeks, or grooves, as that the fresh air may rush down in them above the fuel that lies in the hopper, for when the hopper is fitted in as close with coal as it can be, these grooves of cheeks prevent the coal from getting into them, and form separate and definite spaces for the air to rush down on the burning fuel, and perform the same office as the regulating plate, though the proper quantity cannot be so well adjusted this way, yet the only way to accomplish this is to have these grooves or cheeks made as near the proper size as possible; they ought also to be so narrow, that little of the coal will get betwixt them. Fig. 10, is a front view of the hopper, in the state where A represents the opening the coals are put into; another method is to let in the current of fresh air above the uppermost plate of the hopper, this may be done either by another plate placed above, or the building so formed over it, as that a proper quantity of fresh air may get in, and in a proper direction; indeed, this may be accomplished many ways in a greater or lesser degree, by letting in a definite quantity, directed in such a manner as to come in contact with the fuel, though perhaps in no way better than the methods explained: to make this furnace more complete, doors are placed to the front, with a sufficient space below them to let air into the furnace, these doors are represented by SS, fig. 8, as standing open; they are kept shut while the furnace is going, except when coals are put in, or the bars cleaned, or the like when they are opened for that purpose; the use of these doors is to prevent, in a great measure, the radiant heat that comes from under the bars and from the opening at the forefide from escaping; this also adds something to the draught or well-going of the furnace, as this heat when suffered to escape rarifies the air before the

furnace, which air passes upwards, performing in a small degree that which a chimney does, and depriving the fire of a portion of air which it otherwise has when the doors are shut: these furnaces are made of various sizes, according to the uses they are applied to; in some large ones there is a division in the middle of the hopper, as in fig. 8; this size, as measured by the scale, will serve a steam-engine boiler of about nine or ten feet diameter; lesser furnaces do not need this division in the middle of the hopper."

We next present the reader with the specification of a patent granted to Mr. Murray, of Leeds, for a method of constructing the air-pump, and sundry other parts belonging to a steam-engine, by which a considerable saving will be made in the consumption of fuel, and an increased power obtained. It is dated August 4, 1801.

"First, in respect to the principles of the new air-pump," says the inventor, "I cause the air to be discharged from the air-pump without its having to make any effort in opening of valves, or pressing through a body of water, and in causing the water and the air to be discharged separately, and different ways; this is effected by discharging the air alone by one bucket, and the water alone by another, or by an eduction pipe of 2 feet in length, as in figs. 1, 2, 3 (Pl. 50.). Secondly; an improved method of packing the cylinder-lid, stuffing-boxes for valves, &c. I cause the removable parts of each to come in immediate contact with one another; this is effected by placing the necessary packing on the upper side of the cylinder-lid (instead of being betwixt the cylinder and lid as formerly), which prevents the piston-rod receiving friction from any oblique pressure, by the cylinder-lid being forced down more upon one side than the other, which is unavoidably the case in all other methods of packing-lids, valves, stuffing-boxes, and other similar things, where great accuracy is required, as in fig. 4. Thirdly; an improvement in the valves and working gear, the principle of which consists in the advantageous form in which they are made, and in the two uppermost valves being inverted, and the communication by the valve-rods passing through reservoirs of oil, or liquid matter, which will prevent any air getting into the engine to impair the vacuum; the principle of the cylinder-lid is here applied in fixing the stuffing-boxes for the valves, and valve-box lids, which is of the utmost importance to their operating well, as the oblique pressure (which cannot be prevented in the old method) throws the valves out of their seats, and renders them proportionally imperfect, fig. 5. Fourthly; a new principle, opening and shutting the valves by a circular motion (instead of the plug and hand-geer now in use), which prevents the engine making a false stroke, or turning the wrong way round, by which means a steam-engine is rendered as steady in its motion as a water-wheel, as in figs. 6, 7, 8, 9. Fifthly; a new method of connecting the piston-rod to the parallel-motion, as described in fig. 10. Sixthly; an improved method of constructing fire-places for consuming the smoke arising from steam-engines, and other fires, fig. 11. Now I do declare, that the six above-mentioned principles comprehend the real object of my inventions. And, in order for the better comprehension and understanding how the aforesaid may be reduced to practical use, I do hereby further declare, that although I vary my mode of construction, as a difference of circumstances may require, to produce the same effect, and obtain the main purposes intended; yet I principally adhere to the methods herein described, as being fully answerable to what is required, and best calculated to be understood from the drawings and descriptions thereof. And the same is described fully in the drawing or plan added hereto, and contained in the skin of parchment hereunto annexed. (See the plate.) Figs. 1, 2, and 3, are plans exhibiting the principle

of the air-pump. A, the condenser; B, the air-pump; C, the air-gift; D, the air-valve, which is opened and shut by the working parts of the engine, and has an elastic rod; E, the valve for discharging the air; F, the exhausting-pipe, having a free communication betwixt the condenser and the top of the air-pump, when the valve D is open; G, the eduction-pipe; H, a bucket, and balance-valve, for discharging the water down the bored eduction-pipe in fig. 3; I, the delivering-valve for water in figs. 2 and 3; K, in fig. 1, a bucket for lifting the water upwards as in a common pump; L, a foot-valve for preventing the return of the water during the descent of the bucket K; M, the barrel of the pump for discharging water alone; N, N, in fig. 2, an eduction-pipe, thirty feet long or upwards, where the water is discharged by its own gravity, and may be attached to the air-pump, or condenser, as the dotted lines shew. Fig. 4, exhibiting the principle of the top, stuffing-boxes for valves, &c. A A, the cylinder-lid. B B, the top ring that is screwed down with bolts to the flanch of the cylinder. C C, the packing of paper, hemp, or other materials, laid on to the cylinder-lid A, and under the top ring B B. D D, a shoulder bored in the top of the cylinder, for the lid A to be turned and ground into; this method applies to steam-cylinders, air-pumps, stuffing-boxes for valves, as is shown in the other figures. Fig. 5, plan of the working valves and side pipes. A A A, the rods that lift the valves. B B, stuffing-boxes for the valves to work through, fixed in the same manner as the cylinder-lid in fig. 4. C C, rings for fixing the stuffing-boxes. D D D, mortises for the levers for the opening of the valves. E E, are the two inverted top valves. F F, are reservoirs for holding oil, or other liquid matter. G G, two circular valve-boxes for admitting the steam. Figs. 6, 7, 8, and 9, shew the principle of opening and shutting the valve by a circular motion. A, the axle-tree. B, a wheel to be turned from the motion of the fly-wheel, or other parts of the engine or mill-work. C C C C, cranks with rollers fixed upon the axle-tree A, parallel to each other, or at right angles, as circumstances may require. D D, circular box rods for receiving alternate motion from the circular motion of the cranks C C. E E, tappet plates for the cranks to work against. F F, levers for the mortises D D D in fig. 5, for lifting the valves. Figs. 8 and 9, shew the same principle, but differ from the other by having straight plates to work against instead of circular ones. G G G G, handles for setting the engine to work, and may be supported at H H H H. The axle-trees A A, must make the same number of revolutions as the engine does strokes, which may be easily regulated by the wheel-work. Fig. 10, shewing the method of connecting the piston rod to the parallel motion. A, the piston rod. B, the top cone end of the rod. C, two half-sockets which fit the cone end of the rod. D, the outermost socket. E, the cone part of this socket, fitting the outside of the socket C. F, the cotter for pressing the rod A, with its sockets C, into the cone part of the outside socket D, which fixes the whole together as in one piece, without cutting any holes in the rod, as is the case in the old method. Fig. 11, shewing the method of constructing a fire-place for consuming of smoke. A, the boiler. B B B B, brick-work. C, the funnel for conveying coals to the fire. D, sliding plate for lessening the aperture of the funnel, and regulating the quantity of coals in. E, the fire-place. F, the grate-bars lying in a frame, and moving upon a joint at No. 1. No. 2, the grate-bars lowered down for the purpose of cleaning out the fire. G, charging-box for pushing the fire further on the grate-bars, and making room for fresh coals as the others are consumed; this box is filled with holes for the purpose of letting air into the fire. H, a small wheel and rack for working the charging-box G in large fires; but

the box may be thrust in by the handle **I** in small ones. **K**, a lever for turning the wheel **H**. No. 3, plan of the grate-bars frame taken out of its place to the pivots that it turns upon when it is lowered to clean out the fire. 4, plan of the charging-box **G**, to shew the method of working it by wheel-work, either by hand, or by a motion from the engine."

These seem the most important of the recent inventions in aid of this valuable machine, but other contrivances worthy of attention will be found fully described in the Repertory of Arts, &c.

STEEGE, a sea-port of Denmark, in the island of Moen, 38 miles S.S.W. of Copenhagen. Long. 12. 20. E. Lat. 55. 5. N.

STEEL (*Encycl.*). The following is extracted from the specification of a patent granted to Messrs. Wilde and Ridge, of Sheffield, for making saws, steel doctors for printers, plates made of iron, springs, and other articles; dated August 25, 1796.

"When the steel or iron is pared or cut into proper shape, the saws, &c. are put into a frame of metal, or otherwise: they may then be made red-hot in the said frame, and stretched by screw, spring weight, or any other proper power or purchase, and so formed into a curved, straight, or any other direction wanted. They are then to be immersed in water, or a composition of oils or grease, to be hardened in the frame in the direction wanted; and when so hardened they are also to be tempered in the same direction in the frame over fire; and when the saw, doctor for printers, or plate, is over the fire, it must be kept in motion over the fire until the oil or grease upon the said saw, doctor, or plate, smokes. It is then to be gently stretched, and continually kept moving over the fire until a blue blaze alternately appears and disappears. It is then to be stretched with as much power as will bring it into the direction required. The saw, doctor, or plate, is next to be put into another frame, which may be made to move upwards and downwards, or in any other direction necessary, by crank, or any other movement, between proper stones, or between plates of metal, blocks of wood, or any other material that will grind or polish with sand, emery, or other proper material to grind and polish the saws, steel doctors for printers, plates made of iron, also of steels, beads, mouldings, and fender plates, made of iron and steel united, or of iron or steel, and all sorts of springs made of steel, and divers other articles made of iron and steel united, and also of iron or steel. But if the saw, doctor, or plate, is not intended to be hardened, it must be made red-hot, and stretched with as much power as will bring it into the direction wanted; it must then lie in the open air, in the frame, in the said direction required, till cold; then to be ground by a machine for the purpose of grinding and polishing in a frame the said saws, steel doctors for printers, plates made of iron, also of steel, beads, mouldings, and fender plates, made of iron and steel united, or of iron or steel, and all sorts of springs made of steel, and divers other articles made of iron and steel united, and also of iron or steel." This machine is to move the article to be manufactured by means of a crank, or otherwise, so as to sharpen, grind, and polish the plates, and form beads and mouldings, and various other articles."

STEENBERGEN, a strong town of Dutch Brabant, in the marquisate of Bergen-op-Zoom. It has a communication with the Maese, and is seven miles N. of Bergen-op-Zoom, and 17 W. of Breda. Long. 4. 28. E. Lat. 51. 32. N.

STEENKEER, a town of Norway, in the province of Drontheim, 36 miles N.E. of Drontheim. Long. 11. 34. E. Lat. 63. 50. N.

STEENKIRK, a village of Austrian Haizault, famous for

the victory obtained over William III., in 1692, by the Duke of Luxemburg. It is 15 miles N. of Mons, and 16 W. of Brussels.

STEENWYCK, a strong town of the United Provinces, in Overijssel, seated on the river Aa, 20 miles S.E. of Slooten, and 32 N. of Deventer. Long. 5. 50. E. Lat. 52. 50. N.

STEEVENS (George), an eminent English author, received the early part of his education under the tuition of the Rev. R. Wooddison, at Kingston-upon-Thames, at which school he was contemporary with Gibbon, the historian. He went from thence to Eton. Afterwards he was admitted a fellow-commoner of King's College, Cambridge. He also accepted a commission in the Essex militia, on its first establishment.

In 1766 he published "Twenty of the Plays of Shakspeare," in 4 vols. 8vo. Dr. Johnson had brought out, the preceding year, an edition of our great bard; this induced an interview between the respective commentators: abilities and resources were combined, and the public soon felt the benefit of this conjunction.

The year 1773 saw the first fruits of this great coalition in a complete edition of the poet, in 10 vols. 8vo; which edition, with occasional amendments, was twice reprinted between the years 1773 and 1783.

Mr. Steevens certainly possessed, in an eminent degree, the requisites for his important undertaking. He had studied the age of Shakspeare; he was intimately and perfectly acquainted, not only with the laws, manners, and writings of that period, but he was equally versed in the provincial peculiarities, whether of language or custom, which prevailed in different parts of the kingdom, and particularly in those where Shakspeare passed the first years of his life. Fortune likewise favoured his studies: he had ample pecuniary resources, from which he is known to have expended nearly 200l. in the purchase of curious and illustrative books, while preparing each edition of Shakspeare. He had the second folio of that poet, with notes and alterations of scenes by Charles II. in his own hand; and he was assiduous in enriching his own Shakspeare with 1500 portraits of all the persons in the notes and text: of such productions he was a critical judge, excelling himself in painting, with which he frequently amused his hours. Thus qualified and prepared, he produced, in 1793, that invaluable edition of Shakspeare, then published in 15 vols. 8vo. Uncommon indeed, and fully meriting the countenance which he obtained, were his exertions in the completion of this trust: he gave an instance of editorial activity and perseverance that is without example. To this work he devoted, solely and exclusively of all other attentions, a period of eighteen months; and, during that time, he quitted his house every morning at one o'clock with the Hampstead patrol, and proceeded, regardless of the weather or the season, to the chambers of his friend, Mr. Isaac Reid, in Barnard's-inn, where he was privileged to admit himself, and found a room prepared to receive him, with a sheet of the Shakspeare letter-press ready for correction. There, too, was every book he might wish to consult; and on Mr. Reid's pillow he could apply, on any doubt or sudden suggestion, to a knowledge of English literature perhaps equal to his own. This nocturnal toil greatly accelerated the printing of the work; as, while the printer slept, the editor was awake; and there was a sort of perpetual motion in its progress towards publication; and thus, in less than twenty months, did he complete his last edition of Shakspeare, in fifteen large octavo volumes—an almost incredible labour, which proved the persevering energy of his mind. The edition of Mr. Malone, if we err not, employed nine years. It may not be unnecessary to say, that he read the proofs of *Boydell's* splendid Shakspeare, and

that his own large octavo edition is now reprinting. He possessed a strong original genius, and an abundant wit; his imagination was of every colour, and his sentiments were enlivened with the most brilliant expressions. He was also a classic of the first order, and equally acquainted with the belles-lettres of Europe; and he had studied history, ancient and modern, but particularly that of his own country. His conversational allusions to the sciences always evinced the easy familiarity of intimate acquaintance. That he contented himself with being a commentator must have arisen in the habits of his life, and in his devotion to the name with which his own will defend to the latest posterity. Many of his *jeu d'esprit* might probably be collected: of this description are a few fanzas in Dodley's Annual Register, under the title of the "Francic Lover." His manners were singular and eccentric: he never took a pinch of snuff after he lost his box in St. Paul's Church yard, though this recreation had been the custom of his life, and though he was in the habit of making all his memorandums by bits of paper in his box: he would sometimes break off his longest habits, without any offensive reason. Animated and logical in argument, and piquant in wit, his colloquial powers surpassed those of other men; and his jokes, which were remembered by all who heard them, and repeated by all who remembered them, often procured him a kind of malevolent fame which he had by no means justly incurred. He would frequently, in his sportive and almost boyish humours, condescend to a species of ribaldry but little above O'Keefe; indeed, he loved what is called *fun*—a disposition which has a tendency to mischief. As he managed a liberal fortune with discretion, he was enabled to gratify his wishes, which he did without any regard to expence, in forming his distinguished collections of classical learning, literary antiquity, and the arts therewith connected. He bought largely at Sir Clement Dormer's, where he got his Xenophon, worth upwards of 40*l.* for twelve guineas. He was rich in books and prints. Neither was he deficient in generosity: though never fain to give eleemosynary expences to sturdy beggars or sweepers of the crossings, few persons distributed bank-notes with more genuine munificence; and some of his acts of pecuniary kindness, such as could only proceed from a mind adorned with the noblest sentiments of humanity, might be named. Educated at an era when urbanity was the characteristic of a gentleman, he possessed all the graces of exterior accomplishment; all that could soften the asperities of life, and harmonise the social intercourse. Mr. Stevens passed the latter years of his life chiefly at Hampstead in retirement, seldom mixing with society but in bookellers' shops, or in the Shakespeare Gallery, or at the morning conversation of Sir Joseph Banks. When death, by one stroke and in one moment, makes such a dispersion of knowledge and intellect—when such a man is carried to his grave—the mind can feel but one emotion: we consider the vanity of every thing beneath the sun—"we perceive what shadows we are, and what shadows we pursue." Mr. Stevens bequeathed his valuable Shakespeare, illustrated with near 1500 prints, to Lord Spencer; his Hogarth (perfect, with the exception of one or two pieces) he left to Mr. Windham; and his corrected copy of Shakespeare to Mr. Reid, together with a bequest of 200 guineas. His library is become the property of Miss Stevens, his relation, to whom he has left the bulk of his fortune, and who is his residuary legatee. There are only two or three other small legacies in money. Mr. Stevens died in January, 1800.

STEBURG, a sea-port of Sweden, in East Gothland, seated on the Baltic, 25 miles S. of Nöking, and 82 S.W. of Stockholm. Long. 16. 40. E. Lat. 58. 16. N.

STEIN, a small independent town of Switzerland, under

the protection of the canton of Zurich. It is seated on the Rhine, where it issues from the lake of Constance, 15 miles W. of Constance, and 25 N.E. of Zurich. Long. 8. 48. E. Lat. 47. 32. N.

STEINAU, a town of Silesia, capital of a circle, in the principality of Wohlau, 10 miles W.N.W. of Wohlau, and 20 S.E. of Glogau. Long. 16. 50. E. Lat. 52. 23. N.

STEINFURT, a town of Westphalia, in the county of Bentheim, with an academy, seated on the Vecht, 16 miles N.W. of Munster. Long. 7. 41. E. Lat. 12. 15. N.

STEINHEIM, a town of Germany, in the electorate of Mentz, seated on a hill, near the river Maine, with a castle, nine miles from Francfort. Long. 8. 54. E. Lat. 49. 52. N.

STEKE, a town of Denmark, on the N. coast of the isle of Mona, with a castle. It is almost surrounded by a lake. Long. 12. 15. E. Lat. 55. 4. N.

STENAY, a fortified town of France, in the department of Meuse, seated on the river Meuse, 24 miles N. by W. of Verdun. Long. 5. 19. E. Lat. 50. 28. W.

STENDAL, a town of Germany, in the marquise of Brandenburg, seated on the Ucht, 30 miles N. by E. of Magdeburg. Long. 12. 6. E. Lat. 52. 41. N.

STENNIS, a village in the island of Orkney. At this place, between Kirkwall and Stromness, is a curious bridge, or causeway, across a narrow neck of land, between two lakes. At the end of this causeway, some stones of astonishing magnitude, and 20 feet high, have been erected; and there are many huge masses of stone in the neighbourhood, similar to Stonehenge, on Salisbury Plain.

STEREOTYPE, a mode of letter-press printing, in which whole pages of a work are worked off from a solid block of metal, instead of those composed of single letters arranged by the side of each other. An account of the origin and progress of letter-press-plate or stereotype printing, appears in the Philologist Magazine, from which we draw the following particulars.

We have shewn in the article PRINTING, the progressive steps by which typography was brought to that state of perfection to which it has attained. It is a curious fact, however, that all the improvements followed each other in such quick succession, that in a few years from its first invention in Europe, we find the printers in possession of all our common modes of working, and producing specimens of their art, which even now cannot be surpassed. Some of the early-printed missals upon vellum are proofs of this.

But if we have reason to be surprised at the quick steps by which printing with moveable types was perfected, we have more cause to wonder why with the acquisition of moveable types the art became stationary. The transition from solid pages, cut at an expence and labour beyond the value of the interest of any capital that could be required to be sunk in printing an edition of any work, made it a desirable object to devise means for making the same letters do over and over, not only for different sheets in succession of the same work, but for subsequent publications. Hence came the first moveable types; which, however, as we have already observed, were all cut singly. The success which followed the attempts made to lessen this labour of cutting, by making well-formed letters, once cut, serve for ever, by the facility of multiplication which founding afforded, ought, one would think, instantly to have led to a further improvement. If founding could be applied to single letters, why not to pages, to get rid of a sacrifice of capital submitted to at first, because of the enormous expence of block cutting! *Founding of pages*, on the first view of it, promises many advantages in point of economy; and to science it holds out what can never otherwise be obtained—the possibility of procuring in a short time

immaculate editions. From books cast into solid pages, no more copies would be printed than might be wanted for immediate sale; the money thus saved from being sunk in paper, to be piled up in warehouses for years, as at present, would serve as surplus capital to print other works; and thus the printer, his workmen, and the bookfellers, would all be benefited; (for it would be easy to prove, did our present limits allow it, that not only the business of the pressmen, but of the compositors, would be materially benefited and increased by the general adoption of such an improvement); and all errors, as soon as discovered, could be rectified in the plates, to prevent them from appearing in after copies, instead of running through a large edition as at present.

It appears that this art, or one extremely similar, was practised many years by Mr. Foulis, and before him by Mr. Ged, concerning whom Mr. Nicholls has published an interesting pamphlet, entitled *Biographical Memoirs of William Ged*; including a particular account of his progress in the art of block-printing, 1781. The first part of the pamphlet was printed from a MS. dictated by Ged, some time before his death: the second part, written by his daughter, for whose benefit the profits of the publication were intended: the third was a copy of proposals that had been published by Mr. Ged's son, in 1751, for reviving his father's art; and to the whole was added, Mr. Mores's narrative of block-printing.

From this publication it appears, that so far back as the year 1725 Mr. Ged had begun to prosecute plate-making. In 1727 he entered into a contract with a person who had a little capital, but who, on conversing with some printer, got so intimidated, that at the end of two years he had laid out only 22l. In 1729 he entered into a new contract with a Mr. Fenner, Thomas James a type-founder, and John James the architect; and some time after, a privilege was obtained from the university of Cambridge to print Bibles and Prayer-books. But it appears that one of his partners was actually averse to the success of the plan, and engaged such people for the work as he thought most likely to spoil it. A straggling workman who had wrought there, informed Mr. Mores, that both Bibles and Common-prayer books had been printed, but that the compositors when they corrected one fault, made purposely half a dozen more, and the pressmen, when the masters were absent, battered the letter, in aid of the compositors. In consequence of these base proceedings, the books were suppressed by authority, and the plates sent to the king's printing-house, and from thence to Mr. Caillon's foundry.

After much ill usage, Ged, who appears to have been a person of great honesty and simplicity, returned to Edinburgh. His friends were anxious that a specimen of his art should be published, which was at last done by subscription. His son, James Ged, who had been apprenticed to a printer, with the consent of his master, set up the forms in the night-time, when the other compositors were gone, for his father to cast the plates from; by which means, Sallust was finished in 1736.

Besides the Sallust, another work, printed some years after, from plates of Mr. Ged's manufacture, is *The Life of God in the Soul of Man*, printed on a writing-pot, 12mo, and with the following imprint: Newcastle: printed and sold by John White, from plates made by William Ged, goldsmith in Edinburgh, MDCCLXII. It is a very neat little volume, and is as well printed as books generally were at the time. By the writer of this account, in conjunction with Mr. Foulis, of Glasgow, several small volumes were actually printed from plates of the stereotype, and the editions sold to the trade without any intimation of their being printed out of the

common way. The first essays were, in the lowest sense of the word, common: one or two small histories, and a cheap edition of the *Economy of Human Life*. They also printed a Greek volume, Xenophon's *Anabasis*, 1783; and had plates for several small volumes of the *English Poets* almost finished, but the latter were never put to press.

Twice, then, had this art been invented and practised in Britain, when about three years ago, Didot, the celebrated French printer, applied it to logarithmic tables, and afterwards to several of the Latin classics, and to various French publications, which he has executed with considerable accuracy. The press-work has been carefully attended to, and does great credit to the printer. Indeed, after what Didot has done, clamour and prejudice will attempt in vain, in future, to decry letter-press-plate, and his name will always be mentioned as a principal promoter of this useful art, the introduction of which will be marked as a distinct era in the history of printing. Some of his countrymen indeed (for we cannot suppose Didot would attempt it) wish to ascribe to him the whole merit of the invention, and to have it believed that it originated with himself. The facts stated, shew with how little justice this claim is made. It is true he may have discovered, for himself, the secret of the art; but it is hardly credible that he could be ignorant of Ged's progress, and of Foulis's, especially as it is well known that, when patents are obtained, a specification of the process is obliged to be put upon record, of which any one may obtain an office copy at a small expence.

Having stated what relates immediately to the invention of modern stereotype, it would not be ingenuous were we not to state that claims have been set up in favour of a Dutchman as having practised the art even prior to Ged. The following extract, translated from *Nieuw Algemeen Konst en Letter Boek*, 1798, No. 232, will put our readers in possession of all we have yet met with respecting this printer.

"Above a hundred years ago, the Dutch were in possession of the art of printing with solid or fixed types, which in every respect was superior to that of Didot's stereotype. It may, however, be readily comprehended that these letters were not cut in so elegant a manner, especially when we reflect on the progress which typography has made since that period. Samuel and J. Leuchtmans, bookfellers at Leyden, have still in their possession the forms of a quarto Bible which were constructed in this ingenious manner. Many thousand impressions were thrown off, which are in every body's hands, and the letters are still good.

"The inventor of this useful art was J. Vander Mey, father of the well-known painter of that name. About the end of the 16th century he resided at Leyden. With the assistance of Muller, the clergyman of the German congregation there, who carefully superintended the correction, he prepared and cast the plates for the above-mentioned quarto Bible. This Bible he published also in folio, with large margins ornamented with figures, the forms of which are still in the hands of Elwe, bookfeller at Amsterdam: also an English New Testament, and Schaaf's Syriac Dictionary, the forms of which were melted down; and likewise a small Greek Testament, in 18mo.

"As far as is known, Vander Mey printed nothing else in this manner; and the art of preparing solid blocks was lost at his death, or, at least, was not afterwards employed. The cause may readily be conceived; for, though this process in itself is very advantageous, it is far more expensive than the usual method of printing, except in those cases when such works are to be printed as are indispensably necessary, and of standing worth. The number of these, however, is certainly small; especially as we are acquainted with no instance

in the annals of Dutch printing, that any dependance can be placed on the sale of 150,000 copies, as was the case with the brothers Guyot.²⁹

The publisher of the preceding notice supposes, nay, asserts, that the expense of stereotype precludes its use, except in such instances as those adopted by Didot.

STEREOMETER, an instrument lately invented in France, for measuring the volume of a body, however irregular, without plunging it in any liquid. If the capacity of a vessel, or, which is the same thing, the volume of air contained in that vessel, be measured, when the vessel contains air only, and also when the vessel contains a body whose volume is required to be known, the volume of air ascertained by the first measurement, deducting the volume ascertained by the second, will be the volume of the body itself. Again, if it be admitted as a law, that the volume of any mass of air be inversely as the pressure to which it is subjected, the temperature being supposed constant, it will be easy to deduce, from the mathematical relations of quantity; the whole bulk, provided the difference between the two bulks under two known pressures be obtained by experiment.

Let it be supposed, for example, that the first pressure is double the second, or, which follows as a consequence, that the second volume of the air be double the first, and that the difference be fifty cubic inches, it is evident that the first volume of the air will likewise be fifty cubic inches. The stereometer is intended to ascertain this difference at two known pressures.

The instrument is a kind of funnel AB (fig. 1, Pl. 45.), composed of a capsule A, in which the body is placed, and a tube B, as uniform in the bore as can be procured. The upper edge of the capsule is ground with emery, in order that it may be hermetically closed with a glass cover M, slightly greased. A double scale is pasted on the tube, having two sets of graduations; one to indicate the length, and the other the capacities, as determined by experiment.

When this instrument is used, it must be plunged in a vessel of mercury, with the tube very upright, until the mercury rises within and without to a point C of the scale. See fig. 2.

The capsule is then closed with the cover, which being greased, will prevent all communication between the external air, and that contained within the capsule and tube.

In this situation of the instrument, in which the mercury stands at the same height within and without the tube, the internal air is compressed by the weight of the atmosphere, which is known and expressed by the length of the mercury in the tube of the common barometer.

The instrument is then to be elevated, taking care to keep the tube constantly in the vertical position. It is represented in this situation, fig. 2. second position. The mercury descends in the tube, but not to the level of the external surface, and a column DE of mercury remains suspended in the tube, the height of which is known by the scale. The interior air is therefore less compressed than before, the increase of its volume being equal to the whole capacity of the tube from C to D, which is indicated by the second scale.

It is known, therefore, that the pressures are in proportion to the barometrical column, and to the same column diminished by the subtraction of DE. And the bulks of the air in these two states are inversely in the same proportion; and again the difference between these bulks is the absolute quantity left void in the tube, by the fall of the mercury; from which data, by an easy analytical process, the following rule is deduced: multiply the number which expresses the less pressure by that which denotes the augmentation of capacity,

and divide the product by the number which denotes the difference of the pressures. The quotient will be the bulk of the air when subject to the greater pressure.

To render this more easy by an example, suppose the height of the mercury in the barometer to be 78 centimetres, and the instrument being empty, to be plunged in the mercury to the point C. It is then covered, and raised until the small column of mercury DE is suspended, for example, at the height of six centimetres. The internal air, which was at first compressed by a force represented by 78 centimetres, is now compressed only by a force represented by 78—6, or 72 centimetres.

Suppose it to be observed, at the same time, by means of the graduations of the second scale, that the capacity of the part CD of the tube which the mercury has quitted is two cubic centimetres. Then by the rule 72×2 give 24 cubical centimetres, which is the volume of the air included in the instrument when the mercury rose as high as C in the tube.

The body of which the volume is to be ascertained, must then be placed in the capsule, and the operation repeated. Suppose, in this case, the column of mercury suspended to be eight centimetres, when the capacity of the part CD of the tube is equal to two centimetres cube. Then the greatest pressure being denoted by 78 centimetres, as before, the least will be 70 centimetres, the difference of the pressures being 8, and the difference of the volumes two cubical centimetres. Hence 70×2 , gives the bulk of the included air under the greatest pressure 175 cubical centimetres. If therefore 175 centimetres be taken from 24 centimetres, or the capacity of the instruments when empty, the difference 65 cubical centimetres will express the volume of the body which was introduced. And if the absolute weight of the body be multiplied by its bulk in centimetres, and divided by the absolute weight of one cubic centimetre of distilled water, the quotient will express the specific gravity of the body in the common form of the tables where distilled water is taken as unity, or the term of comparison.

After this description and explanation of the use of his instrument, the author proceeds with the candour and acuteness of a philosopher to ascertain the limits of error in the results; an object seldom sufficiently attended to in the investigation of natural phenomena. From his results it appears, that with the dimensions he has assumed, and the method prescribed for operating, the errors may affect the second figure. He likewise gives the formulæ, by means of which the instrument itself may be made to supply the want of a barometer in ascertaining the greatest pressure.—He likewise adverts to the errors which may be produced by change of temperature. To prevent these as much as possible, the actual form of the instrument and arrangements of its auxiliary parts are settled, as in fig. 3, by which means the approach of the hand near the vessel and its tube is avoided. In this figure, the vertical position of the tube is secured by the suspension of the vessel, and a perforation in the table through which the tube passes. The table itself supports the capsule in its first position, namely, that at which the cover is required to be put on.

Mr. Nicholson, from whose Journal this abstract is immediately taken, supposes, with great probability, that the author of the invention had not finished his meditation on the subject, when the memoir giving an account of it was published. "If he had," says the ingenious journalist, "it is likely that he would have determined his pressures, as well as the measures of bulks, by weight. For it may be easily understood, that if the whole instrument were set to its positions by suspending it to one arm of a balance at H (fig. 3), the

quantity of counterpoise, when in equilibrio, might be applied to determine the pressures to a degree of accuracy much greater than can be obtained by linear measurement.

STERNBERG, a town of Germany, in the marquisate of Brandenburg. It carries on a great commerce in cattle, and is 20 miles N. E. of Francfort on the Oder. Long. 15. 11. E. Lat. 52. 30. N.

STERNBERG, a town of Lower Saxony, in the duchy of Mecklenburg, 16 miles S.E. of Wismar. Long. 11. 50. E. Lat. 53. 45. N.

STERTZINGEN, a town of Germany, in the Tyrol, seated at the foot of a mountain, on the river Eyloch, 12 miles N.W. of Brixen.

STEVENSWAERT, a fortress of Dutch Guelderland, seated on the Maese, 20 miles N.E. of Maestricht.

STEWART'S ISLANDS, five islands in the Pacific Ocean, discovered by Captain Hunter, in 1791, and named by him in honour of Admiral Keith Stewart. Long. 163. 18. E. Lat. 8. 26. S.

STEYNING, a borough in Suffex, with a market on Wednesday. It sends two members to parliament, and is 15 miles W. of Lewes, and 51 S. by W. of London. Long. 0. 15. W. Lat. 50. 56. N.

STEYRE, a town of Upper Austria, in the quarter of Traun. It carries on a great trade in iron, and is seated at the confluence of the Steyre and Enns, 20 miles S.E. of Linz. Long. 14. 23. E. Lat. 48. 6. N.

STEYREGG, a town of the archduchy of Austria, 36 miles E.S.E. of Passau, and 84 W. of Vienna. Long. 15. 20. E. Lat. 48. 15. N.

STICKHAUSEN, a town and citadel of Westphalia, in the county of E. Friesland, 18 miles E.S.E. of Emden. Long. 7. 13. E. Lat. 53. 14. N.

STILIGIANO, a town of Naples, in Basilicata, famous for its baths, and seated near the river Salandrella.

STIRUP; see *SADDLE, Supp.*

STIRUM, a town of Germany, in the duchy of Berg, seated on the Roer, 12 miles N. of Duffeldorp. Long. 6. 52. E. Lat. 51. 24. N.

STOCHEM, a town of Germany, in the bishopric of Liege, seated on the Maese, 12 miles N. of Maestricht. Long. 5. 42. E. Lat. 51. 4. N.

STOCKACH, a town of Suabia, in the landgrate of Nellenburg. Near this town, on March 25, 1799, the Archduke Charles gained a victory over the French, under General Jourdan. It is seated on a river of the same name, 12 miles N. of Constance. Long. 9. 10. E. Lat. 47. 50. N.

STOCKERAU, a town of the archduchy of Austria, situate on the Danube, six miles N.W. of Neuberg.

STOCKPORT, a town in Cheshire, with a market on Friday. It has a considerable manufacture of cotton and printed goods, and is seated on the Mersey, six miles S. of Manchester, and 175 N.N.W. of London. Long. 2. 18. W. Lat. 55. 35. N.

STOCKZOW, a town of Silesia, in the principality of Teschen, seated on the Vistula, 12 miles S.E. of Teschen. Long. 18. 32. E. Lat. 49. 45. N.

STOKESLEY, a town in the N. riding of Yorkshire, with a market on Saturday, 36 miles N. of York, and 239 N. by W. of London. Long. 1. 2. W. Lat. 54. 29. N.

STOLHOFFEN, a town of Suabia, in the marquisate of Baden, seated in a morass, near the Rhine, eight miles S.W. of Baden, and 12 N.E. of Straßburg. Long. 8. 10. E. Lat. 48. 41. N.

STOLPEN, a town of Upper Saxony, in Prussian Pomerania, seated in a valley, on a river of the same name, 50

miles N.E. of Colberg, and 66 N.W. of Dantzic. Long. 16. 45. E. Lat. 54. 32. N.

STONE, a town in Staffordshire, with a market on Tuesday, seated on the Trent, seven miles N. by W. of Stafford, and 140 N.W. of London. Long. 2. 6. W. Lat. 52. 54. N.

STONEHAVEN, or **STONEHIVE**, a town in Kincardineshire, with a good harbour secured by a stone pier. Near it are the ruins of the castle of Dunnotyre, on a lofty perpendicular rock, almost surrounded by the sea. Not far hence, is a precipitous cliff, called Fowl's Cleugh, remarkable for the resort of the birds called kittiwakes, the young of which are much fought after in the hatching season. In this town is a manufacture of canvas, and some trade in dried fish and oil. It is 14 miles S. by W. of Aberdeen.

STORKAU, a town of Upper Saxony, in the Ucker marche of Brandenburg, 24 miles E.S.E. of Berlin, and 26 W.S.W. of Frankfort on the Oder. Long. 13. 35. E. Lat. 52. 24. N.

STORMARIA, a principality in the duchy of Holstein, bounded on the N. by Holstein Proper, on the E. by Wageria and Lauenburg, and on the S. and W. by Lüneburg and Bremen, from which it is separated by the Elbe. Glückstadt is the capital.

STOSSEN, a town of Upper Saxony, in Thuringia, six miles S. of Weissenfels, and six S.E. of Naumburg.

STOURBRIDGE, a town in Worcesterhire, with a market on Friday. It is noted for its glass and iron works; and is seated on the Stour, over which is a bridge; 22 miles N. of Worcester, and 124 N.W. of London. Long. 2. 0. W. Lat. 52. 32. N.

STOURMINSTER, a town in Dorsetshire, with a market on Thursday. Near it are the ruins of an ancient castle, which was the seat of the W. Saxon kings. It is seated on the Stour, over which is a stone bridge, 20 miles N.E. of Dorchester, and 111 W. by S. of London. Long. 2. 37. W. Lat. 50. 56. N.

STOVE (*Encycl.*). In the *Annales de Chimie*, Citizen Guyton has given an account of the stoves used in Sweden, with apertures emitting heat.

"It is well known," says he, "by the accounts of travellers, that the cold felt in Sweden, during a common winter, exceeds by several degrees that of our most severe winters in France; and yet in no country do the inhabitants defend themselves from the inclemency of the season at a smaller expence. But though these facts are well known, we cannot accumulate too many documents and proofs, when we would convert a vague tradition into a certain conviction, and induce mankind to abandon any ancient long-established custom."

"As to the construction of these stoves, the authors I have examined observe, that it costs very little, saves much of the iron formerly employed, and only requires bricks or square tiles."

"They recommend laying them on their broadest side (de champ), to choose them as thin as possible for the interior walls, and to place the circulating flues so that the rain that falls down the flues of the chimney may never find its way into them."

"They also give some directions relative to the feeding these stoves, which is so easy, that in the largest public establishments, a single individual lights all the fires. This supply consists in putting in as much wood as the fire-place, which is very small, will hold, in only introducing sawed wood of equal length, and as soon as it is burnt, shutting the slide that cuts off the communication of the circulating flues with the chimney-flue; by which means, all the heat the fuel has produced, is retained in these channels, escaping slowly, and so

Swedish Stove.

M^r. Adams's Portable Telescope.

Arms of Great Britain and Ireland since their Union.

as only to spread itself through the apartment; whereas any piece of wood that could not have burnt out in an equal space of time, would require the flue to continue open, and the current of air necessary for its combustion would carry off, through the flue of the chimney, the greater part of the heat at first produced."

References to Plate 51.—Fig. 1, represents a front view of the stove, its height being 166 centimetres, or about 61 inches French, exclusive of the vase, which is merely an unconnected ornament standing on the flat surface at top. Its breadth is 85 centims, or about 31 $\frac{1}{2}$ inches French; its depth is 58 centimetres, or about 21 $\frac{1}{2}$ inches French; the height may vary according to that of the room, and may without inconvenience be extended to two metres. It may also be reduced for a laboratory stove, which ought to have a sand-bath breast-high.

The two other dimensions are determined by those of the bricks employed in constructing the internal circulating flues, which bricks ought to be, in certain fixed proportions, that the smoke may pass freely, and yet that it may not be accompanied by a quantity of air sufficient to condense it, or to lower the temperature below the degree of heat requisite for its complete combustion.

V.V. The external furniture of the two heating apertures; *mm*, apertures where the air enters, which afterwards issues from the heating apertures. These are closed whenever the air is brought in from without by a connected tube under the floor; which is far more favourable to the renewal of the respirable air of the apartment, and prevents the danger arising from currents of cold air attracted by the fire-place; which becomes necessary, whenever the volume of air in the apartment is insufficient to supply at once the consumption of the fire and the circulation in the heating tubes.

Fig. 2, is the plan of the foundation of the hearth at the line *AB*, in fig. 1; *ll*, are the vacancies to receive and conduct the air into the compartments where it is to be heated, previous to its issuing from the heating apertures, whether it be brought from without or through the apertures *mm*, in fig. 1.

Fig. 3, is a plan at the line *CD*, in fig. 1, that is below the door of the fire-place; *nn, nn*, the double cast-iron plates forming the compartments, where the air receives heat from the fire; *oo*, vacancies between these iron plates.

Fig. 4, is a front section at the line *IK* in fig. 3, the darts shewing the direction of the smoke in the circulating flues in front. The iron plates *nn*, are here again represented in their perpendicular position, with the tongues that form the compartments on each side of the fire-place. One of these plates is represented in front, fig. 7; *T*, is an aperture reserved at the bottom of the fourth circulating flue, to establish, if needful, the draught of air in the fire-place, by burning a few slips of paper, or other light combustible substance. This precaution, however, may be neglected, as soon as the stove has been sufficiently heated to expel all its internal moisture.

The door of this air-pump, as it were, must shut accurately. For this purpose it is enough to cut a piece of brick, which may be pierced so as to receive a handle, and affix upon it a piece of wrought iron as a covering.

Fig. 5, is a plan taken at the line *EF*, in fig. 1.

Fig. 6, is a lateral section at the line *GH*, in fig. 3, shewing the height of the fire-place, and the first direction of the flame. *V*, shews the disposal of the heating-flues: the dotted lines shew in profile, the partitions forming the four great circulating-flues; *R*, the tube that conveys the smoke from the circulating flues into the chimney, being furnished with a key to intercept the communication. This is a common flue-pipe of plate-iron; but it would be more advantageous to

use, in that part where the slide or stopple acts, some substance that is a worse conductor of heat, as for instance, a pipe made on purpose, of earthen-ware.

The angle formed by this tube in its way to the chimney, renders it unnecessary to repeat, that the first condition is that the body of the stove be detached from the wall. That now describing, is 25 centimetres from the nearest point of the niche where it stands; *S*, is an elongation of the perpendicular tube which enters the chimney; it is intended as a receptacle for the water that may be condensed in the upper part, and to prevent its penetrating into the interior of the stove. The cover that terminates this elongation, facilitates the cleaning the pipe without taking it to pieces. The dotted lines forming the square space *Q*, shew the place where a niche or oven, which actually exists in some of the Swedish stoves, may be fixed, and which advantageously varies the masonry-work that would otherwise fill that space. All these figures being drawn on the same scale, the proportions may be easily preferred throughout.

The construction of this stove is neither difficult nor expensive. The external surface may be coated with china tiles similar to those used in common stoves, that is to say, thin in the middle, and with a rim all round; which renders them more firm. They may also be fixed by a plate of metal in form of a girt. The back may be plain brick. The vase which stands on a slab of marble, or stone, is only an ornament.

In case heating apertures should not be wanted, the whole internal part may be built of bricks, of a convenient shape, cemented with diluted potters'-earth, and laid on their broad surface (*de champ*) for the circulating flues, without any other iron-work than a cast-iron plate over the fire-place, the door, and its frame.

The additional expense attending the heating-aperture, consists merely of the four cast-iron plates, with their tongues and grooves to form the compartments represented in fig. 7. All the rest is made of iron rolled and nailed; which being once bedded in brick-work, can never suffer the air to escape.

These iron plates with grooves, have been well known since the adoption of Dr. Franklin's stove, and there is an engraving of them in his works; but if there be any difficulty in procuring them, the deficiency may be supplied in two ways:

1st. By ends of cast-iron pipes placed vertically between each other, thus serving as sides to the fire-place, and communicating with each other by small channels above and below, constructed in the brick-work.

2d. By common smooth cast-iron plates, soft enough to be pierced with a drill, in order to affix, with rivetted nails, wrought iron-plates bent into squares throughout their length, which are a complete substitute for the tongues and channels in cast-iron, and as they are never exposed to the flame, there is no danger of their failing.

It may easily be perceived that this last method is the most advantageous, because it occupies less space, and yet offers a larger surface to receive the heat and communicate it to the air; but there are many objections to stoves of this kind.

STOWLEY, a town in Somersetshire, with a market on Tuesday, seven miles W. by N. of Bridgewater, and 145 W. by S. of London. Long. 3. 9. W. Lat. 51. 10. N.

STRABANE, a town of Ireland, in the county of Tyrone, situate on the Mourne, 11 miles S.S.W. of Londonderry, Long. 7. 19. W. Lat. 54. 50. N.

STRADELLA, a strong town of Italy, in the Milanese, with a castle, seated on the Verfa, near the Po, 10 miles S.E. of Pavia, and 47 N.W. of Parma. Long. 9. 12. E. Lat. 45. 5. N.

STRALEN, a town of the Netherlands, in Prussian Guel-

derland, five miles S.W. of Gueldres. Long. 5. 57. E. Lat. 51. 23. N.

STRANGFORD, a sea-port of Ireland, in the county of Down, seated on the narrow channel that connects Lough Strangford with the Irish Sea, seven miles E. of Down. Long. 5. 20. W. Lat. 54. 31. N.

STRANGFORD, LOUGH, a deep inlet of the sea, in the county of Down, on the E. coast of Ireland. It is 17 miles long, and five broad, and abounds with excellent fish, particularly smelts; and off the bar, about August, is a periodical herring fishery. The bar, or entrance into it from the Irish Sea, is three miles below Strangford. It contains 54 islands, that have names, and many others that are nameless. The burning of kelp profitably employs a great number of hands in these islands. Four of them are called Swan Islands, from the number of swans that frequent them.

STRATFORD-ON-AVON, a corporate town in Warwickshire, with a market on Thursday. It is memorable as the birth-place of Shakspere, who was buried there in 1616. It is governed by a mayor, and seated on the Avon, over which is a stone bridge, eight miles S.W. of Warwick, and 94 N.W. of London. Long. 1. 44. W. Lat. 52. 15. N.

STRATFORD, FENNY, a town in Buckinghamshire, with a market on Monday, seated on the Roman Watling-street, 12 miles E. of Buckingham, and 45 N.W. of London. Long. 0. 42. W. Lat. 51. 58. N.

STRATFORD, ST. MARY'S, a considerable village in Suffolk, which has a share in the woollen manufacture. It is 12 miles S.W. of Ipswich.

STRATFORD, STONY, an ancient town in Buckinghamshire, with a market on Friday. It has two churches; and is seated on the Ouse, and on the Roman highway, called Watling-street, eight miles N.E. of Buckingham, and 52 N.W. of London. Long. 0. 50. W. Lat. 52. 3. N.

STRATTON, a town in Cornwall, with a market on Tuesday. It is seated between two rivulets, which here unite and fall into the Bristol Channel at a small distance. It is 18 miles N.W. of Launceston, and 221 W. by S. of London. Long. 4. 43. W. Lat. 50. 55. N.

STRAUBINGEN, a town of Bavaria, capital of a territory of the same name. It is a large place, with broad streets, handsome churches, and fine convents. It was taken, in 1743, by the Austrians, who demolished the fortification; but it was restored in 1745. It is seated on the Danube, 22 miles S.E. of Ratibon, and 65 N.E. of Munich. Long. 12. 35. E. Lat. 48. 54. N.

STREBLA, a town of Upper Saxony, near which the Prussians were defeated by the Austrians in 1760. It is seated on the Elbe, 14 miles N.W. of Meissen, and 28 N.W. of Dresden. Long. 23. 15. E. Lat. 51. 30. N.

STRELITZ, OLD, a town of Lower Saxony, in the duchy of Mecklenburg Strelitz. It had a palace, which was burnt down in the night, in 1712; Duke Adolphus Frederic III. and his family, narrowly escaping. It is seated in a plain, almost surrounded by morasses, 55 miles S.W. of New Brandenburg.

STRELITZ, NEW, a town in the duchy of Mecklenburg Strelitz, which owes its origin to the destruction of the dual palace in Old Strelitz; in consequence of which, Duke Adolphus Frederic III. began to erect a magnificent palace, two miles from the site of the old one, at a place called Glienke, which was before his hunting seat; and, in 1733, he founded a new town adjoining to the palace, and ordered it to be called New Strelitz. It is regularly planned in the form of a star. The centre is a spacious market-place, and thence a number of streets branch out in straight lines. The

chief street leads to the palace, and the next to a pleasant lake.

STRENG, or **STRENGUES**, a town of Sweden, in Sudermania, with a bishop's see, and a college. It is seated on the lake Macler, 30 miles W. of Stockholm. Long. 17. 40. E. Lat. 59. 20. N.

STRIEGAU, a town of Silesia, in the principality of Schwidnitz, nine miles N.W. of Schwidnitz.

STROEMSHOLM, a town of Sweden, in Westmanland, situate on the lake Malar, 45 miles S.W. of Upsal. Long. 16. 24. E. Lat. 59. 30. N.

STROMBERG, a town of Westphalia, capital of a small district, in the bishopric of Munster. It is 20 miles S.E. of Munster, and 20 N.W. of Paderborn. Long. 7. 43. E. Lat. 51. 45. N.

STROMBERG, a town of Germany, in the palatinate of the Rhine, 26 miles W. of Mentz, and 48 E. of Treves. Long. 7. 21. E. Lat. 49. 57. N.

STROMSOE, a town of Norway, in the province of Aggerhus, 18 miles S.W. of Christiania. Long. 20. 20. E. Lat. 59. 43. N.

STROMSTADT, a town of Sweden, in the province of W. Gothland, celebrated for its shell-fish. Long. 11. 4. E. Lat. 59. 43. N.

STUHLWEISSENBERG, a strong town of Lower Hungary, capital of Ekekeridegwar. It had the title of regalis, or royal, because formerly the kings were crowned and buried here. It has been several times taken by the Turks, but has been in the hands of the house of Austria ever since 1688. It is seated on the Raauza, 20 miles S.W. of Buda, and 162 N. by W. of Belgrade. Long. 18. 40. E. Lat. 47. 19. N.

STULINGEN, a town of Suabia, subject to the Duke of Furttenberg, with a castle, 35 miles W. of Constance. Long. 8. 24. E. Lat. 47. 45. N.

STUTTGART, a city of Suabia, capital of the duchy of Wirtemberg. It is surrounded by walls and ditches, and has an ancient castle, with a rich cabinet of curiosities, a ducal palace, an orphan house, and a college. The streets are narrow in the city, and the houses generally of wood; but there are fine houses, and straight streets, in one of the suburbs. Stuttgart was taken by the French in June, 1796. It is seated in a plain among mountains, near the river Neckar, 36 miles E. of Baden, and 52 N.E. of Straßburg. Long. 9. 10. E. Lat. 48. 50. N.

SUANES, **SUANI**, or **SUANERI**, a poor and simple people of Asia, who inhabit one of the four divisions of Imeritia. They subsist by raising cattle, and by a little agriculture.

SUAQAM, a sea-port of the country of Abex, seated on a small island of the same name, on the W. side of the Red Sea. It is the residence of a Turkish governor under the Bashaw of Cairo, and was once a very flourishing place, but is now gone to decay. Long. 37. 55. E. Lat. 19. 56. N.

SUBBIACO, a town of Italy, in Campagna di Roma, with a castle, seated on the Teverone, 33 miles E. of Rome.

SUCCESS BAY, a bay of Tierra del Fuego. The S. promontory, at its entrance, called Cape Success, is 10 long. 65. 27. W. Lat. 55. 1. S.

SUCHTELEN, a town of Westphalia, in the duchy of Juliers, 12 miles E. of Rurmonde, and 21 N. of Juliers. Long. 6. 2. E. Lat. 51. 18. N.

SUDERHAMN, a town of Sweden, in the province of Hellingland. It has a considerable trade in linen, butter, timber, and flax. It is situate at the mouth of a river, near

the gulf of Bothnia, 20 miles N. of Gelle. Long. 17. 5. E. Lat. 63. 20. N.

SUDERKÖPING, a town of Sweden, in E. Gothland, 10 miles S. of Nordkoping, and 90 S.W. of Stockholm. Long. 15. 56. E. Lat. 58. 19. N.

SUDERMANIA, or **SUDERMANLAND**, a province of Sweden Proper, 62 miles long, and 42 broad; bounded on the N. by Upland and Wettermania, on the E. by the peninsula of Tarlo, on the S. by the Baltic, and on the W. by Nerica. It is the most populous part in Sweden, and abounds in corn, and mines of divers metals. Níkingop is the capital.

SUDERTELGE, a town of Sweden, in the province of Sudermania. It was formerly a considerable staple town, and has still a manufacture of worsted and silk stockings. It is 16 miles W.S.W. of Stockholm. Long. 18. 0. E. Lat. 59. 10. N.

SVENSBORG, a sea-port of Denmark, in the island of Funen, with the best harbour in the island. Here are manufactures of woollen and linen. It is 22 miles S. of Odensee. Long. 10. 37. E. Lat. 55. 9. N.

SUGELMESSA, or **SIGELMESSA**, a province of Barbary, bounded on the S. by the kingdom of Taflet, and on the N. by Mount Atlas. It is about 100 miles in length; abounds in corn, dates, and other fruits, and has mines of iron, lead, and antimony. The government is a republic. The capital, of the same name, is seated on the Zig, 150 miles N.N.E. of Taflet. Long. 5. 5. W. Lat. 29. 40. N.

SULLY, a town of France, in the department of Loiret, seated on the Loire, 20 miles S.E. of Orleans. Long. 2. 26. E. Lat. 47. 40. N.

SULMONA, a town of Naples, in Abruzzo Citeriore, with a bishop's see. It was anciently called Sulmo, and is remarkable for being the birth-place of Ovid. It is seated on the Sora, 26 miles S.W. of Chieti. Long. 14. 55. E. Lat. 42. 0. N.

SULPHURET, a new chemical name, applied to any combination of sulphur with other substances on which it is capable of acting. Dr. Higgins invented a *sulphuret of lime*, which he proposes to be used in the arts as a substitute for pot-ash. Four pounds of the flowers of sulphur and twenty of flaked lime in fine powder are mixed, and boiled in 16 gallons of water, about half an hour, stirring it now and then. Soon after the agitation of boiling has ceased, the clear sulphuret of lime is to be drawn off. On the dregs, 16 gallons of fresh water are added, and, after boiling and straining, 33 gallons more, for the purpose of obtaining the whole of the sulphuret. These dilutions are sufficient to render the liquid (when all is mixed together) of a proper strength for a *bleaching liquor*; and thus about 60 gallons are obtained from four pounds of brimstone.

SULTANIA, a considerable town of Persia, in Irac-Agemi. Here is a magnificent mosque, which contains the tomb of Sultan Chodabend. It is 50 miles N.W. of Calbin. Long. 51. 53. E. Lat. 36. 16. N.

SULTANPOUR, a town of Hindoostan Proper, in the province of Lahore, 62 miles S.E. of Lahore. Long. 73. 50. E. Lat. 30. 25. N.

SULTANPOUR, a town of Hindoostan Proper, in the province of Oude, 32 miles S. of Fyzabad, and 50 N. of Allahabad. Long. 82. 30. E. Lat. 29. 5. N.

SULTZ, a town of Suabia, in the duchy of Wirtemberg, near the Neckar, where are some salt-works sufficient to supply the duchy with salt. It is 13 miles S.E. of Freudenstadt, and 12 N. of Rothwell. Long. 8. 35. E. Lat. 48. 18. N.

SUTZ, a town of France, in the department of Upper

Rhine, with a medicinal spring, 12 miles S.S.W. of Colmar.

SULTZBACH, a town of Germany, in the palatinate of Bavaria, with a castle, subject to the Duke of Neuburg-Sultzbach. It is 10 miles N.W. of Amberg, and 32 N. of Ratibon. Long. 11. 56. E. Lat. 49. 38. N.

SULTZBURG, a town of Suabia, in the margravate of Baden-Durlach, with a fine palace. It is seated in a territory, fertile in good wine, eight miles S.W. of Friburg. Long. 7. 30. E. Lat. 47. 54. N.

SUMBUL, a town of Hindoostan Proper, in the province of Oude, 45 miles W.N.W. of Benilly, and 65 E. of Delhi. Long. 78. 55. E. Lat. 21. 25. N.

SUMBULPOUR, or **SUMELPOUR**, a town of the peninsula of Hindoostan, in the province of Orissa, 144 miles W.N.W. of Cattack, and 280 W. of Calcutta. Long. 83. 40. E. Lat. 21. 25. N.

SUMEH, a town of Turkey in Asia, in the province of Natolia, 14 miles E. of Pergamo.

SUMEREIN, a town of Lower Hungary, seated in the island of Schur, made by the river Danube. It is 16 miles S. of Preburg. Long. 17. 23. E. Lat. 48. 4. N.

SUNBURY, a sea-port of the United States, in Georgia, with a safe and convenient harbour. Several small islands interlocking with each other, render the passage to sea winding, but not difficult. The town being very healthy, is the resort of the planters from the adjacent places of Midway and Newport, during the sickly months. It is 34 miles S. of Savannah. Long. 81. 15. W. Lat. 35. 34. N.

SUNBURY, the county-town of Northumberland, in Pennsylvania, seated below the junction of the E. and W. branches of the Susquehanna, 126 miles N. of Philadelphia. Long. 76. 50. W. Lat. 40. 51. N.

SUNDERBUNDS, or **THE WOODS**, a tract of country, consisting of that part of the Delta of the Ganges, in Bengal, which borders on the sea. In extent it is equal to the principality of Wales. It is completely enveloped in woods, infested with tigers, and composed of a labyrinth of rivers and creeks, all of which are salt, except those that immediately communicate with the principal arm of the Ganges. Here salt, in quantities equal to the whole consumption of Bengal and its dependencies, is made and transported with equal facility; and here also is found an inexhaustible store of timber for boat building.

SUNDERBURG, a town of Denmark, in the island of Alsen, with a castle. It is seated on a strait, called Sundaburg Sound, 12 miles E. of Flensburg. Long. 10. 0. E. Lat. 54. 51. N.

SUNDERDOO, or **MELUNDY**, a fortified island and sea-port of the Deccan of Hindoostan, on the Concan coast, reduced by Commodore James in 1756. It is about 10 miles N.E. of Vingrola Rocks, and 36 N.N.W. of Goa. Long. 73. 26. E. Lat. 16. 3. N.

SUNDERLAND, a sea-port in the bishopric of Durham. It is a flourishing town, and, for the exportation of coal, is next in consequence, on that side of the kingdom, to Newcastle. Its port, at the mouth of the Wear, will not admit very large ships; but vessels hence can get out to sea much more readily than from the Tyne. The coal is brought down the Wear from numerous pits near its banks. Here are several glasshouses; and there is an exportation of grindstones and other articles. It is 13 miles N.E. of Durham, and 264 N. by W. of London. Long. 1. 14. W. Lat. 54. 56. N.

SUNDERLAND, a town of the United States, in Massachusetts, situate on Connecticut River, 100 miles W. of Boston.

SUNDI, a province of Congo, which lies along the river Zaire. Its rivers render it extremely fertile, and in the mountains are mines of several metals. The capital is of the same name. Long. 17. 55. E. Lat. 4. 50. S.

SUNDSWALL, a sea-port of Sweden, in the division of Norland, and province of Medelpadia. The chief trade is in tar, bark of birch trees, deals, and linen. It is seated near the gulf of Bothnia, 195 miles N. by W. of Stockholm. Long. 18. 5. E. Lat. 62. 45. N.

SUNNEBERG, or **SONNEBERG**, a town of Brandenburg, in the territory of Sternburg, with a castle, seated on the Darta, 50 miles E. by N. of Berlin. Long. 15. 10. E. Lat. 52. 41. N.

SUPERIOR LAKE, a lake of N. America, so called from its being the largest on that continent. According to the French charts it is 1500 miles in circumference. It contains many islands; two of them very large, especially Isle Royale, which is 100 miles long, and, in many places, 40 broad. The Indians suppose these islands to be the residence of the Great Spirit. Upward of 30 rivers enter this lake, some of which are of considerable size. It abounds with trout and sturgeon. Storms affect this lake as much as they do the Atlantic Ocean. It discharges its waters from the S.E. corner, through the straits of St. Marie, into Lake Huron.

SUPINO, an ancient town of Naples, in Molise, with a castle. It is seated at the source of the Tamara, at the foot of the Apennines, 17 miles N. by W. of Benevento.

SURE, a river of Ireland, in Tipperary, which flows by Clonmel and Carrick to Waterford, and falls into St. George's Channel.

SURGOOJA, a town of the peninsula of Hindoostan, capital of a province of the same name, in the country of Orissa. It is 180 miles S.S.W. of Patna.

SURINGIA, a commercial town of Japan, in the island of Nippon, capital of a province of the same name, with a castle, where the emperors formerly resided. Long. 139. 5. E. Lat. 39. 30. N.

SURSEE, a town of Switzerland, in the canton of Lucern, seated near the lake of Sempach, five miles S. of Lucern.

SURSOOTY, a town of Hindoostan Proper, in the province of Delhi, 114 miles N.W. of Delhi.

SUS, a river of Morocco, which forms the S. boundary of that empire, and enters the Atlantic, at Meffa. Like the Nile, its annual inundations enrich the country.

Sus, one of three great divisions of the empire of Morocco; bounded on the W. by the Atlantic, on the N. by Mount Atlas, on the E. by Gefula, and on the S. by the river Sus. It is a flat country, abounding in corn, sugar-canes, and dates. The inhabitants, who are chiefly Berbers, or ancient natives, are distinguished by their industry; and many of them, who live in towns, become opulent, and are much more polite than the natives of Fez and Morocco. In the mountainous part they are entirely free, and are governed by their own chiefs.

SUSA, a strong town of Piedmont, capital of a marquissate of the same name, with a fort. Here is a rich convent, called the abbey of St. Just, and a triumphal arch to the honour of Augustus Cæsar. It is seated on the Doria, among pleasant mountains, and is called the key of Italy; being the principal passage out of France into Italy. It was taken by the French in 1704, but restored to the Duke of Savoy in 1707. It is 30 miles N.W. of Turin. Long. 7. 24. E. Lat. 45. 20. N.

SUSDAL, a town of Russia, in the government of Vo-

lodiin, capital of a duchy of the same name, with an archbishop's see. It is built of wood, and seated on the Klafina, 90 miles N.E. of Moscow. Long. 40. 25. E. Lat. 56. 26. N.

SUSQUEHANNAH, a river of N. America, which issues from Lake Ortego. It crosses three times the line which divides the state of New York from Pennsylvania, and empties itself into the head of the bay of Chesapeake.

SUSSAC, a town of France, in the department of Upper Vienne, 15 miles S.E. of Limoges.

SUSTER, an ancient and celebrated, but now decayed, town of Persia, capital of Kustistan. It is seated on the Caron, 105 miles S.W. of Ispahan. Long. 51. 19. E. Lat. 31. 15. N.

SUSTEREN, a town of Westphalia, in the duchy of Juliers, two miles from the river Maese, and 12 S. of Ruremonde. Long. 5. 50. E. Lat. 50. 56. N.

SUTRI, a town of Italy, in the patrimony of S. Peter, with a bishop's see, seated on the Puzzolo, 22 miles N.W. of Rome. Long. 12. 25. E. Lat. 42. 10. N.

SUWOROW (Prince Alexander Bagliowitch), famed, on account of his military achievements at Rymnik and in Italy, Rymnikki and Italskoi, was born in the year 1730. His family was of the class of nobility, and of Swedish origin: one of his ancestors settled in Russia the latter end of last century, and having distinguished himself in the wars against the Tartars, was rewarded with lands and peasants. Basil, the father of Alexander, was godson to Peter the Great, and at his death enjoyed the two-fold rank of general and senator.

He intended his son for the profession of the law, but a preference very common in youth, impelled him to choose the military instead of the forensic line. He was at the age of twelve enrolled in the Russian army, but staid at home some years afterwards to improve in the sciences. He pursued the line of reading both professional and historical, calculated to form a soldier, with great diligence and success: he studied, besides, general history and philosophy on an enlarged scale, and made himself master of most European languages, which he spoke and wrote with correctness and facility.

Suworow began his career as a private soldier, being enrolled as a fusilier in the guards of Seimonow. In 1747 he served as a corporal, and was soon advanced to the rank of serjeant. His subsequent promotion was rapid: in 1754 he quitted the guards with the brevet of lieutenant in the army; in 1756 the conduct of provisions was entrusted to him: he was afterwards lieutenant to the auditor-general, and appointed to the command of Memel with the rank of lieutenant-colonel. He made his first campaign in the seven-years' war against the Prussians, and by his valour obtained the favourable notice of his commanding officer, Count Fermor, but he found no opportunity to acquire distinction. In 1761 he served in the light troop under General Berg, and made himself conspicuous in various encounters, particularly in an attack on the town of Golnau, where his horse was killed under him, and he received a dangerous contusion on the breast from the rebound of a musket ball. General Berg, in a subsequent action at Naugarten, intrusted him with the command of his right, which he conducted with great bravery, though the attack was unsuccessful. On the 16th of December, the campaign terminated by the surrender of Colonel de Heyde to Count Romanow. The affairs of the King of Prussia were considered as desperate, when he was, at length, saved by the death of the Empress Elizabeth. Her successor, on the 5th of May, 1762, made peace, and afterwards concluded an alliance with Frederick, and the Russians engaged no more in that war. Suworow was rewarded with the command of

the regiment of dragoons of Archangelgorod, and sent to Peterburgh with an especial letter of recommendation.

After the revolution which placed the late Empress Catharine on the throne, Suworow was treated with many marks of confidence and kindness, and obtained great applause for his activity in teaching the troops the new exercise. In 1768 he was advanced to the rank of brigadier: war being commenced against the confederates of Poland, he was ordered to repair thither, and began his march in the unfavourable month of November. In the course of this war he distinguished himself by his prudence in council, celerity in marching, and intrepidity in the field: the post of honour was always assigned to him, and he constantly maintained an eminent reputation. In the autumn of the year 1770, he fell into the Vistula, having by accident missed the pontoon in leaping from the bank, and was in great danger of being drowned. A grenadier at length succeeded in drawing him out by the hair, but in so doing struck his head against a pontoon with such violence as to occasion a contusion, which he did not recover for some months. He continued on service in Poland till the spring of 1773, and acquired the admiration of all judges of military discipline and tactics. The battle of Stalowitz, which he gained on the 11th of September, 1771, was peculiarly extolled by the King of Prussia: and the empress, being highly satisfied with Suworow's conduct, raised him to the rank of major-general, and conferred on him the order of St. Alexander Newsky, which she accompanied with a very flattering letter.

On quitting Poland, Suworow repaired immediately to Peterburgh, where he did not long remain, being in the spring of 1773 ordered to join the army which had then taken the field against the Turks. He reached Jassy in the beginning of May, and soon afterwards gained the famous and important battle of Turtukay, though two thousand Coffacs, promised by Potemkin, did not arrive till after the battle. Suworow's dispatch to Romanzow, the commander-in-chief, is a specimen of his usual laconism: "Honour and glory to God! Glory to you, Romanzow! We are in possession of Turtukay, and I am in it. Suworow." The empress, in token of approbation and gratitude, sent him the cross of the order of St. George, of the second class, accompanied with many expressions of satisfaction. In June the general was obliged to retire to Bucharest for the recovery of his health, which was assailed with a violent fever. Yet he attended military operations, and on the 27th of July, though in so weak a state that he could not walk, unless supported by two men, and his voice so feeble that he was obliged to have an officer near him to repeat the commands, he contributed materially to another important victory near Turtukay. In September he again defeated the Turks near Nitrow.

Previously to his last engagement, Suworow had received several dangerous hurts, particularly one in his leg, and another on his back, which was occasioned by a fall down stairs: his health was, in other respects, but partially re-established, and therefore, in October, he retired into Russia, and passed the winter there. In the ensuing spring, he returned to the army of the Danube, being advanced to the rank of lieutenant-general, and appointed to command the second division. On the 11th of June he gained a great victory at Kalladgi; but his ill health obliged him once more to return to Bucharest, and before he completely recovered, peace was concluded.

Suworow now intended to have returned to Russia, but, at Jassy, was met by an order to repair immediately to Warsaw, to assist Prince Wolguski in appeasing the troubles in the interior of that part of the empire. He arrived at Moscow, in August, 1774, and soon succeeded in quelling the insurrection,

and taking prisoner Pugatschew, the chief of the insurgents. Having performed this important service, and restored peace, he retired to pass some time on his estate.

From this retreat he was called in November, 1776, when he received a commission for the Crimea, where the government was unsettled, the people in insurrection, and exposed to the inroads of the Circassians, and the whole peninsula in disorder. Here he remained, with few intervals, for several years. He was in this period complimented by the empress with a snuff-box, containing her portrait set in diamonds; and, in 1783, the grand cross of the equestrian order of Saint Wolodimir.

In 1786, Suworow was promoted to the rank of commander-in-chief. In February, 1787, the empress paid a visit to the Crimea, now called Catherineopolis, and Taurida, of which Prince Potemkin was then governor. Suworow, on this splendid occasion, was appointed to command the corps distributed in the environs of Kiowie and Pultawa: he was much noticed by the Emperor Joseph II. who attended the empress under the title of Count Falkenstein. The empress presented Suworow with a box enriched with her cypher in diamonds. In August he assumed the command of the corps of Cherlon and Kinburn.

The Turks now commenced hostilities without a preliminary declaration, by an attempt to surprise two Russian vessels in the bay of Kinburn. After several unimportant attempts, they began to bombard the town, and on the 1st of October, invaded the island with very superior numbers. In this situation, Suworow had nothing to depend on but his valour and military skill; he gave strict orders that not a shot should be fired till the enemy were within 200 yards of the glacis. This prudent command was strictly obeyed; a spirited fire was opened at the precise moment, and the garison sallied: twice the Russians were overpowered by numbers, and compelled to retire as far as the glacis; but, at length, after a sanguinary contest of nine hours, victory declared in their favour. The Turks had sent away their boats to prevent retreat, and therefore out of 6000 who landed, not more than 700 escaped; the rest were either slain in battle, or drowned in the sea. Suworow was once in imminent danger; he was dismounted, and seeing a Turk leading a spare horse, mistook him for a Coffac, and demanded the beast: the Turk lifted his sabre to dispatch him, but was, in the same moment, thrust through the body with a bayonet. The general received a musket shot in the arm, which, for the moment, he only washed in salt water, and bound up with his cravat: it was afterwards properly attended to. Te Deum was performed at Peterburgh by the empress's order, who sent Suworow a letter highly complimentary, and afterwards the order of Saint Andrew for himself, and six crosses of Saint George, to be distributed according to his discretion.

He now directed a considerable share of attention to the fortifying of Kinburn, conceiving, that although the Turks had for a time retreated, they would soon return. He was not deceived in this expectation: Hassan Pacha made several attempts to destroy the Russian fleet, but, being generally defeated, was obliged to return to Constantinople. Prince Potemkin then resolved to attack Oczakow, and the siege began, in due form, on the 29th of August, 1788. From a rally made by the Turks on the preceding evening, a general engagement ensued, and Suworow, being pointed out by a Greek slave who had deserted, was aimed at, and wounded in the neck. He was, in consequence, obliged to retire to Kinburn, where his symptoms became dangerous and alarming; he was also attacked by the jaundice, but recovered from both. During his convalescence, his life was endan-

gered by the blowing up of a magazine, full of charged bombs, grenades, and various other combustibles; a bomb fell in his bed-chamber, tore his bed, broke down part of the wall, and wounded him in the face, breast, and knee. Thus he was incapacitated from attending the further progress of the siege, and obliged to remain at Cherfon and Kremienchuk for the recovery of his health. In the beginning of 1780 he went to Peterburgh, where he was most graciously received; the grateful and discerning empress presented him with a plume of diamonds for his casque, distinguished with the letter K in a cypher, as an acknowledgment for his defence of Kinburn.

Suworow shortly afterwards returned to the army, and, arriving at Berlats, eighteen miles from Jassy, took the command of the corps there; and, in conjunction with the Prince of Saxo-Cobourg, whom he joined by a most rapid and astonishing march, defeated the enemy at Forhani, and took the fortified convents of Saint Samuel and Saint John. At this period, Suworow sustained considerable injury from a small accident: a pin ran into his foot, the head broke off, and it could not be extracted. This made him rather lame, and the Turks, in derision, used to call him *Tuzak Bacha*, or the limping general.

After his co-operation with Cobourg, for which he received thanks in a very obliging letter from the emperor Joseph, Suworow returned to Berlar, but was soon summoned again to join the Austrians, as the Turkish army under the grand-vizier was advancing to give them battle. He effected the required junction, by a rapid and dangerous march; and on the 22d of September, 1789, they gained an important and decisive victory, near the river Rymnik. The Turks lost ten thousand men, and an immense booty, while the loss of the allies did not amount to three hundred. The number of the Turkish army was near one hundred thousand; that of their opponents about twenty-five thousand. The conduct of Suworow was highly extolled by both the allied sovereigns. The emperor Joseph conferred on him the dignity of count of the empire; the empress sent him a sword, enriched with diamonds, and the order of Saint Andrew, decorated with brilliants: in a short time after, he received the diploma of count of the empire of Russia, with the title of Rymnikski, and the order of Saint Andrew of the first class. These honours were accompanied with letters replete with friendship and gratitude.

In 1790 some attempts at pacification were made, but without success, though at length an armistice was agreed upon at Reichenbach. In the beginning of November, Suworow made his approaches to the important fortrefs of Ilimailow, which he was ordered by Potemkin to take at all hazards. This order was extremely difficult, from the advanced period of the year, and the great strength of the place, which the Turks deemed impregnable. Finding, from the smallness of his army, and the want of heavy artillery, that it was in vain to attempt a regular siege, he only made a feint of doing so, and resolved on a scalade. On the 6th of December, he sent a letter of Prince Potemkin, to which he added a few lines, requiring the seraskier to surrender: the answer displayed confidence in the strength of the place, and advised the Russians to retreat. "The next day, in answer to a message of the same import, the seraskier declared, "that the Danube should cease to flow, or the heavens bow down to the earth, before Ilimailow should surrender to the Russians." Suworow sent a third message, assuring the seraskier, on his word of honour, that unless he hung out a white flag on that very day, the place would be taken by assault, and all the garrison put to the sword. Many of the Ottomans were disposed to surrender, but the

seraskier and the majority rejected the proposition, and returned no answer.

Suworow now animated his troops by an admirable harangue, and though he received a dispatch from Potemkin, advising him, if not sure of success, to desist from the assault, he determined to take advantage of the ardour of his troops, and proceed. Some Cossack deserters apprised the enemy of the intended operations; and they were prepared; yet, notwithstanding the disproportion of numbers and strength, the Russians at length succeeded on every side. The Turks, after the Russians had entered, defended themselves with great obstinacy, and contested every foot of ground. The seraskier was unfortunately killed, after he had surrendered. After a most sanguinary assault, the victory was complete. The Turks defended themselves with great rage and fury; even women and children armed with poniards, fell on the Russian soldiers. Firing was kept up during the whole night by some Turks, who had secreted themselves in dwelling-houses: all who refused to surrender were put to the sword, but those who demanded quarter were spared. The Ottomans lost, according to the official report, thirty-three thousand killed or dangerously wounded, and about nineteen thousand prisoners. The loss of the assailants, was eighteen hundred and thirty killed, and two thousand five hundred wounded. The dead Turks were thrown into the Danube. Of the whole garrison, only one man escaped; he being slightly wounded, fell into the Danube, and reached the opposite bank. He carried the fatal news to the vizier. The plunder was estimated at ten millions of piastres: the soldiers, according to promise, were permitted to pillage for three days. Suworow would not retain for his own use the smallest article. His dispatch to Potemkin was in these words: "The Russian colours wave on the ramparts of Ilimailow." In January, 1791, Suworow returned to Peterburgh, where he was received with a degree of cordiality proportioned to his merits; he was appointed lieutenant-general of the Preobrazhenski guards, and a large medal in gold and in silver was struck by the empress's order, in commemoration of his important victory. In December, 1791, peace was concluded, and the empress shewed her gratitude by giving Suworow a ring and a ribbon ornamented with diamonds, valued at sixty thousand rubles.

Suworow's military talents were not again called into exercise till the war in Poland in 1794, which ended in the total destruction of that kingdom. Many Poles had entered into the Russian army, but when Kosciusko appeared in arms in Poland, vast numbers deserted in large bodies, with their arms, drums, and colours, and joined their countrymen. Suworow was ordered to proceed by forced marches to Red Russia, with a corps of fifteen thousand men, in order to disarm the Poles who yet remained. This delicate and important service he executed with great dispatch, and without effusion of blood. On the 14th of August, 1794, he set out for Poland, at the head of eight thousand men, by forced marches. After several victories of small note, and a most important battle in which he utterly defeated the Poles near Theresopol, Suworow proceeded to the siege of Praga. Having made the necessary preparations, he admonished the garrison of the folly of resistance, and advised them to accept the amnesty, as the only means of preserving themselves from destruction. Infatuated with the visions of French licentiousness, one of the Polish chiefs sent him a letter couched in terms not sufficiently respectful; Suworow chastised the writer by an energetic answer, which produced great dismay among the confederates. On the 22d of October he advanced against Praga, with drums beating and colours flying. The assault and defence were conducted with great intrepidity,

both sides being animated by deadly animosity, but victory declared in favour of the Russians, who at nine in the morning, after four hours' fighting, remained masters of the place. Thirteen thousand Poles were left dead on the field of battle, and two thousand drowned in the Vistula: fourteen thousand six hundred and eighty were taken prisoners.

Suworow announced his victory in his usual laconic style, in a letter to the King of Prussia: *Praga est à moi, et Varsovie tremble*. In fact, the council at Warlaw soon sent a message of capitulation, and obtained terms much more lenient than they expected.

After some delays, Suworow with his army entered Warsaw the 28th of October: when the keys were presented, he pressed them to his lips, and holding them up towards heaven, said, "Almighty God, I render thee thanks, that I have not been compelled to purchase the keys of this place as dear as—" and turning his face towards Praga, burst into tears. He saluted the magistrates with cordiality, and embraced every one whose countenance displayed satisfaction, especially common people of an advanced age. The people, overjoyed at the expected return of order, rent the air with shouts of "Long live Catherine! Long live Suworow!" He had the satisfaction of restoring to liberty 1376 Russian prisoners, whom a wretch named Kolontay had proposed to the revolutionary committee to massacre. The termination of this unexampled campaign, the success of which was entirely due to Suworow, was highly propitious to Russia, as the Polish rebels were entirely defeated, disarmed, and dispersed, and the submission of the country amply secured. The partition of the kingdom speedily ensued.

All the sovereigns interested in this event vied in shewing gratitude to Suworow. The King of Prussia sent him, by an extraordinary messenger, the order of the red and black eagle; the emperor presented him with his portrait enriched with diamonds, estimated at fifty thousand crowns; the empress wrote him a letter, announcing his elevation to the rank of field marshal, and sent him a baton for the occasion, the jewels of which were equally valuable with the emperor's present; she also gave him an estate of 7000 peasants of both sexes, in the district of Kobin.

During the continuance of Catherine's reign, he was treated with constant attention, and undiminished regard, and appointed to the government of an army of 80,000, including the command of four extensive provinces. On the accession of Paul I. Suworow enlisted himself to his esteem, not by the courtly mode of flattery, but by a display of honest and frank disinterestedness and spirit. A great number of military officers being dismissed by the emperor without a trial, the general received them kindly, employed several in his own division, and liberally shared his house and table with others, till they should be re-appointed. Paul was angry at this conduct, and reproached Suworow, who replied, "I know them; they are loyal and brave: some are entirely blameless, others have committed only trivial errors. But granting them to be more culpable, they are poor and neglected—Are they to turn rogues and robbers?—I should not want to be a loyal Russian, if I could suffer it:—I have taken them into my protection." The emperor justly appreciated the field-marshal's frankness, and many of the officers were promoted on his recommendation.

The general events of the campaign of 1799, when Suworow gained so much additional renown, and was exalted to the rank of Prince, with the surname *Italiskoy*, are too recent and too well known to be enumerated in this sketch. The causes which occasioned some disasters at the close of the campaign are not yet sufficiently understood. The strange and unaccountable mode of conduct subsequently adopted by

Paul I. baffles conjecture, and is referable to no fixed principle. The neglect and displeasure he shewed towards Suworow from the time of his recall to Russia, shew his character in a very unfavourable view. The brave and estimable veteran, who in an active and vigorous career of upwards of forty years, had rendered his country the most important services, and contributed so largely to elevate her rank among the powers of Europe, died indignant at unmerited neglect, and broken-hearted at observing a system of politics which tended to counteract all that the sagacious Catherine had effected. He was buried with uncommon pomp and splendor, and the immense multitudes who with grief attended his funeral were the most emphatical reproach to the emperor.

In 1774 he married Barba Nanowna, princess Proisrowski, by whom he had two children who survived him:—Natalia countess Suworow, who married Count Nicola Zoubow; and Arcadius, who is now about 18 years of age, and serving in the Russian army.

The peculiarities of Suworow's manners have been often described and delineated; their basis seems to have been a rigid attention to health and discipline, and that honest simplicity of character which constitutes a hero: in this he was truly great. He was zealous and sincere in religion; direct and honest in patriotism; candid and upright in his views, and no less alert than judicious in the use of his means. No mean art was practised by him to captivate admiration, no delusion was exercised to facilitate a proposed end. His friendship and his humility were alike frank and open. Riches, which he did not overvalue, though he received them from the sovereigns whose cause he had served, were not used by him as the means of promoting a dishonest ambition, exhibiting an absurd vanity, or encouraging an effeminate voluptuousness: they were moderately enjoyed by himself, and generously disbursed at the call of friendship. It is truly asserted by M. Seume, an intelligent German officer who published some anecdotes respecting him, that he possessed more originality, energy, sagacity, personal probity, and humanity, than any other military public character of the age.

SUZANNE, St. a town of France, in the department of Maine. It has a considerable paper manufacture, and is 24 miles W. of Mans.

SWAFFHAM, a town in Norfolk, with a market on Saturday, seated on a hill, 34 miles N.N.E. of Newmarket, and 64 N.E. of London. Long. 0. 46. E. Lat. 52. 43. N.

SWALE, a river in Yorkshire, which rises on the confines of Westmoreland, and running S.E. by Richmond and Thirsk, falls into the Ouse.

SWALLY, a town of the Deccan of Hindoostan, in Cambaya. It has a harbour, where ships receive and deliver their cargoes for the merchants of Surat, being 12 miles N.W. of that place. Long. 72. 15. E. Lat. 21. 18. N.

SWANSEA, a town of the United States, in Massachusetts, situate on the Taunton, 36 miles S. of Boston.

SWANSEY, a sea-port and corporate town in Glamorganshire, with a market on Wednesday and Saturday, an old castle, and two churches. It is seated at the mouth of the Tawy, is governed by a portreeve, and has plenty of coal in its neighbourhood. Of these it sends great quantities to Ireland and the S. coast of England; and it has a considerable trade to Brittol. Here are great works for the smelting of copper and lead ore. Many ships have been built here, and it is resorted to for sea-bathing. It is 24 miles W.N.W. of Cowbridge, and 205 W. of London. Long. 4. 0. W. Lat. 51. 38. N.

SWANSHALS, a town of Sweden, in W. Gothland, 25 miles W.S.W. of Lindköping.

SWARTEBERG, a town of Sweden, in W. Gothland, 18 miles N.W. of Uddevalla.

SWARTSLUYS, a town and fortrefs of the United Provinces, in Overysfel, feated on the Vecht, four miles from its mouth, and five N.N.W. of Haffelt.

SWERNICH, a town of Turkey in Europe, on the confines of Servia and Boshia, feated on the Drino, 70 miles S.W. of Belgrade. Long. 19. 32. E. Lat. 44. 42. N.

SWINDON, a town in Wilshire, with a market on Monday, feated on the top of a hill, near a rich vale, 28 miles N. of Salisbury, and 83 W. of London. Long. 1. 45. W. Lat. 51. 30. N.

SYA, a town of Sweden, in West Gothland, 13 miles S.W. of Lindköping.

SYDNEY BAY, a bay on the fouth side of Norfolk Island, in the Pacific Ocean, formed by Point Hunter and Point Rofs, which are near two miles afunder. Here is a fettlement of convicts from England. Long. 168. 12. E. Lat. 29. 4. S.

SYDNEY COVE, the town or fettlement of convicts, founded at Port Jackson, in New South Wales, in 1788. The ground about it was then covered by a thick foreft; but, in 1790, fome good buildings had been erected, and greateft part of the civil and military officers were comfortably lodged. The governor's houfe is built of ftone, and has a very good appearance, being 70 feet in front. The lieutenant-governor's houfe is of brick, as are alfo thofe belonging to the judge and the commiffary. The reft of the houfes are built with logs and plastered, and all the roofs are either covered by ftingles or thatched. Long. 151. 28. E. Lat. 33. 50. S.

SYRIAN, a town of Pegu, feated near the bay of Bengal, on a river of the fame name, which is one of the extreme branches of the Ava. Long. 96. 40. E. Lat. 16. 50. N.

SZEBEN, a town of Hungary, on the river Tareza, 30 miles N. of Caffovia. Long. 21. 25. E. Lat. 44. 20. N.

SZEKELY, a town of Hungary, 18 miles E.S.E. of Debreczen. Long. 22. 15. E. Lat. 47. 26. N.

SZUCCA, a town of Western Pruffia, in the palatinate Culm, feated on the Viftula, 12 miles S. by W. of Culm. Long. 18. 24. E. Long. 53. 14. N.

T.

TAB

TAAFE, or **TAVE**, a rapid river in Glamorganfhire, which enters the Briftol Channel at Cardiff. On this river, near Caerphilly, is a ftone bridge called Pont y Pryddal, of one arch, 140 feet in the fpan and 34 high, planned and executed by the felf-taught genius of a common mafon in this county.

TAAIF, a town of Arabia, in the province of Hedjas. It has a confiderable trade in fruits, rafins, and almonds; and is fituete on a lofty mountain, 60 miles S.E. of Mecca. Long. 41. 35. E. Lat. 21. 5. N.

TAA8, a city of Arabia, in the province of Yeman, where is the tomb of a faint, who, according to tradition, was king of the country. When M. Niebuhr was here it had a garrifon of 600 men. It is 48 miles E.N.E. of Mocha. Long. 44. 10. E. Lat. 13. 45. S.

TAATA, a town of Upper Egypt, one mile from the Nile. It is the refidence of a governor, has many curious remains of antiquity, and is 200 miles S. of Cairo. Long. 31. 25. E. Lat. 26. 56. N.

TABAGA, an ifland in the bay of Panama, four miles long and three broad. It is a mountainous place, abounding with fruit trees. Long. 80. 16. W. Lat. 7. 50. S.

TABARIA, the ancient Tiberias, a town of Paleftine, fituete on the weft fide of a lake, formerly called the fea of

TAB

Tiberias, 50 miles N.N.E. of Jerufalem, and 70 S.S.W. of Damafcus. Long. 35. 45. E. Lat. 32. 40. N.

TABASCO, a province of New Spain, in the audience of Mexico; bounded on the N. by the bay of Campeachy, on the E. by Yucatan, on the S. by Chiapa, and on the W. by Guaxaca. It is 100 miles in length, and nearly as much in breadth, and its chief riches confift in cocoa nuts. The air is extremely moift, and there are fhowers every day for nine months in the year.

TABASCO, an ifland of New Spain, in the province of Tabafco, formed by a river of the fame name, and by that of St. Peter and St. Paul. It is 30 miles long and 10 broad, and is 10 miles from the bay of Campeachy.

TABASCO, a town of New Spain, capital of the province of Tabafco. The Spaniards call it Nuefta Senora de la Victoria, from a great victory obtained here by Cortes, on his firft arrival. It is fituete in the ifland of the fame name. Long. 58. 15. E. Lat. 17. 40. N.

TABLE ISLAND, one of the New Hebrides, in the Pacific Ocean. Long. 16. 67. E. Lat. 15. 38. N.

TABLE-MOUNTAIN, a promontory of Africa, near the Cape of Good Hope. The bay at the foot of it is called Table Bay.

TABOONYAMANOO, or **SAUNDER'S ISLAND**, an ifland

in the S. Pacific Ocean, near that of Huahine, to which it is subject.

TABOR, a town of Bohemia, in the circle of Bechin, on a mountain, which the Hussites, under their celebrated general Ziska, fortified and made their principal retreat. It is 25 miles N. by E. of Budweis, and 45 S. by E. by Prague. Long. 14. 56. E. Lat. 49. 23. N.

TABRISTAN, a province of Persia, on the S. shore of the Caspian Sea, bounded by Afrabad on the E. and Ghilan on the W.

TACHAU, or **TACHOW**, a town of Bohemia, in the circle of Pilsen, 28 miles W. of Pilsen. Long. 13. 27. E. Lat. 49. 45. N.

TADIVAN, or **TADUAN**, a town of Parfistan, 60 miles S. of Schiras. Long. 54. 15. E. Lat. 28. 45. N.

TADOUSAC, a town of Lower Canada, which is a place of great resort for trading with the Indians, who bring thither furs to exchange for cloth and other European goods. It is situated at the mouth of the Saguenay, 98 miles N.E. of Quebec. Long. 69. 35. W. Lat. 48. 5. N.

TAFALA, or **TAFALLA**, a town of Spain, in Navarre, with a castle, seated on the Cidazzo, in a country producing good wine, 18 miles S. of Pampeluna. Long. 1. 36. W. Lat. 42. 29. N.

TAFILET, a kingdom of Barbary, in the empire of Morocco; bounded on the N. by Fez and Tremefan, on the E. by the Berberies, on the S. by the desert of Barbary, and on the W. by Sus, Morocco, and Fez. It is divided into three provinces, Dras, Saro, and Tuet. It is a mountainous sandy country, but produces wheat and barley by the sides of the rivers. The inhabitants live upon camels' flesh and dates, and they breed horses to sell to foreigners. The Arabs live in tents, and the Berberies, the ancient inhabitants, dwell in villages. Tafilet, the capital, is a trading place, with a castle, and seated on a river, 275 miles S.E. of Morocco. Long. 5. 45. W. Lat. 28. 2. N.

TAGASTA, a town of Algiers, in the province of Constantina, formerly a considerable place, but now greatly reduced. It is famous for being the birth-place of St. Augustine.

TAGE, a town of Arabia Felix, with a castle on a mountain, 60 miles E. of Mecca. Long. 42. 5. E. Lat. 21. 45. N.

TAGHMON, a borough of Ireland, in the county of Wexford, seven miles W. of Wexford.

TAGLIACCOZZO, a town of Naples in Abruzzo Ulteriore, 28 miles S.W. of Aquila, and 33 E.N.E. of Rome. Long. 12. 57. E. Lat. 45. 50. N.

TAGOST, a town of Morocco, the largest in the province of Sus. A great many Jews live here, who carry on a considerable trade. It is seated in a fertile plain, 37 miles S. of Taradant. Long. 8. 5. W. Lat. 29. 23. N.

TAGUMADERT, a town of the kingdom of Tafilet, with a strong castle on a mountain, seated on the river Dras. Long. 6. 43. W. Lat. 27. 10. N.

TAHOOROWA, one of the smallest of the Sandwich Islands, lying off the S.W. part of Mowee, from which it is distant three leagues. It is destitute of wood, and the soil seems to be sandy and barren.

TAJO, anciently **TAGUS**, a river which has its source on the confines of Arragon, in Spain, runs through New Castile, by Toledo and Talavera, whence it proceeds to Alcantara, in Estremadura; when entering Portugal, it washes Santaren, below which it forms the harbour of Lisbon, and then falls into the Atlantic Ocean. This river was formerly famous for its golden sands.

TAIN, a borough and sea-port in Rotheshire, remarkable for a large square tower, adorned with five spires, and for a collegiate church, still pretty entire. It is seated on the frith of Dornoch, 12 miles N. of Cromarty.

TAI-PING-FOU, a city of China, in the province of Kiang-nan, seated on the river Kiang. It has only three cities in its district. Long. 107. 15. E. Lat. 32. 20. E.

TAI-TCHEOU-FOU, a city of China, in the province of Tche-kiang. It has six cities in its district. Long. 121. 2. E. Lat. 28. 55. N.

TAI-TONG-FOU, a strong city of China, in the province of Chang-fi, built near the great wall. Its jurisdiction contains four cities of the second, and seven of the third class.

TAI-YUEN-FOU, a city of China, capital of the province of Chan-fi. It is eight miles in circumference, but is much decayed since it was the residence of the princes of the blood of the last imperial family of Tai-ming-tchao. Its district contains five cities of the second, and 20 of the third class. It is 160 miles S.W. of Peking.

TAILEBOURG, a town of France, in the department of Lower Charente, seated on the Charente, 30 miles S.E. of Rochelle. Long. 0. 40. W. Lat. 45. 46. N.

TALAMONE, a sea-port of Tuscany, 15 miles N. of Orbetello. Long. 11. 6. E. Lat. 42. 30. N.

TALavera, a town of Spain in New Castile, with a fort. It belongs to the Archbishop of Toledo, and is seated on the Tajo, in a valley abounding in corn, fruits, and excellent wine, 58 miles S.W. of Madrid. Long. 4. 1. W. Lat. 39. 41. N.

TALAUERUELA, a town of Spain in Estremadura, seated on the Guadiana, 14 miles E. of Badajoz. Long. 6. 34. W. Lat. 38. 34. N.

TALAGUANA, a sea-port of Chili, on the S.E. shore of the bay of Concepcion. It is now the only Spanish settlement in the bay, and nine miles from the new city of Concepcion. Long. 73. 0. W. Lat. 36. 42. S.

TALLAGH, a borough of Ireland, in the county of Waterford, situate near the river Bride, 23 miles W.N.W. of Cork, and 32 W.S.W. of Waterford.

TALLANO, a sea-port of Corsica, and capital of a district in the French division. It is situate on a bay, called the gulf of Tallano, 24 miles N. of Bonifacio, and 30 S.S.W. of Corte. Long. 9. 18. E. Lat. 51. 20. N.

TALLARD, a town of France, in the department of Upper Alps, seated on the Durance, 47 miles S. of Grenoble. Long. 6. 20. E. Lat. 44. 28. N.

TALMONT, a sea-port of France, in the department of Lower Charente, seated on a peninsula of the Gironde, 20 miles S.E. of Saintes, and 260 S.W. of Paris. Long. 0. 50. W. Lat. 45. 32. N.

TAMALAMECA, a town of Terra Firma, in the government of St. Martha, seated on the Rio de la Magdalena. Long. 74. 45. W. Lat. 9. 6. N.

TAMAR, a river of England, which runs from N. to S. divides Cornwall from Devonshire, and forming the harbour of Hamoaze, enters Plymouth Sound.

TAMARA, a sea-port on the N. coast of the island of Socotora, near the strait of Babelmandel. Long. 52. 25. E. Lat. 11. 30. N.

TAME, a river, which rises in Staffordshire, and entering Warwickshire, runs first E. and then N. till it re-enters into its native county of Tamworth, falling soon after into the Trent.

TAMM, a rivulet in Oxfordshire, which flows into the Thames, at Dorchester, and has been erroneously supposed to give name to the Thames.

TAME, a town in Oxfordshire, with a market on Tuesday, a famous free-school, and a small hospital. It is seated on a rivulet of the same name, 12 miles E. of Oxford, and 45 W. by N. of London. Long. 0. 55. W. Lat. 51. 46. N.

TAMIEH, a town of Egypt, on a canal which runs into the Nile, 12 miles N.E. of Fayoum.

TAMWORTH, a borough in Staffordshire, with a market on Saturday. It sends two members to parliament, and is seated on the Tame, eight miles S.E. of Lichfield, and 114 N.W. of London. Long. 1. 38. W. Lat. 52. 49. N.

TANARO, a river of Piedmont, which rises in the Apennines, and flows by Cherasco, Alba, and Asti, to Alexandria, in the Milanese, and falls into the Po.

TANASSERIM, a town of the kingdom of Siam, capital of a province of the same name, 220 miles S.W. of Siam. Long. 98. 0. E. Lat. 11. 50. N.

TANBOF, a government of Russia, formerly a part of the government of Voronez. Its capital, of the same name, is seated on the Zua, which falls into the Mokcha.

TANCOS, a town of Portugal, in Estremadura, seated on the Zerara, near its fall into the Tajo, 60 miles N.E. of Lisbon. Long. 8. 30. W. Lat. 39. 20. N.

TANCROWALL, a town of Vignitia, seated on the Gambia, where the English have a fort, 30 miles E. of James River.

TANDA, of **TANRAH**, a town of Hindooestan Proper, in Bengal, of which souab it was the capital in the 17th century. There is little remaining of it but the rampart; and the period when it was deserted is not certainly known. It is seated on the Ganges, 120 miles N.W. of Dacca. Long. 87. 56. E. Lat. 23. 25. N.

TANGATABOO, one of the Friendly Islands, in the S. Pacific Ocean, the residence of the sovereign and the chiefs.

TANGERMUNDE, a town of Germany in the old marche of Brandenburg, with a castle, seated on the Tanager, where it falls into the Elbe, 24 miles N.W. of Brandenburg, and 28 N.E. of Magdeburg. Long. 13. 30. E. Lat. 52. 46. N.

TANJORE, a province of Hindooestan, on the coast of Coromandel. It is an appendage of the Carnatic, but subject to its own rajah, who pays an annual subsidy to the English East-India Company.

TANJORE, a city of Hindooestan, in the Carnatic, capital of a province of the same name. It is seated on the Caavery, 156 miles S. by W. of Madras, and 166 S.E. of Seringapatam. Long. 79. 12. E. Lat. 10. 46. N.

TANKIA, or **TINKIA-LING**, a town and fortress of Thibet, at the foot of Mount Langur, 275 miles W. by S. of Lassa.

TANNA, a fertile island, in the Pacific Ocean, one of the New Hebrides, on which is a volcano. The inhabitants are brave and hospitable, and their arms are bows and arrows, slings, spears, and clubs. Long. 160. 46. E. Lat. 19. 30. S.

TANNING (*Encycl.*). To what has been there offered we purpose to add the following experiments on the tanning principle, and reflections on the art of tanning, published by M. Guillet in the *Annales de Chimie*.

"The length of the process described by M. Proust," says he, "to obtain tan, induced me to make some experiments, and to seek a more expeditious method of procuring it: the following are the results:

1. "I infused bark, reduced to a fine powder, in water; I let it stand several days, filtered the infusion, and treated it with lime-water; I obtained a precipitate in considerable quantity, which I collected on a filter, dried it, and afterwards applied alcohol, to ascertain whether it was soluble

in this menstruum; but the alcohol was not even tinged by it.

2. "Being desirous of discovering if the lime possessed a greater affinity to acids than to the tan with which it was combined, I treated four grammes of the precipitate mentioned above with nitric acid diluted with water; with the assistance of a very gentle heat, a moderate effervescence was produced, with a separation of carbonic acid; after twenty-four hours' infusion, I filtered the liquor, which had assumed a very deep colour, and there remained on the filter a granulated, black, shining substance, having a sour and rather bitter taste; this residuum weighed something less than two grammes.

3. "To ascertain whether the nitric acid had dissolved the lime, I treated the liquid which I had filtered with acidulated oxalate of potash, and obtained an abundant precipitate, which made me conjecture that since the nitric acid had dissolved the lime, the substance which I had obtained on the filter must be tan, since the precipitate obtained by the mixture of the lime-water and infusion of bark was produced by the union of the tanning principle and lime: to convince myself of this, I treated one portion with water, and the other with alcohol; I let the infusion of these substances stand on a sand-bath twenty-four hours, the water was deeply coloured, and the alcohol still more; but all the tan (hitherto I only supposed it such) was not dissolved; the alcohol dissolved rather more than half, and the water less. I treated these two liquids, after having filtered them, with a dissolution of pape, and obtained a precipitate resembling that produced by a mixture of the infusion of bark with the same solution, but of a deeper colour, and rather less elastic. When treated with the nitrate of tin, I obtained a precipitate that became gelatinous: when treated with lime-water, the tan united with the lime, and reproduced the tanate of lime formed before.

"Could I suppose that with these properties it was not the pure tan? No, because it gives the same results as that obtained by M. Proust's process.

"If purer tan be required than that obtained by the dissolution of the lime of the tanate of this substance by an acid, the infusion of alcohol must be evaporated, and tan of the purest quality will be left.

"Muric acid produced the same effects as nitric acid.

"The expedition with which the upper leathers are tanned, by the process of M. Seguin, who, in manufacturing them, merely subjects them to the preparations of washing and finishing with lime-water, without afterwards swelling them, and then tans them, caused me to suppose that in this case a combination is formed between the tan and the lime contained in the skin thus finished, independent of the combination of the tan with a gelatinous substance contained in the skin, which accelerates the fabrication. May it not hence be presumed, that the fabrication of these leathers would be accelerated if, after having washed them and finished them with lime-water, they were to be swelled in *juice*, or water in which old bark, which has been once used for tanning, is infused. Under this circumstance the small quantity of tan dissolved in this water would combine with the lime with which the skin would be charged in the finishing, and would form a tanate of lime. The swelling would probably take place by this method with less celerity than by the sulphuric acid; but it would perhaps be preferable, as the skin in swelling would begin to be charged with tan, whilst, by the sulphuric acid, the lime with which the skin is impregnated after having been finished with this substance dissolved in water—the lime, I say, combines with the sulphuric acid employed to make it swell, which I presume must give leather a brittle quality that it would perhaps not have by this method. Perhaps, likewise,

after having swelled the skins in the infusion of old bark, their fabrication might be accelerated by putting them at first into an infusion of bark, according to the method of M. Seguin, and afterwards dipping them alternately in lime-water and the infusion of bark, always taking care to leave them but a short time in the lime-water, which might perhaps alter them, if they were suffered to remain in it too long. Under this circumstance the lime-water with which the leather would be charged would, when the latter is put into an infusion of bark, produce a more speedy precipitation of the tan, and its union with the lime, as well as with the gelatinous substance contained in the leather. I think, likewise, that by this method leather would acquire a greater weight, a quality aimed at by tanners, and would perhaps become less permeable to water.

"These conjectures I have ventured to advance, because they appear to be suggested by the theory of the art of tanning. Perhaps in this instance, as in many others, practice will not accord with theory. I leave it to artists to try this method, which I myself shall not fail to do when a favourable opportunity presents itself."

The following is extracted from the specification of a patent granted to Mr. Francis Brewin, of Bermondsey, in the county of Surrey, for an improved method of tanning. It is dated November 18, 1801.

"My improved process of tanning," says Mr. Brewin, "consists principally in consolidating floaters and taps, that is by drawing the oozes for the vats, and handlers from the floaters, and working the oozes through the floaters in every respect as though they were a set of taps, and using them at the same time in the nature of floaters, by handling the greenest packs in them. These vats I call floating taps. The process I describe more particularly as follows: twenty or twenty-five vats I consider as constituting one complete tanyard; and my vats being nearly of one size, I take two or three of the centre vats, which I use as spenders; four or six immediately next to these I make my floating taps, each containing an eye and a false bottom. The remainder are vats and handlers, in which I use all my fresh bark. One floating tap I keep empty, that it may contain the whole of the ooze and bark in a vat or handler, into which floating vat I draw the ooze and bark, from that vat or handler which I conceive most necessary to be drawn. I draw off by a pump from this floating tap, now the best, my oozes into the vat or handlers from which it last came, making up the deficiency from the second floating tap, late the best; but working it first through the one now made, I put the goods down in the drawn oozes, with about three times the quantity of bark that is generally used with one pack. I continue to work the whole of the floating taps as though they were one set of taps; but first I throw up each pack of goods, and after the floating taps are worked through, I shift the floating packs as in a set of handlers. The bark in the late worst floating tap, being after the whole has been worked through thrown into the spender, causes such floating tap to become the empty floating tap, ready to receive the ooze and bark from the vat or handler next to be drawn. Experience perhaps may prove it to be most advantageous, particularly where the number of floating taps exceed six, to draw the oozes from one of the more backward floating taps instead of the best; in this case those floating taps only that follow the one drawn from must be considered as floating taps, and the others worked merely as floaters, by shifting the packs only. In this case, some labour in pumping would be saved, and the goods before they go into the fresh bark would be more tanned. The precise number of floating taps in a yard is not very material, but more than ten I conceive will seldom be found most advantageous, or less

than four. By disposing of the spenders, floating taps, vats, and handlers, as before described, barrows or long floats will seldom if ever be required to convey the bark or ooze from the vats or handlers to the floating taps, or from the floating taps to the spenders, as such vats or handlers may be drawn as lie next to the empty floating tap, and such floating tap is so disposed as to lie next to the spender that has received its bark, as may be seen by the following plans of two of my yards.

V	H	V	H	V
H	Empty. F.T.	S 3	F.T. 1	H
V	F.T. 5	S 2	F.T. 2	V
H	F.T. 4	S 1	F.T. 3	H
V	H	V	H	V

V	H	V	H	V
H	Empty. F.T.	S 2	F.T. 1	H
V	F.T. 3	S 1	F.T. 2	V
H	V	H	V	H

"I draw so many vats or handlers into each floating tap, as that when the goods and oozes are out of them the bark will about one half fill them: but as I generally put as much bark into a vat or handler as will be sufficient for this purpose, I do not often draw more than one vat or handler into one floating tap; one spender will contain two floating taps, from which, if the spenders are just half the number of the floating taps, which I consider as a proper proportion, the whole will both be worked round, or emptied in the same time, of course the floating tap that is to be cast will always continue to be near the spender, that is to receive the bark. Three or four times handling the goods after they have been regularly through the floating taps, besides when drawn for, I find sufficient. I seldom handle the floating taps but when the ooze is drawn, excepting the greenest pack, which I generally handle once in two or three days at least. The size of the vats, handlers, floating taps, and spenders, should be at

least equal in size to the handlers and vats. This general rule should be observed, not to draw so often, or more vats or handlers into a floating tap, as that the floating tap will not contain goods sufficient to spend the bark to your satisfaction. By the above process the oozes in the vats and handlers may always be kept about twice as strong as such oozes generally are, as so much more bark is used at one time with each pack of goods; and as each pack of goods may be drawn for while the ooze continues to be very strong, and of course will cause the drawn oozes to be very strong also, and yet by the process the bark goes through in the floating tap it will be, before thrown away, more completely spent than by any other process, from the water being made to go through the bark after it has been used in the vats or handlers so many more times than is done by the usual process before it comes to be used with the fresh bark, but above all from the green goods, after the oozes are drawn from it, spending the bark at the same time that it is spending, by the water being worked through it. The great advantages derived from this process are, the leather is made of a superior quality, being more solid and weighty than other leather, and is manufactured in less time, from the oozes in the vats and handlers containing double the quantity of the tanning quality than is contained in common oozes. The leather when carried will be much more water-proof than common leather, as it will take in more oil in the process of currying, provided the oozes in the handlers and vats are not kept stronger than oozes in general are. The leather will be much tougher than other leather, as by this process it is not put into old acid oozes while green, by which the texture of leather in general is much injured. The leather in manufacturing requires less labour than by any other process, as the labour of drawing oozes from the large quantity of bark used in each ooze is considerably abridged, and there is a saving of bark from its being more completely spent than by any other process, and as the quantity of bark permitted to stand without goods is much less than usual. Elm-bark, or weaker barks than oak, may by this process be used with particular advantages, since the bark is thereby so completely spent, and the labour so much abridged, and inasmuch as it enables the keeping of the oozes in the vats and handlers much stronger than by any other process; by which means the leather tanned by elm, or other weak barks, becomes as solid and weighty as common leather tanned by oak-bark."

TANORE, a sea-port of Hindoostan, on the coast of Malabar. Long. 75. 50. E. Lat. 10. 55. N.

TANTALLAN, a ruinous castle in Haddingtonshire, two miles E. of North Berwick. It is seated on a high rock, washed on three sides by the German Ocean. It was destroyed by the Covenanters in 1639.

TAOO, the most southern of the Friendly Islands, in the South Pacific Ocean, about ten leagues in circuit. It has several springs inland, and a small stream of good water, which reaches the sea when the springs are copious. The S.E. side rises with great inequalities immediately from the sea: so that the plains and meadows, of which there are some of great extent, lie all on the N.W. side; and are adorned with tufts of trees, intermixed with plantations, and intersected by paths leading to every part of the isle.

TAOUKAA, an island of the Pacific Ocean. Long. 145. 9. W. Lat. 14. 30. S.

TAPOOR, a town of the peninsula of Hindoostan, in the Mysore country, 15 miles S.S.W. of Darampoory, and 83 E.S.E. of Seringapatam.

TAPTY, a river of the Deccan of Hindoostan, which rises at Maltoy, 84 miles to the N.W. of Nagpore, and falls into the gulph of Cambay, about 20 miles below Surat.

TAR (*Engel.*). The following observations on the

pine-tree, and instructions relative to the manner of extracting the tar, and other refinous principles, from it, by M. Chaptal, appear in the *Journal des Arts et Manufactures*.

"There are few trees from the cultivation of which so many advantages are likely to result as that known by the name of the pine. It grows in dry and sandy grounds, in the midst of rocks; it crowns the summits of mountains with its agreeable verdure; it appropriates to itself soils which seem to be flunned by every other vegetable; it shoots up rapidly, requires scarcely any culture, and its uses and products are as multifarious as they are useful. The young plants, and the shoots lopped off from the trees of all ages, furnish a large supply of props for the vines. The wood of the pine affords very good fuel; its flame is brisk, and is attended with no other inconvenience than that of producing too much smoke. In all countries where the pine abounds, those pieces of its wood which contain the most resin are used instead of candles. The trunks of these trees are very proper for making planks: they are likewise employed for forming the bodies of pumps, for water-pipes, for beams, for the side planks of the decks of ships, for masts, &c. Its fruit is an alimentary substance of some consequence: many domestic animals are very fond of feeding upon it. Of the wood of the pine a species of charcoal is made, which is found to be very useful in metallurgical operations. These trees, when arrived at a certain size, afford an annual crop of twelve or fifteen pounds of resin. The trees which fall down with age, and those which are torn out of the ground, or broken off from their roots by the wind, as also the chips cut from the trunks when they are made into beams, the roots, &c. afford still a large quantity of tar. Proprietors of lands cannot therefore be too strongly urged to cultivate so valuable a tree.

"It would require nothing more than to scatter the fruit on such lands as are adapted to the nature of the tree, in order to insure its production. We must take care not to sow the pine-fruit in any other spots than such as are sheltered from the rays of the sun; for exposure to the sun proves destructive to the young plants. On this account the trees in the pine-forests are not filled in a regular manner, but only here and there, in order to insure an uninterrupted re-production."

The following are described to be the processes for extracting the refinous principles of the pine.

"All pines yield a refinous juice, but some in larger quantities than others. Those which contain the greatest quantity of resin are the Cyprus pine, the grey, the white, and the red pines. Soil, age, and size, have less influence upon the quantity of resin than the exposure of the plant, and the thickness of the bark: the pines exposed to the south, and to the rays of the sun, yield it in large quantities, whilst those whose bark is very thick yield less. Pines that grow too near to each other contain scarcely any resin; the interval between them ought to be twelve feet. The distance ought to be determined by the situation of the ground, and the position of the trees with respect to exposure to the sun. The young branches that shoot out from the stem should be carefully lopped off, by which means the tree grows to a greater height, and its trunk is more exposed to the action of the sun. Pines become more refinous in rich grounds, and in rainy seasons; but then the resin is not equally good. Young pines yield resin as well as the old ones, but the extraction of it enables them. The resin flows particularly during the summer season. Pines yield resin during the space of twenty or twenty-five years, and the extraction of it is generally commenced when they are twenty years old.

"The resinous juice flows out almost solely from the woody part of the tree, and runs down between the wood and the bark; the exterior layers yield it in greater quantity than the interior ones: only a few drops of good resin transude through the bark. The roots also yield a great quantity of juice. The knots contain more resin than the rest of the tree, the roots more than the branches, &c.; and the woody part in the vicinity of notches or wounds of the stem yields still more.

"When the pines have arrived at the age of about twenty years, they have acquired a circumference of three or four feet, and are sufficiently strong to admit of the extraction of a part of the resinous juice which circulates in the different parts of the tree. The resinous juice begins to flow in the spring, and it is during this season that incisions are begun to be made into the trees; in order to extract their produce. The juice continues to flow till the autumn. It generally begins to flow during the month of May, and ceases in September.

"In order to facilitate this flow, and determine it to a single point, a space, three inches in breadth, and six or eight in length, is pitched upon at the foot of the trunk, quite near to the earth, on the side exposed to the south, and in a part which appears to abound most in resin, and to be most disposed to let it run off: in this place the bark is peeled off, and a chip cut out of the wood, from whence the resin immediately begins to flow, and is seen transuding through the ligneous fibres, in small transparent drops; it runs down upon the bark of the lower part of the trunk, and is received into a hole made at the root of the tree, or into a vessel placed there for that purpose. When the flow of the resin begins to grow languid, the wound of the tree is enlarged at its upper part, and a new layer of the woody part is cut off. The wound must be renewed in this manner once every fortnight. Thus the wound is progressively enlarged, and at the end of the year it is a foot in length. The operation is discontinued as soon as the return of the frost hardens the resin, and stops its flow.

"In the following spring, the wound is again renewed, and at the end of five or six years it has acquired a height of five or six feet. When it has been enlarged to this height, a new cut is made at the foot of the trunk, almost close to the former, and is gradually carried higher up, parallel with the first. Whilst the resin is discharged by this second wound, the first heals up in such a manner, that the operation may be successively performed round the whole circumference of the tree, and repeated upon the places where the former wounds had been made. In renewing the wounds, we must use the precautions, to cut the chips very thin. For this purpose, the workman must be provided with very sharp instruments. Upon these precautions the health of the tree, and the quantity of resin produced, materially depends.

"In this manner a single person may manage from two thousand five hundred to two thousand eight hundred feet of trees. He pours into barrels the resin collected in the vessels placed for receiving it at the foot of the trees, and it is then fit to be introduced into commerce.

"The resin obtained in this manner in Guienne is known by the name of *galipot*; that of Provence, is termed *Perinne vierge*. In some parts of Provence, it is the practice to make a small hole at the bottom of that which receives the resin, and to separate the one from the other, by laying some twigs of rosemary over the orifice of the second. By this means the more fluid part of the resin filtrates into the smaller hole, and the resin obtained in this manner is termed *bijon*.

"A healthy tree yields annually from twelve to fifteen

pounds of resin. From the autumn to the spring, the small quantity of resin which flows from the tree hardens upon the surface, from which it is detached by means of iron scrapers fixed to the end of a pole. This resin is known at Bourdeaux by the name of *barras*.

"In order to form the yellow species of resin, known in commerce by the name of *brai sec*, and in Provence by that of *rafle*, they place upon a stove a copper boiler, the sides of which are bent into a lip, several inches in breadth, which is provided, at some point of its circumference, with a gutter, six or eight inches in length, under which is placed a trough hollowed into a piece of a pine-trunk, and filled with water.

"Both the liquid and the solid resin that has been obtained from the pine is put into the boiler. This substance is melted by a moderate heat: as soon as it is melted, a quantity of water is poured upon it, upon which the resin puffs up, and a part of it runs into the trough, which the workman continually pours back into the boiler, mixing the whole mass well together; and this manœuvre he continues till the whole of the water is dissipated. Towards the end of the operation, the melted resin becomes more tranquil, and acquires a yellow colour, in which state it is poured into another trough, where it filtrates through straw, and runs thence into moulds carefully formed in the sand. These moulds are round holes, the sides of which are rendered compact by being well beaten. The cakes of resin, which assume the shape of these moulds, weigh about two hundred pounds.

"If, instead of boiling the resin in an open vessel, we boil it in an alembic with water, it forms a species of oil of turpentine, termed *eau de rafle*, which, however, is greatly inferior to the genuine oil of turpentine.

"When the *galipot* is put into troughs composed of several planks fastened together, and exposed to the sun, the part which oozes through the crevices is known by the name of *San Turpentine* (*terébenthine de Joëil*). The term of *turpentine of the boiler* (*terébenthine de chaudrière*) is applied to the *galipot* that has been melted in one of these vessels. Even the most liquid *galipot* has been classed amongst the turpentine; but this species is the worst of all in its qualities, being inferior to that of the larch, and still more so to that of the fir.

"The living tree does not give out the whole of its resin by the wounds made in its trunk; but after it is dead, it is subjected to an operation, by which every particle is extracted; and it is this resinous substance, extracted from the dead tree, that is known by the name of *tar* (*goudron*).

"In order to extract the tar, all that is required is, to apply to those parts of the wood in which it is contained, a degree of heat sufficient to soften it, and make it run, without either setting fire to, or volatilizing it. This end is obtained by disposing the wood of the pine, previously cut into small pieces, in a heap, the sides of which are covered with earth, sods, or bricks. The whole mass is heated by means of fire applied to the upper part, and all the resin that runs down to the bottom is carried off from the heap by gutters. The kilns, in which this smothered combustion is performed, are of different forms and dimensions. But all the processes which have hitherto been made known have certain principles and operations in common with each other, of which we shall give some account. For extracting tar, the heart of the tree, the knots, and all the resinous veins, are chosen. The red parts of the wood are taken in preference to the rest. The bark and leaves are rejected, as the tar which they furnish is of an inferior quality. The tar is extracted also from the straw, which has served for filtrating the *brai sec*,

and from the chips that have been cut off from the trunk, in order to renew the wounds of the tree.

"In preparing tar, use is also made of trees exhausted of their resin, and particularly of those decayed by age, of those that have been broken off, or rooted up by the wind, and of the chips produced in various species of labour for which this wood is employed.

"The tar is the better in proportion as the trees from which it is extracted are more resinous, the more attention is paid to the separation of the bark and young shoots, and the more care is taken to prevent the combustion and volatilisation of the resin. In order to obtain good tar, it is also of essential advantage to employ wood that is neither too green nor too dry; that which is in a state of half-dryness is the best. The trees may be felled at any season of the year, but it is principally during the autumn that they are hewn down for this purpose, and the extraction of the tar is performed during the winter. It is further necessary that the wood should be cut into small pieces, as equal as possible in size, in order that the whole of the resin which it contains may be melted out at one and the same time.

"The management of the fire demands likewise great attention; for, 1st, too active a fire burns and dissipates the resin; 2dly, too violent a heat volatilises it, and produces tar of too dry a nature; and, 3dly, if the heat be too low, it extracts only a part of the resin, and leaves combined with the tar the watery particles which existed in the vegetable. A kiln, filled with very red and resinous wood, yields a quarter of its weight of tar; but this substance is generally obtained in the proportion of not more than 10 or 12 per cent. to the whole.

"Each species of kiln that has been employed for the extraction of tar appears to me to possess certain advantages and disadvantages of its own. In the mountains of Provence, the kilns are shaped like large pitchers, partly sunk into the ground; they are eighteen inches in diameter at the bottom, six feet in the belly, and two at the top. The wood is cut into pieces eighteen inches long, and an inch and a half wide; these are disposed in layers of the form of a gridiron, having the interstices filled up by other pieces placed perpendicularly.

"In the neighbourhood of Bourdeaux they dig a circular pit, thirty-six or forty feet in circumference, where a hearth is formed by bricks, placed upon the ground, and well cemented together. A small canal is made at the centre for receiving the tar, and conveying it into a receptacle, which is termed the *vault (cave)*, and in which a quantity of water is kept, in order to purify the tar. The vault is emptied as fast as it fills, and the tar put into the barrels, in which it is transported from place to place. The hearth of the kiln is covered with wood cut into small pieces, and piled into a heap eight or ten feet high. The sides of the heaps are covered with sods, and clods of earth; and the upper part of the cone, where they place a layer of wood drier than the rest, is set on fire. The heat communicates itself to the whole mass, and when the fire slackens, openings are made to increase the draught, by taking out some of the clods in different parts of the sides. When the operation is completed, all the draught-holes are closed, and the charcoal that has been formed is taken out of the kiln.

"The kilns used in *Louisiana* differ very little from those which we have just described; only the ground is not covered with bricks, but the tar is made to run merely by the slope of the earth, which is strongly beaten, and thence it is conveyed, by very long gutters, into reservoirs dug into the ground.

"The method used in the *Valais*, for extracting the tar,

is practised by all the peasants; and as it presents to us all the means proper to be employed for avoiding any waste of the tar, and obtaining it of good quality, we shall describe it with more minuteness than the others, introducing at the same time some variations, which, from our observations and experience, appear to us to be necessary.

"A kiln is constructed of a form similar to that of an egg placed upon one end. Its dimensions may be varied according to the quantity of wood we have to burn: it ought, in general, to be twice as high as it is broad. The largest may be ten feet in height, five in diameter, and two and a half at the superior orifice. In constructing this kiln, the first operation is the marking out of its dimensions at the base, after which the walls are raised of stone, to the height of two-thirds of the whole height of the kiln. The inside is paved with free-stone, well joined together; or, where this cannot be procured, with bricks laid upon the ground, and well cemented. The bottom is concave, and of the form of an egg-shell. Six inches from the bottom an orifice is made, eighteen lines in diameter, which terminates on the outside and at the bottom of the kiln, sloping down six or eight inches, and to this is adapted a large tube, resembling a musket-barrel, of a large bore, for the purpose of conveying the tar into the barrels destined to receive it.

"At the distance of twenty or twenty-five inches from the bottom of the kiln, bars of iron are placed, parallel with each other, for supporting the wood, and letting the tar, which is melted out by the heat, run down to the bottom. The construction of the kiln is completed with fragments of stone and earth, and at the top an open space is left, two feet and a half in diameter, for the convenience of filling the kiln. It is plastered over both within and without, and any cracks or flaws that may be formed are immediately stopped up. It is also of advantage to make some perforations in the walls of the kiln, which may be used, as occasion requires, for increasing the draught, and graduating the heat at pleasure.

"When a kiln of this kind has been constructed, a man goes into the inside, and disposes the wood, cut into billets two inches broad and eighteen long, upon the grate, and with these he fills up the whole cavity, taking great care to leave no empty spaces, and the top of the kiln he fills with dry chips. The orifice at the top is closed up with flat stones, or plates of iron or copper, so as to leave only one opening, or chimney, about four inches in diameter. The chips are then set on fire, and, when the fire is well kindled, this orifice is closed with a flat stone, which is covered over with earth. The melting now commences, and the tar runs down to the bottom, whence it is conveyed, by the tube inserted there, into the barrel. If the melting should cease, the orifice must be opened again, and even a draught of air let in through the holes in the sides of the kiln. If the smoke finds a vent through the sides of the building, the holes must be stopped with wet earth, sods, or other substances.

"When the kiln has cooled, it is opened, and the charcoal produced by the operation is taken out. The impurities collected at the bottom are then extracted, and the kiln is filled again.

"By a kiln of this construction, which is neither laborious, expensive, nor difficult, all unnecessary waste is avoided; and the tar must necessarily be more pure, as, on account of the solidity of the structure, the materials cannot be mixed with it, besides that the tar preserves all those principles which the other furnaces suffer to be dissipated.

"The expence which attends the construction of such a furnace cannot be placed in competition with the advantages

which it affords. Besides, it is built in the midst of the forests, and consequently surrounded with all the materials that are required. Moreover, it is a stable and permanent establishment, whilst the other one is obliged to demolish and rebuild for every single operation.

"Another refinous preparation, known in commerce by the name of *brai-gras*, is obtained by filling the kiln with alternate layers of green wood and resin or dry chips, making the uppermost layer of dry chips. The orifice by which the juice might run out is closed, and fire applied to the kiln. Great care is taken to prevent the production of flame, and to produce a dead heat, which is kept up for seven or eight days. By this means, the resin is melted, mixes with the sap, and runs to the bottom of the kiln. When the operation is finished, the orifice is unclosed, and the *brai-gras* runs out. Sometimes the tar which is obtained from very refinous wood is used instead of the *brai-gras*. By mixing *brai-fee* with very refinous wood, and not opening the vent-hole till the refinous substance has boiled, we obtain *brai-gras*.

"In order to make *lamp-black*, small pieces of the refuse of all these refinous substances are put into iron pots, and placed in the middle of a close chamber, entirely lined with canvas or paper; after which the pieces of resin are set on fire. A thick smoke is thus produced, which settles upon the walls, and forms the substance termed *lamp-black*. The places chosen for performing this operation ought always to be in a perfectly insulated situation."

TAR, or PAMLICO, a river of North Carolina, which flowing by Tarborough and Washington, enters Pamlico Sound, 40 miles S.E. of the latter town.

TARAGALLA, a town of the kingdom of Tafilet, with a castle, seated on the Dras, 27½ miles S.W. of Tafilet. Long. 6. 3. W. Lat. 27. 40. N.

TARARE, a town of France, in the department of Rhone and Loire, seated on the Tordive, at the foot of a mountain of the same name, 23 miles N.W. of Lyons. Long. 4. 43. E. Lat. 45. 52. N.

TARASCON, a town of France, in the department of the Mouths of the Rhone, with a castle, seated on the Rhone, opposite Beaucaire, with which it communicates by a bridge of boats. Its commerce consists in oil, brandy, starch, and stuffs that are much worn, one sort being of coarse silk, and the other of the same material and wool. It is 10 miles N. of Arles, and 37½ S. by E. of Paris. Long. 4. 30. E. Lat. 43. 48. N.

TARASCON, a town of France, in the department of Arriège, seated on the river Arriège, seven miles S.E. of Foix.

TARBES, a populous town of France, capital of the department of Upper Pyrenées, with a bishop's see, an ancient castle, and a college. It is seated on the Adour, 42 miles S.W. of Auch, and 112 S. by E. of Bourdeaux. Long. 0. 3. E. Lat. 43. 14. N.

TARBOROUGH, a town of the United States, in North Carolina, seated on the river Tar, 40 miles N.W. of Washington.

TARENTESIA, a province of Savoy, which is a barren country, full of dreadful mountains. Moutier is the capital.

TARGA, a town of the kingdom of Fez, on the Mediterranean, with a castle on a rock. It is seated in a plain surrounded by mountains and thick forests, which is considered as a desert; but there are good wells and fine pastures. Long. 4. 56. W. Lat. 35. 20. N.

TARGOROD, a town of Turkey in Europe, in Moldavia, 50 miles S.W. of Jassy. Long. 26. 29. E. Lat. 46. 49. N.

Vol. X.

TARIFFA, a town of Spain, in Andalusia, with a castle, seated on an eminence, on the straits of Gibraltar, 17 miles W.S.W. of Gibraltar. Long. 5. 40. W. Lat. 30. 0. N.

TARKU, the capital of Daghestan, seated on the West coast of the Caspian Sea, 52 miles S.E. of Terki, and 300 N.E. of Tauris. Long. 47. 5. E. Lat. 45. 50. N.

TARN, a department of France, including part of the late province of Languedoc. It takes its name from a river, which has its source in the department of Lozhere, and having watered Mithoud, Alby, Guillac, Montauban, and Moissac, falls into the Garonne. Castres is the capital.

TARNOWITZ, a town in Silesia, in the principality of Oppelen, near which is a silver mine, 38 miles S.E. of Oppelen. Long. 18. 15. E. Lat. 50. 20. N.

TARO, or BORGO-DI-VAL-DI-TARO, a town of Italy, in the duchy of Parma, capital of the territory of Val-di-Taro. It is seated on the river Taro, 25 miles S.W. of Parma. Long. 10. 9. E. Lat. 44. 36. N.

TARODANT, or TARUDANT, a town of Morocco, in the province of Sus, seated near the Atlantic, 120 miles S.S.W. of Morocco. Long. 8. 10. W. Lat. 30. 0. N.

TARRAGA, or TARREGA, a town of Spain, in Catalonia, seated on a hill, near the river Cervera, 15 miles E. by S. of Lerida, and 60 W. of Barcelona. Long. 1. 3. E. Lat. 41. 28. N.

TARRAGONA, a strong sea-port of Spain, in Catalonia, with a bishop's see, and a university. It was built by the Phœnicians, was very powerful in the time of the Romans, and has many noble monuments of antiquity. It is surrounded by walls built by the Moors, and is defended also by regular works. It is neither so large nor so populous as it was formerly; for though there is room for 2000 houses within the walls, there are not above 500, which are all built with large square stones. It carries on a great trade, and is seated on a hill on the Mediterranean, 35 miles N.E. of Tortosa, and 220 miles E. by N. of Madrid. Long. 1. 15. E. Lat. 41. 5. N.

TARREGA, a town of Spain, in Catalonia, situate on the Cervera, five miles W. of Cervera, and 30 N. of Terragona.

TARTAS, a town of France, in the department of Landes. The Midouze runs through it; and on one side of this river it rises in the form of an amphitheatre; the other is seated on a plain. It is 12 miles N.E. of Dax. Long. 0. 48. W. Lat. 43. 50. N.

TARVIS, or TARWIS, a town of Germany, in the duchy of Carinthia, 28 miles W.S.W. of Clagenfurt, and 46 N.N.W. of Trieste. Long. 13. 40. E. Lat. 46. 34. N.

TASSACORTA, a sea-port of the ile of Palma, one of the Canaries. It lies S.W. of St. Cruz, and being exposed to westerly winds is little frequented, but by boats. Long. 17. 58. W. Lat. 28. 38. N.

TASSASUDON, the capital of Bootan, a feudatory country of Thibet. It is 260 miles S. by W. of Lassa. Long. 89. 0. E. Lat. 27. 43. N.

TASSING, an island of Denmark, between Funen, Langeland, and Arroe. It is separated from the former by a strait, and contains a few towns and villages.

TASSO, an island of the Archipelago, near Romania, at the entrance of the gulf of Costefia. It is 35 miles in circumference; and was formerly famous for mines of gold, and quarries of beautiful marble. The capital, of the same name, has a good harbour, and several castles.

TASSO, a mountain of Italy, between Bergamo and Como, from which the illustrious family of the poet Tasso took their name, which was originally Torregiani. They were lords of

Bergamo, Milan, and other towns in Lombardy, but being expelled by the Visconti, they settled on the most advantageous spots of this mountain.

TATTA, or **SINDE**, a city of Hindoostan Proper, capital of the province of Sindy. It is seated on a branch of the river Sinde or Indus, called the Richtol River. In the 17th century, it was very extensive and populous, possessing manufactures of silk, wool, and cotton; and it was celebrated for its cabinet-ware. Little of these now remain, and the limits of the city are very circumscribed. On the shores of the Indus, above the Delta, considerable quantities of felpetre are made; and within the hilly tract, which commences within three miles on the N.W. of Tatta, are mines of iron and salt. The Indus, and its branches, admit of an uninterrupted navigation from Tatta to Moultan, Lahore, and Cashmere, for vessels of near 200 tons; and a very extensive trade was carried on between those places, in the town of Aurnagzebe; but, at present, very little of this trade remains, owing to a bad government in Sindy, and to a hostile disposition of the Seiks, the present possessors of Moultan and Lahore. Tatta is 741 miles N.W. of Bombay. Long. 67. 37. E. Lat. 24. 50. N.

TATTAH, a town on the common frontiers of Morocco, Drah, and Zanghaga, and in the route from Morocco and Sus to Tombuctou. It is 170 miles S.E. of Morocco.

TATTERSHALL, a town in Lincolnshire, with a market on Friday. It was formerly of note for its castle, and is seated on the Bane near its confluence with the Witham, 20 miles S.E. of Lincoln, and 127 north of London. Long. 0. 8. W. Lat. 53. 6. N.

TAVASTUS, a town of Sweden, in Finland, capital of the province of Tavasteland, seated on a river which falls into the lake Wana, 62 miles N.E. of Abo.

TAUCHEL, a town of Poland in Pomerellia, seated on the Vêrd, 30 miles N.W. of Culm, and 55 S.W. of Marienburg. Long. 18. 5. E. Lat. 53. 38. N.

TAVERNA, a town of Naples, in Calabria Ulteriore, seated on the Coraca, 20 miles E. of Naccaro, and 70 N.E. of Reggio. Long. 16. 44. E. Lat. 39. 11. N.

TAUMACO, a town of Turkey in Europe, in the province of Janna, 18 miles N.W. of Zeiton.

TAUMAGO, an island of the South Pacific Ocean, discovered by Quiros in 1606. Long. 176. 45. W. Lat. 13. 0. S.

TAUREAU, an ile of France, in the department of Finistère, lying at the mouth of the river Morlaix. On this island is a castle, which defends the port of Morlaix. Long. 3. 51. W. Lat. 48. 40. N.

TAUS, a town of Bohemia, in the circle of Pilsen, 26 miles S.S.W. of Pilsen, and 50 S. of Saatz. Long. 13. 45. E. Lat. 49. 25. N.

TAVY, a river in Devonshire, which rises in Dartmoor Forest, and watering Tavistock, enters the harbour of Hamozze, above Plymouth.

TAW, a river in Devonshire, which rises in the centre of the county, flows to Barnstaple, and joins the Towridge, at its mouth in the Bristol Channel.

TAWY, a river in Glamorganshire, which flows parallel to the Neath, and enters the Bristol Channel, at Swansea Bay.

TAY, Loch, a lake in Perthshire, through which flows the river Tay. It is 15 miles long, and in many parts above one broad. On the 12th of September, 1784, this lake was seen to ebb and flow several times in a quarter of an hour, when all at once the waters rushed from E. to W. in opposite currents, so as to form a ridge, leaving the channel dry to the distance of almost 100 yards from its usual boundary. When the opposing waves met, they burst with a clashing noise and

much foam: the waters then flowed out at least five yards beyond their ordinary limits. The flux and reflux continued gradually decreasing for two hours. A similar motion was observed several days, but in a less degree. The banks of this lake are finely wooded; and it has a small tufted island, on which are the ruins of a priory, built by Alexander I.

TEHANG-TCHA-FOU, a city of China, the capital of the S. part of the province of Hou-quang. It has one city of the second and eleven of the third class under its jurisdiction, and is seated on a large river, which has a communication with an extensive lake, called Tong-ting-hou, 62 1/2 miles S. by W. of Pekin. Long. 112. 25. E. Lat. 48. 11. N.

TCHANG-TCHEOU-FOU, a city of China, in the province of Fo-kien. It is very considerable, on account of its trade with Emou, Pong-hou, and Formosa. Long. 117. 35. E. Lat. 24. 32. N.

TCHANG-TE-FOU, one of the most northern cities of Honan, in China. It is remarkable for a fish, like a crocodile, the fat of which is of such a singular nature, that, when once kindled, it cannot be extinguished. Long. 111. 5. E. Lat. 29. 2. N.

TCHE-KIANG, a province of China, one of the most considerable in that empire, in extent, riches, and population. It is bounded on the N. and W. by Kiang-nan, on the S.W. by Kiang-si, on the S. by Fokien, and on the east by the ocean. In this province, whole plains may be seen covered with dwarf mulberry-trees, purposely checked in their growth; and prodigious quantities of silk-worms are bred here. Their silk stuffs, in which gold and silver are intermixed, are the most beautiful in China. The tallow tree grows here, and here are found the small gold fish, with which ponds are stocked.

TCHERNIGOF, a government of Russia, formerly a part of the Ukraine. Its capital, of the same name, is seated on the Dniepr.

TCHING-KIANG-FOU, a strong city of China, in the province of Kiang-nan, the key of the empire on the sea-coast. Its situation and trade, and the beauty of its walls, give it a pre-eminence over the other cities of the province; but its jurisdiction is confined to three cities of the third class. It is 25 miles E. by N. of Nan-king. Long. 118. 55. E. Lat. 32. 14. N.

TCHING-TCHEOU-FOU, a city of China, in the province of Hou-quang, seated near the canal through which all barks must pass in going from Sou-tcheou, to Kiang. Under it are five cities of the third class, in which a kind of plain earthen ware is prepared; highly valued by the Chinese, who prefer it to the most elegant porcelain. It is 630 miles S.S.W. of Pekin. Long. 109. 40. E. Lat. 28. 23. N.

TCHING-TING-FOU, a large city of China, in the province of Pe-tcheli. Its district contains five cities of the second and 27 of the third class; and it is 110 miles S. by W. of Pekin. Long. 114. 21. E. Lat. 38. 9. N.

TCHING-TOU-FOU, a city of China, the capital of Setcheuen, formerly the residence of the emperors, and one of the largest and most beautiful cities in the empire; but, in 1646, it was almost entirely destroyed, during the civil wars that preceded the last invasion of the Tartars. Its district contains six cities of the second and 15 of the third class. Long. 103. 44. E. Lat. 30. 40. N.

TCHI-TCHEOU-FOU, a city of China, in the province of Kiang-nan. It is seated on the river Kiang, and has under it six cities of the third class. Long. 117. 0. E. Lat. 30. 45. N.

TCHONG-KING-FOU, a city of China, one of the most commercial provinces of Setcheuen. It is seated on a

mountain, rising in the form of an amphitheatre, at the confluence of the Hin-cha-kiang and Yang-tse-kiang. Under it are three cities of the second and 11 of the third class. It is 637 miles S.W. of Pekin. Long. 106. 20. E. Lat. 29. 42. N.

TCITICAR, the most northern of the three departments of Eastern Chinese Tartary. Its capital, of the same name, is a modern city, built by the Emperor of China, to secure his frontiers against the incursions of the Russians. It is 450 miles N.E. of Pekin.

TEAKI, an island in the Mediterranean, 20 miles long and four broad. It is the ancient Ithaca, the kingdom of Ulysses. Long. 20. 54. E. Lat. 38. 47. N.

TEBESSA, a town of the kingdom of Tunis, with several remains of antiquity. It is seated at the foot of a mountain. Long. 8. 5. E. Lat. 34. 51. N.

TEBZA, a strong town of the kingdom of Morocco, capital of a province of the same name. It carries on a good trade, and is seated on the side of one of the mountains of Atlas. Long. 4. 55. W. Lat. 32. 50. N.

TECUT, a town of Morocco, in the province of Sus, seated on the river Sus, in a country abounding in dates and sugar-canes, four miles E. of Meffa. Long. 8. 25. E. Lat. 29. 10. N.

TECOANTEPECA, a considerable sea-port of New Spain, in the audience of Mexico and province of Guaxaca, seated on a bay of the same name, in the Pacific Ocean. It has a fortified abbey, and several handsome churches. Long. 95. 15. W. Lat. 15. 28. N.

TECORT, or **TICARTE**, a strong town of Barbary, capital of a kingdom of the same name, in Biledulgerid. It is seated on a mountain, 420 miles S.W. of Tripoli. Long. 7. 55. E. Lat. 29. 35. N.

TECRIT, a town of Turkey in Asia, in the government of Mosul, 130 miles S. of Mosul.

TECULET, a sea-port of the kingdom of Morocco, with an old castle, seated on the side of a mountain, at the mouth of a river of the same name. Long. 9. 5. W. Lat. 30. 45. N.

TEDELEZ, a strong town of Algiers, in a province of the same name, on the coast of the Mediterranean, with a castle, 50 miles N.E. of Algiers. Long. 3. 5. E. Lat. 47. 5. N.

TEDLA, or **TADILA**, a province of Morocco, which extends along the E. side of Mount Atlas, to the borders of Fez and Algiers.

TEDNEST, a large town of Morocco Proper, capital of the province of Hea. It was taken by the Portuguese in 1517, but they were driven away soon after. It is almost surrounded by a river. Long. 8. 35. W. Lat. 30. 30. N.

TEDSI, a commercial town of Morocco, in the province of Sus, seated in a plain abounding in corn, 20 miles S.E. of Taroiant.

TEFEZARA, a strong town of Algiers, in the province of Tremesen, 12 miles from the city of that name. There are a great many mines of iron in its territory.

TEGAZA, a town of Zahara, capital of a territory of that name, to the N.E. of Senegal. It is remarkable for mountains of salt. Long. 6. 30. W. Lat. 21. 40. N.

TEGLIO, a town of the county of the Grisons, capital of a government of the same name, in the Valteline. It is situate on the top of a mountain, nine miles from Tirano, and 12 from Sondrio.

TEIGN, a river in Devonshire, composed of two branches, which rise in the centre of the county, and uniting, enter the English Channel at Teignmouth.

TEIGNMOUTH, a sea-port in Devonshire, reckoned part of the port of Exeter. It sends a number of vessels to the

Newfoundland fishery, and has a considerable coasting trade, especially in carrying tobacco-pipe clay to Liverpool, whence are brought back coal, salt, earthen ware, &c. This is the place where the Danes first landed, and where they committed several outrages. It was almost entirely destroyed by the French, who landed and set fire to it in 1690. It is seated at the mouth of the Teign, 12 miles S. of Exeter, and 288 W. by S. of London. Long. 3. 29. W. Lat. 50. 32. N.

TEISENDORF, a town of Bavaria, in the archbishopric of Salzburg, 12 miles W.N.W. of Salzburg.

TEISSE, a river of Hungary, which rises in the Carpathian mountains, passes by Tockay and Segedin, and falls into the Danube, near Titul.

TELEGRAPH (*Encycl.*). The following is the specification of a patent granted to Mr. Boaz, manufacturer in Glasgow, for an improved method of communicating thoughts, information, and intelligence, to and from different places, at a distance from each other.

This invention consists in representing, at pleasure, by means of lights or luminous bodies, and also by means of opaque bodies, or by means of both combined, any letter of the alphabet, or any numerical figure, or any appearance or appearances which it may be desirable to exhibit as a sign, symbol, or signal, such as a circle, a semicircle, a segment of a circle, a square, one side of a square, or two or three sides of a square, a cross, a triangle, and other such like. This may be effected in various ways, and a smaller or larger number of lights or bodies; but perhaps, in regard to luminous bodies, and where correct circular appearances are not necessary to be represented, as simple a mode as any is the following. Take five-and-twenty lamps, dispose of them on a board or frame, so as to form a square; that is by fixing them in five rows, and five lamps in each row, at equal distances from each other. Affix a cover or blind (made of any opaque substance) before each lamp, of a round or rather an oval shape, having a handle or neck made so as to move backwards and forwards, or up and down, round a pin, nail, or pivot, fixed in the board or frame. Fix a small line (made of small twine or rope, according to the size of the machine, or of catgut, or a small metal chain, or any other pliable and connecting substance) around the handle or neck of each of these covers or blinds. Connect each of these lines with a pulley at one side of the board or frame. Raise this board or frame perpendicularly upon a square or oblong frame. Fix in this last square or oblong frame as many thin oblong pieces of wood or metal as there are lamps and lines attached to them; such thin or oblong pieces of wood or metal moving upon two pivots in the side of the square or oblong frame in which they are placed; and these thin or oblong pieces of wood or metal being placed in their frame in such manner as that their oblong direction may run from side to side of their frame upon the pivots fixed on which they move, and so that each of these thin oblong pieces may, when not pressed upon as after mentioned, remain perpendicular to its frame, and all of them, when at rest, may be parallel to each other. One of the lines affixed to the lamp-covers, or blinds, and connected with its pulley, being fixed to the upper edge of one of these thin oblong pieces of wood or metal, that is, the one extremity of such line being affixed to the handle or neck of the lamp-cover, or blind; and the other extremity being affixed to the upper edge of one of the thin oblong pieces of wood or metal; then, upon turning the thin or oblong pieces of wood or metal, so as to make it incline, the lamp-cover, or blind, will be drawn up; and by thus making as many of the thin oblong pieces of wood or metal incline as lamps are wanted to be uncovered, the letter of the alphabet or figure wished to be represented will be made to appear. In order the more easily to give the necessary in-

inclination or turning to these thin oblong pieces of wood or metal (which, seeing they act by their inclined positions, shall be called incliners), place a piece of wood or metal, nearly of the same size with the incliners, so as to be easily moved backwards and forwards (in grooves for example) in the frame in which the incliners are placed at right angles to them, and so that the upper edges of such pieces of wood or metal may come near to the under edges of the incliners. By fixing in such pieces of wood or metal pins or teeth (made of wood or metal), the piece of wood or metal having such pins or teeth being pushed in (and which shall be called the pusher, seeing it acts by being pushed in), the pins or teeth which are fixed in it striking against the under edge of the incliners, give them the inclined direction which is necessary to pull the lines affixed to the lamp-covers; and thus, by affixing in each of these pushers as many pins or teeth as lamps are meant to be uncovered, and so that these pins or teeth may strike against the under edge of the incliners (connected as they are by means of lines and pulleys with the covers, or blinds of the lamps meant to be uncovered), as many lamps will be uncovered as are necessary to represent the letter of the alphabet, or other sign or appearance meant to be exhibited; and, by having a double set of lamp-covers or blinds, and lines and pulleys, that is, by having lamp-covers or blinds behind as well as in front of the board or frame, and lines and pulleys, to connect them with the incliners in the same manner as the covers and blinds in front are connected with the incliners, the same lamps may be rendered visible behind, which are made visible in front, of the board or frame; or other lamps may be rendered visible behind, which are not made visible in front, of the board or frame. Upon drawing back the pusher the lamp-covers or blinds fall down by their own weight, and cover the lamps, and the incliners also resume their former position. For the greater facility and ease in producing the desired effect, there may be a pusher, having pins or teeth fixed therein as aforesaid for each letter of the alphabet, and for each numerical figure or other sign or appearance wished to be represented, and these pushers may further be marked on the outside of their frame, from whence they are pushed in, with the letter of the alphabet or numerical figure, or other sign or appearance, which, upon being pushed in, they represent by means of the lamps which they uncover; and a handle or knob may be fixed to the end of the pusher at which the letter or figure, or sign, is marked, for the greater convenience in pushing it in and pulling it back; and the letter, figure, or sign, may be marked upon the handle or knob. Cranks will do equally well as the thin oblong pieces of wood or metal, which form the incliners to which the lines are attached, which connect them with the lamp-covers or blinds; but thin oblong pieces of wood or metal are suggested as being more simple in their configuration and construction; and these thin oblong pieces of wood or metal, or cranks, acting as incliners, may be placed in a perpendicular as well as in a horizontal direction. Instead of lines and pulleys, the lamps too might be uncovered, and again covered, by means of wires and keys pressing upon them, as in a piano-forte: but lines and pulleys are suggested, as being more simple in their construction, and less liable to go out of repair. Various other modes of construction might also be easily adopted to produce the same effect. For instance, in place of having lamps with covers or blinds, and lines and pulleys, and incliners and pushers, the lamps might be made with an opaque and a shining side; and by means of a screw or levers, as well as by means of lines and pulleys, the lamps may be made to turn, so as to exhibit their opaque or their shining side that is to be made visible or invisible at pleasure. In order to comprehend this invention the more distinctly, a drawing is annexed (Plate 52, fig. 1) agreeably to the de-

scription first given, in which the machine is supposed to represent the letter H. The black square represents the board or frame behind which the lamps are placed, having a hole or aperture, through which each lamp shines; that is, having as many holes or apertures in it as there are lamps affixed behind it. The oval figures (a) represent the lamp-covers or blinds. The lines represent the lines attached to the lamp-covers and incliners. The five dots at the bottom of the black square represent the pulleys (which, though only five in appearance, represent twenty-five pulleys, the number of pulleys being equal to the number of lamps and incliners). The oblong figures, immediately below the black square, represent the incliners. The dark oblong figure at the bottom of the whole represents the pusher, with its pins or teeth, which, striking against each of the five outward incliners and three of the middle ones, is supposed to uncover each of the five outward lamps and three of the middle ones, at right angles to the former, and thereby represent the letter H; the small white circles representing the lamps supposed to be uncovered, and the oval figures raised upwards, shewing the lamp-covers or blinds of the lamps supposed to be uncovered, while the other oval figures represent the other lamp-covers or blinds supposed to shut the holes or apertures, and cover the lamps, by remaining down from their own weight. To prevent these lamp-covers from going wrong by rising too high upon being pulled up, small pins are placed (represented by small dots), to confine them to their position when raised; and other pins are placed (also represented by small dots) to prevent them from falling too low. In order to give additional power or glare to the light, the lamps may be made with reflectors, or a lens or refractor may be placed before each lamp. The frame attached to the black square in the annexed drawing (fig. 1), represents these lenses or refractors so placed in a frame as that a lens or refractor may come before each lamp, the frame in which they are placed being attached by hinges to the back-board or square in which the lamps are placed, so that the frame containing these lenses or refractors may be opened and shut at pleasure.

The annexed drawing (fig. 1) supposes the lamps to be first covered, and then such of them to be uncovered as represent the letter H, which is meant to be represented. But it is evident that the same effect might be produced by having all of the lamps uncovered in the first instance, and then covering all of them but those necessary to represent the appearance of the letter. Five-and-twenty lamps, with their covers or blinds, are also here represented; and the same number of lines and pulleys, and incliners, are also supposed to be represented. But nine lamps, with their covers or blinds, and as many lines and pulleys, and incliners (as represented in the annexed paper of drawings in the figure marked fig. 9, where the letter H is also supposed to be represented), would produce nearly the same effect; and a similar effect may be produced by a greater or a smaller number of lamps than five-and-twenty (as many pushers being always made use of as there are letters of the alphabet, or separate signs meant to be represented), so that it is not in the number of lamps made use of, or in the particular configuration or construction of the machine, that the invention consists, but it is in being able to represent, by means of lamps or luminous bodies (and also by means of opaque bodies, or by both combined, as after mentioned), any letter of the alphabet, and any numerical figure, or any appearance or appearances to be used as signs, signals, or symbols. For although lamps are supposed to be made use of, candles or phosphoric substances would produce a similar effect, though perhaps in an inferior degree: and one large lamp may be so placed or suspended as to produce a similar effect upon mirrors or reflectors, which might be covered or uncovered at pleasure.

as the lamps above mentioned. It is also obvious, that almost any form, figure, or shape, may be represented by the disposition or arrangement of lamps or luminous bodies, rendered visible or invisible at pleasure, in the manner that has been described. But it is further obvious, that by combining the representations of two or more letters or figures together, as many different varieties of signs or appearances may be produced as there are combinations of letters or figures, which may be represented separately. In order the more easily to comprehend the form of the lamp-covers or blinds above described, two drawings are given of the same in the annexed paper of drawings, viz. fig. 5, in which a front view of the lamp-cover is seen, with its line attached to it, and fig. 6, in which a side view is given of it. A drawing is also given in the annexed paper of drawings of the incliner, viz. fig. 7. The whole figure taken together represents the incliner as made of a thin piece of wood or metal. The black part of it represents the crank, which may accomplish its purpose equally well with the thin piece of wood or metal. A drawing is also given in the annexed paper of drawings, viz. fig. 8, of a smaller frame, in which the lamps may be first fixed, which smaller frame may be easily made to slide into a case, or in grooves behind or before, or may be otherwise attached to the larger frame in which the lamps are placed in the rows in which they are wanted. The drawing marked fig. 13, in the annexed paper of drawings, shews the manner in which the pushers may be placed in their frame, running in grooves or cases. The whole machine may, for the sake of preservation, be inclosed in a box or case, which box or case may, for the sake of convenience, run on castors; and the machine may be raised to the top of its box either by means of a pulley or by the hand, if of small dimensions. A representation of the machine and its box is given in fig. 10, of the annexed paper of drawings, shewing a front view of the ends of the pushers, and a lateral-view of the lamps. The description hitherto given relates to the modes by which any letter of the alphabet, and any numerical figure, or any appearance or appearances necessary to be used, as signs, signals, or symbols, may be effected by means of lamps or luminous bodies.

Mr. Boaz next shews how these effects may be produced by means of *opaque bodies*. For this last purpose, take a frame, having bars or divisions, running either in a perpendicular or horizontal direction in the frame. For instance, take a square or oblong frame, having four rims or sides; place horizontally in it five bars or divisions; place at equal distances, on each of these bars, five boards, or thin pieces of wood or metal, of any shape or size, thinner than the bar to which they are to be attached, leaving a space between each board or piece of metal. When the boards or pieces of metal are parallel to each other, and present their edge or thin side to the front of the frame or bars, they are not seen at a distance; the whole exhibiting at a distance only the appearance of the bars. The boards may be so constructed as always to remain of themselves in this position; that is to say, let the boards be fixed, by means of pivots or hinges, to the upper side of the front of the bars; the pivots or hinges being placed on the board, not at its middle, but near one edge of it, so that the greater weight of that part of the board, the edge of which is furthest from the hinges or pivots, would bring that part of it downwards, and make the board hang perpendicularly, were it not for the bar below, to which it is attached; which bar below being made broader, or as broad as the breadth of that part of the board, the edge of which is furthest removed from the hinges or pivots, catches such part of the board, and, keeping it in an horizontal position, prevents it from falling, as it otherwise would do, to its perpendicular. In order to raise the board, fix to it, in that part of it, the edge of which is least removed

from the hinges or pivots, a line (made of twine or rope, or other pliable substance, according to the size of the machine), and connecting it with a pulley at the under part of the frame, affix the extremity of such line to the under edge of the incliner as in the preceding part of the description. The pusher, upon being pushed in, will produce its effect as in the former part of the description, by bringing the incliner to its inclined position, which will raise the board with which it is connected by the line and pulley, as above mentioned; and here, as in the former case, there being an equal number of boards and lines, and pulleys and incliners, and as many pushers as there are letters, numerical figures, or signs, meant to be represented, the letter, numerical figure, or sign, wished to be represented, may be exhibited at pleasure by the opaque body in the same manner as by the luminous body, by pushing in the pusher, and, upon pulling back the pusher, the boards will fall down by their own weight, and the incliners will then also resume their former positions. The same effect may be produced by making each board turn horizontally on a pivot, in the horizontal bars; and in order to turn each board so as to make it present its flat surface or its thin edge at pleasure, to the front of the frame or bars, let a small wheel be fixed to the pivot; the edges of which wheel may be grooved, the better to keep the lines to be attached to them in their proper position. Affix at opposite sides of the groove in this wheel the ends of two lines, so that the one line upon being pulled will turn the wheel one way, and the other line being pulled will make it turn the other way. Pass these lines, the ends of which are so fixed in the groove of the wheel, through two pulleys, placed in such manner on the bars as that the lines may be pulled opposite ways. The lines dropping to the bottom of the frame or bars will then be passed through two corresponding pulleys at the bottom thereof; and the end of the one line being fixed to the upper edge of the incliner, and the end of the other line being fixed to the under edge of the incliner, the incliner, upon receiving its inclined position, by means of the pusher, will turn the board so that its flat surface or its thin edge may be presented to the front of the frame or bars at pleasure. And in this construction there being no other means to make the boards resume their first position, the under edge of the incliner should, in this mode of construction, be made heavier than the upper, so that the pusher being pulled back, the weight of the under edge of the incliner may bring it to its perpendicular position, and thus turn the board to its original position. For the sake of strengthening the frame in which the boards are placed, perpendicular as well as horizontal bars may be used and fixed together as they pass each other at right angles. And it may be easily perceived, without any particular description, how the boards may be moved by means of pivots placed in the perpendicular bars, or be made to move round the perpendicular bars connected with the incliners by means of lines and pulleys, in the manner which has been mentioned. What has been hitherto stated regards the modes by which any letter of the alphabet, or any numerical figure, or any appearance or appearances necessary to be used as signs, signals, or symbols, may be represented by means of lamps or luminous bodies, or by means of opaque bodies separately.

Lastly, we are shewn how these effects may be produced by means of *luminous bodies and opaque bodies combined*. For this purpose, apertures must be made in the boards above described, and lamps must be placed in the apertures of the boards, in such manner as that the lamps remaining stationary do not interfere with the movements of the boards. This may be effected by means of a small seat or rest attached to the bar to which the boards are fixed, as represented in fig. 12. The flame or light of the lamp will then be seen through the

aperture of the board when its flat surface is presented to the front of the frame or bars; and, in order to prevent the flame or light from being seen when the thin edge of the board is presented to the front of the frame or bars, let a thin piece of wood or metal, rather larger than the aperture in the board (as represented in fig. 11 of the annexed paper of drawings), be fixed at right angles to the board below the aperture, so that when the thin edge of the board is presented to the front the thin piece of wood or metal is raised up, and hides the lamp; and thus the lamps are visible through the apertures of the boards only when the flat surfaces of the boards are presented to the front of the frame or bars.

In order that the nature of this invention may be the better understood, a drawing is given in fig. 2, of the machine, as shewing its combined effects by means of opaque and luminous bodies. The drawing, as in the first part of the description, represents the machine as forming the letter H. The lines in this drawing, running perpendicularly and horizontally, exhibit the frame and bars. The black squares represent the boards, with their flat surfaces in front of the frame or bars, forming the letter H. The small white oblong spaces in these black squares represent the apertures in them, through which the light or flame of the lamps is seen. The small white lines appearing under these white oblong spaces, represent the thin edges of the thin pieces of wood or metal which cover the lamps when the thin edge of the boards is in front of the frame or bars. The black oblong figures represent the boards, having their thin edges in front of the frame or bars. The small elevations arising from these black oblong figures, shew the thin pieces of wood or metal which hide the flame or light of the lamps when the thin edge of the boards is in front of the frame or bars. The lines represent the lines fixed to the boards and incliners, connected by their pulleys. The dots at the bottom of the bars represent these pulleys. The figures (b) immediately under these dots represent incliners; and the black oblong figure at the bottom of the whole represents the pulser, with its teeth or pins, which producing its effect upon the incliners connected with their lines and pulleys with the boards, exhibits, by means of the boards or lamps, or both combined, the appearance of the letter H. Two drawings are also given, in the annexed paper of drawings, of a board, with its lamp turning horizontally upon a pivot, viz. fig. 3 and fig. 4. Fig. 3, represents a front view of the board and lamp, so that when the flat surface of the board is in front, the flame or light of the lamp is visible. Fig. 4, represents a side or lateral view of the board and lamp, so that when the thin edge of the board is in front, the light or flame of the lamp is invisible; and the lamp, according to this mode of construction, is fixed in the board, and turns with it. These flame figures, viz. figs. 3 and 4, also shew that lamps, with an opaque and a shining side, mentioned in a previous part of this description, may be made to turn by means of lines and pulleys, so as to exhibit their opaque or their shining side, that is, to be made visible and invisible at pleasure.

TELEMONA, a town of Tuscany, with a small harbour, and a strong fort. It is seated at the mouth of the Ofra, at the extremity of a point of a craggy rock, 10 miles from Orbitello. Long. 11. 11. E. Lat. 42. 28. N.

TELESCOPE (*Encycl.*). Mr. Dudley Adams, of Fleet-street, London, obtained a patent, in 1800, for a method of rendering telescopes and other optical glasses more portable.

In order to produce the peculiar degree of portability that has been effected, it was found expedient to adopt a new species of spring, that would, from its principle and construction, occupy the least possible space, and at the same time render the telescopes, to which it was applied, strong and steady when drawn out. This was the more necessary, as, ac-

cording to the new construction, the number of joints or tubes would be augmented considerably beyond the number hitherto employed. It was necessary also to devise some means by which the several glasses, applied to the eye-ends of telescopes, should acquire their true positions and distances when the joints or tubes were drawn out, after having been compressed into a small space, and the frame be retained in every situation wherein they might be placed by the observer during the time the telescope was being adjusted for use.

The following are the references to Plate 51. in which this invention is delineated.

Fig. 1, A, represents the form and construction of the spring. It consists of a thin piece of metal tube, turned in a lathe strictly true and cylindrical, and to fit the inside of the drawer or tube in which it is intended to slide. It is then slit down, from the open end, in two, three, four, or more places, to give it elasticity: this latter circumstance is not however absolutely necessary. The dotted lines at B represent the underside of the spring perforated, in which a screw is cut, of the size to screw on the end of the tube at C, fig. 2, and made fast there.

This inverted cylindrical spring, simple as it is in its construction, affords all the advantages necessary; it occupies less space than the springs hitherto adopted, and by that means admits of more drawers, tubes, or joints, being added than could, according to the former mode, be used or applied within the same space; by its cylindrical form, that strength and steadiness is obtained, which is so essential to the constructing a good telescope with drawers. It preserves the axis therefore as one uninterrupted line, in every position of the drawers, whether they are drawn out to the fullest extent, or returned in part into their several tubes. It is also of superior advantage, and the best adapted to the construction of plated telescopes, whether plated in gold or silver, or whether the drawers or tubes are lacquered, painted, or japanned, &c. as by its action and principle all pressure and friction on their polished, plated, or painted surfaces, may be avoided, and the possibility of those surfaces being rubbed, scratched, or worn, thereby totally prevented. Fig. 3, represents the tube C with the spring thereon at D. E, represents the tube in which it slides.

The second part of the invention is effected in the following manner. Fig. 4, C, represents the tube called the eye-tube, or that which is placed next the eye when the telescope is being used; a, the spring thereon. H and I, two tubes, that are made to slide into the interior of the tube C. F, a broad circular plate, shoulder, or flaunch. To explain the action and principle of the tubes H and I more fully, another figure, viz. fig. 5, has been given. C, represents the tube to be placed next the eye; a, the new-invented cylindrical spring thereon. D, the next tube, in which the said spring slides, provided also with its spring a, which slides in the third tube E. The first and second glasses are contained in the eye-tube C, and are represented by dotted lines G, G. The third and fourth glasses are inserted in the tube H at b c. These tubes, as have been mentioned, are made to slide into the interior of the eye-tube C, when the instrument is closed, but when the tubes are drawn out, they will have nearly the effect represented. For when the tubes C, D, and E, are drawn out, the flaunch F will strike against the end of the tube D, and by that means the two tubes H and I will also be drawn out, and will retain their present position until all the tubes are nearly closed. For it is not until the flaunch F reaches one of the last tubes, that the two tubes H and I will be forced into the tube C. The glasses therefore contained in them will acquire and retain their true distances while being used.

The advantages of this part of the invention need not be

M. Lester's New Invented Implement for Tillage.

enlarged upon, as will appear obvious to every one who considers the subject, that by means thereof, together with the new spring, the utmost portability in telescopes may be effected, and their length in consequence be considerably extended beyond what is usually adopted if necessary.

The same degree of portability, and any degree of length, may be obtained by the addition of three, four, or more tubes, in the place of the two already mentioned; and the tube containing the first and second glasses might be constructed after the same manner, viz. to consist of two, three, or more tubes, and made to slide one within the other; and in some instances, where the telescopes are very long, one tube might be made perhaps to answer the purpose. These and other similar modes might hereafter be adopted without altering the principle of this invention, which establishes a rule whereby the several glasses at the eye-ends of telescopes may, from the manner in which they are placed, be brought near to each other, and afterwards placed at their proper distances, without inconvenience or prejudice to the telescope. Of the many modes that have been tried, the particular one adopted has been preferred; it is the most simple, and it moreover possesses all the advantages required.

TELGEIN, or **TELGA**, a trading town of Sweden, in Sudermania, seated on the S. bank of the lake Macler, 12 miles S.W. of Stockholm. Long. 17. 24. E. Lat. 59. 28. N.

TELLES, a sea-port of the kingdom of Fez, 120 miles E.S.E. of Tangier.

TELLICHERRY, a sea-port of Hindoostan, on the coast of Malabar, where there is an English factory. It is 30 miles N.N.W. of Calicut. Long. 75. 50. E. Lat. 11. 48. N.

TELTSCH, a town of Germany, in Moravia, seated on the frontiers of Bohemia, at the source of the river Teya, 36 miles W.N.W. of Znaim. Long. 16. 0. E. Lat. 49. 0. N.

TEMENDEFUST, a town of the kingdom of Algiers, seated on the Mediterranean, 10 miles E. of Algiers.

TEMESWAR, a town of Upper Hungary, capital of a territory called the bannat of Temeswar. It formerly passed for impregnable; but it was taken by Prince Eugene, in a dry season, in 1716. It is seated in a morass, 60 miles N.E. of Belgrade, and 150 S.E. of Buda. Long. 22. 20. E. Lat. 45. 37. N.

TEMPLIN, a town of Upper Saxony, in the Ucker marche of Brandenburg, which has a great trade in timber. It is 15 miles S.W. of Prenzlau, and 34 N. of Berlin. Long. 13. 25. E. Lat. 53. 5. N.

TEMROCK, a sea-port of Cuban, seated on the sea of Afrop, 20 miles E. of the straits of Caffa. Long. 37. 20. E. Lat. 45. 27. N.

TENASERIM, a town of Siam, capital of a province. It is situate on a river, of the same name, which falls into the bay of Bengal. Long. 98. 8. W. Lat. 12. 12. N.

TENBURY, a town in Worcestershire, with a market on Tuesday, seated on the Teme, 15 miles W. by N. of Worcester, and 130 W.N.W. of London. Long. 2. 13. W. Lat. 52. 16. N.

TENBY, a sea-port in Pembrokeshire, with a market on Wednesday and Saturday. Its castle was demolished in the civil wars, and its trade is inconsiderable. It is 10 miles E. of Pembroke, and 233 W. of London. Long. 5. 5. W. Lat. 51. 42. N.

TENCH'S ISLAND, an island in the Pacific Ocean, two miles in circumference, discovered by Lieutenant Ball in 1790. It is low, but entirely covered with trees, many of which are the cocoa nut. The natives observed in the canoes, that ventured to come somewhat near the ship, were remarkably stout men, quite naked, and of a copper colour; their hair resembling

that of the New Hollanders, and some of their beards reaching as low as the navel, with an appearance of much art having been used to form them into long ringlets. Two or three of the men had something like a bead or bone suspended to a string, which was fastened round the neck. The largest of their canoes appeared to be about 28 feet long, and made out of a large tree, with a long outrigger. Long. 151. 31. E. Lat. 1. 30. S.

TENDA, a town of Piedmont, capital of a county of the same name. It is seated at the foot of a mountain, on the river Boga, 52 miles S. of Turin. Long. 7. 45. E. Lat. 44. 10. N.

TENEDOS, a celebrated island in the Archipelago, on the coast of Natolia, and 10 miles S.W. of the straits of Gallipoli. It is 11 miles long, and seven broad, inhabited almost wholly by Greeks, and its muscadine wine is the best in all the Levant. On the E. side is a large town, seated at the foot of a mountain, with a fine harbour, commanded by a castle. On the 5th of June, 1794, after some severe shocks of an earthquake, a small volcanic island was discovered to have emerged from the sea, between this town and the Asiatic shore.

TENEN, or **KNIN**, a town of Venetian Dalmatia, on the borders of Bosnia, with a bishop's see. It has been several times taken and retaken by the Turks and Venetians. It is 48 miles S. of Bihaç. Long. 16. 30. E. Lat. 44. 5. N.

TENERIFF, a town of Terra Firma, in the government of St. Martha, seated on the Rio de la Madalena, 100 miles S. by W. of St. Martha. Long. 74. 15. W. Lat. 9. 47. N.

TENEZ, a town of Algiers, in the province of Tremesen, capital of a district of the same name, with a strong fort. It is seated on the side of a mountain, four miles from the sea. Long. 1. 0. E. Lat. 39. 20. N.

TEN-NGAN-FOU, a populous and commercial city of China, in the province of Hou-quang, with six cities dependent on it. It is 200 miles W. by S. of Nan-king. Long. 112. 21. E. Lat. 31. 0. N.

TENG-FONG-HIEN, a city of China, under the jurisdiction of Ho-nan-fou, in the province of Ho-nan. It is famous on account of the tower, erected for an observatory by the celebrated astronomer Tcheou-kong.

TENNASSEE, one of the United States of America, situate between the parallels of 35 and 36½ degrees of latitude; bounded on the S. by South Carolina and Georgia, on the W. by the Mississippi, on the N. by Kentucky and Virginia, and on the E. by the Iron and Bald mountains, which separate it from North Carolina, of which state it was lately the western part. It is upward of 400 miles in length, and 104 in breadth; and is divided into three districts, and 11 counties. The districts are Washington, Mero, and Hamilton; and the counties are Blount, Sullivan, Davidson, Greene, Hawkins, Jefferson, Knox, Sumner, Sevier, Tennessee, and Washington. Its principal rivers are the Mississippi, Tennessee, Cumberland, Holston, Clinch, and Duck; and it is abundantly watered by other rivers and creeks. The Cumberland mountains, a ridge near 30 miles broad, cut this state into the eastern and western divisions, and the latter is the largest part. The climate, soil, and produce of Tennessee are much the same as the adjoining state of Kentucky. It was admitted a member of the United States in 1796; and on taking the census in 1795, there appeared to be 77,262 inhabitants, of whom 66,649 were free persons. Knoxville is the capital.

TENNESSEE, a river of North America, formerly called the Cherokee River. It rises in the Iron mountains, on the confines of Georgia; and, after traversing the borders of the Cherokee country northward, is joined by the Holston branch, when it is called the Tennessee; thence it runs S.W. on the

E. side of the Cumberland mountains, into Georgia, where it makes a circuit to the W. called the Great Bend; it then re-enters the state of Tennessee, which it passes quite through, directly N. into that of Kentucky: here it soon turns to the N.W. and then falls into the Ohio. 60 miles above the confluence of that river, with the Mississippi. The Tennessee is 600 yards broad at its mouth, and thence navigable by vessels of great burthen for 260 miles, to the Muscle Shoals, in the Great Bend: here the river widens to between two and three miles, for nearly 30 miles; and these shoals can only be passed in small boats: hence it may be navigated, by boats of 40 tons burthen, at least 600 miles further, some trifling falls excepted.

TENNESTADT, a town of Upper Saxony, in Thuringia, near the rivers Seltenlein and Schambach, five miles from Erfurt.

TENNIS, a town of Egypt, situate on an island in a lake of the same name, 28 miles S.E. of Damietta. Long. 32. 15. E. Lat. 31. 2. N.

TEN-TCHEOU-FOU, a city of China, in the province of Chang-tong, with a good port, and eight cities in its jurisdiction. It is seated on the N. side of a peninsula of the Yellow Sea, 200 miles S.E. of Peking. Long. 115. 50. E. Lat. 35. 20. N.

TENTERDEN, a corporate town in Kent, governed by a mayor, with a market on Friday. The steeple of the church is very lofty, and at the time of the Spanish invasion, in 1582, was made use of as a beacon. It is 24 miles S.W. of Canterbury, and 56 E. by S. of London. Long. 0. 55. E. Lat. 51. 12. N.

TENTUGAL, a town of Portugal, in Beira, eight miles W.N.W. of Coimbra. Long. 8. 20. W. Lat. 40. 17. N.

TEPIC, a town of New Spain, in the audience of Guadalupe, 500 miles N.W. of the city of Mexico.

TEPLITZ, a town of Bohemia, in the circle of Leitmeritz, celebrated for its warm baths, 14 miles W.N.W. of Leitmeritz.

TERAMO, a town of Naples, in Abruzzo Ulteriore, with a bishop's see, seated at the confluence of the Violata and Tordino, 10 miles N.W. of Atri, and 25 N.E. of Aquileia. Long. 13. 39. E. Lat. 42. 37. N.

TERASSO, a decayed town of Turkey in Europe, in Carmania, with an archbishop's see. It was formerly called Tarsus, was the capital of Cilicia, and is the birth-place of St. Paul. It is seated on the Mediterranean. Long. 35. 55. E. Lat. 37. 10. N.

TERASSON, a town of France, in the department of Dordogne, seated on the Vézère, 20 miles N. of Sarlat. Long. 3. 10. E. Lat. 45. 5. N.

TERCHIZ, or TERHIZ, a town of Persia, in the province of Chorasan, 120 miles W.N.W. of Herat. Long. 57. 25. E. Lat. 35. 5. N.

TERGOVISTO, or TARYIS, a commercial town, capital of Walachia. It has a fine place, belonging to the wayode, and is seated on the Jalonitz, 30 miles N.W. of Bucharest. Long. 25. 26. E. Lat. 45. 45. N.

TERKI, a town of Circassia, where a prince resides dependent on the Russians, this being their frontier town against Persia. It is seated on a river of the same name, in a marshy place, one mile from the Caspian Sea, and 125 E. of Tefflis. Long. 47. 50. E. Lat. 43. 22. N.

TERMINI, a town on the N. coast of Sicily, in Val di Demona, with a strong castle. It is famous for its mineral waters, and has a fine aqueduct. It is seated at the mouth of a river of the same name, in a territory abounding in corn, oil, and wine, 20 miles S.E. of Palermo. Long. 13. 44. E. Lat. 38. 5. N.

TERMOLI, or TERMINI, a town of Naples, in Capitanata,

with a bishop's see, seated near the sea, 32 miles S.E. of Lanciano, and 70 N.E. of Naples. Long. 15. 20. E. Lat. 41. 50. N.

TERNATE, an island of the Indian Ocean, the principal of the Moluccas. It is mountainous, and has a great number of woods, which furnish much game; but it produces a great quantity of cloves, and other fruits proper to the climate. It lies a little to the W. of Gilolo, and 100 miles E. of Celebes. Long. 129. 0. E. Lat. 1. 0. N.

TERNAVASSO, a town of Piedmont, six miles N.E. of Carmagnola, and eight S. of Chieri.

TERNEUSE, a strong town and fort of Dutch Flanders, on the W. branch of the Scheldt, called the Hondt. It is eight miles N. of Sas-van-Ghent, and 25 W.N.W. of Antwerp. It was taken by the French in 1794. Long. 3. 45. E. Lat. 51. 50. N.

TERNOVA, an ancient town of Turkey in Europe, in Bulgaria, with an archbishop's see. It was formerly the seat of the princes of Bulgaria, and is seated on a mountain, near the Janera, 88 miles N.W. of Adrianople, and 97 N.E. of Sophia. Long. 26. 2. E. Lat. 43. 1. N.

TERRACINA, a decayed town of Italy, in Campagna di Roma, with a bishop's see. It was called Anxur, was the capital of the warlike Volci, and the principal church was originally a temple of Jupiter. It is seated among orange and citron groves, near the sea, on the side of a mountain, 46 miles S.E. of Rome. Long. 13. 15. E. Lat. 41. 24. N.

TERRANOVA, a town of Sicily, in Val di Noto. It belongs to the Duke of Monte-Leone, and is seated near the mouth of a river of the same name, 20 miles E.S.E. of Aliecia. Long. 14. 10. E. Lat. 37. 9. N.

TERRA NUOVA, an ancient sea-port, on the N.E. coast of Sardinia, seated at the bottom of a gulf of the same name, 65 miles N.N.E. of Sassari. Long. 9. 35. E. Lat. 41. 3. N.

TERRE DE SALINELLE. The following observations concerning an earth so named, and which contains magnesia, are given by Berard, ex-professor of chemistry at the Ecole de Médecine, at Montpellier, in the Annales de Chimie.

"The manufacture of artificial alum," says he, "in the large way, and by processes both simple and easily to put in practice, has for a long time been the object of my labours. For this purpose, I was obliged to look out for the argilla that abounded most in the alumine, and that were the nearest to the place in which the manufacture was carried on.

"The earth of Salinelle, near Sommières, in the département of Le Gard, is reckoned one of the best kinds of argill for taking stains out of cloth; it is even generally known in the country by the name of *Pierre de tache* (sellers'-earth); and this property induced me to examine it. I procured a certain quantity of it, upon which I immediately operated with a view to obtain alum. But what was my surprise, when in the first experiment, which was to impregnate it with sulphuric acid (at 40 degrees of Baume's hydrometer), I perceived, 24 hours afterwards, a very considerable efflorescence, and the small mass of the earth, that had been impregnated with the acid the day before, changed into a saline-earthly substance, full of small shining crystals. I soon discovered, both by the taste and the manner in which this first combination took place, that the salt that had been formed was not alum. Some experiments which I made led me to imagine that it was sulphate of magnesia. In order to ascertain this point, I immediately went to Salinelle, to examine the place from whence this earth was procured, and I afterwards subjected it to the experiments of which I am shortly to give an account.

"The village of Salinelle is situated at the distance of about

two kilometres from Sommières, upon the road from this town to Quidac, and almost close to the banks of the river called Le Vidourle. The whole village is built upon a soil under which this earth is generally found. A single individual at present employs himself in digging it, and furnishes it, as it is called for, to some merchants, factors, and druggists. The first of these conceal the use which their employers make of it, and it is suspected at Salinelle that some soap-manufacturers make use of it in the preparation of this compound. The druggists prepare from it the substance which is known in pharmacy by the name of *Terra Saginata*.

"The stratum of the terre de Salinelle is at the depth of about two metres and five decimetres from the surface of the ground: first we find six or seven decimetres of good vegetable earth; afterwards several close strata of white chalk; the whole about one metre five decimetres in thickness. In the middle of this thickness appears a vein of blackish semi-transparent flint, a decimetre and five centimetres thick. We afterwards meet with a small layer of terre de Salinelle, mixed with fragments of the superior strata, and at last we find the vein of good terre de Salinelle, two decimetres and five centimetres in thickness, under which we immediately meet again with a mixed stratum, and afterwards those of white chalk that had before been found above. The disposition of all these strata may easily be observed in digging wells, vaults, or foundations; in these cases the earth of which we are speaking is carefully collected.

"The terre de Salinelle, when dug out of its bed, is still soft, very moist, lamellated, and slightly transparent when divided into thin plates. It has a chocolate colour, nearly resembling that of the small roots of some trees that grow upon the same soil. This earth when dried in the air acquires a less deep colour; it becomes of a light grey, slightly tinged with red; and by being dried in this manner it loses about thirty parts in a hundred of its weight. It then acquires hardness, produces a strong sensation of atrangency when applied to the tongue: it does not lose its cohesion in the water, like the argills, but when moistened and kneaded it forms a paste pretty soft and fine to the touch; placed upon red-hot coals, it decrepitates and flies into splinters. In order to enable it to bear the action of the fire, I was obliged to pound it into a coarse powder, and form it into balls, by moistening it with a little water; I then heated it to whiteness, without the smallest decrepitation taking place. By this operation 100 parts that had already been dried in the air were reduced to 68; the earth became very light, and of a very beautiful white colour, much resembling that of the magnesia prepared in the laboratories. If we calcine it in powder, the evaporation of the water produces a bubbling even in this powder, which ceases as soon as the whole of the water is dissipated.

"Acids poured upon this earth, after it has been dried in the air, produce no sensible effervescence; they combine with a portion of its constituent principles, and the products are magnesian salts.

1. "Sulphuric acid, concentrated to 66°, becomes violently heated as soon as we mix it with this earth. When reduced to 40°, it does not become heated immediately; but if we form a paste with this acid and the same earth in powder, a disengagement of heat takes place at the end of half an hour, the paste puffs up, increases greatly in its volume, and is at last reduced to a very light pulverulent substance, in which we may observe an infinite number of small crystals. The salt thus formed has all the characters of true sulphate of magnesia. A certain quantity of earth is left behind, which has resisted the action of the acid; this appeared to me to be flint.

2. "The nitric and muriatic acids, poured upon this earth in sufficient quantity to form a paste, produce no disengage-

ment of heat nor efflorescence; the paste on the contrary attracts moisture from the atmosphere, but nitrates and muriates of magnesia are formed. All these salts yield, by means of the alkalies, an abundant precipitate of very white, light, and pure magnesia.

"I boiled at several times, and during several hours, the terre de Salinelle, dried in the air and reduced to powder, in the three above-mentioned acids, in the proportion of 100 parts of the earth to 600 of acid. I then lixiviated it with a large quantity of water and filtrated it: the earth that remained upon the filtre, calcined to redness, was reduced to 45 parts: this appeared to me to be flint; it is very white and fine.

"The same acids exert a far inferior operation upon this earth, when it has been calcined to redness. The concentrated sulphuric acid does not even produce any extrication of heat, and the earthy residuum is more considerable, though we take into the account the quantity of water that exists in the non-calcined earth.

"All the lixivia produced by combinations of any of the three acids with this earth are but slightly coloured, especially the muriatic, and they are hardly coloured at all when the earth has been calcined; however they all yield, with the prussiate of lime, a precipitate of iron in the state of Prussian blue.

"From the experiments which I have related, and from some others which it would be superfluous to describe, it appears, that 100 parts of the terre de Salinelle, dried in the air, and such as it is generally found some time after it has been dug out of the ground, form a natural mixture of 32 parts of water, 22 of pure magnesia, 45 of flint, and 1 of oxyd of iron; that this earth differs greatly from the magnesian mixtures known by the names of *Scintilles*, *albestes*, *micæ*, &c.; and that it stands in the same relation to magnesia as the argills do to alumine; in a word, that it is a genuine ore of magnesia, which, as far as I know, has not been hitherto described; but for giving a very accurate and detailed analysis of it, I neither possessed proper instruments, nor sufficient chemical knowledge. I therefore resolved to send a quantity of this substance to Citizen Vauquelin, whose profound genius for the art of chemical analysis is universally known, and who has engaged to ascertain the place in which this earth ought to be ranged in natural history and chemistry.

"A pupil and associate of Citizen Chaptal, and engaged for a long time, by profession, in the application of chemistry to the arts, I endeavoured to apply the terre de Salinelle to an useful purpose, and from the experiments which I have made upon a large scale, it appears, that 100 parts of this earth, and 100 parts of sulphuric acid, at 40°, produce, by simple mixture, by the lixiviation of this mixture, by condensation of the lixivium and crystallisation, 95 parts of beautiful sulphate of magnesia in fine silky crystals. The mother-waters, which have a yellow tinge imparted to them by a small quantity of sulphate of iron, may still contain 5 parts of sulphate of magnesia. This result presents the manufacturers of sulphuric acid with an advantageous method of preparing the sulphate of magnesia in the large way. Medicine will derive from it another advantage; namely, that of easily procuring this salt in a state of purity, as well as the common magnesia; for it is universally known that the sulphate of magnesia, or Epsom salt, such as is met with in commerce, and which is obtained from the water of salt marshes, is a mixture of various salts, such as sulphate of magnesia, sulphate of soda, muriate of magnesia, muriate of lime, &c.: it is also known that most druggists, by using the sulphate of magnesia of commerce, in order to extract the magnesia, obtain a mixture of this earth and lime. This mixture must necessarily produce

effects very different from those that belong to pure magnesia or its carbonate; and we shall be sure of obtaining these two substances pure, if we employ the sulphate of magnesia prepared with sulphuric acid and the terre de Salinelle."

TERREUEL, a town of Spain, in Arragon, with a bishop's see, seated in a large fertile plain, at the confluence of the Guadalquivir and Alhambra, 75 miles S.W. of Saragossa, and 112 E. of Madrid. Long. 1. 0. W. Lat. 40. 25. N.

TERROUEN, a town of France, in the department of the Straits of Calais, seated on the Lis, six miles S. of St. Omer.

TERVERE, or **VEERE**, a town of the United Provinces, in Zeland, on the N.E. coast of the isle of Walcheren, with a good harbour, and a fine arsenal, four miles N.E. of Middleburg. Long. 3. 42. E. Lat. 51. 36. N.

TESCHEN, a town of Upper Silesia, capital of a duchy of the same name, subject to the house of Austria. It was taken by the Prussians in 1757, but restored in 1763. It was surrounded on all sides by a morass, and seated near the source of the Vistula. At a little distance from it is an old castle, on an eminence, where the ancient dukes resided. The inhabitants carry on a trade in leather, woollen stuffs, and Hungary wines; and make pretty good fire-arms, and excellent beer. A treaty of peace was concluded here in 1779, between the Emperor Joseph II. and Frederic William III. of Prussia. It is 27 miles S.E. of Troppau, and 65 S.W. of Cracow. Long. 18. 17. E. Lat. 49. 52. N.

TESEGDELT, a town of Morocco Proper, surrounded by a craggy rock, which renders it impregnable. It is seated at the mouth of the Tschubi, 200 miles W. of Morocco.

TESINO, a river of Switzerland, which has its source in Mount St. Gothard, flows through the country of the Grisons, and the lake Maggiore; then running through part of the Milanese, it washes Pavia, and a little after falls into the Po.

TESSET, a town and district of Zahara, 170 miles S. of Morocco. Long. 6. 56. W. Lat. 15. 24. N.

TEST, or **TESE**, a river, which rises in the N.W. of Hants, and watering Stockbridge and Rumsey, falls into the bay of Southampton.

TETBURY, a town in Gloucestershire, with a market on Wednesday, and a considerable trade in cheese, yarn, and wool. It is 25 miles E.N.E. of Bristol, and 99 W. of London. Long. 1. 8. W. Lat. 51. 36. N.

TETICACO, a lake of Peru, in the audience of Lima and province of Callao, above 200 miles in circumference.

TETTNANG, a town of Suabia, and the principal place of a lordship of the same name. It is eight miles N. of Linthau, and 18 E.N.E. of Constance. Long. 9. 50. E. Lat. 47. 46. N.

TEVERONE, a river of Italy, the ancient Anio, which rises in the Apennines, 50 miles above Tivoli, glides through a plain till it comes near that town, when it is confined for a short space between two hills, covered with groves. These were supposed to be the residence of the sibyl Albunea, to whom a temple here was dedicated, the elegant form of which indicates its having been built when the arts were in the highest state of perfection. The river moving with augmented rapidity, as its channel is confined, at last rushes violently over a lofty precipice; the noise of its falls resounds through the hills and groves of Tivoli; a liquid cloud arises from the foaming water, which afterwards divides into numberless small cascades. Having gained the plain, it soon afterward receives the waters of the lake Solfatar, and flows quietly on till it loses itself in the Tiber.

TEVIOT, a river of Scotland, which rises in the mountains in the S.W. of Roxburghshire, and passing almost through the centre of that county, unites with the Tweed, near Kelso.

TEURART, an ancient town of the kingdom of Fez, seated on a mountain near the river Za.

TEUSCHNITZ, a town of Franconia, in the bishopric of Bamberg, 34 miles N.E. of Bamberg. Long. 11. 27. E. Lat. 50. 22. N.

TEUSERA, a town of Barbary, in Biledulgerid, divided into two parts by a river. It stands on the confines of Tunis, in a country abounding in dates. Long. 10. 16. E. Lat. 31. 28. N.

TEYA, a river of Germany, which rises near Telstih, in Moravia, flows E. by Znaim, on the borders of Austria, and enters the Moraw, on the confines of Hungary.

TEYN, a town of Bohemia, belonging to the archbishop of Prague, 52 miles S.W. of that city. Long. 13. 40. E. Lat. 49. 38. N.

TEZAR, a town of the kingdom of Fez, capital of the province of Cuzi. Here is a mosque larger than that of Fez, being half a mile in circumference. It is seated on a small river, 45 miles E. of Fez. Long. 4. 15. W. Lat. 33. 40. N.

TEZCUCO, a town of New Spain, and the capital of a large government. Here Cortez caused a canal to be dug, where he built 18 brigantines, to carry on the siege of Mexico. It is seated near the lake of Mexico, 30 miles E. of the city of that name. Long. 100. 4. W. Lat. 20. 3. N.

TEZELIA, a town of the kingdom of Algiers, in Tremesen, with a castle, 15 miles from Oran. Long. 0. 25. E. Lat. 35. 25. N.

TEZOTE, a town of the kingdom of Fez, seated on the point of a rock, eight miles from Melilla. Long. 1. 55. W. Lat. 44. 40. N.

THAINEE, a town of the kingdom of Tunis, near the mouth of a river of the same name, 120 miles S. of Tunis. Long. 10. 15. E. Lat. 34. 50. N.

THAMSBURCK, a town of Upper Saxony, in Thuringia, eight miles S.E. of Mulhausen, and 16 W.N.W. of Erfurt. Long. 10. 52. E. Lat. 51. 20. N.

THANHAUSEN, a town of Suabia, situate on the Mindel, 14 miles N. of Mindelheim, and 22 E. of Ulm. Long. 9. 50. E. Lat. 48. 17. N.

THASO, an island of the Archipelago, on the coast of Macedonia, at the entrance of the gulf of Contessa. It is 12 miles long, and eight broad, and abounds in all the necessities of life. The fruits and wine are very delicate; and there are mines of gold and silver, beside quarries of fine marble. The chief town, of the same name, has a harbour frequented by merchants. Long. 24. 32. E. Lat. 40. 59. N.

THAXTED, a corporate town in Essex, with a market on Friday. It is governed by a mayor, and seated near the source of the Chelmer, 20 miles N.W. of Chelmsford, and 43 N.E. of London. Long. 0. 21. E. Lat. 51. 56. N.

THEBAID, a country of Upper Egypt, reaching from Fayoum to the Red Sea. It is the least fertile, and the thinnest of people, of any province in Egypt, being full of deserts, and celebrated for the retreat of a great number of Christians, who lived here in a solitary manner. It is now inhabited by Arabs, who are robbers by profession.

THEBES, the ancient name of a city of Upper Egypt. It was celebrated for having 100 gates; and there are many magnificent remains of antiquity. Three villages, named Camack, Luxor, and Gournou, are seated among its ruins, which are hence called the antiquities of Carnack and Luxor.

THENGEN, a town of Suabia, situate on the Hegau, eight miles N. of Schaffhausen, and 22 N.W. of Constance. Long. 3. 40. E. Lat. 47. 46. N.

THERMIA, an island of the Archipelago, S. of the island of Zia, and near the gulf of Engia, 12 miles long and five

broad. The soil is good and well cultivated, and it has a great deal of silk. The principal town, of the same name, is the residence of a Greek bishop. Long. 24. 59. E. Lat. 37. 31. N.

THETFORD, a borough in Norfolk, with a market on Saturday. It is seated on the Little Ouse, and there is a high mount, which has been walled round, and fenced with a double rampart. It is governed by a mayor, sends two members to parliament, and has three churches, a good free-school, and a town-hall. The lent assizes for the county are kept here. The river, which here divides Suffolk from Norfolk, is navigable from Lynn; and a good deal of wool-combing is carried on here. It formerly had upwards of 40 churches, and was a bishop's see; but it was destroyed in the time of the Danes. It is 30 miles S.S.E. of Lynn, and 80 N.E. of London. Long. 0. 50. E. Lat. 52. 28. N.

THEUX, a village three miles N.W. of Spa, in the bishopric of Liege, where the French obtained a victory over the Austrians, in 1794.

THIBET, or GREAT THIBET, a country of Asia, lying between 81 and 102° E. long. and 25 and 40° N. lat. bounded on the N.W. and N. by the Desert of Kobi in Tartary, on the E. by China, on the S. by Affan and Burmah, and on the W. and S.W. by Hindoostan Proper and Bootan. This country is one of the highest in Asia; it being a part of that elevated tract which gives rise not only to the rivers of India and China, but also to those of Siberia and Tartary. Its length from E. to W. cannot be less than 1000 miles; its breadth is very unequal. It is divided into three parts, Upper, Middle, and Lower Thibet. The Upper lies toward the sources of the Ganges and Burmahpooter; the Middle is that in which Lassa, the capital, is seated; and the Lower, that which borders on China. Little Thibet is situate between Upper Thibet and Cathgur. But Major Rennell, who considers the geography of the whole country as very obscure, is very uncertain whether Little Thibet is subject to Lassa or not. Notwithstanding the very rough and sterile state of Thibet, and the severity of its climate, from its wonderful elevation, its inhabitants are in a high state of civilisation; their houses lofty and built of stone; and the useful manufactures in some degree of improvement. The Thibetians are governed by the grand lama, who is not only submitted to, and adored by them, but is also the great object of adoration for the various tribes of pagan Tartars, who walk through the vast tract of continent which stretches from the river Volga to Corea. He is not only the sovereign pontiff, the vicergerent of the deity on earth, but by the more remote Tartars is absolutely regarded as the deity himself. They believe him to be immortal, and endowed with all knowledge and virtue. Every year they come from different parts to worship, and make each offerings at his shrine. Even the Emperor of China, who is of a Tartar race, does not fail to acknowledge the lama, in his religious capacity, although, as a temporal sovereign, the lama himself is tributary to that emperor. The opinion of the most orthodox Thibetians is, that when the grand lama seems to die, either of old age or infirmity, his soul, in reality, only quits a crazy habitation, to look for another younger or better; and it is discovered again in the body of some child, by certain tokens known only to the lamas or priests, in which order he always appears. In 1774, the grand lama was an infant, who had been discovered some time before by the tayshoo lama, who, in authority and sanctity of character, is next to the grand lama, and, during his minority, acts as chief. The lamas, who form the most numerous, as well as the most powerful body in the state, have the priesthood entirely in their hands; and they constitute many monastic orders, which are held in great veneration among them. Beside the religious influence and authority of

the grand lama, he is possessed of unlimited power throughout his dominions. His residence is at Patoli, a vast palace, on a mountain, near the banks of the Burmahpooter, seven miles from Lassa. In 1774, the English East-India Company made a treaty with the lama. The religion of Thibet, though, in many respects, it differs from that of the Indian bramins, yet, in others, has a great affinity to it. The Thibetians have a great veneration for the cow, and highly respect also the waters of the Ganges, the source of which they believe to be in heaven. The sonniasies, or Indian pilgrims, often visit Thibet as a holy place; and the lama always maintains a body of near 300 of them in his pay.

THIEL, or TIEL, a strong town of Dutch Guelderland, taken by the French in 1704. It is seated on the Waal, 20 miles W. of Nimeguen. Long. 5. 16. E. Lat. 51. 56. N.

THIELT, a town of Austrian Flanders, in the châtellany of Courtray, 10 miles N. of Courtray.

THIERS, a town of France, in the department of Puy de Dome, famous for its statuary, hardware, and cutlery. It is seated on the side of a hill, 22 miles E. of Clermont, and 220 S. by E. of Paris. Long. 3. 38. E. Lat. 45. 51. N.

THIONVILLE, a strong town of France, in the department of Moselle. It was taken by the Prince of Condé in 1643. The Austrians bombarded it in 1793, but were obliged to raise the siege. It is seated on the Moselle, over which is a bridge defended by a hornwork, 14 miles N. of Metz, and 195 N.E. of Paris. Long. 6. 15. E. Lat. 49. 21. N.

THIRSK, or THURAK, a borough in the north riding of Yorkshire, with a market on Monday. It sends two members to parliament; and was formerly noted for its strong castle. It is 20 miles N.W. of York, and 230 N. by W. of London. Long. 1. 16. W. Lat. 54. 15. N.

THIVE, or THERESE, a celebrated city of Livadia, with a bishop's see. It is nothing now to what it was formerly, and yet it is four miles in circumference, but so full of ruins, that there are not above 4000 Turks and Christians in it. It is famous for a sort of white clay, of which bowls for pipes are made after the Turkish fashion; they are never burnt; but dry naturally, and become as hard as stone. Here are two mosques, and several Greek churches. It is seated between two rivers, 20 miles N.W. of Athens, and 280 S.W. of Constantinople. Long. 23. 40. E. Lat. 38. 17. N.

THIVIERS, a town of France, in the department of Dordogne, 18 miles N.N.E. of Perigueux. Long. 0. 55. E. Lat. 45. 25. N.

THOISSEL, a town of France, in the department of Ain, with a handsome college. It is seated in a fertile country, near the Saone and Chalcrone, 10 miles N. of Trevoaux, and 200 S.E. of Paris. Long. 4. 50. E. Lat. 46. 13. N.

THOMA, Sr. an island of Africa, lying under the equator, in 8° E. long. It was discovered in 1429, and is almost round, about 30 miles in diameter. The soil is fertile, and produces plenty of sugar-canes. On the same vine are blossoms, and green and ripe grapes, all the year round. It is a very unwholesome country, possessed by the Portuguese, and few live to a great age. It consists chiefly of hills, intermixed with valleys, which are constantly filled with a thick stinking fog; but it agrees very well with the cattle, which are larger and finer here than on the Gold Coast of Guinea.

THOMAS, Sr. one of the Virgin Islands, in the West Indies, with a harbour, a town, and a fort. After the capture of St. Eustasia, in 1781, it became the mart of that part of the West Indies. It is 15 miles in circumference, and belongs to the Danes. Long. 64. 51. W. Lat. 18. 21. N.

THOMAS, Sr. a town of Hindoostan, on the coast of Co-

romandel, with an archbishop's see. It is subject to the Portuguese, and three miles S. of Madras. Long. 80. 25. E. Lat. 13. 2. N.

THOMAS, St. a town of Guiana, seated on the Orinoko, and subject to Spain. In 1618, it was taken and burnt by Sir Walter Raleigh. Long. 63. 30. W. Lat. 7. 6. N.

THOMDAMM, a town of Lower Saxony, in the duchy of Saxe-Lauenburg, situate on the Elbe, 15 miles S.E. of Lauenburg, and 38 S.E. of Hamburg. Long. 11. 5. E. Lat. 53. 10. N.

THONON, a town of Savoy, capital of Chablais, with a palace, and several convents. It is seated on the lake of Geneva, at the mouth of the river Drama, 13 miles S.W. of Lausanne, and 16 N.E. of Geneva. Long. 6. 44. E. Lat. 49. 10. N.

THORN, or THOREN, a town of Westphalia, in the bishopric of Liege, with a noble abbey, seven miles S.W. of Ruremonde.

THORN, a town in the west riding of Yorkshire, with a market on Wednesday, situate on a marshy soil, near the river Don, 10 miles N.E. of Doncaster, and 167 N. by W. of London. Long. 1. 2. W. Lat. 53. 39. N.

THORNBURY, a corporate town of Gloucestershire, with a market on Saturday. It is governed by a mayor, and seated near the Severn, 24 miles S.W. of Gloucester, and 121 W. of London. Long. 2. 31. W. Lat. 51. 35. N.

THORNEY, a small island in the bay of the English Channel, near the coast of Suffex, with a village of the same name, at the mouth of the Lavant, seven miles S.W. of Chichester.

THOUARS, a considerable town of France, in the department of Two Seviés. The capital of its ancient dukes is on a rock, surrounded by walls 120 feet high, which, from the whiteness of the stone, might be supposed not more than ten years old. It is seated on a hill by the river Thoue, 32 miles S.E. of Angers, and 162 S.W. of Paris. Long. 0. 15. W. Lat. 46. 59. N.

THRAPSTON, a town in Northamptonshire, with a market on Thursday, seated on the Nen, over which is a bridge, seven miles N. of Higham-Ferrers, and 75 N.N.W. of London. Long. 0. 36. W. Lat. 52. 26. N.

THREE HILLS ISLAND, an island, one of the New Hebrides, in the South Pacific Ocean, lying to the S. of Malicollo.

THUIN, a town of Austrian Hainault, but subject to the bishopric of Liege. It is seated on the Sambre, eight miles S.W. of Charleroy, and 15 S.E. of Mons. Long. 4. 22. E. Lat. 50. 21. N.

THUN, a lake of Switzerland, in the canton of Bern, five leagues long and one broad. Its borders are richly variegated, and covered with numerous villages. The river Aar passes through it, and at the north-west extremity is the town of Thun.

THUN; a town of Switzerland, in the canton of Bern, with a castle, where the avoyer resides. It is seated on a lake of the same name, where the river Aar issues from it, partly in a small island, and partly on a hill, 15 miles S.S.E. of Bern. Long. 7. 20. E. Lat. 46. 45. N.

THUNDER BAY, a bay nine miles broad, at the north-west corner of Lake Huron, in North America; so called from the continual thunder that is heard there.

THUR, a river of Switzerland, which rises in the south part of the county of Toggenburg, and runs into the Rhine, seven miles S.S.W. of Schaffhausen.

THURGAU, a bailiwick of Switzerland, which lies along the river Thur, bounded on the east and north by the lake, town, and bishopric of Constance; on the south by the terri-

tory of the abbot of St. Gallen; and on the west by the canton of Zurich. It is the largest bailiwick in Switzerland, as well as the most pleasant and fertile; and is extremely populous. The sovereignty belongs to the eight ancient cantons. Frauenfeld is the capital.

THURSO, a borough in Caithnessshire, at the mouth of the river Thurlo, on the west side of Dunnet Bay. It has a considerable trade, and a manufacture of woollen and linen cloth. Long. 3. 16. W. Lat. 58. 36. N.

TIAGAR, a town of Hindoostan, in the Carnatic, 50 miles W.S.W. of Pondicherry, and 75 S. of Arcot. Long. 79. 0. E. Lat. 11. 25. N.

TIANO, a town of Naples, in Terra di Lavoro, with a famous nunnery. Near it is a mineral spring, said to be excellent for the stone. It is 15 miles N.W. of Capua. Long. 14. 8. E. Lat. 41. 14. N.

TIBUROON, a cape, at the most western extremity of the island of St. Domingo, with a town, on an open road, opposite Port Antonio in Jamaica. It was taken by the English and royalists in 1794, but retaken by the republicans the next year.

TICKELL, a town in the west riding of Yorkshire, with a market on Friday. It had a castle and fortifications, demolished in the civil wars, of which some ruins remain. It has a distinct liberty, called the Honour of Tickell, which is part of the duchy of Lancaster. It is five miles S. of Doncaster, and 155 N. by W. of London. Long. 1. 11. W. Lat. 53. 27. N.

TICKLEY, a town of the peninsula of Hindoostan, in the circar of Cicacole, 30 miles N.E. of Cicacole, and 70 S.W. of Ganjam. Long. 84. 30. E. Lat. 43. 50. N.

TICONDERAGO, a fort of the United States, in New York, built by the French in 1756, on the narrow passage or communication between the lakes George and Champlain. It had all the advantages that art or nature could give it. It was taken in 1759 by General Amherst, and in 1779 by General Burgoyne, but evacuated soon after the convention at Saratoga. It is 110 miles S. of Montreal, and 185 N. of New York. Long. 73. 25. W. Lat. 43. 45. N.

TIDESWELL, a town in Derbyshire, on the south confines of the Peak, with a market on Wednesday. It is remarkable for a well that ebbs and flows two or three times in an hour after great rains; the waters gushing from several cavities at once, for the space of five minutes: the well is three feet deep and broad, and the water rises and falls two feet. It is deemed one of the wonders of the Peak. Tideswell is 22 miles N.W. of Derby, and 158 N.N.W. of London. Long. 1. 46. W. Lat. 53. 15. N.

TIDOR, an island in the Indian Ocean, one of the Moluccas, to the east of Gilolo, and to the south of Ternate. It is 17 miles in circumference, and produces cloves and flax. The Dutch are masters of the island, though it has a king of its own. The woods and the rocks that surround it, render it a place of defence. Long. 126. 0. E. Lat. 0. 50. N.

TIENGEN, a town of Suabia, situate on the Wuotch, 29 miles E. of Balle, and 36 W. of Constance. Long. 8. 5. E. Lat. 47. 40. N.

TIERRA DEL ESPIRITU SANTO, the most western and largest island of the New Hebrides, in the Pacific Ocean, being 40 leagues in circuit. The land is exceedingly high and mountainous, and in many places the hills rise directly from the sea. Except the cliffs and beaches, every part is covered with wood, or laid out in plantations. Beside the bay of St. Philip and St. Jago, on the north side of it, the isles which lie along the south and east coast, form several good bays and harbours. Long. 165. 0. E. Lat. 16. 0. S.

TIERRA DEL FUEGO, several islands at the southern extremity of America. They take their name from a volcano on the largest of them, and are all very barren and mountainous. Upon the lower grounds and islands, that were sheltered by the high mountains, Mr. Forster found several forts of trees and plants, and a variety of birds. Among the trees was Winter's bark-tree, and a species of arbutus, loaded with red fruit of the size of small cherries, which were very well tasted. In some places there is also plenty of celery. Among the birds was a species of large duck, which ran along the sea with amazing velocity, beating the water with its wings and feet; at the Falkland Islands it is called the loggerhead-duck. There are also plenty of geese and falcons. The rocks of some of the islands are covered with large muscle-shells, the fish of which is well flavoured. The natives of this country are short in their persons, not exceeding five feet six inches, their heads large, their faces broad, their cheek-bones prominent, and their noses flat. They have little brown eyes, without life; their hair is black and lank, hanging about their heads in disorder, and besmeared with train-oil. On the chin they have a few straggling short hairs instead of a beard. The whole assemblage of their features forms the most loathsome picture of misery to which human nature can be reduced. They had no other clothing than a small piece of seal-skin, which hung from their shoulders to the middle of the back, being fastened round the neck with a string; the rest of their body was perfectly naked. Their natural colour seems to be an olive brown, with a kind of gloss, resembling that of copper; but many of them disguise themselves with streaks of red paint, and sometimes, though seldom, with white. Their whole character is a strange compound of stupidity, indifference, and inactivity. They have no other arms than bows and arrows, and their instruments for fishing are a kind of fish-gigs. They live chiefly on seal's flesh, and like the fat oily part most. There is no appearance of any subordination among them, and their mode of life approaches nearer to that of brutes, than that of rational creatures.

TILBURY, East, a village in Essex, near the mouth of the Thames, east of Tilbury Fort. It is supposed to be the place where the Emperor Claudius crossed the Thames, in pursuit of the Britons. In this parish is a field, called Cave Field, in which is a horizontal passage to one of the spacious caverns in the neighbouring parish of Chadwell. Of these Camden has given a sketch in his *Britannia*; and he describes them as in a chalk cliff, built very artificially of stone, to the height of ten fathoms. Dr. Derham measured three of the most considerable of them, and found the depth of one of them to be 50 feet, of another 70 feet, and of the third 80 feet. Their origin is too remote for investigation.

TILBURY, West, a village in Essex, situate on the Thames, north of Tilbury Fort. Here the four Roman provincial ways crossed each other, and, in 630, it was the see of Bithop Ceadda, or St. Chad, who converted the East Saxons. The marshes here feed a great number of Lincolnshire and Leicestershire sheep, for the London market. In this parish is a celebrated spring of alternative water, discovered in 1717. When the Spanish armada was in the Channel, in 1588, Queen Elizabeth had a camp here, which was where the windmill now stands, and some traces of it are visible.

TILBURY FORT, in Essex, situate on the Thames, opposite Gravesend, a regular fortification, which may be termed the key to London. It has a double moat, the innermost of which is 180 feet broad; with a good counterfarp, a covered way, ravelins, and terrails. Its chief strength on the land side consists in its being able to lay the whole level under

water. On the side next the river is a strong curtain, with a noble gate, called the Water-gate, in the middle; and the ditch is palliaded. Before this curtain is a platform in the place of a counterfarp, on which are planted 106 guns, from 26 to 46 pounders each, beside smaller ones planted between them; and the bastions and curtains are also planted with guns. It is 28 miles E. by S. of London.

TILLAGE, in agriculture, the process of moving and stirring land with a view to promote the growth of useful vegetables. This is effected in a great variety of ways, as the plough, spade, &c. The following description of an implement in Husbandry, called a **CULTIVATOR**, by the inventor, Mr. William Lester, of Northampton, is published in the *Transactions of the Society for the Encouragement of Arts, Manufactures, and Commerce*, who presented their silver medal to Mr. Lester for his invention.

"As," says he, "health and luxuriance of corn depend, in a great measure, on the pulverisation of the soil, previous to the seed being sown, the Society of Arts will, I am persuaded, give every encouragement in their power to the introduction of any implement that promises an abridgment of labour; and as all the tenacious soils are pulverised in the best manner in dry weather, when their particles are the most disjointed, and their contact broken, the propriety of taking the advantage of working them in that state will be obvious; and at the same time it follows, that an improved implement for the abridgment of labour would be a desirable thing, in a climate like England, where the seasons are so uncertain."

"In working on a rough fallow, my cultivator should be set at its greatest expansion, and contracted in proportion as the clods are reduced. I am confident that one man, a boy, and six horses, will move as much land in a day, and as effectually, as six ploughs; I mean land in a fallow state, that has been previously ploughed."

It will be requisite in some states of the soil to alter the breadth of the shares; but of this, I presume, the farmer will always be a proper judge. By the expansion and contraction of the cultivator, the points of the shares are, in a small degree, moved out of the direct line; but this is so trifling, that it is no impediment to its working."

The following is a description of the Cultivator as represented in Plate 53.

A, the beam; B, B, the handles; C, C, a cross-bar, of a semi-circular form, containing a number of holes, which allow the two bars D, D, to be placed nearer or further from each other; D, D, are two strong bars, moveable at one end, upon a pivot E, and extending thence in a triangular form to the cross-bar C. In these bars are square holes, which allow the shares F, placed therein, to be fixed to any height required. The seven shares marked F are shaped at their lower extremities like small trowels; the upper parts of them square iron bars. G, G, G, are three iron wheels, on which the machine is moved; they may be raised or lowered at pleasure. H, the iron hook, to which the swing-tree and horses are to be fixed.

When the machine is first employed on the land, the bars D, D, are expanded as much as possible. As the soil is more loosened, they are brought nearer to the centre: the shares then occupy a less space, and the soil will consequently be better pulverised.

A certificate from Mr. William Shaw, of Cotton-End, near Northampton, accompanied this letter; in which he states that he had used Mr. Lester's cultivator upon a turnip fallow last summer, and that he believes it to be a very useful implement for cultivating the land in a fallow state, by its working or scuffling off seven acres per day with six horses.

He adds, that from its property of contracting and expanding, it is calculated to work the same land in a rough or fine state, by which means it unites the principles of two implements in one; and, by the index on the axis, it may be worked at any given depth required.

A model of the above-described cultivator is reserved in the Society's repository, at which place it may be inspected by any one who pleases.

FILLIERES, a town of France, in the department of Eure, six miles N.E. of Verneuil, and 12 W. of Dreux. Long. 1. 3. E. Lat. 48. 46. N.

TILSTT, a town of Prussia, in the Lithuanian department. It has a considerable trade in linseed, butter, and other provisions; and the number of inhabitants is about 7050. It is situate on the Memel, 50 miles N.E. of Königsberg, and 95 S.S.W. of Mittau. Long. 22. 8. E. Lat. 55. 8. N.

TIMANA, a town of Terra Firma, in Popayan, capital of a territory of the same name, which abounds in fruits and pastures. It is seated on a river, 130 miles E.S.E. of Popayan. Long. 73. 55. W. Lat. 1. 35. N.

TIME-KEEPER (*Encycl.*). The following hints on the improvement of time-keepers, by David Rittenhouse, LL.D. President of the American Philosophical Society, appear in their Transactions.

"The invention and construction of time-keepers may be reckoned among the most successful exertions of human genius. Pendulum clocks especially have been made to measure time with astonishing accuracy; and if there are still some causes of inequality in their motions, the united efforts of mechanism, philosophy, and mathematics, will probably in time remove them.

"The least and least of those causes, which perhaps may be worthy of notice when all others of more importance are removed, is that arising from unequal density of the air, which by varying the actual weight of the pendulum will accelerate or retard its motion. The effects arising from this cause will be found very small: for if we suppose the greatest range of the barometer to be three inches, which indicates a change of density in the air of above one tenth of the whole; and supposing lead, of which pendulums are generally made, to be 8,800 times heavier than air, the variations of the actual weight of a pendulum may be one 88,000th part of its whole weight, and consequently the change in its rate of going one 176,000th part. And, as there are 86,400 seconds in a day, the clock may vary in its rate of going, from this cause, about $\frac{1}{2}$ a second in 24 hours. Mentioning the barometer seems naturally to point out a remedy for this cause of irregularity by means of that instrument. But my design at present," says Dr. Rittenhouse, "is to describe a very different and extremely fine method, which, though only a matter of curiosity at present, may at some future time perhaps be found useful; especially as the variation above mentioned is governed solely by the actual density of the surrounding air, and the barometer can only give the weight of an entire column, which does not strictly correspond with the density of its base; whereas the method I propose depends on the real density of the air surrounding the pendulum, and nothing else.

"Let AB (Plate 46, fig. 1) be a pendulum vibrating on the point A, and removed from the perpendicular line DE. Let the inflexible rod be continued from B A to C, and let a body C, of equal dimensions with the pendulum B, but hollow and light as possible, be fixed on the rod, making AC equal to AB. Now it is evident that B will be pressed upwards by a force equal to the weight of its bulk in air; and its descent retarded. But the body C will be equally pressed

upwards, and consequently the motion of the pendulum towards the perpendicular will be as much accelerated. These two forces therefore will destroy each other, and the pendulum will perform its vibrations in equal times, whether the air be light or heavy, dense or rare.

"I have for greater perspicuity described the most simple case, but perhaps not the most eligible, for if we can enlarge the vessel or body C, in any proportion, the distance of its centre from A may be diminished at the same rate.

"However plausible the above may appear in theory, no doubt difficulties will occur when we attempt to reduce it into practice. But I am persuaded they will not be so insuperable.

"The only experiment I have hitherto made on this subject has been merely to shew that a pendulum can be made in this manner which shall vibrate quicker in a dense medium than in one more rare, contrary to what takes place with common pendulums.

"I made a compound pendulum on the principles above mentioned, of about one foot in its whole length. This pendulum, on many trials, made in the air 37 vibrations in a minute. On immersing the whole in water it made 50 vibrations in the same time, shewing evidently that its motion was quicker in so dense a medium as water than in the air. When the lower bob or pendulum only was plunged in water it made no more than 44 vibrations in a minute; the remaining 15 being solely the effect of the pressure of the water against the upper vessel C."

TIMERYCOTTA, a town and fortress of the Deccan of Hindoostan, in the province of Golconda, 64 miles S.E. of Hyderabad, and 95 W. of Masulipatam. Long. 79. 26. E. Lat. 15. 20. N.

TIMORLAND, an island in the Indian Ocean, between Timor and New Guinea. Long. of the S. point 131. 54. E. Lat. 8. 15. S.

TIN (*Encycl.*). The following observations concerning the tin extracted from bell-metal, and the fixity which antimony acquires when it has been used as an alloy for tin, by M. Le Sage, are inserted in the Journal de Physique.

In order to separate the copper from bell-metal, recourse has been had to operations which scorch the tin, and a part of the copper. Metal was calcined in the reverberatory furnace; this oxyd was spread upon bell-metal kept in a state of fusion: the fire was kept up, the fused metal was run off, and pure copper was obtained in the proportion of 60 lbs. to the quintal of bell-metal; there remained blackish scoria intermixed with vitreous matter of a greenish colour. For want of means of reducing them, the scoria was abandoned to the purposes of mending roads and constructing dykes, as has been done at Romilly, near Rouen: however, the scoria contained still from 30 to 40 lbs. of tin and copper per quintal, as has been ascertained by the experiments of Citizen Ansfy, a pupil of the first Academy of Mines, who has been able to turn them to such great advantage, that he has reproduced at least fifteen hundred thousand weight of tin, and two millions of pure copper.

This chemist reduces the scoria by fusing it with a pretty considerable quantity of charcoal: he obtains a metallic alloy with shining facettes, composed of copper, tin, and antimony; it is surmounted with an enamel of a greenish grey colour, which contains a quarter of its weight of tin. This metallic alloy he fuses in the reverberatory furnace, takes away every hour what is oxydized, which is in the form of a dirty white powder, and which he separates from the copper by lixiviation. There remains in the furnace an alloy of copper and tin, the fracture of which is not in facettes, but similar to that of the bell-metal.

The copper is separated from the tin by the process indicated in the preceding paragraph.

The calx, or oxyd of copper, of a dirty white colour, when it has been reduced by the charcoal, produces an alloy of tin and copper; its colour is yellow, like that of the pyrites of copper, and its fracture exhibits striated lamina, or crystals. This alloy, when in the state of fusion, is furnished by a mixture of tin and the oxyd of this metal, which, when it has cooled, produces solid masses of a yellowish grey colour, the fracture of which presents a shining grain like the irregular martial pyrites.

The vitreous matter, which floats upon this metallic alloy, is of a yellowish-grey colour when it has cooled; it is a glass or rather an enamel of tin, in which three layers are distinguished; that which is in contact with the metal in a state of fusion, is grey, shining, contains a large quantity of tin in the metallic state; the intermediate layer presents an enamel of a yellowish-grey colour; and the superior layer, which was exposed to the contact of the air and fire, is scoriiform of a blackish colour. These three strata in which the tin presents itself, depend upon the quantity of charcoal, as Citizen Anfray has observed. The oxyd, or white calx of tin, cannot be nitrified without the addition of a little charcoal, and cannot be reduced unless with the aid of ten parts.

During all these operations a very fine sublimate is formed of the oxyd, or white calx of tin, which is extracted out of the chimneys of the reverberatory furnaces, in which the calcinations and reductions are performed.

It has been remarked, that the tin, which is extracted from the scoria of bell-metal, has more solidity than pure tin; that it is brittle, and exhibits a greyish metallic grain, which is not exhibited by pure tin. It owes this property to a portion of antimony which is employed by the pewterers in order to give durability to this metal. When this alloy has once been made, it is almost impossible to effect the separation of the two metals. As the bell-founders employ the tin of commerce, it is not to be wondered at that the tin which is extracted from the scoria of bell-metal contains antimony; perhaps also the founders themselves introduce some of it.

Being well convinced, by observing the solutions and effects of re-agents, that the tin extracted from bell-metal did not contain iron or copper in any perceptible quantity, and not being able to separate the antimony from it, Mr. Le Sage made alloys of this semi-metal with tin, in different proportions, and found, that tin, alloyed with a sixth part of antimony, was rendered similar to that extracted from bell-metal by the process of Anfray; that it had the same grain, the same durability, the same sound, and that it had also lost a part of its shrillness.

Though the tin extracted from bell-metal contains antimony, it may be employed in the fabrication of tin-plates, as he found by experience; it is more difficult to form into blocks than pure tin; it is more proper for tinning utensils than the tin employed by the pewterers for spoons, &c. which is besides alloyed with lead, bismuth, and copper.

The experiments quoted shew that the bell-metal does not consist merely of copper and tin, but that it also contains antimony.

The following are the mixtures employed by pewterers:

Best tin.—Tin 100 lbs. copper 4 lbs. bismuth 8 oz.

Pewterers metal.—Tin 100 lbs. copper 6 lbs. bismuth 1 lb. 8 oz.

Common tin.—Tin 100 lbs. brass 6 lbs. lead 15 lbs.

The pewterers always alloy this metal with more or less antimony.

TINA, a town of Turkey in Europe, in Bosnia, on the river Tis, 37 miles N.W. of Spalatro. Long. 17. 9. E. Lat. 44. 28. S.

TINA, or **TINOS**, the ancient Tenos, an island of the Archipelago, one of the Cyclades, to the west of Nicaria. It is 17 miles long and eight broad, and is subject to the Venetians. This island produces 16,000 pounds of silk every year, and the flockings made of it are very good; but nothing can equal the gloves which are knit here for the ladies. The fortress stands on a rock; and here is a bishop's see of the Latin church, though the Greeks have 200 papas or priests. St. Nicolo is the principal town. Long. 25. 24. E. Lat. 37. 30. N.

TINIAN, an island in the Pacific Ocean, one of the Ladrões, 12 miles in length and six in breadth. The soil is dry; and, being somewhat sandy, is the less disposed to rank and over-luxuriant vegetation. The land rises in gentle slopes from the shore to the middle of the island, intermixed with valleys of an easy descent; which are beautifully diversified with the mutual encroachments of the woods and lawns. The woods consist of tall and well-spread trees, and the lawns are covered with clean and uniform turf, producing fine trefoil, and variety of flowers. Here are at least 10,000 cattle, all milk white, except their ears, which are brown or black; also a vast number of fowls, which are easily caught, and plenty of wild hogs. In the woods are prodigious quantities of cocoa-nuts, cabbage-trees, guavaes, limes, sweet and four oranges, and bread fruit. Here are also vegetables proper for the scurvy; such as water-melon, dandelion, creeping purslain, mint, scurvy-grass, and sorrel. Here are some ruins of a particular kind, consisting of two rows of square pyramidal pillars, each pillar being about six feet from the next, and the distance between the rows is 12 feet; on the top of each there is a semi-globe, with the flat surface upward, and they are composed of sand and stone cemented together. The climate is extremely healthful, for the rains are not continual, but fall in frequent refreshing showers. There are no streams, but the water of the wells and springs is excellent. The principal inconvenience arises from the number of muskitoes, and other kinds of flies; and there are likewise insects called ticks, which fasten upon the limbs and bodies of men, and bury their heads under their skins. The road is inconvenient, and in some seasons, there is little security for a ship at anchor. Long. 146. 0. E. Lat. 15. 0. N.

TINMOUTH, a sea-port in Northumberland, at the mouth of the Tyne, nine miles east of Newcastle. It has a castle, seated on a high rock, inaccessible on the sea-side, and well mounted with cannon. There is a bar across the mouth of the river, which is not above seven feet deep at low water. There are dangerous rocks about it, called the Black Middins; but there are light-houses to guide the ships by night. Here ships take in their loading of coal, and of goods brought from Newcastle. Long. 1. 10. W. Lat. 55. 6. N.

TINTAGEL, a village in Cornwall, one mile west of Bosciney, noted for the remains of a remarkable fortification called King Arthur's castle. It is seated on a bold promontory, in the Bristol Channel; and is said to have been the birth-place and royal residence of Arthur.

TINTO, a river of Spain, which rises in the province of Seville, and has its name from the water being tinged of a yellow colour. Near its spring it has a petrifying quality, no trees or plants will grow on its banks, nor will any fish live in it; which properties continue till other rivulets run into it and alter its nature; for when it passes by Niebla it is not different from other rivers. It falls into the Atlantic about 18 miles below Niebla.

TINZEDA, a town of Barbary, in Mledulgerid. It is seated on a river of the same name, in a country fertile in

dates and barley, and abounding in indigo. Long. 6. 13. W. Lat. 27. 30. N.

TINZULIE, a strong town of Barbary, in Biledulgerid, seated on the river Dras. Long. 5. 43. W. Lat. 28. 25. N.

TIORN, an island on the west coast of Sweden, about 27 miles in circumference, and abounding in excellent pastures. Long. 11. 20. E. Lat. 58. 0. N.

TIPPERAH, or **TIPRAH**, a kingdom of Asia, in the dominions of the King of Burmah, lying under the tropic of Cancer, to the east of Hindoostan Proper.

TIPPERARY, a town of Ireland, in the county of the same name, nine miles S.S.W. of Calkeel.

TIRANO, a town of the country of the Grisons, capital of the Upper Terzerro. It contains several handsome buildings, but from the narrowness of the streets, and many ruinous houses, its general appearance is desolate. The river Adda divides it into two parts, which are joined by a stone bridge of a single arch. There are some remains of the stone walls by which it was formerly surrounded, and which, with an adjoining fortress, was built by Ludovico Sforza, against the incursions of the Grisons, but were dismantled by the latter, when they acquired possession of the Valteline. The staple commerce of this town consists in the exportation of wine and silk. Near the town on the other side of the Adda, is the magnificent church of the Madonna, or Virgin Mary, much visited by the Catholic pilgrims. The massacre of the Protestants of the Valteline, in 1620, began in this town. It is 17 miles S.W. of Bormio. Long. 9. 46. E. Lat. 46. 12. N.

TIREE, a small but rich island of Scotland, one of the Hebrides, lying to the S.W. of Col, and noted for its marble quarry and a handsome breed of little horses.

TIRSH, a town of Turkey in Asia, in Natolia, situate on the Meinder, 32 miles S.S.E. of Smyrna. Long. 27. 50. E. Lat. 38. 10. N.

TIRLEMONT, a village of Austrian Brabant, formerly one of the most considerable places in that duchy, but ruined by the wars. It is seated on the river Geet, over which are several bridges, 12 miles E.S.E. of Louvain, and 25 E. of Brussels. Long. 4. 41. E. Lat. 50. 48. N.

TIRNAU, a strong and considerable town of Upper Hungary, in the county of Neitra. It is seated on the Tirna, five miles W. of Leopoldstadt, and 22 N.E. of Presburg. Long. 17. 39. E. Lat. 48. 24. N.

TITAN, or **CARRROS**, an island of France, the most eastern of the Hieres, in the Mediterranean.

TITICACA, or **CHUCUITO**, an island of Peru, in the audience of Los Charcos. It is situate in a lake of the same name, which is one of the largest in South America.

TITLISBERG, one of the highest mountains in Switzerland, at the foot of which is the greatest part of the valley of Engelberg.

TITTMANNING, or **DITTMANNING**, a town of Germany, in the archbishopric of Saltzburg. It was almost desolated by the plague in 1310, and was reduced to ashes by lightning in 1571; but it has been since rebuilt. It is seated on the Saltza, 24 miles N.W. of Saltzburg. Long. 12. 46. E. Lat. 47. 54. N.

TITUL, a strong town of Upper Hungary, in the county of Bodrog. It is seated on the Teilde, near its confluence with the Danube, 23 miles E. of Peterwaradin, and 20 N.W. of Belgrade. Long. 20. 34. E. Lat. 45. 30. N.

TIVERTON, a borough in Devonshire, with a market on Tuesday. It is seated on the Ex, over which is a stone bridge, is governed by a mayor, and sends two members to parliament. It has a noble free-school (founded by a clothier of

this town), which has an endowment also for the maintenance of eight scholars at Balliol College, Oxford, and Sidney Sussex College, Cambridge. Tiverton has suffered very severely by fire, particularly in 1598, 1612, 1731, and 1794. This town has been noted for its great woollen manufacture, and is 14 miles N.N.E. of Exeter, and 161 W. by S. of London. Long. 2. 38. W. Lat. 50. 54. N.

TIUMEN, a town of Siberia, in the province of Tobolsk, on the Tara, 125 miles W. of Tobolsk.

TIVOLI, a celebrated town of Italy, in Campagna di Roma, with a bishop's see. It is now wretchedly poor; but boasts, however, of greater antiquity than Rome itself, being the ancient Tibur, which, Horace says, was founded by a Grecian colony. It was the favourite country residence of the ancient Romans, as Fregati is of the moderns. Near the bottom of the eminence on which Tivoli stands, are the ruins of the vast and magnificent villa built by Emperor Adrian. Other illustrious Romans had also their villas here; as Julius Caesar, Caius Cassius, Augustus, Catullus, Propertius, Mæcenas, &c. Horace is thought to have composed great part of his works in this favourite retreat. Near Tivoli are a celebrated cascade, a temple of Vesta, and another of the sybil Albunea, a magnificent villa belonging to the Duke of Modena, called the Villa Esteffe, and the remarkable lake of Solitara. Tivoli is seated on the Teverone, 12 miles E.N.E. of Rome, and 15 N.N.E. of Fregati. Long. 12. 43. E. Lat. 41. 59. N.

TIZZANO, a town of Italy, in the duchy of Parma, 13 miles S. of Parma.

TLASCALA, a province of New Spain, in the audience of Mexico; bounded on the N. by Panuco, on the E. by the gulf of Mexico, on the S. by Guaxaca and the Pacific Ocean, and on the W. by the audience of Mexico. In the west part of this province is the mountain of Tlascala, 12 miles in circumference: it is well peopled and cultivated, except on the summit, which is always covered with snow. There are also other mountains, covered with trees, in which are tigers and monkeys.

TLASCALO, a town of New Spain, capital of a province of the same name. It is seated on a river, partly on a mountain, and partly on a plain, 82 miles E.S.E. of Mexico. Long. 59. 22. W. Lat. 19. 30. N.

TOCAYMA, a town of New Granada, seated on the Pati, in a country abounding in fruit and sugar-canes. Here are hot-baths between two cold springs; and near the town is a volcano. Long. 73. 50. W. Lat. 4. 3. N.

TOCKAY, a strong town of Upper Hungary, in the county of Zimplin, with a castle. It is celebrated for its excellent wine; but being produced only by one vineyard, it is scarce even at Vienna. At some distance from it are large salt-works. It is seated at the confluence of the Bodrog and Teilde, 75 miles N.W. of Great Waradin, and 90 N.E. of Buda. Long. 21. 25. E. Lat. 48. 10. N.

TOCORT, or **TOGOURT**, a town of the kingdom of Algiers, 240 miles S.S.E. of Algiers. Long. 4. 40. E. Lat. 32. 40. N.

TODI, a town of Italy, in the duchy of Spoleto, with a bishop's see; seated on a hill, near the Tiber, 22 miles S. of Perugia, and 50 N. of Rome. Long. 12. 32. E. Lat. 42. 44. N.

TOGGENBURG, a county of Switzerland, depending on the abbey of St. Gallen. It is a narrow country, situate between high mountains, is fertile in corn and fruit, and is divided into the Upper and Lower. It contains 30 parishes, and upwards of 46,000 inhabitants. There are more Protestants than Catholics, but both religions are bound by oath to maintain reciprocal harmony.

TOISSEY, a town of France, in the department of Ain, seated near the confluence of the Saone and Chalarogne, 25 miles N. of Lyons. Long. 4. 52. E. Lat. 45. 20. N.

TOLAGA BAY, a bay of the island of New Zealand. Long. 178. 33. E. Lat. 38. 21. S.

TOLEN, a town of the Dutch Netherlands, in Zealand, in an island of the same name, separated by a narrow channel from Dutch Brabant. It is five miles N.W. of Bergen-op-Zoom. Long. 4. 20. E. Lat. 51. 30. N.

TOLENTINO, a town of Italy, in the marquise of Ancona, with a bishop's see. It is the place where the relics of St. Nicholds are kept, and is seated on the river Chiento, eight miles S.E. of St. Severino, and 88 N.E. of Rome. Long. 13. 11. E. Lat. 43. 14. N.

TOLESBURG, a sea-port of Russia, in the government of Riga, seated on the gulf of Finland, 60 miles W. of Narva. Long. 26. 4. E. Lat. 59. 38. N.

TOLFA, a town of Italy, in the patrimony of St. Peter. In the environs are mines of alum and iron, with warm baths, and quarries of alabaster and lapis lazuli. It is four miles from the sea coast, and 25 N.W. of Rome. Long. 12. 40. N. Lat. 42. 10. N.

TOLHUYS, a town of Dutch Guelderland, seated on the Rhine. Here the French army passed the Rhine in 1672. It is eight miles E. of Nimeguen. Long. 6. 0. E. Lat. 51. 56. N.

TOLMEZZO, a town of Italy, in Venetian Friuli, 30 miles N.E. of Belluno. Long. 12. 50. E. Lat. 46. 30. E.

TOLMINO, a town of Germany, capital of a district in the duchy of Carniola, 12 miles N. of Goritz.

TOLNA, a town of Lower Hungary, capital of a county of the same name. It is seated on the Danube, in a country producing excellent wine, eight miles S.W. of Colocza, and 45 S. of Buda. Long. 19. 28. E. Lat. 46. 33. N.

TOLNANI, a town of the Deccan of Hindoostan, in the country of Baglana, 75 miles W. of Burhampoor, and 124 E. of Surat. Long. 70. 3. E. Lat. 21. 15. N.

TOLOSA, a town of Spain, the capital of Guipuscoa, seated in a valley, between the Araxis and Oria, over which are two bridges, and near them several natural cascades. It is inhabited by a great number of artists, who make sword blades in high esteem. It was taken by the French in 1794. It is 37 miles S.W. of Bayonne, and 47 S.E. of Bilbao. Long. 2. 5. W. Lat. 43. 10. N.

TOMAR, a town of Portugal, in Estremadura, seated on the river Nabao, at the foot of the mountains, where there is a castle belonging to the knights of Christ. It is 40 miles S.E. of Coimbra, and 65 N.E. of Lisbon. Long. 7. 55. W. Lat. 39. 30. N.

TOMBEC, a town of Austrian Brabant, eight miles S. of Louvain, and 10 E. of Brussels. Long. 4. 49. E. Lat. 50. 45. N.

TOMBELAINE, a small island of France, with a town of the same name, on the coast of Normandy, in a small gulf between Avranches and St. Malo. This island, as well as that of St. Michael, in which there is a monastery, are every day joined, at low water, to the main land.

TOMBUCTOO, a kingdom of Nigritia, which lies to the south-east of the great desert of Zahara, and west of the empire of Cashna. It produces great plenty of corn, cattle, milk, and butter. The king has 300 horsemen, beside a great number of foot, who frequently take captives, and sell them to the merchants for slaves. The houses are built like bells, with walls of hurdles plastered with clay, and covered with reeds. The better sort of women have their faces covered, their religion being Mahometanism. Both men and women are very fond of dancing, and spend a great part of the night in that exercise.

VOL. X.

TOMBUCTOO, the capital of a kingdom of the same name, in Nigritia, with a stately mosque built of stone, and a royal palace. Here is a great number of weavers of cotton cloth; and hither the cloth and other merchandise are brought by caravans from Barbary. Instead of money, they make use of shells and small bits of gold. In the proceedings of the African Association, this place is mentioned as a luxurious, opulent, and flourishing city, subject to a severe police, and, as such, attracting the merchants of the most distant states of Africa. It is seated near the Niger, 270 miles S.W. of Moorsook. Long. 0. 8. W. Lat. 19. 59. N.

TOMBAMBAMBA, a town of Peru, in the audience of Quito, where was a temple of the Sun, whose walls, as the Spaniards assert, were covered with gold. It is 120 miles S. of Quito. Long. 77. 50. W. Lat. 2. 16. S.

TOMINA, a government of South America, in the vice-royalty of Buenos Ayres, and archbishopric of La Plata.

TOMINI, a town on the east coast of the island of Celebes, in a bay to which it gives name. Long. 119. 0. E. Lat. 0. 45. S.

TOMSK, a town of Siberia, in the province of Tomsk. On the highest part stands a wooden castle, defended by 14 pieces of cannon; and in it are a cathedral built of wood, the chancery, and an arsenal. The inhabitants carry on a great trade, this town lying on the great road through all the east and north parts of Siberia. It contains above 2000 houses, and is seated on the river Tom, 105 miles E.S.E. of Tobolsk. Long. 84. 59. E. Lat. 55. 45. N.

TONDEREN, or **TUNDEREN**, a town of Denmark, in the duchy of Sleswick, capital of a bailiwick of the same name, with a fort. It is seated in a fertile country, on the river Widaw, and on a bay of the German ocean, 25 miles S.E. of Ripen, and 30 N.W. of Sleswick. Long. 9. 40. E. Lat. 54. 58. N.

TONGATABOO, or **AMSTERDAM ISLAND**, one of the Friendly Islands, 20 leagues in circuit. It has the best harbour or anchoring-place to be found among these islands. It is wholly laid out in plantations, with roads or lanes for travelling; and is the seat of government for all the other islands, and the ordinary residence of all the principal chiefs. Long. 175. 5. W. Lat. 21. 8. S.

TONGRES, a town in the bishopric of Liège, formerly one of the richest and most flourishing cities in the Roman province of Gallia Belgica. It has severely suffered by the calamities of war; the first time by Attila, king of the Huns, and the last by the French in 1673 and 1677. It is seated on the Jecker, 12 miles S.W. of Maestricht, and 15 W. of Liège.

TONG-TCHANG-FOU, a city of China, in the province of Chang-tong, containing in its district, three cities of the second, and 15 of the third class. It is 150 miles S. of Pekin. Long. 115. 25. E. Lat. 36. 30. N.

TONG-TCHUEN-FOU, a fortified city in China, in the province of Se-tchuen. The inhabitants are all soldiers, who have followed the profession of arms from father to son. It is 867 miles S.W. of Pekin. Long. 101. 30. E. Lat. 25. 50. N.

TONGUSIANS, a people who inhabit the east part of Siberia, and are subject to the Russians. They are all Pagans, and chiefly subsist by grazing and hunting of saibles. They live in huts, which, when they remove their dwellings, they take down and set up elsewhere. These huts are composed of wooden poles, covered all over with hair and rubbish, except a hole left at the top to let out the smoke. Their fire is made in the middle, and they all sit round it upon turfs. Both sexes are very strong, and broad-

faced, and they all ride on horseback, not excepting the girls. Both men and women dress alike in a sort of frock, with boots of skins on their legs, and their common drink is water.

TONNA, a town of Upper Saxony, in the principality of Gotha, six miles N. of Gotha.

TONNAY BOUTONNE, a town of France, in the department of Lower Charente, seated on the river Boutonne, 17 miles N. of Saintes. Long. 0. 34. W. Lat. 45. 56. N.

TONNAY CHARENTE, a town of France, in the department of Lower Charente, with a castle and a small port. It is seated on the Charente, three miles from Rochefort, and 253 S.W. of Paris. Long. 0. 46. W. Lat. 45. 56. N.

TONNIENS, a town of France, in the department of Lot and Garonne, seated on the Garonne, two miles from its junction with the Lot, and seven E. of Marmande.

TONNERRE, a town of France, in the department of Yonne, famous for its good wines. It is seated on the Armancon, 27 miles S. of Troyes, and 102 E. of Paris. Long. 4. 4. E. Lat. 47. 51. N.

TONNINGEN, a town of Denmark, in the duchy of Sleswick, capital of a territory of the same name. It is seated on a peninsula formed by the river Eyder, where there is a commodious harbour, 25 miles S.W. of Sleswick, and 58 N.W. of Hamburg. Long. 9. 10. E. Lat. 54. 30. N.

TONSBERG, a sea-port of Norway, in the province of Aggerhuys, 30 miles W. of Frederickstadt. Long. 10. 20. E. Lat. 58. 50. N.

TOOBOUAL, an island in the Pacific Ocean, discovered by Captain Cook. It is not in any direction above six miles over; but there are hills in it of considerable elevation, covered with herbage, except a few rocky cliffs, with patches of trees interspersed to their summits. It is plentifully stocked with hogs and fowls, and produces several kinds of fruits and roots. Long. 149. 23. W. Lat. 23. 25. S.

TOOTH-ACH. See *ODONTALGIA*, *Supp.*

TOPCLIFF, a town in the North Riding of Yorkshire, seated on a considerable ascent on the Swale, 24 miles N. of York.

TOPEL, or **TOPL**, a town of Bohemia, in the circle of Pilsen, 24 miles N.W. of Pilsen, and 56 W. of Prague. Long. 14. 10. E. Lat. 50. 10. N.

TOPOLITZ, a town of Bohemia, in the circle of Leutmeritz, near which the Austrians defeated the Prussians in 1762. It is 14 miles W.N.W. of Leutmeritz. Long. 14. 10. E. Lat. 50. 36. N.

TOPOLITZA, a town of Turkey in Europe, in Moldavia, 12 miles S.W. of Niemez. Long. 26. 9. E. Lat. 46. 51. N.

TOPOLTZAU, a town of Hungary, 42 miles N.E. of Presburg, and 68 E. of Vienna. Long. 17. 30. E. Lat. 48. 35. N.

TOPSHAM, a town of Devonshire, with a market on Saturday. It is seated on the Ex, five miles S.E. of Exeter (of which it is the port), and 170 S.W. of London. Long. 3. 26. W. Lat. 50. 39. N.

TOR, or **ELTOR**, a town of Arabia Petrea, seated on the Red Sea, with a good harbour defended by a castle. Here is a Greek convent, in the garden of which are fountains of bitter water, pretended to be those which Moses rendered sweet, by throwing in a piece of wood. Long. 33. 45. E. Lat. 28. 27. N.

TORBLIA, a town of Piedmont, in the county of Nice.

Here is an ancient tower, of Gothic architecture, and in the environs are found many remains of Roman monuments. It is seven miles E. of Nice.

TORBOLE, a town of Italy, in the Trentino, 14 miles S.E. of Trent. Long. 11. 30. E. Lat. 45. 56. N.

TORCELLO, a town of Italy, in the territory of Venice. It is thin of people, on account of the unwholesome air, and seated in a small island, seven miles N. of Venice. Long. 12. 9. E. Lat. 45. 32. N.

TORDA, or **TORENBURG**, a town of Transylvania, famous for its salt-works. The Hungarian language is said to be spoken with the greatest purity in this town. It is 15 miles W.N.W. of Clautenburg, and 38 N.W. of Hermanstadt. Long. 23. 13. E. Lat. 46. 50. N.

TORDESILLAS, a fortified town of Spain, in Leon, with a magnificent palace; where Queen Joan, mother of Charles V. ended her melancholy days. It is seated in a country fertile in corn and wine, on the river Douero, 24 miles W. of Valladolid, and 75 S.E. of Leon. Long. 4. 56. W. Lat. 41. 48. N.

TORGAU, a town of Upper Saxony, in Saxony Proper. It has a castle, the stair-case of which is built in such a manner, that a person may ride in a chaise to the top of it. The inhabitants brew excellent beer, which they send to other places on the Elbe, on which the town is seated. Here the King of Prussia obtained a great victory over the Austrians in 1760. It is 27 miles N.E. of Leipzig, and 35 N.W. of Dresden. Long. 13. 3. E. Lat. 51. 34. N.

TORIGNY, a town of France, in the department of the Channel, with a magnificent castle, seated on a rivulet, seven miles S.E. of St. Lo. Long. 0. 42. W. Lat. 49. 0. N.

TORMES, a river of Spain, which rises in the mountains of Avila, in Castile, passes by Alva, Tormes, and Salamanca, and falls into the Douero, below Miranda-de-Douero.

TORNA, or **TORNAW**, a fortified town of Upper Hungary, capital of a county of the same name, with a castle. It is seated on an eminence, on the river Sayo, 22 miles W. of Cassovia. Long. 20. 43. E. Lat. 48. 50. N.

TORNE, a river of Sweden, which rises in the mountains of Norway, forms a lake of the same name, and flowing S.E. falls into the gulph of Bothnia, at Tornea.

TORNEA, a town of Sweden in West Bothnia, capital of a territory of the same name, with a good harbour. It is a place of some trade, because all the Laplanders in those parts come and exchange their skins and other articles, for what they want. The houses are low, and the cold so severe, that sometimes people lose their fingers and toes. It is seated at the mouth of the Torne, at the N. extremity of the gulph of Bothnia, 180 miles N.E. of Uma, and 420 N.N.E. of Stockholm. Long. 24. 17. E. Lat. 65. 51. N.

TORNOVA, a town of Turkey in Europe, in Janna, with a bishop's see. It is seated at the foot of Mount Dragonzia, on the river Salempria, 10 miles N.W. of Larissa. Long. 22. 36. E. Lat. 39. 52. N.

TORO, a town of Spain, in Leon, seated on a hill, on the river Douero, in a country fertile in corn and fruits, and whose vineyards yield excellent red wine. It is 37 miles N. by E. of Salamanca, and 100 N.W. of Madrid. Long. 5. 2. W. Lat. 41. 39. N.

TORELLA-DE-MONGRIS, a sea-port of Spain, in Catalonia, famous for a battle gained by the French over the Spaniards, in 1694. It is seated near the mouth of the Tor, in the Medierranean, at the foot of the Pyrenées, 19 miles E. by S. of Gironna, and 60 N.E. of Barcelona. Long. 3. 18. E. Lat. 41. 55. N.

TORPERLEY, a town in Cheshire, nine miles E. of Chester. It was formerly a borough, and had a market.

TORRE-DEL-GRECO, a town of Naples, in Terra-di-Lavoro, seated at the foot of Mount Vesuvius, on the bay of Naples, five miles S.E. of that city. It was destroyed by an eruption of Vesuvius in 1631; and in 1794 was overwhelmed by a torrent of lava, from that volcano. The inhabitants, however, to the amount of 18,000, escaped with their lives, about 15 excepted; and the town is now rebuilding on the lava that covered the former habitations.

TORRE DE MONCORVO, a town of Portugal, in Tra los Montes, surrounded with a wall, and defended by a bastion and a castle. It is 27 miles S.E. of Mirandela, and 42 S.S.W. of Braganza. Long. 5. 55. W. Lat. 41. 0. N.

TORRE DE LAS SALINAS, a town of Spain, in Valencia, near the coast of the Mediterranean, which carries on a great trade in salt, procured from a small lake formed by saline springs. This is the most considerable salt-work in all Spain. It is 20 miles S.E. of Origuella, and 37 N.N.E. of Cartagena. Long. 0. 50. W. Lat. 37. 58. N.

TORREJO, a town of Spain, in New Castile, 15 miles S. of Madrid. Long. 3. 21. W. Lat. 40. 10. N.

TORRES, a sea-port of Spain, in Granada, seated on the Mediterranean, 45 miles S.W. of Granada. Long. 3. 56. W. Lat. 36. 39. N.

TORRES NOVAS, a strong town of Portugal, in Estremadura, with a castle. It is surrounded by walls, and seated in a fertile plain, on the river Almonda, 55 miles N.E. of Lisbon. Long. 8. 8. W. Lat. 39. 10. N.

TORRES VEDRAS, a town of Portugal, in Estremadura, with a castle, seated near the Atlantic, in a country abounding in corn, fruits, and good wine, 17 miles S. of Lisbon.

TORRIGLIA, a town of Italy, in the territory of Genoa, 10 miles N. of Genoa. Long. 8. 44. E. Lat. 44. 34. N.

TORRINGTON, a corporate town in Devonshire, with a market on Saturday. It has two churches, a manufacture of stuffs, and is governed by a mayor. Some remains of a castle are still visible. It is seated on the Towridge, over which is a bridge, 11 miles S. by W. of Barnstaple, and 194 W. by S. of London. Long. 4. 0. W. Lat. 51. 4. N.

TORSIL, a town of Sweden, in Sudermania, seated on the S. bank of the lake Maeler, 43 miles W. of Stockholm. Long. 17. 20. Lat. 59. 20. N.

TORTOLA, the principal of the Virgin Islands, in the West Indies, 18 miles long and seven broad. It formerly belonged to the Dutch, who built a strong fort, from which they were expelled by the English in 1666. It produces excellent cotton, sugar, and rum, and of late years has undergone great improvements. Its fruits, of which there are no great variety, are but indifferent; some apples excepted. The entrance into the harbour is at the E. end of the island. Long. 63. 0. W. Lat. 18. 33. N.

TORTONA, a fortified town of Italy, in the duchy of Milan, capital of the Tortonese, with a bishop's see, and a castle on an eminence. It is deemed a considerable frontier place; was taken by the allies in 1744, by the Spaniards in 1745, and by the French in 1796. It is seated on the Scrivia, 28 miles S.E. of Casal, and 27 S.W. of Milan. Long. 8. 58. E. Lat. 45. 8. N.

TORTORELLA, a town of Naples, in Principato Citeriore, five miles N.E. of Policastro.

TORTOSA, a city of Spain, in Catalonia, with a bishop's see, a university, and a citadel. It is divided into the Old and New Town, both surrounded by modern fortifications. The entrance is over a large bridge of boats, on the river Ebro, whose head is fortified. It has a great number of

churches and religious houses; among which the cathedral, the royal college of Dominicans, and the convent of the Carmelites, are the most remarkable. It is situated in a country fertile in corn and fruits, and abounding with quarries and mines of silver, iron, alabaster, jasper of divers colours, and stones with veins of gold. Here is a great deal of silk and oil, and very fine potters-ware, which resembles porcelain. It is seated partly on a plain, and partly on a hill, 35 miles S.W. of Tarragona, and 180 E. of Madrid. Long. 0. 35. E. Lat. 40. 53. N.

TORTUGA, an uninhabited island near the coast of Terra Firma, 40 miles W. of the island of Margareta, and about 30 miles in circumference. The E. end is full of bare rugged broken rocks, which stretch a little way out to sea. At this end is a large salt pond, where the salt begins to kerm in April; and there have been 20 ships here at a time for salt. At the west end is a small harbour with fresh water; and it is full of low trees. There are a few goats on it; and the turtles or tortoises come upon the sandy banks to lay their eggs, whence this island has its name. It was formerly much frequented by the bucaniers. Long. 64. 50. W. Lat. 11. 38. N.

TORTUGA, an island of the West Indies, near the north coast of the island of Hispaniola, where the French bucaniers used to fortify themselves. It is about 80 miles in circumference, and has a safe harbour, but difficult of access. Long. 75. 10. W. Lat. 20. 10. N.

TOSA, a sea-port of Spain, in Catalonia, seated at the bottom of a bay, which forms a good harbour, where vessels are sheltered from all winds, except the S.W. It is built partly on a plain, and partly on a steep hill, which projects into the sea. On the top of the hill, nearer the sea, is a strong citadel, with other fortifications. It is 37 miles N.E. of Barcelona. Long. 2. 54. E. Lat. 41. 42. N.

TCSCANELLA, a town of Italy, in the patrimony of St. Peter, 35 miles N. of Rome. Long. 12. 35. E. Lat. 42. 20. N.

TOSENA, a town of Sweden, in West Gothland, 20 miles W.N.W. of Uddevalla. Long. 12. 2. E. Lat. 58. 33. N.

TOSSO, a town of Sweden, in West Gothland, 42 miles N.N.E. of Uddevalla. Long. 12. 15. E. Lat. 58. 51. N.

TOTNESS, a borough in Devonshire, with a market on Saturday. It is seated on the river Dart, on the side of a hill, and had formerly a castle and walls. It sends two members to parliament, is governed by a mayor, and has a manufacture of ferges. It is 27 miles S.W. of Exeter, and 106 W. by S. of London. Long. 3. 44. W. Lat. 50. 24. N.

TOUL, a town of France, in the department of Meurthe. Before the revolution it was a bishop's see, and the cathedral and late episcopal palace are handsome structures. It was an imperial town of Germany, till taken by the French in 1552. It is seated on the Moselle, in a plain almost surrounded by mountains, 10 miles west of Nancy, and 167 S.E. of Paris. Long. 6. 2. E. Lat. 48. 40. N.

TOULOMBA, or **TULMABINI**, a fortress of Hindoostan Proper, in Lahore, seated on the Rauvee, 70 miles E.N.E. of Moulton.

TOUR, a town of France, in the department of Puy de Dôme, 22 miles S. of Clermont. Long. 3. 10. E. Lat. 45. 25. N.

TOUR DE ROUSILLON, a town of France, in the department of Eastern Pyrenees, seated on a hill near the river Tet, two miles below Perpignan.

TOUR DU PIN, a town of France, in the department

of Here, seated on a river of the same name, 24 miles S. of Vienne.

TOUR LA BLANCHE, a town of France, in the department of Dordogne, 15 miles N.W. of Périgueux. Long. 0. 40. E. Lat. 45. 18. N.

TOUR LA VILLE, a town of France, in the department of Charente, separated from Cherbourg by a river.

TOURANCOURCHY, a town of Hindoostan, in the Carnatic, 35 miles S.S.W. of Trichinopoly. Long. 78. 36. E. Lat. 47. 50. N.

TOURINE, a town of Germany, in the bishopric of Liege, 13 miles N.E. of Namur. Long. 5. 0. E. Lat. 50. 36. N.

TOURNAN, or **TOURNANS**, a town of France, in the department of Seine and Marne, 22 miles E. by S. of Paris. Long. 2. 45. E. Lat. 48. 43. N.

TOURNAY, a considerable city of Austrian Flanders, capital of the Tournaysis, with a bishop's see, and a strong castle. It has several fine manufactures, and is particularly famous for good stockings. The cathedral, and the abbey of St. Martin, are very magnificent. It was taken by the allies in 1709, and ceded to the house of Austria by the treaty of Utrecht; but the Dutch were allowed to place a garrison in it, as one of the barrier towns. It was taken in 1745, by the French, who demolished the fortifications, but restored it in 1748. In 1781, the Emperor Joseph obliged the Dutch to withdraw their garrison. It was again taken by the French in 1792: they were obliged to abandon it in 1793, but re-entered it again, on the final conquest of Austrian Flanders, in 1794. It is seated on the Scheld, which divides it into two parts, that are united by a bridge, 14 miles S.E. of Lille, 30 S.W. of Ghent, and 135 N. by E. of Paris. Long. 3. 28. E. Lat. 50. 33. N.

TOURNEHEM, a town of France, in the department of Straits of Calais, nine miles N.W. of St. Omer.

TOURNIQUET (*Encycl.*). A patent was lately granted to Mr. Savigny, of King's-street, Covent-garden, for an improved tourniquet. The construction of it will be understood from the following description:—In a brass frame are placed two brass rollers, the one fixed, the other moveable on its axis. To the former of these rollers is fastened the bandage, which is to encircle the limb, and which, being drawn over the moving roller, is fastened by a kind of buckle. A plate of brass, being in shape a segment of a circle, is pressed against the limb by the turning of a screw, till it produce the requisite degree of tightness.

TOURNON, a town of France, in the department of Ardèche, with a fine college, and a castle. It is seated on the declivity of a mountain, near the river Rhone, 40 miles W. of Grenoble, and 280 S. by E. of Paris. Long. 4. 50. E. Lat. 45. 6. N.

TOURNUS, a town of France, in the department of Saône and Loire, seated on the Saône, in a country fertile in corn and wine, 15 miles S. of Chalons, and 202 S. by W. of Paris. Long. 5. 0. E. Lat. 46. 34. N.

TOURS, a considerable city of France, capital of the department of Indre and Loire. From an archiepiscopal see it has been lately reduced to a bishopric, suffragan to that of Bourges. It is seated on the Loire, and near the Cher. Over the former is one of the finest bridges in Europe, consisting of 15 elliptic arches, each 75 feet diameter: three of these were carried away by the breaking-up of ice in 1789. The principal church is remarkable for the delicacy of its structure, its curious clock, its mosaic pavement, and its rich library of manuscripts. Under the ministry of Cardinal Richelieu, 27,000 persons were here employed in the

silk manufacture; but now the whole number of inhabitants is only 22,000. The red wines of Tours are much esteemed. In one of the suburbs is the late abbey of Marmoutier, reputed the most ancient in the West. Near the city is Plessis-les-Tours, a late royal palace, built by the profligate and superstitious Lewis XI. who died here, in 1483, notwithstanding he had the precaution to be covered all over with relics. Tours is 62 miles N.N.E. of Poitiers, 54 E. of Angers, and 127 S.W. of Paris. Long. 0. 47. E. Lat. 47. 24. N.

TOUSERA, a town of Barbary, capital of Biledulgerid, seated in a country abounding in dates, and dependent on the kingdom of Tunis. Long. 10. 55. E. Lat. 32. 30. N.

TOWCESTER, a town in Northamptonshire, with a market on Tuesday. It was once strongly fortified, and is seated on a small river, 52 miles S.E. of Coventry, and 60 N.W. of London. Long. 1. 15. W. Lat. 52. 4. N.

TOWTON, a village in the West Riding of Yorkshire, S.E. of Tadcaster. It is famous for that bloody battle between the forces of the houses of York and Lancaster, so fatal to the latter, on Palm-Sunday, 1461.

TOWY, a river of S. Wales, which rises in Cardiganshire, enters Carmarthenshire at its N.E. extremity, and passing by Carmarthen, enters the British Channel.

TRAARBACH, a town of Germany, in the circle of Upper Rhine and county of Sponheim, 20 miles E.N.E. of Treves, and 34 S.W. of Coblenz. Long. 6. 45. E. Lat. 50. 2. N.

TRACHENBURG, or **DRACHENBURG**, a town of Germany, in Silesia, and capital of a principality of the same name. It is seated on the Barch, 12 miles N.E. of Wola, and 26 N. of Breslaw. Long. 17. 15. E. Lat. 51. 30. N.

TRAJANAPOLI, a town of Turkey in Europe, in Romania, with a Greek archbishop's see, though it is small and thin of people. It is seated on the Marica, 37 miles S.W. of Adrianople, and 112 N.W. of Constantinople. Long. 26. 18. E. Lat. 41. 15. E.

TRAJETTO, a town of Naples, in Terra di Lavoro, built on the ruins of the ancient Minturna. Here are the ruins of an amphitheatre and an aqueduct. It is seated near the mouth of the Garigliano, in the Mediterranean, 25 miles N.W. of Capua. Long. 14. 4. E. Lat. 41. 20. N.

TRAIN, a town of Germany, in Upper Bavaria, situate on the Ambs, five miles S. of Abensberg, and 20 E. of Ingoldstadt. Long. 11. 52. E. Lat. 48. 40. N.

TRAINA, a town of Sicily, in Val di Demona, seated on a high mountain, at the source of the river Traina, 22 miles W. of Mount Etna, and 70 S.W. of Messina. Long. 14. 30. E. Lat. 37. 46. E.

TRALEE, a borough and sea-port of Ireland, in the county of Kerry, seated near a bay of the same name, seven miles S.S.E. of Ardiert. Long. 9. 36. W. Lat. 52. 12. N.

TRALEBORG, a sea-port of Sweden, in the province of Schonen, near the Baltic, 19 miles S. of Uund. Long. 13. 5. E. Lat. 55. 20. N.

TRANCHIN, a town of Upper Hungary, capital of a county of the same name. The castle stands so high, that it may be seen at the distance of near 30 miles. There are two warm baths within a mile of this place, and a great number of mineral springs in the adjacent country. It is seated on the Waag, 50 miles N.E. of Preiburg. Long. 17. 50. E. Lat. 49. 56. N.

TRANCON, a town of Portugal, in Tra los Montes, with a castle, seated in a fertile country, 14 miles W. by S. of Pinhel. Long. 7. 0. E. Lat. 40. 44. N.

Transplanter.

German Washing-Machine.

Tumbrel.

M^r Besant's Undershot Water-Wheel.

TRANI, a sea-port of Naples, in Terra di Bari, with a castle, and an archbishop's see. It is the usual residence of the governor of the province; but is much decayed since the harbour has been choked up with mud. It is seated on the gulf of Venice, 20 miles W. of Bars, and 125 N. by E. of Naples. Long. 16. 36. E. Lat. 41. 18. N.

TRANQUEBAR, a town of Hindoostan, on the coast of Coromandel, with a fort and factory, belonging to the Danes. It is seated at the mouth of the Cauvery; 65 miles S. of Madras. Long. 79. 47. E. Lat. 10. 44. N.

TRANSPLANTER, an instrument calculated for expeditiously raising plants with their roots, and configning them to other parts of the field in which they grow. Notwithstanding every precaution, it frequently happens in turnip-fields that large spots remain barren. In Pl. 54. we have given a representation of a simple instrument invented by Mr. Gray, of South Repps, Norfolk, for the purpose of filling up such vacant spaces from the adjoining parts of the same field; and which has also been employed for transplanting other vegetables.

The handle A, must be held with the left hand; and the short handle B, drawn up with the right. The planter should next be put over the vegetable intended to be taken up, and forced into the ground with the foot: it is then to be twisted round, and carefully drawn up, so that the earth may adhere to the root. A hole should, in the mean time, be made by an assistant, furnished with a similar instrument, for the reception of the turnip; the root may be conveyed in the first planter, and deposited in the cavity; after which, the right hand being kept steady, the left must be gradually raised; when the earth and plant will be left in the hole undisturbed.

TRAO, or **TRAU**, a strong town of Venetian Dalmatia, with a bishop's see. It is seated on the gulf of Venice, in a small island, joined to the mainland by a long bridge of wood, and to the isle of Buia by another of stone, 27 miles S.E. of Sebenico. Long. 17. 52. E. Lat. 44. 0. N.

TRAPANI, or **TRAPANO**, a sea-port on the W. side of Sicily, in Val di Mazara, with a fort, and an excellent harbour, in the form of a sickle, whence its ancient name Drepanum. It contains 20,000 inhabitants, and is a trading place, famous for its salt-works, and fisheries of tunnies and coral. It is seated on a small peninsula, 20 miles N. of Mazara, and 45 W. of Palermo. Long. 12. 20. E. Lat. 38. 10. N.

TRAPPE, a once celebrated monastery of France, in the department of Orne, situate in a large valley, surrounded by mountains. The monks were famous for their austerity, and keeping perpetual silence.

TRARBACH, a town of Germany, in the palatinate of Lower Rhine, and country of Spanheim, seated on the Moselle. Its fortress, which is on a mountain, and commands the passage of the Moselle, was taken by the French in 1794. It is 22 miles N.E. of Treves, and 28 S.W. of Coblenz. Long. 7. 7. E. Lat. 49. 55. N.

TRAVANCORE, a province of Hindoostan, extending along the coast of Malabar from Cape Comorin to 10. 15. N. lat. and bounded on the N. by Myfore, and on the E. by the Carnatic. It is subject to a rajah, who is an ally of the English East-India Company, and in defence of whom they engaged, in conjunction with the Mahrattas and the nizams of the Deccan, in the war against Tippoo Sultan.

TRAVANCORE, the capital of a province of the same name, in the peninsula of Hindoostan, 100 miles S.S.E. of Cochin. Long. 77. 8. E. Lat. 3. 15. N.

TRAVUNDE, a strong town of Germany, in the VOL. X.

duchy of Holstein, seated at the mouth of the Trave. It is the port of Lubec, to which it belongs, and is 12 miles N.E. of that city. Long. 10. 55. E. Lat. 54. 1. N.

TRAVERS, a town of Switzerland, in the county of Neuchatel, 11 miles W. of Neuchatel. Long. 6. 50. E. Lat. 47. 6. N.

TRAUNSTEIN, a town of Germany, in Upper Bavaria, seated on the river Traun. Near it are springs of salt-water.

TRAUTENAU, a town of Bohemia, in the circle of Koniggratz, 21 miles north of Koniggratz. Long. 16. 6. E. Lat. 50. 45. N.

TRAGUYERA, a town of Spain, in Valencia, 30 miles S. of Tortosa. Long. 0. 50. E. Lat. 40. 26. N.

TREBBIN, a town of Upper Saxony, in the middle marche of Brandenburg, 10 miles S.S.E. of Potsdam, and 20 S.S.W. of Berlin. Long. 13. 50. E. Lat. 52. 44. N.

TREBIA, a river of Italy, which rises in the territory of Genoa, washes Bobio in the Milanese, and falls into the Po, above Placentia. On the banks of this river the Romans, under the consul Sempronius, were defeated by Hannibal.

TREBIGNI, or **TREBIGNA**, a town of Turkish Dalmatia, with a bishop's see. The inhabitants are partly Turks and partly Greeks, and there are some Papists. It is seated on the gulf of Venice, on the river Trebignka, 14 miles N. of Ragusa. Long. 18. 11. E. Lat. 43. 4. N.

TREBISSIACI, a town of Naples, in Calabria Ulteriore, seated on the Tarento, five miles E. of Cassano.

TREBISOND, a large and strong sea-port of Turkey in Asia, in Natolia, with a Greek archbishop's see, and a castle. It is seated at the foot of a very steep hill. The walls are square and high, with battlements; and are built with the ruins of ancient structures, on which are inscriptions not legible. The town is not populous; for there are more woods and gardens in it than houses, and these but one story high. The castle is seated on a flat rock, with ditches cut in it. The harbour is at the E. end of the town, and the mole built by the Genoese is almost destroyed. It stands on the Black Sea, 104 miles N.N.W. of Erzerum, and 440 E. of Constantinople. Long. 40. 25. E. Lat. 40. 45. N.

TREBITZ, a town of Germany, in Moravia. It has a manufacture of cloth, and is seated on the Iglaw, 21 miles S.E. of Iglaw, and 52. N.W. of Budweis. Long. 16. 12. E. Lat. 49. 4. N.

TREBNITZ, a town of Germany, in Silesia, with a large nunnery. Near it is a hill consisting of a soft clay, or stone, which is immediately formed into vessels of all kinds; and on being exposed to the air, they become as hard as if they had been baked. It is 12 miles N. of Breslaw. Long. 17. 15. E. Lat. 51. 15. N.

TREFFURT, a town of Upper Saxony, in the landgrate of Hesse, with a castle. It belongs to the elector of Mentz, and is seated near the Verta, 22 miles W. of Saxe-Gotha. Long. 10. 19. E. Lat. 51. 8. N.

TREGANNON, a corporate town in Cardiganhire, with a market on Thursday. It is governed by a mayor, and seated on the Tyvy, 15 miles S.E. of Aberystwith, and 202 W. by N. of London. Long. 3. 56. W. Lat. 52. 13. N.

TREGONY, a borough in Cornwall, with a market on Saturday. It is much decayed, has no church, and only 150 houses poorly built, but is governed by a mayor, and sends two members to parliament. It is seated on a creek by Falmouth haven, 41 miles W. by S. of Plymouth, and 245 of London. Long. 4. 43. W. Lat. 50. 16. N.

TREGUIER, a sea-port of France, in the department of 12 X

the North Coast, seated near the English Channel, 22 miles N.W. of St. Brieux. Long. 3. 10. W. Lat. 48. 47. N.

TREILEBURG, a sea-port of Sweden, in the province of Schonen, seated on the Baltic, 50 miles S.E. of Copenhagen. Long. 13. 26. E. Lat. 55. 26. N.

TREMESEN, or TLEMSSEN, a province of the kingdom of Algiers, 370 miles long and 125 broad: bounded on the N. by the Mediterranean, on the E. by the province of Africa, on the S. by the desert of Zahara, and on the W. by the kingdom of Fez. It is dry, barren, and mountainous, except on the N. side, where there are plains abounding in corn, fruits, and pastures. The capital, of the same name, is surrounded by strong walls, and inhabited by poor Arabs, Moors, and Jews. Long. 1. 29. W. Lat. 34. 40. N.

TREMITI, three islands of Italy, in the gulf of Venice, 15 miles from the coast of Naples. They are called Capraria, St. Nicolo, and St. Domino.

TREMOUILLE, a town of France, in the department of Vienne, seated on the Benualle, 23 miles E. by S. of Poitiers. Long. 1. 10. E. Lat. 46. 29. N.

TREMP, a town of Spain, in Catalonia, seated on the river Noguera Pallaresa, 85 miles N.W. of Barcelona.

TREPTOW, a town of Upper Saxony, in Prussian Pomerania. It has a manufacture of stockings and woollen stuffs, and is seated on the Rega, near its mouth, in the Baltic, 43 miles N.E. of Stetin. Long. 15. 19. E. Lat. 54. 10. N.

TREPTOW, a town of Upper Saxony, in Anterior Pomerania, 50 miles S. of Stralsund, and 50 W.N.W. of Stetin. Long. 13. 12. E. Lat. 53. 39. N.

TRESEN, or TROSA, a sea-port of Sweden, in Sudermania, seated on the Baltic, 35 miles S.W. of Stockholm. Long. 17. 29. E. Lat. 53. 0. N.

TRETHIMROW, a strong town of Poland, in Volhnia, seated on the Dniester, 45 miles below Kiof.

TREUCENBRIETZEN, a town of Upper Saxony, in the middle marche of Brandenburg, 20 miles S. of Brandenburg, and 34 S.W. of Berlin. Long. 12. 43. E. Lat. 52. 5. N.

TREVI, a town of Italy, in Umbria, 23 miles S.E. of Perugia. Long. 11. 51. E. Lat. 42. 54. N.

TREVIGLIO, a town of Italy, in the duchy of Milan, 17 miles E.N.E. of Milan. Long. 9. 28. E. Lat. 45. 35. N.

TREVIGO, a town of Naples, in Principato Ulteriore, with a bishop's see, 23 miles E. of Benevento. Long. 15. 20. E. Lat. 42. 6. N.

TREVINO, a strong town of Spain, in Biscay, with a citadel, seated on a hill, near the river Aguda, 10 miles S.W. of Vittoria. Long. 3. 4. W. Lat. 42. 48. N.

TREVISANO, a marquitate of Italy, in the republic of Venice; bounded on the E. by Friuli and the gulf of Venice, on the S. by that gulf, the Dogado, and the Paduano, on the N. by the Feltrino and the Bellunese, and on the W. by the Vicentino. The soil is fertile, and produces corn, wine, and wood: and they export cattle, silk, and woollen cloth. Treviso is the capital.

TRIEST, a strong sea-port of Germany, in Carniola, with a bishop's see. The harbour is spacious, but not good; being open to the W. and S.W. winds. The inhabitants have a good trade in salt, oil, almonds, iron, &c. brought from Laubach; and they make good wines. It is seated on the side of a hill, on the gulph of Venice, eight miles N. of Capo d'Istria, and 80 N.E. of Venice. Long. 14. 4. E. Lat. 45. 56. N.

TRIM, the county-town of E. Meath, in Ireland, seated on the Boyne, 23 miles N.W. of Dublin.

TRINCOMALE, a town on the E. side of the island of Ceylon, with a harbour, reckoned the finest in the East Indies. It was taken from the Dutch, by the English, in January, 1782; retaken by the French in August following; retaken to the Dutch by the peace of 1783; and again taken by the English in August, 1795. It is seated on a gulf of the same name, 100 miles N.E. of Candy. Long. 81. 52. E. Lat. 8. 45. N.

TRING, a town in Hertfordshire, with a market on Friday, 22 miles W. of Hertford, and 31 W.N.W. of London. Long. 0. 36. W. Lat. 51. 46. N.

TRINIDAD, a sea-port of New Spain, in the audience of Guatimala, seated on the Pacific Ocean. It is an open town, but very important, there being no other harbour on this coast. A mile and a half hence is a place which the Spaniards call one of the Mouths of Hell; because it is continually covered by a thick smoke, and emits flames from time to time. It is 70 miles S.E. of Guatimala. Long. 89. 30. W. Lat. 12. 50. N.

TRINIDAD, a town of New Granada, seated on the Rio de la Magdalena, 58 miles N.W. of St. Fede Bogota. Long. 73. 45. W. Lat. 4. 45. N.

TRINITY, or LA TRINITE, a sea-port of Martinico. The harbour is spacious and safe, and the town carries on a considerable trade. Long. 61. 8. W. Lat. 14. 53. N.

TRINO, a fortified town of Italy, in Monterrat, subject to the King of Sardinia. It was taken, in 1704, by the French, who abandoned it in 1706. It is seated near the Po, eight miles N.W. of Casal, and 35 N.E. of Turin. Long. 8. 30. E. Lat. 45. 26. N.

TRINOMALY, a town of Hindoostan, in the Carnatic, near which the troops of Hyder Ally were defeated by the British under Colonel Smith in 1768. It is 45 miles S.S.W. of Arcot, and 52 W.N.W. of Pondicherry. Long. 78. 35. E. Lat. 12. 2. N.

TRIST, a small uninhabited island of New Spain, on the coast of Tabasco, in the bay of Campeachy, separated by a narrow channel, on the E. from the isle of Port Royal. Long. of the E. point 92. 45. W. Lat. 18. 0. N.

TRISTAN D'ACUNHA, an island in the South Atlantic Ocean, 15 miles in circumference. The land is extremely high, and rises gradually toward the centre of the island (where there is a lofty conical mountain) in ridges covered with trees of a moderate size and height. The coast is frequented by sea-lions, seals, penguins, and albatrosses. Long. 11. 43. W. Lat. 37. 8. S.

TRITCHINOPOLY, a strong town of Hindoostan, in the Carnatic, 208 miles S.S.W. of Madras. Long. 78. 46. E. Lat. 10. 49. N.

TRIVENTO, a town of Naples, in Molise, with a bishop's see, seated on a hill, near the river Trigno, or Trino, 15 miles N. of Bogano, and 62 E. of Naples. Long. 15. 37. E. Lat. 40. 50. N.

TROCHTELFINGEN, an imperial town of Suabia, 16 miles N.W. of Buchan, and 29 S. of Stutgard. Long. 9. 7. E. Lat. 48. 18. N.

TROGEN, a town of Switzerland, and the chief place of the Protestant part of the canton of Appenzell. It is celebrated for its manufacture of cloth. Near it is a mineral spring containing copper, sulphur, and alum, used externally for several complaints. It is seven miles N. of Appenzell, and seven S.E. of St. Gall.

TROJA, a fortified town of Naples, in Capitanata, with a bishop's see, immediately under the pope. It is seated at the foot of the Appennines, on the river Chilaro, 32 miles N.E. of Benevento, and 60 N.W. of Naples. Long. 15. 15. E. Lat. 42. 21. N.

TROIS RIVIERES, a town of Upper Canada, on the river St. Lawrence, 55 miles S.W. of Quebec. Long. 71. 20. W. Lat. 46. 35. N.

TROKI, a town of Lithuania, capital of a palatinate of the same name. It is seated among morasses, 15 miles W. of Wilna, and 85 N.N.E. of Grodno. Long. 25. 13. E. Lat. 54. 38. N.

TRON, St. a town of Germany, in the bishopric of Liege, with a famous Benedictine abbey, 21 miles W.N.W. of Liege. Long. 5. 22. E. Lat. 50. 48. N.

TROPEA, a populous town of Naples, in Calabria Ulteriore, with a bishop's see. It was half ruined by an earthquake in 1638, and is seated on the top of a rock, on the E. coast, 10 miles N.W. of Nicotera, and 45 N. by E. of Reggio. Long. 16. 24. E. Lat. 38. 42. N.

TROPEZ, St. a sea-port of France, in the department of Var, with a citadel. It is seated on the bay of Grimaud, in the Mediterranean, 12 miles S.W. of Fréjus, and 58 E. of Marseilles. Long. 6. 44. E. Lat. 43. 16. N.

TROPAPU, a strong and considerable town of Germany, in Upper Silesia, capital of a duchy of the same name, with an ancient castle. It was taken by the Prussians in 1741 and 1756, but restored to the house of Austria by a treaty subsequent to each capture. It is seated in a pleasant plain, on the rivers Oppa and Mohra, 40 miles N. by E. of Olmutz, and 72 S. by E. of Breslaw. Long. 17. 40. E. Lat. 50. 1. N.

TROWBRIDGE, a town in Wiltshire, with a market on Saturday. The inhabitants are principally clothiers, who make superfine broad-cloth and kerseymer, in a great degree by machinery. It is seated on a hill, 23 miles S.W. of Marlborough, and 58 W. of London. Long. 2. 6. W. Lat. 51. 19. N.

TROYES, a considerable city of France, in the department of Aube, with a bishop's see. It is surrounded by good walls, but almost all the houses are of wood, and good water is wanting. Among the objects of curiosity are St. Stephen's, the principal church; the public library of the late Cordeliers; and the castle in which the ancient counts of Champagne resided. Its commerce, once very flourishing, now consists only in some linens, dimities, fustians, wax-chandlery, canals, and wine. It is seated on the Seine, 30 miles E.N.E. of Sens, and 90 E.S.E. of Paris. Long. 4. 10. E. Lat. 48. 13. N.

TRUGILLO, a town of Terra Firma, in Venezuela, 120 miles S. of the lake Maracaybo. Long. 7. 40. W. Lat. 9. 46. N.

TRUNS, a town of the country of the Grisons, where the independence of the Grey League was first ratified, and an alliance concluded between the chiefs and communities. It is seated on the Rhine, seven miles W. of Ilanz.

TRURO, a borough in Cornwall, with a market on Wednesday and Saturday. It has the benefit of the coinage of tin, and its chief business is in shipping tin and copper ore, found in abundance in its neighbourhood. Here, after the battle of Naseby, the forces of Charles I. under Lord Hopeston, surrendered to General Fairfax. Truro is seated in a vale, between the rivers Kenwyn and St. Allen, and at the very head of Falmouth Haven, 10 miles N. of Falmouth, and 257 W. by S. of London. Long. 4. 55. W. Lat. 50. 16. N.

TRUXILLO, a considerable town of Spain, in Estremadura, seated among mountains, on the side of a hill, at the top of which is a strong citadel. It is the birth-place of the noted Francis Pizarro, and situate near the river Almont, 65 miles S.W. of Toledo, and 117 S.E. of Madrid. Long. 5. 23. W. Lat. 39. 6. N.

TRUXILLO, a rich commercial sea-port of Peru, in the audience of Lima, built by Francis Pizarro, in 1533. In its territory are above 50,000 native Americans, who are tributary to Spain. It is seated in a fertile country, on a small river, near the Pacific Ocean, 300 miles N.W. of Lima. Long. 78. 35. W. Lat. 8. 1. S.

TRUXILLO, a strong sea-port of New Spain, in the province of Honduras, seated on a gulf of the same name, between two rivers, and surrounded by thick groves. Long. 85. 50. W. Lat. 16. 20. N.

TRUXILLO, of NUESTRA SEÑORA DE LA PAZ, a town of Terra Firma, in Venezuela, 220 miles S. of Maracaybo. Long. 69. 15. W. Lat. 9. 21. N.

TSCHOFA, a town of Upper Saxony, in the circle of Erzeburg, celebrated for its blue manufactures, seven miles S.E. of Chemnitz.

TSCHUTSKI, a country in the E. extremity of Asia, opposite the N.W. of America, bounded by the Anadir on the S. The attention of the natives is confined chiefly to their deer, with which their country abounds. They are a well-made, courageous, warlike race, and are formidable neighbours to the Koriacs, who often experience their depredations. The Russians have long endeavoured to bring them under their dominion; and though they have lost a great number of men, in their different expeditions to accomplish this purpose, they have never yet been able to effect it.

TSI-NAN-FOU, a celebrated city of China, the capital of Chang-tong. It was once the residence of a long series of kings, whose tombs, rising on the neighbouring mountains, afford a beautiful prospect. In its district are four cities of the second and 26 of the third class. It is seated S. of the river Tsi or Tsiang-ho, 160 miles S. by E. of Peking. Long. 117. 25. E. Lat. 36. 30. N.

TSI-NING-TCHOU, a city of China, in the province of Chang-tong, and district of Yen-tcheou-fou. From its situation on the grand canal, it is little inferior to the capital of the province, either in extent, population, riches, or commerce.

TSONG-MING, an island of China, on the coast of the province of Kiang-nan, to which it belongs, and from which it is separated by an arm of the sea, 13 miles broad. It is 50 miles long and 13 broad. It was formerly a sandy desert, to which criminals were banished: those that first landed on it began to till the ground, that they might not perish with hunger; some poor Chinese families emigrated thither afterward; and, in less than ten years, the island was peopled and cultivated. Its principal revenue arises from salt, which is made in such abundance that it can supply most of the neighbouring countries. In this island is only one city of the third class; but villages are so numerous, that they seem to touch each other, and to form one continued city. The country is delightful, and intersected by many canals. Long. of its S.E. end 121. 55. E. Lat. 30. 15. N.

TSUEN-TCHOU-FOU, a city of China, in the province of Fo-kien. In its district are seven cities of the third class; and its situation, extent, commerce, triumphal arches, temples, and well-paved streets, secure it a distinguished rank among the most beautiful cities in the empire.

TUBAN, one of the strongest towns in Java, with a harbour, and a king of its own. It is seated on the N. coast of the island. Long. 114. 51. E. Lat. 6. 0. S.

TUBE (*Encycl.*). The following remarks on the phenomena of capillary tubes, by M. Milon, is taken from the *Journal de Physique*.

The phenomena of capillary tubes are as follow: 1st, If one of these tubes be plunged in a fluid, such as water, alcohol, &c. the fluid rises within it above its external level; and this

elevation is in direct proportion to the smallness of the tube. 2d. But if it be plunged in mercury, instead of rising as above described, it is depressed; and this depression is also in direct proportion to the smallness of the tube.

In times, when the sciences were cultivated with less accuracy than at present, and when chemistry in particular was not enriched with that beautiful theory which now forms its basis, philosophers have long debated on the cause of this phenomenon now generally attributed to molecular attraction; the only point on which they differ being, that some admit both the phenomena of ascension and those of depression, while others only admit those of ascension.

The celebrated Haüy, in the third volume of the first part of the *Séances de l'Ecole Normale*, p. 40, after having described the first of the above-mentioned phenomena, says, "Mercury on the contrary remains below the level, and its depression is in inverse proportion to the diameter of the tube. But these effects presuppose that the tube is applied without preparation; for we shall presently see, that by means of certain precautions, the elevation of mercury above the level may in like manner be obtained." And in support of this assertion, he quotes, page 50 of the same volume, an experiment made at Metz, by Citizen Calbois, from which it appears, that the depression of the mercury arises merely from the moisture contained in the mercury and the tubes employed; which moisture, interposing itself between the mercury and the glass, neutralizes the attraction which the glass may have for that fluid; and that, on removing this moisture, mercury is governed by the general law above stated, and rises in capillary tubes in the same manner as other fluids.

On the other hand, Citizen Libes, in his new and excellent *Traité élémentaire de Physique*, vol. II. page 23, &c. explains the depression of mercury by observations to the following effect: "That although the glass may have some attraction for the mercury (a fact, which he proves, by a very simple experiment), the mutual attraction of the molecules of this fluid for each other is more considerable." This is proved by the following experiment: if a globe of mercury adhering to a plate of glass be presented to a mass of that metal, the globe abandons the glass and unites with the mercury. Hence he draws several very just inferences.

This contrariety of opinions must necessarily give rise to doubts, which it is important to clear up. The following is the process which has contributed to fix the opinion of M. Milon on this subject.

"I first," says he, "made the ordinary experiment with pure mercury, when the fluid was as usual depressed. I then poured the mercury into a small long-necked matrafs, and exposed it to the fire of a simple furnace by means of a sand bath. I placed this apparatus out of a window, which I shut, in order to observe what passed without exposing myself to the dangerous influence of the mercurial vapour. After a while, the mercury began to boil, and then becoming volatile, it collected about the sides of the matrafs in small drops, which fell down again in proportion as their weight increased. This continued about a quarter of an hour, after which I thought I might consider the mercury as deprived of all moisture. I then heated to a white heat the capillary tubes I intended to employ, and having only allowed time for these as well as the mercury to return to the temperature of the place where I performed the experiment, I plunged them in the mercury thus deprived of its moisture, and observed the same depression as in my former experiment.

"To ascertain that the depression of the mercury did not arise from the moisture that might remain in the tubes, notwithstanding the precautions I had taken, I placed two of these tubes perpendicularly in the mercury, and, approxim-

ing them to each other, I perceived the same result as before; for the nearer they approached, the more was the mercury depressed between them.

"It may be replied, perhaps, that the mercury had already attracted the humidity of the air. But I would answer, 1st, That the weather was then very dry: a circumstance by no means indifferent. 2d, That although the attraction of mercury for a certain portion of moisture may be considerable, it is not sudden; and that its union with surrounding water only takes place after a considerable interval of time, as, for instance, eight or ten hours, and that I was careful to perform the experiment with great dispatch.

"Hence I think I am authorized to believe, that the depression of mercury is constant, that the moisture of the mercury makes no alteration in this phenomenon which is peculiar to it; and that, if it rose above the level in the experiment of Citizen Calbois, which, though very different from mine as to the process pursued, ought to lead to the same result, the success of that experiment certainly depends on peculiar circumstances, which it would be well to examine: for, if the phenomenon of ascension took place with mercury when well purified from water, it would follow, that it has a stronger affinity to glass than to itself, which is contrary to experience."

TUBINGEN, a fortified town of Suabia, in the duchy of Wirtemberg, with a university, and a castle. Here is a large house called New Bau, where a certain number of students in law are lodged and boarded gratis; and in the town-house is a very curious clock. It is seated on the Neckar, in a country abounding in corn and wine, 20 miles S. of Stuttgart, and 50 E. by S. of Strasburg. Long. 9. 4. E. Lat. 48. 30. N.

TUCUYO, a town of Terra Firma, in Venezuela, and in a valley of the same name. A river runs through the middle of the valley, and the soil abounds in sugar-canes, cotton, and all the necessaries of life. Long. 69. 2. W. Lat. 7. 31. N.

TUDDINGTON, a town in Bedfordshire, with a market on Saturday, five miles N. of Dunstable, and 38 N.N.W. of London. Long. 0. 32. W. Lat. 52. 0. N.

TUDELA, a considerable town of Spain, in Navarre, with a castle. It is seated in a country that produces good wine, on the river Ebro, over which is a handsome bridge, 45 miles N.W. of Saragossa, and 140 N.E. of Madrid. Long. 1. 10. W. Lat. 42. 9. N.

TVER, a government of Russia, once an independent principality, united to the empire by Ivan Basilowitz, in 1490, and comprised in the government of Novogorod, from which it has been separated. The population has increased to a surprising degree; a circumstance evincing the advantage arising from the new code of laws of Catharine II. It was the first province newly-modelled according to that code; and it has experienced the beneficial effects of these excellent regulations. The country produces abundantly all kinds of corn and vegetables. Its forests yield the most valuable timber. The quadrupeds, and the feathered race, are the same as in all the N. of Europe; and, beside the fishes common to most lakes and rivers, there is a fish peculiar to the waters of these northern regions, called the sterlet, the *acipenser ruthenus* of Linnaeus, and is a species of sturgeon, highly esteemed for the flavour of its flesh, and for its roe, of which the finest caviare is made.

TVER, a commercial city of Russia, capital of a government of the same name, seated at the confluence of the Tverza and Volga, along which is conveyed all the merchandise sent by water from Siberia, and the S. provinces, toward Peterburgh. It is divided into the old and new town: the former,

situate on the opposite side of the Volga, consists almost entirely of wooden cottages: the latter having been destroyed by a dreadful conflagration, in 1763, has risen with lustre from its ashes. Catherine II. ordered a regular and beautiful plan of a new town to be made. At her own expence, she raised the governor's house, the episcopal palace, the courts of justice, the exchange, the prison, and some other public edifices; and to every person who engaged to build a house of brick, she offered a loan of 300*l.* for a year, without interest. The streets are broad and long; extending in straight lines, from an octagon in the centre; and the plan, when completed, is to comprise two octagons. The houses are of brick, stuccoed white, and make a magnificent appearance. Here is an ecclesiastical seminary, which admits 600 students. In 1796 the empress founded a school for the instruction of 200 burghers' children; and, in 1779, an academy for the education of 120 of the young nobility of the province. Tver is 99 miles N.N.W. of Moscow. Long. 36. 5. E. Lat. 56. 7. N.

TUGGURT, a country of Barbary, lying S. of Algiers, and W. of Biledulgerid. The capital, of the same name, is 310 miles S.E.E. of Algiers. Long. 5. 10. E. Lat. 33. 0. N.

TULA, a government of Russia, formerly a province of the government of Moscow. Its capital, Resan, is seated on the Trubesh, 118 miles S.E. of Moscow. Long. 40. 45. E. Lat. 55. 25. N.

TULEBRAS, a town of Spain, in Navarre, situate on the Queios, seven miles W. of Tudela.

TULLAMORE, a town of Ireland, in King's County, situate on a river of the same name, 44 miles W.N.W. of Dublin.

TULLES, a commercial town of France, in the department of Correze, with a bishop's see. The cathedral is famous for its steeple, which is very high and curious. It is seated at the confluence of the Borreze and Solane, partly on a mountain, and partly below it, in a country surrounded by mountains and precipices, 37 miles S.E. of Limoges, and 62 S.W. of Clermont. Long. 1. 42. E. Lat. 45. 23. N.

TULLOW, a town of Ireland, in the county of Carlow, eight miles E.S.E. of Carlow, and 38 S.S.W. of Dublin.

TULN, a town of Austria, near the Wienerwald, or wood of Vienna, with a bishop's see. It is seated near the river Tuhn, in a country abounding in corn and wine, 15 miles W. of Vienna. Long. 16. 6. E. Lat. 48. 14. N.

TULSK, a borough of Ireland, in the county of Roscommon, nine miles N. of Roscommon.

TUMBEEZ, a town of Peru, in the audience of Quito, where the Spaniards first landed on their discovery of that country. It was then a place of some note, distinguished by a stately temple, and a palace of the incas or sovereigns of the country. It is seated on the Pacific Ocean, 270 miles S. by W. of Quito. Long. 79. 51. W. Lat. 3. 40. S.

TUMBREL, a machine employed chiefly in the county of Lincoln; for the purpose of giving food to sheep, during the winter.

In the 4th vol. of the *Repository of Arts*, &c. we meet with a description of a contrivance which is equally simple and useful: we have, therefore, been induced to give a figure of it in Pl. 54.

It consists of a circular cage or crib, which may be made of willow, osiers, or similar pliant brushwood. The whole is ten feet in circumference, being closely wattled to the height of one foot, above which it is left open for the space of about eighteen inches; when it is again wattled to the height of eight or nine inches; an opening, eighteen inches broad, being left at the top for the purpose of putting in turnips, or other provender. The staves, forming the skeleton of the

machine above described, are ten inches apart, so that twelve sheep may feed at one time from each tumbrel.

Considerable advantages are derived from this method of feeding sheep; as it greatly reduces the expence of provender, which is thus prevented from being soiled with dung, or trodden under foot. In such a state of separation, the strongest animals cannot drive away the weaker sheep; each being secured by the head, while they are eating. Further, the construction of the tumbrel being attended with no difficulties, it may be readily procured, and be daily conveyed to any part of a farm: if proper care be taken, this utensil may be preserved in constant use, for eight or ten years.

TUMEL, a rapid river in Perthshire, which, after exhibiting many beautiful cataracts, forms itself into a lake, called Loch Tumel, and then falls into the Garry.

TUMEN, a town of Siberia, in the province of Tobolsk, 125 miles W. of Tobolsk.

TUMPACH, a town of Bavaria, in the Upper Palatinate, 17 miles N.N.W. of Amberg, and 32 E.N.E. of Nuremberg. Long. 11. 55. E. Lat. 49. 40. N.

TUNGINSKOL, a town of Russia, situate on the Irkut, 80 miles S.W. of Irkutsk. Long. 103. 15. E. Lat. 51. 18. N.

TUNJA, a town of New Granada, capital of a district of the same name. It is seated on a high mountain, in a country where there are gold and emeralds, 30 miles S.W. of Truxillo. Long. 73. 5. W. Lat. 5. 0. N.

TURA, a town of Germany, in the county of Tyrol, 24 miles S.W. of Trent.

TURKHEIM, a town of France, in the department of Upper Rhine, remarkable for a victory gained here by Turrenne, over the Austrians, in 1675. It is seated near the river Colmar, one mile N.W. of Colmar.

TURCOMANS, **TEREKEMENS**, or **TRUKHMENTIANS**, a people of Asia, who speak the Turkish dialect of the Tartar language, and inhabit the eastern slope of Mount Caucasus, the coast of the Caspian about Boinak, Derbent, and Utenish, and the southern promontories between the sea and the river Alazan. Some of them are subject to the khan of Cuba; others to a chief who resides at Nukhu; and a third to the sovereign of Georgia.

TURENNE, a town of France, in the department of Correze, with a castle, 42 miles S. of Limoges. Long. 1. 30. E. Lat. 45. 9. N.

TURINGE, a town of Sweden, in the province of Sudermland, 24 miles W.S.W. of Stockholm. Long. 17. 54. E. Lat. 59. 10. N.

TURINSK, a town of Russia, in the government of Tobolsk, 144 miles W. of Tobolsk. Long. 63. 44. E. Lat. 58. 5. N.

TURKIN, a town of Russia, in the government of Caucasus, situate on the Caspian Sea, 140 miles S. of Astracan. Long. 47. 15. E. Lat. 44. 15. N.

TURNDORF, a town of Bavaria, in the Upper Palatinate, 21 miles N.N.W. of Amberg, and 32 N.E. of Nuremberg. Long. 11. 55. E. Lat. 49. 42. N.

TURNHOUT, a town of Austrian Brabant. Here, in 1596, Prince Maurice of Nassau, at the head of only 800 cavalry, totally defeated the Spaniards, consisting of 6000 horse. It is 24 miles N.E. of Antwerp. Long. 5. 0. E. Lat. 51. 22. N.

TURNIP-DRILL, an agricultural implement, by means of which turnip-seed may be sown after the manner of the drill culture. The following account of some experiments to determine the comparative advantage of the drill or broadcast method in the cultivation of turnips, and description of a new invented drill, by the Rev. T. C. Munnings, of East Dereham, in Norfolk, is published in the Transactions of the

Society for the Encouragement of Arts, Manufactures, and Commerce, who conferred on the author their silver medal and ten guineas.

"Residing in a country," says Mr. Munnings, "in which the turnip-crop is very deservedly considered as the basis of its husbandry, I have, for some time, directed my attention, and made some experiments, relative to the improvement of the cultivation of that valuable vegetable; conceiving that in whatever degree I could more advantageously produce turnips, or when produced could provide for a more economical expenditure of the crop, I might fairly be regarded as in the same degree promoting the general and lasting interests of the community. With this view I have made repeated trials, to ascertain the comparative advantage of the drill or broad-cast method in the cultivation of turnips; and as the result of an experiment which I made last year has not only been satisfactory to myself, but also to all who have witnessed the effects of it, I am induced to offer myself a candidate for the premium held out by the Society.

"But, before I proceed to a detail of my experiments, I think it right to observe, that I have, *by way of preparation for turnips*, given my land a deeper ploughing in the winter than is customary with the neighbouring farmers. For this purpose, I made use of a Scotch foot-plough; and I think that by such ploughing I bring land into action, which has been for some time dormant; and which is therefore better suited to the turnip than land which has been exhausted by the production of other crops. In every other respect my previous management of my land corresponds with the common practice of my neighbours.

"My land being thus prepared, instead of sowing the turnips *broad-cast* in the usual method, I invented a drill for this purpose, simple in its construction, and of easy management. It consists of a tin box, in the shape of a barrel, affixed to the axis of a wheel, about twenty-two inches in diameter, vertical with the fume, and its revolutions dropping the seed through small apertures in the middle of the barrel. The holes through which the seed falls are distant from the wheel about fourteen inches. (See Plate 53, figs. 1, and 2.)

"I began by having the tops of the different ridges set out with the common Norfolk *two-horse* plough; and, when the same plough took up the furrow next to the top, I immediately followed with my drill, and dropped the seeds upon the fresh mould the instant it was turned up. I was then followed by a one-horse plough, the over that mould of which was quickly buried the seeds. I was thus enabled to sow my seed as fast as the land was ploughed, and to deposit them in regular and straight rows, at equal distances of about eighteen inches; after which I harrowed or rolled my land, in the same direction in which it was ploughed; and the consequence has been, that my crop has grown as regularly as a gardener could plant cabbages. Nearly six acres of my field were thus drilled, and on the same day (in the third week of June) the remainder of the field, or something more than three acres, was sown broad-cast, after the usual practice of the country, and precisely at the same time when the farmers around me were sowing their lands in a similar manner.

"In the course of my observations on the turnip-crop, I had frequently lamented that, when the crop was indeed abundant, the advantages derived from its expenditure were far from corresponding, because no effectual method has yet been adopted, to protect the turnips from the severity of a winter's frost. This, in the common method of *broad-cast*

sowing, I considered as impracticable, and therefore resolved to attempt it in my drilled crop; and in that crop I have been enabled by pulling up the alternate rows to leave regular rows about a yard apart, and have had the land so ploughed, with a one-horse plough, as to mould up the turnips, on each side, most effectually, and to assume the appearance of what is called *two-furrow work*. I have therefore half my crop so buried, as to lessen very materially, if not absolutely to prevent, the danger arising from the frequently fatal effects of a cutting frost.

"I am truly happy that the mildness of the present season prevents my speaking with greater confidence, as to the success of this part of my experiment, though the very complete manner in which the turnips are now buried, leaves me without much doubt but that it fully answers my expectations. Many very-experienced farmers, who have witnessed my proceedings, honour them with their entire approbation, and look upon my method of protecting my plants as a grand discovery in the management of the turnip-crop. I am certainly aware, that I am not the first person who has drilled turnips; but I know of no one who has before done it in so simple a manner—in a manner attended with less expense—in a manner admitting of so much ease, in future operations, for the defence of the plants—or in a manner more likely to be clearly understood by all who may be desirous of making similar experiments. Of the superior produce of the drilled crop over the broad-cast, on equal quantities of land, every experiment that I have made has most powerfully convinced me; and I have the universal opinion of all who have viewed my present crop, to confirm my sentiments. It has been observed by Mr. Kent, in his General View of the Agriculture of the County of Norfolk, that the ground does not relish turnips so well as formerly; and he supposes (in my opinion, with much justice), that the present comparative ignorance of the use of turnips amongst the Hanoverians, has arisen from the ground in that country being injured by repeated crops of them. It is certainly a very obvious truth, that turnips will grow in the greatest abundance on land not accustomed to bear them; but it has frequently occurred to me, that one material reason of failure, in a crop of turnips sown broad-cast, has arisen from the seed not being sown soon enough after the plough; as I have, in numberless instances, taken notice of turnips vegetating very partially, when only a few furrows have been ploughed between one sowing and another; and, in such cases, I have always thought that, if the seed could have been deposited immediately after the plough, it would not have failed to grow uniformly. I trust it will be found that my experiment powerfully tends to confirm this conclusion.

"In a part of my field, from which the alternate rows have not yet been taken, I have, with very great effect, used the hoe-plough, and have not only cut and destroyed whatever weeds were growing between the rows, but have also partially moulded up the apples of the turnips; and I am induced to believe that even so partial a moulding up, executed in the autumnal months, would have a strong tendency to protect the plants, to facilitate a more complete moulding up when part of the crop is removed, and to admit the full benefit resulting from the exposure of the earth to a winter's frost. I am persuaded that such use of the hoe-plough serves likewise to retain necessary moisture, and to produce future pulverisation with much less than common labour. But I have more particularly noticed the very superior verdure of the moulded-up plants, compared with what are not so, and with the larger and almost uninjured

tops of the former, in comparison with the latter; for, during some late frosts, the effects of which were very perceptible in the exposed plants, those moulded up have continued to grow, and to branch luxuriantly, with all the vigour of vernal vegetation. I attribute this to the bulbs of such plants not having their juices stagnated by the keennels of the weather.

"As I am anxious to have this subject fully submitted to the Society for the Encouragement of Arts, &c. allow me to say, that I consider my drill for turnips as much superior to any other, from the single circumstance of its depositing the seed *to instantly* after the plough, as entirely to preserve the good effects of the first evaporation; and that I conceive such evaporation produces the uniform vegetation of such minute seeds. So remarkably uniform was the vegetation last year, that in the six acres of my drilled plants, I believe there was not a deficiency of six square yards; though on three acres of broad-cast, before rain fell, not one half, perhaps not one-third part of the seeds vegetated. I am indeed fully persuaded that the drill method, in the cultivation of turnips, will in all seasons be superior to the broad-cast; but that the very great and striking difference between the two methods will most effectually be perceived in a season of uncommon drought; and it is for this reason that I am solicitous to procure for the drill-method an extensive and impartial trial, that agriculturists in general may be satisfactorily convinced of its important advantages.

"Of the following advantages attending my method of drilling turnips, I am satisfactorily persuaded:—in a dry time, as was the case last season, the seed, by being immediately dropped upon the fresh turned up mould, has consequently an increased probability of successful vegetation. By being buried somewhat deeper than in the broad-cast method, it receives more moisture in its infant state of vegetation; and by having, if I may so say, new hold of the earth, is less liable to injury, from the effects of continued drought. In confirmation of these persuasions I must state, that turnips sown on the same day, in the same field, broad-cast, on land in every other respect treated previously in the same way, have not produced one half or one third of a crop, and that the same has been very generally the case with turnips sown broad-cast; but that every row of my drilled plants has succeeded to admiration. The advantages in the subsequent management of the crop I have already spoken of. If therefore it be desirable to grow turnips to advantage, if it be desirable to protect them when grown, and by such protection be enabled to give stock, sound, uninjured turnips, instead of what may be more than half-rotten, or frost nipt almost to putrefaction; I would willingly flatter myself that the Society for the Encouragement of Arts, &c. will be convinced that, as far as any conclusion can be drawn from a single experiment in favour of one method rather than another, I have, beyond dispute, established the superiority of the drill-method of cultivating turnips.

"Of my previous experiments I am not able to furnish the Society with any satisfactory particulars; yet I would by no means omit to declare, that each has been the mean of persuading me, that the broad-cast method of cultivating turnips can never be so advantageous as that of the drill, when properly managed; and I have much satisfaction in assuring the Society, that, from the extraordinary success of my last year's experiment, many of my neighbours have expressed a resolution to drill, and to protect their turnips far the time to come.

"In addition to the advantages I have before stated, that any drilled plants growing in such straight and equidistant

rows, any noxious weeds, such as charlock, thistles, or feed-weed, may be destroyed in the infant state of the plants, by hoeing the intermediate spaces; that when the alternate rows are removed, and the land ploughed for the defence of the remaining rows, it receives most of the benefits of a winter's frost, and is very much forwarded in preparation for the barley-crop; and that, above all, from my complete success, I have roused a spirit of emulation in the cultivation of turnips, among the farmers of the county of Norfolk.

"With regard to my turnips, it would be easy to multiply certificates, and be diffuse in my observations, because no agriculturist has viewed them without being surprised both at the abundance of the crop (considering the quality of my land), and at the very obvious simplicity of my management of it, from beginning to end. I shall only further observe, that it is now in my power to sow my seed at equal distances of nine, eighteen, twenty-seven, thirty-six inches, or at any given distance of inches, of which nine are an aliquot part; and that I consider this as no trifling convenience."

The following will explain the references to the figure in Plate 53. fig. 1. A is the wheel, with an iron rim. B, the tin barrel, or feed-box, fixed to the axis of the above wheel. C, the aperture by which the seed is introduced into the box:—this aperture is afterwards closed by a cover. D, a semicircular plate of tin, to prevent any dirt falling upon the feed-box. E E, the two handles of the machine.

Fig. 2. F represents the feed-box on a larger scale. G, the holes in the tin box, through which the seed falls upon the land. H, part of the axis of the wheel, to which the feed-box is fixed.

A drill machine for sowing turnip-feed has also been invented by T. A. Knight, esq. of Elton, near Ludlow. The following account of it appears in the Transactions of the Society for the Encouragement of Arts, &c. who voted Mr. Knight their silver medal.

"The small instrument for sowing turnips," says Mr. Knight, "which I have sent to the Society, I have tried on several different soils, and think I can venture to assert, that it will sow the seed, and cover it perfectly well, in any soil that is nearly in a proper state to receive it. It is necessary either to harrow the ground across, or to roll it, previously to the instrument being used, that the labourer may see the rows he has made; but I have always found the crop to succeed better after the roller than the harrow, though the ground has been very strong.

"In Plate 53. A is the iron wheel, which, running on its edge, formed by two concave sides, makes the groove into which the seeds fall. I have sometimes used a wheel with straight sides; but I think that concave sides, when well executed, are to be preferred in strong soils, and indeed in any soil. B is a wheel, moving on the same axis with A, and turning the wheel C (which gives out the seed) by means of a strap. I have several sizes of the wheel B, in order to increase or diminish the rapidity of C; and consequently to sow more or less seed. D, the tube through which the seed passes, and falls into the channel made by the iron wheel. E, the feet of the instrument. F, six lengths of jack-chain; which I find cover the feed remarkably well. The chain is perhaps preferable to any kind of harrow, because it can never become incumbered with loose straw, which is almost always found on, or close to, the surface, when the ground has been manured; and the iron cutting-wheel has a similar advantage over any kind of share. G, the feed-box. H H, the handles of the machine.

"The labour of using the instrument is very small. My workman usually accomplishes four statute acres, or something more, in a day: and one night, with the one I send, he sowed an acre and a half after six o'clock in the evening. There are two holes before the axis of the great wheel, which point out the proper width of the intervals between the rows. I usually place my rows at eighteen or twenty inches distance; and I wish my plants to stand at not more than six inches apart in the row; for I find that three small turnips weigh about as much as one large turnip, are more solid, and I think more nutritious, and certainly are much less apt to suffer by unfavourable weather. The ground between the rows is, of course, worked with the hoe.

"The angle which forms the edge of the wheel A, must be made more or less acute; and the instrument more or less heavy, proportional to the strength of the soil. I have sometimes added weights of lead over the axis of the wheel, but it will rarely be found necessary. I have tried the instrument on different soils, and I think it will answer on any. A great advantage may be derived by sowing turnips with it, at a time when horses, now commonly used for the same purposes, are engaged in other employments. A few days are frequently of importance in sowing turnips, which, by fortunate rains, have got a wonderful start of those which have been sown a day or two later.

"Fig. 3, is a section, on a larger scale, of the seed-box G, in fig. 2. The wheel, marked C, is also the same as in that figure: it is fixed upon the axis of the cylinder I, which is pierced upon the surface with holes at K, for the feed. This cylinder turns round within a groove at the bottom of the box, and is so well fitted therein, that no feed falls from the box but what is delivered by the holes K. A small brush, marked L, rubs against the cylinder, to clear out any seeds which may remain in the holes. M is a front-view of the wheel, exhibiting its edge.

"The seeds fall into the tube underneath the cylinder, and thence into the channel, made by the indenting rim of the iron wheel. The loose chains which follow cover the seeds with earth, as before mentioned."

Both these drill machines are placed in the Society's repository for the inspection of the public. We cannot conclude this article without noticing the patent granted to Mr. Jackson, of Basingwold, in the county of York, for a machine or drill for turnips, which is to be fixed to a plough-beam. The patent is dated Nov. 3, 1801. Mr. Jackson declares his invention to be according to the following description:

Fig. 1 (Plate 53.) consists of a brass plate or frame, wherein the brass roller A is fixed with two caps and screws at B, B. The brass roller hath three, four, or more sets of holes, consisting of different numbers, viz. from six to eighteen in each set or circumference.

Fig. 2 is a sliding cover, whose inside closely fits the roller A. The opening B moved over any of the different numbers of holes, and screwed fast by the two screws A, A, in one revolution will discharge different numbers of seeds. The row f holes with fix in it will sow the feed at sixteen inches distance from each other; and the row with eighteen holes in it will sow the feed five inches distance from each other: but the holes may be varied in their numbers, at the will of a purchaser. At C is a brass screw, hollowed at the lower end, and cemented, full of horse-tail hair, and of the diameter of the aperture B, in the centre of fig. 2.

Fig. 3 is a section of fig. 2, with the feed-box upon it.

Fig. 4, A is a sliding bar of wood, two feet long, two inches broad, and one inch and a half thick, B is a cast-iron

or wood wheel, thirty-one inches diameter, and fastened by a square hole and nut upon the end of the iron axletree C, which axletree runs, and is fixed, to the sliding-bar A, by the two collars at D, D. The axletree hath a square hole in the end at E, where it receives the square end of the arbor E, in fig. 1. FFF is the side view of the feed-box sprout, and fixing to the end of the sliding box, by means of the cock E, part of the plate or frame, as at D, in fig. 1, is screwed, so as to be in a direct line with the axletree of the wheel B. G is a sliding cap or box, through which the sliding-bar A moves backwards and forwards from D to D, and may be fixed in any part between, to suit the breadth of the furrow intended to be ploughed, through the upper part of the frame. The wood frame B, fig. 6, slides likewise to and fro, and may be fixed by the same screw (H, fig. 4); by which motion the feed may be dropped either under the furrow or upon the surface of the ground.

Fig. 6, A, the stud to go through the plough-beam as near the counter-hole as convenient, on the left-hand side of the beam. The frame B, two feet six inches in length, and three inches square, slides through the box or cap as at I, in fig. 4. At E, the wheels, axletree, and the arbor of the drill-roller, join and couple by means of a male and female square, or an universal joint.

Fig. 7, A, the stud, as at A, fig. 6, to put through the plough-beam, as near the counter-hole as convenient, on the right-hand side. The frame frame B, fig. 6. The same drill F and wheel B as described in fig. 4.

Figs. 8, 8, is a frame with two arms and two bolts, as at A A. The upper part of the wheel's axletree goes through the arm and frame at B, and rises and falls to suit the depth you plough, secured by the screw C, and in some measure answers the purpose of a single-wheel plough. The same wheel, and the same drill, as described above, upon each centre or contrate wheel, are fixed of equal sizes; and a rolling-shaft D, with a nut upon each end to suit each wheel; and, by varying the numbers of the nuts upon the shafts, you vary the quantity of feed to be sown. This drill may be used advantageously in sowing of rape and other small round seeds.

TURON, a town of Cochin-china, situate at the bottom of a bay of the same name. Long. 107. 30. E. Lat. 15. 15. N.

TURSI, a town of Naples, in Basilicata, seated on the river Sino, eight miles from the gulf of Tarento, and 50 S.W. of Bari. Long. 16. 50. E. Lat. 40. 36. N.

TUSIS, a town and community of Switzerland, in the country of the Grisons, seated near the torrent Nolla, at the beginning of the valley of Tomilascia, 16 miles S. by W. of Coire.

TUTBURY, a town in Staffordshire, with a market on Tuesday. It had a large castle, which stood on an alabaster hill; several of the towers and a small part of the wall still remain. It is 15 miles E. of Stafford, and 134 N.E. of London. Long. 1. 40. W. Lat. 53. 0. N.

TUTACORIN, a town of Hindostan, in the Carnatic, opposite the island of Ceylon. Here the Dutch have a factory. It is 60 miles N.E. of Cape Comorin. Long. 76. 40. W. Lat. 8. 15. N.

TUTURA, a town of Russia, in the government of Irkutsk, situate on the Lena, 160 miles N. of Irkutsk. Long. 105. 40. E. Lat. 54. 40. N.

TUXFORD, a town in Nottinghamshire, with a market on Mondays; seated in a clayey soil, 13 miles N.W. of Newark, and 137. N. by W. of London. Long. 0. 50. W. Lat. 53. 16. N.

TUY, a town of Spain, in Galicia, with a bishop's see. It is surrounded by strong walls and ramparts, and well furnished with artillery, being a frontier town toward Portugal. It is seated on the top of a mountain, near the river Minho, in a fertile and well cultivated country, 62 miles S. of Compostella, and 254 W. of Madrid. Long. 8. 12. W. Lat. 42. 4. N.

TUZLA, a town of Turkey in Asia, in Caramania, situate at the western extremity of a lake to which it gives name, 28 miles N. of Cogni. Long. 35. 55. E. Lat. 38. 20. N.

TYCOKZIN, a town of Poland, in Polachia, with a castle and a mint. It is seated on the Narew, 22 miles N.W. of Bielsk. Long. 23. 40. E. Lat. 53. 0. N.

TYNE, a river in Northumberland, formed of a branch from the county of Durham, and another from the hills on the borders of Scotland. These uniting a little above Hexham, form a large river, which flows to Newcastle, and enters the German Ocean at Timmouth.

TYNE, a river which rises in the mountains in the S. of Haddingthorpe, waters Haddington, and enters the German Ocean to the W. of Dunbar.

TYPE. See *STEREOTYPE*, *Supp.*

TYRNAW, a large fortified town of Upper Hungary, in the palatinate of Trentschin, 30 miles N.E. of Presburg. Long. 17. 33. E. Lat. 48. 23. N.

TYSTED, a town of N. Jutland, in the territory of Alberg, with a citadel, seated on the gulf of Limford, 44 miles N.W. of Wiburg, and 46 W. of Alburg. Long. 8. 25. E. Lat. 56. 54. N.

TYVY, or **TEIVY**, a river in Cardiganhire, which issues from a lake on the E. side of the county, waters Tregannon and Llanbader, and enters the bay of Cardigan, below the town of that name.

TZADURILLA, a town of Natolia Proper, near the river Sangar, or Acla, 63 miles S.E. of Iznik. Long. 31. 8. E. Lat. 39. 0. N.

TZARITZYN, a town of Russia, in the government of Saratof, seated on the Volga, 120 miles N.W. of Astracan. Long. 45. 25. E. Lat. 48. 0. N.

TZERNITZ, a town of Turkey in Europe, in Romania, near a river of the same name, 32 miles N.N.E. of Adrianople. Long. 26. 40. E. Lat. 42. 5. V.

TZIVILSK, a town of Russia, in the government of Kafan, 56 miles W. of Kafan. Long. 47. 25. E. Lat. 55. 40. N.

V. U.

V A D

VAAST, ST., a town of France, in the department of the Channel, five miles from Harfleur, and eight from Valogne.

VABRES, a town of France, in the department of Aveyron. Though an episcopal see before the revolution, it is little better than a village; but has some manufactures of fergs, dimities, and cottons. It is seated at the confluence of two small rivers that fall into the Tarn, 30 miles S.E. of Rodez, and 32 E. of Alby. Long. 2. 55. E. Lat. 43. 57. N.

VACHA, a town of Germany, in the landgravate of Hesse-Cassel, 40 miles S.E. of Cassel. Long. 10. 12. E. Lat. 50. 55. N.

VACHE, an island of the West Indies, off the S. coast of St. Domingo, opposite St. Louis. It was formerly a rendezvous of the bucaniers, who began a settlement here in 1673.

VADA, a town of Italy, in Tuscany, seated on the Tuscan Sea, 20 miles S. of Leghorn. Long. 10. 20. E. Lat. 43. 15. N.

VADAGARY, a town of the peninsula of Hindoostan, in the province of Madura, 64 miles S.S.W. of Madura.

VADIN, a town of Turkey in Europe, in Bassarabia, situate on the Danube, 32 miles W. of Nicopoli. Long. 25. 0. E. Lat. 44. 25. N.

VADO, a sea-port of Italy, in the territory of Genoa, with a fort; taken by the French in 1795. It is three miles W. of Savona, and 24 S.W. of Genoa. Long. 8. 8. E. Lat. 44. 15. N.

VADSTEIN, a town of Sweden, in East Gothland, where the kings of Sweden had formerly a palace, now in ruins. It is seated on the E. side of the lake Wetter, near the river Motala, 32 miles W. of Nordkiöping. Long. 15. 55. E. Lat. 58. 12. N.

VOL. X.

V A L

VADUTZ, a town and castle of Suabia, in the principality of Lichtenstein, 26 miles S. Lida, and 34 S.S.E. of Constance. Long. 9. 22. E. Lat. 47. 7. N.

VAENA, a town of Spain, in Andalusia, seated at the source of the Caistro, 23 miles S.E. of Cordova. Long. 3. 50. W. Lat. 37. 40. N.

VAIHINGEN, a town of Suabia, in the duchy of Wurtemberg, seated on the Neckar, 34 miles S.W. of Hailbron. Long. 9. 3. E. Lat. 48. 58. N.

VAISON, a decayed town of France, in the department of Vaucluse, with a bishop's see. It was lately subject to the pope, and is seated on a mountain, on which there is a castle, near the river Ozeze, and the ruins of ancient Vaison, which was one of the largest cities of the Gauls. It is 15 miles E.N.E. of Orange, and 22 N.E. of Avignon. Long. 5. 6. E. Lat. 44. 15. N.

VAL DI DEMONA, a province in the N.E. angle of Sicily. It means the valley of demons, and is so called because Mount Etna is situate in this province, which occasioned ignorant and superstitious people, at the time of its fiery eruptions, to believe it was a chimney of hell. The capital is Messina.

VAL DI MAZARA, a province in the W. angle of Sicily, so called from the town of Mazara. It contains Palermo, the capital of the whole island.

VAL DI NOTO, a province at the S.E. extremity of Sicily; so called from the town of Noto, its capital.

VALCKOWAR, a town of Slavonia, seated on the Walpo, near its confluence with the Danube, between Eiseck and Peterwaradin, 70 miles N.W. of Belgrade. Long. 19. 51. E. Lat. 45. 55. N.

VALDAI, a town of Russia, in the government of Novgorod, on the side of a lake of the same name. It con-

tains several brick buildings; and even the wooden houses are more decorated than the generality of Russian cottages. Its environs rise into a variety of gentle eminences, and abound with beautiful lakes, sprinkled with woody islands, and skirted by forests, corn-fields, and pastures.

VALDASNES, a town of Portugal, in Tra los Montes, nine miles E.S.E. of Miranda.

VALDEBUREN, a town of Spain, in the province of Leon, 34 miles N.N.E. of Leon, 34 miles N.N.E. of Leon. Long. 4. 55. W. Lat. 43. 5. N.

VALDECONA, a town in Spain, in Catalonia, 15 miles S. of Tortosa. Long. 0. 35. E. Lat. 41. 15. N.

VALDIGEM, a town of Portugal, in Beira, situate near the Duero, four miles N.E. of Lamego.

VALENCE, a city of France, in the department of Drome, with a bishop's see, a citadel, and a school of artillery. It is surrounded by good walls, and the greatest part of the public places, and many private houses, are adorned with fountains. Beside the handsome cathedral, there are many other churches, as well as late convents, that are worthy of notice. It is seated on the Rhone, 30 miles N. by E. of Viviers, 335 S. by E. of Paris. Long. 4. 52. E. Lat. 44. 56. N.

VALENCE, a town of France, in the department of Lot and Garonne, situate on the Garonne, 12 miles S.E. of Agen.

VALENCA D'ALCANTARA, a considerable town of Spain, in Estremadura, with an old castle. It is surrounded by walls after the antique manner, flanked by some small bastions, and a few towers; is very strong by situation, being built on a rock, near the river Sagar, 20 miles S.W. of Alcantara, and 40 N. of Badajoz. Long. 6. 30. W. Lat. 39. 26. N.

VALENCEY, a town of France, in the department of Indre, with a castle, seated on the Nabon, 15 miles S. of Romorentin.

VALENZO-DO-MINHO, a fortified town of Portugal, in Entre-Minho-e-Douro, seated on an eminence, near the river Minho, three miles S. of Tuy. Long. 8. 11. W. Lat. 42. 2. N.

VALENTINE, a town of France, in the department of Upper Garonne, nine miles N.E. of St. Bertrand. Long. 0. 57. E. Lat. 43. 1. N.

VALENZA, or **VALENTIA**, a strong town of Italy, in the Milanese, capital of the Lomeline, and subject to the King of Sardinia, to whom it was ceded in 1707. It has been often taken and retaken, and is seated on a mountain, near the river Po, 12 miles E. of Casal, and 35 S.W. of Milan. Long. 8. 56. E. Lat. 44. 58. N.

VALESTRA, a town of Italy, in the duchy of Modena, 42 miles S.W. of Modena. Long. 10. 52. E. Lat. 44. 26. N.

VALETTE, a town of France, in the department of Charente, 10 miles S. of Angoulême. Long. 0. 15. E. Lat. 45. 30. N.

VALKENBURG, or **FAUQUEMONT**, a town of Dutch Limburg. In 1568 it was sacked by the Spaniards, and in 1672 was taken by the French, who demolished the fortifications. It is seated on the Geule, eight miles E. of Maestricht. Long. 5. 50. E. Lat. 50. 52. N.

VALLELONGA, a town of Naples, in Calabria Ulteriore, 18 miles E.N.E. of Nicotera. Long. 16. 40. E. Lat. 38. 44. N.

VALLEMONT, a town of France, in the department of Lower Seine, with a castle, 16 miles N. by W. of Caudebec. Long. 1. 25. W. Lat. 49. 46. N.

VALLENCAY, a town of France, in the department of Indre, 20 miles N. of Chateauroux, and 22 E. of Loches. Long. 1. 26. E. Lat. 47. 10. N.

VALLENGIN, a town of Switzerland, capital of a county of the same name, in the principality of Neuchâtel. It is seated near the lake of Neuchâtel, 25 miles N.W. of Bern. Long. 6. 40. E. Lat. 47. 0. N.

VALLERS, a town of France, in the department of Indre and Loire, noted for mineral waters. It is four miles N.W. of Tours. Long. 0. 41. E. Lat. 47. 24. N.

VALLERY, St. a commercial town of France, in the department of Somme, at the mouth of the river Somme, whose entrance is very dangerous. It is 10 miles N.W. of Abbeville, and 100 N. by W. of Paris. Long. 1. 37. E. Lat. 50. 11. N.

VALLERY-EN-CAUX, St. a sea-port of France, in the department of the Lower Seine, 15 miles W. by S. of Dieppe, and 105 N.W. of Paris. Long. 0. 41. E. Lat. 49. 52. N.

VALLIER, St. a town of France, in the department of Ardeche, seven miles N.E. of Tournon. Long. 2. 5. E. Lat. 49. 10. N.

VALOGNE, a town of France, in the department of the Channel, noted for cloth and leather. It is seated on a brook, eight miles from the sea, and 158 W. by N. of Paris. Long. 1. 26. W. Lat. 49. 30. N.

VALONA, a sea-port of Turkey in Europe, in Upper Albania, with an archbishop's see. It was taken, in 1690, by the Venetians, who abandoned it after they had ruined the fortifications. It is seated on the gulf of Venice, near the mountains of Chimera, 50 miles S. of Durazzo. Long. 19. 23. E. Lat. 41. 4. N.

VALPARISO, a town of Chili, with a well-frequented harbour, defended by a strong fort. It is seated on the Pacific Ocean, at the foot of a high mountain. Long. 72. 14. W. Lat. 33. 3. S.

VALPERGA, a town of Piedmont, in the county of Casavefe, 11 miles S.S.W. of Ivrea, and 16 N. of Turin. Long. 7. 44. E. Lat. 45. 21. N.

VALREES, a town of France, in the Venaissin, 12 miles E. of St. Paul Trois Châteaux.

VALS, a town of France, in the department of Ardeche, remarkable for mineral springs. It is seated on the Ardeche, three miles N. of Aubenas. Long. 4. 26. E. Lat. 44. 48. N.

VALTELINE, called by the inhabitants **VALLE-TELINO**, a fertile valley of Switzerland, subject to the Grisons. It extends from the confines of Bormio to the lake of Chiavenna, about the length of 50 miles, and is inclosed between two chains of high mountains. The N. chain separates it from the Grisons, the S. from the Venetian territories; on the E. it borders on the county of Bormio; and is bounded on the W. by the duchy of Milan. The Valte-lines have no manufactures; but they export wine, silk, planks, cheese, butter, and cattle. On the 20th of July, 1620, there was a general massacre of the Protestants in this valley. The inhabitants are computed to be 62,000, and are all Roman-catholics.

VALVA, a town of Naples, in Abruzzo Citeriore, 18 miles S.S.W. of Civita di Chieti, and 36 N.W. of Molise. Long. 14. 12. E. Lat. 42. 21. N.

VALVERDE, a town in Portugal, in Beira, on the confines of Spain, 30 miles N. by W. of Alcantara, and 38 S.S.E. of Guardia. Long. 6. 19. W. Lat. 39. 44. N.

VALVERDE, a town of Spain, in Estremadura, eight miles from Elvas, and eight from Badajoz.

VAN, a town of Turkey in Asia, in Armenia, near the frontiers of Persia. It is a populous place, defended by a castle, seated on a mountain. It is likewise a beglerbeglic, under which there are nine fangicates, or particular go-

vernments. The Turks always keep a numerous garrison in the castle. Long. 44. 30. E. Lat. 38. 30. N.

VAN DIEMEN'S ROAD, a road of the island of Tongataboo, one of the Friendly Islands. Long. 174. 56. W. Lat. 21. 4. S.

VANIAMHADDY, a town of the peninsula of Hindoostan, in the Myfore country, 105 miles S.W. of Madras, and 112 E. of Seringapatam. Long. 78. 45. E. Lat. 12. 41. N.

VANNES, a sea-port of France, in the department of Morbihan, with a bishop's see. Its principal trade is in wheat and rye for Spain; and it has a trade also in pilchards and sea-eels. It is seated on the gulf of Morbihan, three miles from the Atlantic, 56 S.W. of Rennes, and 255 W. by S. of Paris. Long. 2. 46. W. Lat. 47. 39. N.

VAR, a department of France, including part of the late province of Provence. It takes its name from a river which has its source in the county of Nice, and falls into the Mediterranean, four miles W. of Nice.

VARALLO, a strong town of Italy, in the Milanese, 28 miles N.N.W. of Novara, and 47 W.N.W. of Milan. Long. 8. 25. E. Lat. 45. 42. N.

VARAMBON, a town of France, in the department of Ain, seated on the Ain, 14 miles N.N.W. of Bourg. Long. 5. 15. E. Lat. 46. 23. N.

VARRELLA, a cape on the E. coast of the kingdom of Ciampa. Behind it is a mountain, remarkable for having a high rock, like a tower, on its summit. Long. 109. 17. E. Lat. 12. 50. N.

VARENDORF, a fortified town of Germany, in the bishopric of Munster, seated on the river Emba.

VARENNE, a town in France, in the department of Allier, seated on an eminence near the river Allier, 14 miles S.E. of Moulins. Long. 3. 31. E. Lat. 46. 22. N.

VARHELY, a town of Transylvania, 60 miles E. of Temeswar. Long. 17. 10. E. Lat. 45. 40. N.

VARIOLÆ VACCINÆ, the disease popularly named the Cow-Pox. See Cow-Pox. *Supp.*

VARNA, a considerable sea-port of Turkey in Europe, in Bulgaria, capital of the territory of Drobugia, with an archbishop's see. It is seated near the mouth of the Varna, in the Black Sea, 22 miles N. of Mesembria, and 145 N.W. of Constantinople. Long. 28. 28. E. Lat. 42. 44. N.

VARZEY, a town of France, in the department of Yonne, with a castle, 32 miles from Auxerre.

VASIL, a town of Russia, in the government of Novogorod, situate on the Volga, 60 miles E. of Novogorod. Long. 45. 44. E. Lat. 56. 16. N.

VASSERBURG, a town of Bavaria, in the territory of Munich, with a castle. It is surrounded by high mountains, and seated on the river Inn, 28 miles E. of Munich. Long. 12. 15. E. Lat. 48. 10. N.

VASSI, a town of France, in the department of Upper Marne, seated on the Blaise, 10 miles N.W. of Joinville, and 115 E. of Paris. Long. 5. 10. E. Lat. 48. 27. N.

VATAN, a town of France, in the department of Indre, seated in a fine plain, eight miles N.W. of Loudun. Long. 1. 56. E. Lat. 47. 2. N.

VATICA, a sea-port of Turkey in Europe, in the Morea, situate in a large bay to which it gives name, 44 miles S.E. of Mistra. Long. 23. 2. E. Lat. 36. 38. N.

VAUCOLEURES, a town of France, in the department of Meuse, seated on the side of a hill, on the river Meuse, 10 miles W. of Toul, 22 S.W. of Nancy, and 150 E. of Paris. Long. 5. 40. E. Lat. 48. 36. N.

VAUCLUSE, a new department of France, including the county of Venaissin and territory of Avignon. It takes

its name from the fountain of Vaucluse. The chief town is Avignon.

VAUCLUSE, a village and fountain of France, in the department of the same name, 12 miles E. of Avignon, celebrated by Perarch.

VAUD, PAYS DE, a country of Switzerland, in the canton of Bern. It extends along the lake of Geneva, rising gradually from the edge of that lake, and is richly laid out in vineyards, corn fields, and meadows, and chequered with continued villages and towns. It was wrested from the Duke of Savoy, by the canton of Bern, in 1536. Lausanne is the capital.

VAUDABLES, a town of France, in the department of Puy de Donné, five miles from Issoire, and 240 S. by E. of Paris.

VAUDEMONT, a town of France, in the department of Meurthe, with a castle. It is seated in the most fertile country for corn in all Lorraine, 15 miles S.E. of Toul, and 18 S.W. of Nancy. Long. 5. 57. E. Lat. 48. 26. N.

VAUDOIS, VALLEY OF, in Piedmont. They lie N. of the marquise of Saluzo, and the chief town is Lucerna. The inhabitants are called Vaudois; also Waldenses, from Peter Waldo, a merchant at Lyons, who exposed the superstitions of the church of Rome, in 1160, and being banished from France, came here with his disciples. The Vaudois underwent the most dreadful persecutions in the 17th century, particularly in 1655, 1656, and 1696.

VAUDREVANGE, a decayed town of France, in the department of Meurthe, seated on the Sare, near the strong fortrefs of Sar Louis, 50 miles N.E. of Nancy. Long. 6. 36. E. Lat. 49. 28. N.

UBEDA, a town of Spain, in Andalusia, with a strong castle, seated in a fertile country, abounding in corn, wine, oil, and fruits, especially figs. It is five miles N.E. of Baeza, and 158 S.E. of Madrid. Long. 3. 13. W. Lat. 37. 48. N.

UBERLINGIN, a free imperial city of Suabia, in the county of Furttenburg. The inhabitants, who are partly Roman-catholics and partly Protestants, carry on a great trade in corn, which they send to Switzerland; and not far hence are very famous baths. It is seated on a high rock, near the lake of Constance, 12 miles N. of Constance. Long. 9. 10. E. Lat. 47. 50. N.

UBERSKO, a town of Bohemia, in the circle of Chrudim, 10 miles E.N.E. of Chrudim.

UBIGAU, a town of Upper Saxony, in the electorate of Saxony, 28 miles S.E. of Wilttemberg. Long. 13. 12. E. Lat. 51. 34. N.

UBY, or PULO UBY, an island in the Indian Ocean, at the entrance of the bay of Siam, 20 miles in circumference. It yields good water and plenty of wood. Long. 105. 56. E. Lat. 8. 25. N.

UCKER, a river of Germany, which issues from a lake of the same name, near Prenzlau, in the Ucker marche of Brandenburg, runs N. through Pomerania, and being joined by the Rando, enters the Frischen Haf, a bay of the Baltic.

UCKERMUNDE, a town of Upper Saxony, in Prussian Pomerania, with a castle, seated on the Frischen Haf, a bay of the Baltic, 25 miles N.W. of Stettin. Long. 14. 12. E. Lat. 53. 53. N.

UDDEVALLA, a town of Sweden, in West Gothland, situate on a bay of the Categate. The houses are built of wood painted red and yellow, and the streets are spacious. It contains 3000 inhabitants, has a trade in iron, planks, and herrings, and is 50 miles N. of Gotheborg.

UDENSKOI, a town of Siberia, in the government of Irkutsk, seated on the lake Balkul, on the road from Te-

boldt to China, 1000 miles N.W. of Pekin, and 1200 E. of Tobolsk. Long. 96. 30. E. Lat. 53. 0. N.

UDINA, or UDINE, a city of Italy, capital of Venetian Friesland, with a citadel. It contains 16,000 inhabitants, and is seated in a large plain, near the rivers Tagliamento and Jisenzio, 10 miles N. of Aquileia, and 55 N. by E. of Venice. Long. 13. 3. E. Lat. 46. 12. N.

UDSKOI, a town of Russia, in the government of Irkutsk, situate on the Uda, 1100 miles E.N.E. of Irkutsk. Long. 135. 30. E. Lat. 55. 16. N.

VECHTA, a fortified town of Westphalia, in the bishopric of Munster, 30 miles N. of Osnaburg. Long. 8. 22. E. Lat. 52. 54. N.

VEDENSKOI, a town of Russia, in the government of Archangel, situate on the Vokicha, 200 miles E.S.E. of Archangel. Long. 46. 44. E. Lat. 58. 45. N.

VEGA, a town of Spain, in the province of Asturias; 84 miles N.W. of Oviedo. Long. 6. 5. W. Lat. 43. 45. N.

VEGLIA, an island in the gulf of Venice, on the coast of Dalmatia, with a bishop's see, a good harbour, and a citadel. It is the most populous island on this coast, abounds in wine and silk, and has small herds in high esteem. The only town of the same name, is seated on the sea, on a hill commanded by two mountains, 17 miles N.W. of Arbe, and 110 S.E. of Venice. Long. 14. 56. E. Lat. 45. 22. N.

VEGLIANA, a town of Piedmont, in the marquisate of Sufa, seated on an eminence, near the river Doria, 12 miles N.W. of Turin. Long. 7. 34. E. Lat. 45. 7. N.

VEIROS, a town of Portugal, in Alentejo, with a castle, seated on the Anhaloura, 10 miles S.S.W. of Portalegre. Long. 7. 34. W. Lat. 38. 57. N.

VEIT, Sr. a strong town of Germany, in Carinthia, with an old castle, seated at the confluence of the Glan and Wunich, eight miles N. of Clagenfurt, and 173 S.W. of Vienna. Long. 14. 20. E. Lat. 47. 1. N.

VELA, a cape of the N. coast of Terra Firma, 160 miles E.N.E. of St. Martha. Long. 71. 25. W. Lat. 12. 30. N.

VELDEN, a town of Bavaria, in the principality of Neuburg, 22 miles N.W. of Ratisbon. Long. 11. 50. E. Lat. 40. 10. N.

VELDENTZ, a town of Germany, in the palatinate of the Rhine, capital of a county of the same name, with a castle. It is seated on the E. side of the Moselle, 13 miles N.E. of Treves. Long. 7. 3. E. Lat. 49. 52. N.

VELETRI, or VELLETRI, a town of Italy, in Campagna di Roma. It is the residence of the Bishop of Ostia, whose palace is magnificent; and there are large squares adorned with fine fountains. It is seated on an eminence, surrounded by hills, eight miles E.S.E. of Albano, and 20 S.E. of Rome. Long. 12. 56. E. Lat. 41. 46. N.

VELEZ, a town of Spain, in New Castile, with a castle, 45 miles N.E. of Toledo, and 50 S.E. of Madrid. Long. 2. 23. W. Lat. 40. 0. N.

VELEZ MALAGA, a town of Spain, in Granada, with a castle, seated in a large plain, near the Mediterranean, 12 miles N.E. of Malaga, and 52 S.W. of Granada. Long. 3. 24. W. Lat. 36. 42. N.

VELIKA, a town of Slavonia, seated on the river Bakawa, 10 miles E. of Cruetz, and 60 N.W. of Pofega. Long. 10. 50. E. Lat. 46. 18. N.

VELIKI USTIUG, a province of Russia, in the government of Vologda. Ustug is the capital.

VELORE, a town of Hindoostan, in the Carnatic. It is a post of great importance, commanding the great road from Mysore into the Carnatic. It consists of three strong forts on as many hills, and is deemed impregnable to an Indian army. During the last war against Hyder Ally, it was relieved by Sir

Eyre Coote, in the face of the whole army of that chief. It is 90 miles W. of Madras.

VENA, or MONTI-DELLA-VENA, mountains of Carniola, on the confines of Istria, on the S. of the lake Czernie.

VENAFRO, a town of Naples, in Terra di Lavoro, with a bishop's see, seated near the Volturno, 27 miles W. of Capua, and 43 N. of Naples. Long. 14. 19. E. Lat. 43. 32. N.

VENAISSIN, a small but fertile territory of France, lately depending on the pope, but now decreed a part of the republic of France, and included in the department of Vaucluse.

VENANT, Sr. a town of France, in the department of the Straits of Calais. It can be laid under water at any time, which is its chief defence, and is 27 miles S.E. of Dunkirk, and 22 N.W. of Arras. Long. 2. 39. E. Lat. 50. 38. N.

VENASQUE, a town of Spain, in Arragon, in a valley of the same name, with a strong castle. It is seated on the Eßara, in a country producing good wine, 35 miles E. of Balbastro. Long. 0. 25. E. Lat. 41. 58. N.

VENEATIGHERY, a town of the peninsula of Hindoostan, in the Mysore country, 51 miles E. of Bangalore, and 54 W. of Arcot. Long. 78. 38. E. Lat. 13. 5. N.

VENCE, a town of France, in the department of Var. Before the revolution, it was a bishop's see. It is eight miles from the Mediterranean, and 10 W. of Nice. Long. 7. 13. E. Lat. 43. 43. N.

VENDEE, a department of France, including part of the late province of Poitou. It is so called from a small river of the same name. Fontenay-le-Compte is the capital.

VENDEN, a town of Russia, in the government of Riga, situate on the Aa, 36 miles N.E. of Riga. Long. 25. 15. E. Lat. 57. 12. N.

VENDOME, a town of France, in the department of Loir and Cher, seated on the river Loir, 30 miles N.E. of Tours, and 95 S.W. of Paris. Long. 1. 8. E. Lat. 47. 50. N.

VENDRELL, a town of Spain, in Catalonia, 25 miles W.S.W. of Barcelona. Long. 1. 50. E. Lat. 41. 12. N.

VENZUELA, a province of Terra Firma, bounded on the N. by the Caribbean Sea, on the E. by Caracass, on the S. by New Granada, and on the W. by St. Martha. When the Spaniards landed here in 1499, they observed some butts built upon piles, in an Indian village, in order to raise them above the stagnated water that covered the plain: and this induced them to give it the name of Venezuela, or Little Venice. Near the sea-coast are high mountains, the tops of which are barren, but the lower parts in the valley are fertile, producing plenty of corn, rich pastures, sugar, tobacco, and fruits. There are also plantations of cocoa-nuts, which are exceedingly good; and gold is found in the sands of the rivers. This province was bestowed by the Emperor Charles V. on the Vellers of Augburg, the most opulent merchants, at that time, in Europe, in consideration of large sums they had advanced to him. They were to hold it as an hereditary fief of the crown of Castile, on condition of conquering the country and establishing a colony within a limited time. Unfortunately, they committed the execution of their plan to some of the soldiers of fortune with which Germany abounded in the 16th century, by whose rapacity and extortion the country was so desolated, that it could hardly afford them subsistence, and the Vellers were obliged to relinquish their property. The Spaniards immediately resumed possession of it; but, notwithstanding its many natural advantages, it is still one of their most languishing and unproductive settlements.

VENZUELA, the capital of a province of the same name, in Terra Firma, with a bishop's see. It stands on a peninsula, on the E. side of the gulf of Venezuela, 70 miles N.E. of Maracaybo. Long. 70. 15. W. Lat. 10. 43. N.

VENEZUELA, a gulf on the N. coast of Terra Firma, which communicates with the lake of Maracaybo, by a narrow strait.

VENLO, a strong town of Dutch Guelderland, formerly in alliance with the Hanseatic towns. It was more than once taken and retaken in the wars between the Dutch and Spaniards. In 1752 it surrendered to the allies, and was confirmed to the states-general by the barrier treaty in 1715. It was taken by the French, October 28, 1794. It is seated on the E. side of the Maas (on the opposite side of which is Fort St. Michael), 19 miles N. of Ruremonde, and 35 N.W. of Juliers. Long. 5. 50. E. Lat. 51. 20. N.

VENOSA, a town of Naples, in Basilicata, with a bishop's see. It is seated in a fertile plain, at the foot of the Apennines, 13 miles N.W. of Acerenza, and 72 N.E. of Naples. Long. 15. 52. E. Lat. 40. 54. N.

VENTA-DE-CRUZ, a town of Terra Firma, in the isthmus of Darien, seated on the river Chagre. Here the Spaniards used to bring the merchandise of Peru and Chili on mules from Panama, and embark it on the river for Porto Bello. Long. 79. 0. W. Lat. 9. 20. N.

VENZONE, a town of Italy, in the country of Friuli, situate on the Tajamento, 18 miles W.N.W. of Friuli, and 32 E.N.E. of Belluno. Long. 13. 40. E. Lat. 46. 22. N.

VERA, a sea-port of Spain, in Granada, with a bishop's see. It is 43 miles N.E. of Almeria, and 32 S.W. of Cartagena. Long. 1. 30. W. Lat. 37. 15. N.

VERA PAZ, a province of New Spain, in the audience of Guatemala; bounded on the N. by Yucatan, on the E. by the bay and province of Honduras, on the S. by Guatemala Proper, and on the W. by Chiapa. It is 88 miles in length, and nearly as much in breadth, and is full of mountains and forests; but there are many fertile valleys, which feed a great number of horses and mules. There are also many towns and villages of the native Americans. The capital, of the same name, has a bishop's see, but is inconsiderable. It is 120 miles N.E. of Guatemala. Long. 89. 0. W. Lat. 15. 10. N.

VERBERIE, an ancient town of France, in the department of Oise, seated on the river Oise, 10 miles N.E. of Senlis. Long. 2. 51. E. Lat. 49. 22. N.

VERCELLI, a strong town of Piedmont, capital of a lordship of the same name, with a bishop's see, a citadel, and a castle. The town-house, the governor's palace, and the hospital, are handsome structures. It is seated at the confluence of the Sesia and Cerva, 10 miles N.W. of Casal, and 40 N.E. of Turin. Long. 8. 24. E. Lat. 45. 31. N.

VERCHOLENSK, a town of Russia, in the government of Irkutsk, seated on the Lena, 120 miles N. of Irkutsk. Long. 105. 35. E. Lat. 54. 0. N.

VERCHOTURE, a town of Russia, in the government of Perm, with a bishop's see. This was the first town the Russians built in Siberia. It is situate 120 miles N. of Catharinenburg. Long. 60. 15. E. Lat. 58. 45. N.

VERDEN, a duchy of Germany, in the circle of Lower Saxony, 28 miles long and nearly as much broad; bounded on the E. and S. by the duchy of Lunenburg, on the W. by the Wefer and the duchy of Bremen, and on the N. by the duchies of Bremen and Lunenburg. It consists chiefly of heaths and high dry lands; but there are good marshes on the river Wefer and Aller. In 1712, the Danes wrested this duchy from Sweden, and, in 1715, ceded it to the Elector of Hanover; which cession, in 1718, was confirmed by the Swedes. The inhabitants are Lutherans.

VERDEN, a town of Lower Saxony, capital of a duchy of the same name. It contains four churches, and is seated on a branch of the Aller, 26 miles S.E. of Bremen. Long. 9. 0. E. Lat. 53. 10. N.

VERDUN, a town of France, in the department of Meuse, VOL. X.

with a bishop's see, and a strong citadel. Its fortifications were constructed by the Chevalier de Ville and Marshal de Vauban; the latter of whom was a native of this place. In 1755 great part of the cathedral was destroyed by lightning. Verdun was taken by the Prussians in 1792, but retaken soon after. The inhabitants are noted for making fine sweatmeats. It is seated on the Meuse, which runs through the middle, 42 miles S.W. of Luxemburg, and 150 E. of Paris. Long. 5. 22. E. Lat. 49. 9. N.

VERDUN, a town of France, in the department of Upper Garonne, seated on the Garonne, 22 miles N.W. of Toulouse. Long. 1. 20. E. Lat. 43. 54. N.

VEREA, a town of Turkey in Europe, in the province of Macedonia, and the see of a Greek metropolitan. It is 48 miles W. of Salonichi, and 115 E. of Valona. Long. 22. 18. E. Lat. 40. 40. N.

VERERIA, a town of Russia, in the government of Moscow, 56 miles W.S.W. of Moscow. Long. 25. 50. E. Lat. 55. 18. N.

VERINA, a town of Terra Firma, in the province of Comana, celebrated for its tobacco. It is situate on a gulf of the Atlantic, 45 miles E. of Comana. Long. 63. 44. W. Lat. 10. 8. N.

VERMANDOIS, a late territory of France, in Picardy; which, with the late province of Soissonnois, is now included in the department of Aisne. It abounds in corn, and excellent flax.

VERMANTON, a town of France, in the department of Yonne, seated on a river, 10 miles S.E. of Auxerre. Long. 3. 49. E. Lat. 47. 40. N.

VERMONT, one of the United States of America; bounded on the N. by Canada, on the E. by the river Connecticut, which divides it from New Hampshire, on the S. by Massachusetts, and on the W. by New York. It is 157 miles long and 65 broad, and divided into eleven counties. A chain of high mountains, running N. and S. divides the state nearly in the centre, between the river Connecticut and Lake Champlain. The natural growth upon this chain is hemlock, pine, spruce, and other ever-greens: hence it has always a green appearance, and obtained the descriptive name of Vermont, from the French *Verd Mont*, Green Mountain. The country is generally hilly, but not rocky. It is finely watered, the soil is very fertile, and there is not a better climate in the world. The inhabitants have lately been estimated at 100,000. The principal town is Bennington.

VERNEUIL, a town of France, in the department of Eure, seated on the Aure; 22 miles S.W. of Evreux, and 65 W. by S. of Paris. Long. 0. 59. E. Lat. 48. 42. N.

VERNEUIL, a town of France, in the department of Allier, three miles from the river Allier, and 15 S. of Moulins. Long. 3. 25. E. Lat. 46. 20. N.

VERNON, a town of France, in the department of Eure, with an ancient castle, and a fortress at the end of the bridge, over the Seine, 27 miles S.E. of Rouen, and 42 N.W. of Paris. Long. 1. 42. E. Lat. 49. 6. N.

VERNOIS, a considerable town of Russia, in the government of Rezan, seated on a mountain, near a river of the same name, which a little lower falls into the Don. Long. 42. 20. E. Lat. 53. 15. N.

VEROLI, an ancient and populous town of Italy, in Campagna di Roma, with a bishop's see. It is seated on the Cosa, at the foot of the Apennines, 45 miles S.E. of Rome. Long. 13. 15. E. Lat. 41. 28. N.

VERREZ, a town of Piedmont, in the duchy of Aosta, with a fortress deemed impregnable. It is 15 miles S.S.E. of Aosta, and 35 N. of Turin.

VERRIERES, a town of Switzerland, in the principality of

Neuchâtel. The environs are celebrated for excellent cheese. It is six miles E.N.E. of Pontarlier, and 20 W.S.W. of Neuchâtel.

VERSOI, a village of France, in the department of Ain, seated on the lake of Geneva, near the mouth of the river Versoi, six miles S.E. of Gex, and seven N. of Geneva. It goes by the name of *Choisel's Folly*; for Geneva having fallen under the displeasure of France, the Duke de Choiseul (then prime-minister) endeavouring to take advantage of the troubles in 1768, formed a plan to ruin that city, and monopolize the whole trade of the lake. With this view, he fixed on Versoi as a proper situation for a large town, and began to sink a pier, to make a harbour, &c. But when the harbour was nearly completed, and 125,000l. had been expended on the project, it was suddenly relinquished.

VERTUS, a town of France, in the department of Marne, seated in a plain, at the foot of a mountain, on which are vineyards, producing very good wines, 17 miles S.W. of Châlons, and 78 N.E. of Paris. Long. 4. 2. E. Lat. 48. 53. N.

VERUN, or VERRUA, a town of Piedmont, in the county of Asti. It was besieged in 1705, by the French, who did not carry it till after six months, when it was reduced to a heap of ruins, because the commander had blown up all the fortifications. It was afterward restored to the Duke of Savoy. It is seated on a hill, near the river Po, 20 miles W. of Casal, and 23 N.E. of Turin. Long. 8. 2. E. Lat. 45. 13. N.

VERVIERS, a town of the Netherlands, in the bishopric of Liege, seated on the Weze, four miles S.W. of Limbourg, and 17 S.E. of Liege.

VERVINS, a town of France, in the department of Aisne, famous for a treaty, in 1598, between Henry IV. of France and Philip II. of Spain. It is seated on the Serre, 110 miles N.E. of Paris. Long. 4. 0. E. Lat. 49. 50. N.

VERULAM, the vestiges of a celebrated Roman town in Hertfordshire, close by St. Alban's. In the time of Nero it was a *municipium*, or town, the inhabitants of which enjoyed the privileges of Roman citizens. By Tacitus it is called *Verulamium*, and by Ptolemy *Urolanium*. After the departure of the Romans, it was entirely ruined in the wars between the Britons and Saxons; and nothing remains of it but the ruins of walls, tessellated pavements, and Roman coins, which are still sometimes dug up.

VERZUOLO, a town of Piedmont, in the marquise of Saluzzo, with a castle. It is surrounded with an ancient wall, flanked with towers; and is three miles S. of Saluzzo.

VESLEY, a town of France, in the department of Aisne, seated on the river Aisne, 10 miles E.N.E. of Soissons.

VESOUL, a town of France, in the department of Upper Saône. Since the revolution it has been created a bishop's see. In its vicinity is a well, similar to that near Orans. It is seated at the foot of a mountain, called *Motte de Vesoul*, near the river Durgeon, 22 miles N. of Besançon, and 200 S.E. of Paris. Long. 6. 8. E. Lat. 47. 36. N.

VESPERIN, or WEISBRIN, a strong town of Lower Hungary, capital of a county of the same name, with a castle, and an episcopal see, whose bishop is chancellor to the King of Hungary, and has a right to crown him. It is seated on the lake Balaton, at the mouth of the river Sarwie, 50 miles S.W. of Strigonia, and 83 S.E. of Vienna. Long. 17. 57. E. Lat. 47. 14. N.

VEVAY, the ancient Vibiscum, a town of Switzerland, capital of a bailiwick of the same name, in the canton of Bern. The famous General Ludlow retired to this place, on the restoration: here he died in 1693, and is interred in the church. Vevay is surrounded by vineyard hills, and the wine is in great estimation. It stands in a small plain, on the edge of the lake of Geneva, 37 miles S.W. of Bern. Long. 7. 4. E. Lat. 46. 28. N.

VEUDRE, a town of France, in the department of Allier, seated on the river Allier, 17 miles N.W. of Moulins.

VEZELAY, a town of France, in the department of Nièvre. In 1560, this town, being in the possession of the Calvinists, was besieged by the troops of Charles IX. without success, after the loss of 1500 men. Theodore Beza was a native of Vezelay. It is seated on the top of a mountain, near the river Cure, 20 miles S. of Auxerre, and 117 S. by E. of Paris. Long. 3. 42. E. Lat. 47. 26. N.

VEZELIZE, a town of France, in the department of Meurthe, seated on the Brenon, 12 miles S. of Nancy, and 14 S.E. of Toul. Long. 6. 10. E. Lat. 48. 20. N.

UFA, a government of Russia, formerly included in the government of Orenburgh. It is divided into the two provinces of Ufa and Orenburgh.

UFA, a town of Russia, capital of a government of the same name. It is seated on the Bielaï, below the mouth of the Ufa, 760 miles from Moscow. Long. 57. 0. E. Lat. 54. 40. N.

UFFENHEIM, a town of Franconia, in the principality of Anspach, 18 miles S.S.E. of Wurtburgh, and 22 N.N.E. of Anspach.

UGENTO, a town of Naples, in Terra d'Otranto, with a bishop's see, eight miles W. of Alessano, and 20 S.W. of Otranto.

UGLIANI, a town of Piedmont, in the duchy of Aosta, nine miles N. of Ivrea, and 16 E.S.E. of Aosta. Long. 7. 47. E. Lat. 25. 30. N.

UGOCZ, a town of Upper Hungary, capital of a county of the same name, with a castle. It is seated on a small river that falls into the Neißé, 15 miles N. of Zatmar. Long. 22. 34. E. Lat. 48. 5. N.

UGOGNA, a town of Italy, in the duchy of Milan, seated on the Tofa, 16 miles N. of Varallo, and 45 N.W. of Milan. Long. 8. 24. E. Lat. 45. 52. N.

VIADANA, a town of Italy, in the duchy of Mantua, seated on the Po, eight miles N. of Parma, and 17 S. of Mantua. Long. 10. 35. E. Lat. 44. 58. N.

VIANNA, a town of Spain, in Navarre, seated near the Ebro, three miles N. of Logronno, and 46 S.W. of Pampeluna. Long. 2. 20. E. Lat. 42. 32. N.

VIANA, a town of Portugal, in Entre-Douro-e-Minho, seated at the mouth of the Lima, with a good harbour, defended by a fort, 15 miles W. of Braga, and 36 N. of Oporto. Long. 8. 29. W. Lat. 41. 39. N.

VIANDEN, a town of Austrian Luxembourg, capital of a county of the same name. It is divided into two towns by the river Uren. In the one is a castle, on an inaccessible mountain. It is 22 miles N. of Luxembourg, and 22 N.W. of Treves. Long. 6. 13. E. Lat. 49. 55. N.

VIANEN, a town of the United Provinces, in Holland, with a castle. It was taken, in 1672, by the French, who demolished the fortifications. It is seated on the Leck, seven miles S. of Utrecht. Long. 5. 8. E. Lat. 52. 0. N.

VIATKA, a government of Russia, which was formerly a province of Kasan. It takes its name from the river Viatka, which runs through it.

VIATKA, a town of Russia, capital of a government of the same name, with a bishop's see, and a castle. It was formerly called Khlynof, and is seated on the river Viatka, 100 miles N. of Kasan. Long. 54. 15. E. Lat. 57. 25. N.

VIC, a town of France, in the department of Meurthe, seated on the Seille, 12 miles E.N.E. of Nancy, and 197 E. of Paris. Long. 6. 38. E. Lat. 48. 47. N.

VIC, a town of France, in the department of the Upper Pyrenées, situate on the Adour, 12 miles N. of Tarbes. Long. 0. 9. E. Lat. 43. 24. N.

VIC, or VICE, a town of Spain, in Catalonia, with a bishop's see. The cathedral is adorned with a fine portico,

supported by large pillars; and the market-place is very spacious. It is seated in a fertile plain, on a small river that falls into the Tar, 30 miles N. of Barcelona, and 26½ E.N.E. of Madrid. Long. 2. 13. E. Lat. 41. 55. N.

VIC-FEZENSAC, a town of France, in the department of Gers, seated on the Douze, 15 miles W. of Auch.

VIC-LE-COMTE, a town of France, in the department of the Puy de Dôme, with a palace, where formerly the counts of Auvergne resided, and about a mile from it are mineral springs. It is seated near the Loire, 15 miles S.E. of Clermont, and 130 S. of Paris. Long. 3. 22. E. Lat. 45. 36. N.

VICEGRAD, or **VIZEGRAD**, a strong town of Lower Hungary, with a castle on the top of a rock, where the kings of Hungary formerly resided. It was taken from the Turks, in 1634, by the Austrians. It is seated on the S. side of the Danube, eight miles S.E. of Gran, and 16 N.W. of Buda. Long. 19. 7. E. Lat. 47. 35. N.

VICENTINO, a territory of Italy, belonging to the Venetians; bounded on the N. by Treviso and Feltrino, on the E. by Treviso and Paduano, on the S. by Paduano, and on the W. by the Veronese. It is 35 miles long and 27 broad; and so very pleasant and fertile, that it is called the garden of Venice. The wine is excellent, and the butter and cheese very good. Here are also great numbers of mulberry-trees, for silkworms; and there are mines of silver and iron, and quarries of stone, almost as fine as marble.

VICENZA, a strong town of Italy, the capital of Vicentino, with a bishop's see. It is without walls, but is a large place, adorned with several palaces, and has a fine square, with piazzas under the houses. There are also several other squares, and fine churches. Here is an academy, whose members meet in the Olympic theatre, a masterpiece of workmanship by Palladio. It is seated between the rivers Barchigione and Rerone, and two mountains, in a fertile plain, 13 miles N.W. of Padua, 31 W. of Venice, and 135 N. of Rome. Long. 11. 43. E. Lat. 45. 26. N.

VICHY, a town of France, in the department of Allier, famous for the mineral waters near it. It is seated on the Allier, 15 miles S.E. of Gennat, and 180 S. by E. of Paris. Long. 3. 22. E. Lat. 46. 0. N.

VICO, a town of Naples, in Terra di Lavoro, with a bishop's see. It was almost ruined by an earthquake in 1694, and is seated near the bay of Naples, 15 miles S. by E. of Naples. Long. 14. 28. E. Lat. 40. 38. N.

VICO, a town of Naples, in Principato Citeriore, 17 miles S.S.E. of Naples. Long. 14. 30. E. Lat. 40. 43. N.

VICO, a town of Corsica, in which is the cathedral of the bishop of Sagona, a town now in ruins. It is 15 miles S.W. of Corte, and 30 S. of Calvi. Long. 9. 16. E. Lat. 41. 55. N.

VICOVARO, a town and principality of Italy, in the province of Sabina, seated near the Teverone, eight miles E. of Tivoli, and 40 N.E. of Rome. Long. 13. 8. E. Lat. 42. 30. N.

VIELSK, a town of Russia, in the government of Vologda, situate on the Vaga, 156 miles N.N.E. of Vologda. Long. 41. 45. E. Lat. 61. 40. N.

VIENNE, a considerable town of France, in the department of Isère. It is seated on the Rhone, over which it had formerly a bridge, of which only some piers remain, that render the navigation dangerous. Under the Romans it was the capital of a colony, and the seat of a senate. In the 5th century, the Burgundians made it the capital of their kingdom. Its commerce consists in wines, silk, and sword-blades, which last are highly esteemed. Before the revolution, it was the see of an archbishop. The cathedral is a handsome Gothic structure. In 1311, a general council was held here, at which Pope Clement V. presided, and Philip the Fair of France, Edward II. of England, and James II. of Arragon, assisted. This council

is famous for the suppression of the order of the Knights Templars of Jerusalem. Near Vienne, on the banks of the Rhone, are produced the excellent wines of Côte-Rôtie, in a soil where the grape, as the name imports, is almost parched up by the sun; and, a little further, are grown the famous hermitage wines, so called, because a hermit had his grotto there. Vienne is 15 miles S. of Lyons, and 26½ S.E. of Paris. Long. 4. 55. E. Lat. 45. 31. N.

VIENNE, a department of France, formed of part of the late province of Poitou. It takes its name from a river which rises in the department of Corrèze, and falls into the Loire between Chinon and Saumur. Poitiers is the capital.

VIENNE, UPPER, a department of France, comprising the late province of Limosin. Limoges is the capital.

VIERARDEN, a town of Germany, in the marche of Brandenburg, seated on the Vesse, near its confluence with the Oder, 24 miles S.E. of Prenzlau, and 30 N.W. of Custrin. Long. 14. 20. E. Lat. 53. 2. N.

VIERZON, an ancient town of France, in the department of Cher, famous for its forges. It is seated on the Cher and Yevre, in the most fertile part of the department, 17 miles N.W. of Bourges, and 100 S.W. of Paris. Long. 2. 10. E. Lat. 47. 12. N.

VIESTI, a town of Naples, in Capitanata, with an archbishop's see. It is seated on the gulf of Venice, in the place called the Spur of the Boot, and at the foot of Mount Garden, 25 miles N.E. of Manfredonia, and 117 of Naples. Long. 16. 40. E. Lat. 41. 51. N.

VIGAN, a town of France, in the department of Gard, 25 miles W. of Alais, and 25 N.W. of Nîmes.

VIGEVANO, a town of Italy, in the duchy of Milan, capital of the Vigevanasco, with a bishop's see, and a strong castle on a rock. It was formerly the residence of the dukes of Milan, but is now subject, with its territory, to the King of Sardinia. It is seated near the Tefino, 12 miles S.E. of Novaro, and 15 S.W. of Milan. Long. 8. 54. E. Lat. 45. 22. N.

VIGNAMONT, a town of the Netherlands, in the bishopric of Liege, two miles N. of Huy. Long. 5. 22. E. Lat. 48. 46. N.

VIGNOT, a town of France, in the department of Meuse, situate on the Meuse, 16 miles E. of Bar le Duc, and 24 S.S.E. of Verdun. Long. 5. 25. E. Lat. 48. 46. N.

VIGNUOLA, or **VIGNOLA**, a town of Italy, in the duchy of Modena, 15 miles S.E. of Modena.

VIHIERS, a town of France, in the department of Maine, seated on a lake, 20 miles S. of Angers, and 162 S.W. of Paris. Long. 0. 29. W. Lat. 47. 8. N.

VILAINE, a river of France, which rises in the department of Maine, waters Vitré and Rennes, divides the department of Morbihan from that of Lower Loire, and enters the bay of Biscay, below Roche Bernard. When Sir Edward Hawke defeated the French fleet, in 1759, several of their men-of-war took shelter in this river, in which they were obliged to lie several months.

VILLA-ARAGONESE, a town of Sardinia, 17 miles N.E. of Sassari. Long. 8. 50. E. Lat. 40. 56. N.

VILLA-BOHIM, a town of Portugal, in Alentejo, 10 miles S.W. of Elvas.

VILLA-DEL-REY, a town of Spain, in Estremadura, on the frontiers of Portugal, taken by the allies in 1706. It is seated on the Guadiana, 17 miles N.W. of Badajoz. Long. 7. 10. W. Lat. 38. 43. N.

VILLA-DE-CONDE, a sea-port of Portugal, in the province of Entre-Douro-e-Minho, at the mouth of the Ava, 10 miles E. of Barcelos, and 20 N.W. of Oporto. Near it is an ancient aqueduct. Long. 8. 23. W. Lat. 41. 14. N.

VILLA-DE-HORTA, the capital of the island of Fayal, one of the Azores. It is seated on the W. coast, and has a harbour, land-locked on every side except the E. and N.E. and defended by several forts. Long. 28. 36. W. Lat. 38. 32. N.

VILLA-FLOR, a town of Portugal, in the province of Tra-los-Montes, seated on a river, that falls into the Douero. It is 46 E. of Villa Real.

VILLA-REAL, a town of Portugal, in the province of Tra-los-Montes, and capital of Comarca. It is seated at the confluence of the Corgo and Ribera, 15 miles N.E. of Lamego, and 45 S.E. of Braga. Long. 7. 20. W. Lat. 41. 9. N.

VILLA-REAL, a town of Spain, in the province of Valencia, 26 miles N. of Valencia. Long. 6. 20. E. Lat. 39. 46. N.

VILLA-REAL, a town of Spain, in Guipuscoa, six miles S.S.W. of Placentia.

VILLA-VICIOSA, a fortified town of Portugal, in Alentejo, with an old castle, and a palace, where the dukes of Braganza formerly resided. In the suburb is an ancient temple, originally built to the honour of Proserpine. The soil about this town is extremely fertile, and there are quarries of fine green marble. It sustained a famous siege against the Spaniards, in 1667; which occasioned a battle in a neighbouring plain, the event of which placed the crown of Portugal on the head of the Duke of Braganza. It is 16 miles S.W. of Elvas, and 83 S.E. of Lisbon. Long. 7. 16. W. Lat. 38. 36. N.

VILLA-VICIOSA, a sea-port of Spain, in Asturia d'Oviedo, seated on the bay of Biscay, 22 miles N.E. of Oviedo. Long. 5. 24. W. Lat. 43. 22. N.

VILLA-VICIOSA, a town of Spain, in New Castile. Here, in 1710, General Siremberg defeated the French and Spaniards under the Duke of Vendome, although they were twice his number; but, from want of provisions, he was obliged to leave to the vanquished all the advantages of a complete victory, which, accordingly, they ascribed to themselves. Villa Viciosa is six miles N.E. of Erihuega, and 49 N.E. of Madrid.

VILLAC, a town of Germany, in the duchy of Carinthia, belonging to the Bishop of Bamberg, with a castle. It carries on a great trade with the Venetians; and near it are the baths of Toplitz. It is seated at the confluence of the Drave and Gell, surrounded by mountains, 12 miles S.W. of Clagenfurt, and 88 N.E. of Brixen. Long. 14. 3. E. Lat. 46. 50. N.

VILLAGER, the same as cottager, a village being only an assemblage of cottages or mean habitations. See VILLAGE, and also the article COTTAGER in this SUPPLEMENT.

VILLE DIEU, a town of France, in the department of the Channel, 12 miles N.E. of Avranches, and 18 S.E. of Coutances. Long. 1. 8. W. Lat. 48. 52. N.

VILLEFORT, a town of France, in the department of Lozere, 18 miles E. of Mende, and 19 N. of Alais. Long. 3. 50. E. Lat. 44. 27. N.

VILLA-FRANCA, a sea-port of Italy, in the county of Nice, with a castle and fort. In 1744 it was taken by the French and Spaniards, but restored; and was again taken by the French in 1792. It is three miles E. of Nice. Long. 7. 25. E. Lat. 43. 42. N.

VILLA-FRANCA, a town of Italy, in the Veronese, with a silk manufacture, 10 miles S. of Verona. Long. 11. 23. E. Lat. 45. 36. N.

VILLA-FRANCA, the capital of the island of St. Michael, one of the Azores. Long. 25. 35. W. Lat. 37. 50. N.

VILLEMUR, a town of France, in the department of Upper Garonne, seated on the Tarn, 12 miles N.N.E. of Toulouse.

VILLINA, a town of Spain, in the province of Murcia, with a castle, formerly of great strength. It is 55 miles

N.W. of Murcia, and 175 S.E. of Madrid. Long. 6. 49. W. Lat. 38. 40. N.

VILLENEUVE, a town of France, in the department of Lot and Garonne, seated on the river Lot, 17 miles N. of Agen.

VILLENEUVE, a town of France, in the department of Gard, 23 miles N.W. of Nîmes.

VILLENEUVE, a town of Switzerland, in the canton of Bern, celebrated for its trout fishery. It is situate on the east extremity of the lake of Geneva, three miles from the mouth of the Rhone, 15 E.S.E. of Lausanne, and 38 S.S.W. of Bern. Long. 6. 58. E. Lat. 46. 24. N.

VILLENEUVE-DE-BERG, a town of France, in the department of Ardeche, 10 miles N.W. of Viviers.

VILLERS-COTERETS, a town of France, in the department of Oise, with a castle, 10 miles S.E. of Compiègne. Long. 3. 12. E. Lat. 49. 14. N.

VILLINGEN, a town of Suabia, in the Brisgau, seated in the Black Forest, between the sources of the Danube and Neckar, 28 miles E. by S. of Friburg. Long. 8. 37. E. Lat. 48. 8. N.

VILSHOFEN, a town of Lower Bavaria. In 1703 it was taken by the Imperialists; and in 1745, the Austrians took it by storm. It is situate at the confluence of the Vils and Danube, 11 miles W. of Passau, and 72 E.N.E. of Munich. Long. 13. 20. E. Lat. 48. 20. N.

VILVORDE, a town of Austrian Brabant, seated on the canal from Brussels to the Scheldt, seven miles N.E. of Brussels. Long. 4. 31. E. Lat. 50. 56. N.

VIMIOSO, a town of Portugal, in the province of Tra-los-Montes, 15 miles W.N.W. of Miranda-de-Douero, and 17 S.E. of Braganza. Long. 6. 30. W. Lat. 41. 20. N.

VINCENT, CAPE ST. the most southern promontory of Portugal, 25 miles W. by S. of Cape Lagos. Long. 9. 0. W. Lat. 36. 44. N.

VINCENT, ST. one of the Cape Verd Islands, on the coast of Africa. It is uninhabited; but on the N.W. side of it is a good bay, where ships may wood and water, and wild goats be shot. It is said that more turtle is caught near this island than round all the rest, and that it abounds with salt-petre.

VINCENT, ST. a province of Brazil, extending along the coast of the Atlantic, from the province of Rio Janeiro in the N.E. to that of Del Rey in the S. The capital, of the same name, has a good harbour. Long. 46. 30. W. Lat. 44. 15. S.

VINCENT, ST. a town of Spain, in Old Castile, with a castle, seated on a hill, near the river Ebro, 138 miles N.E. of Madrid. Long. 2. 40. W. Lat. 42. 30. N.

VINEGAR (*Enceyl.*). To what has been there offered we wish to add the following important observations on vinegar, by Cit. Parmentier, published in the *Annales de Chimie*.

Vinegar, considered with a view to its economical, pharmaceutical, and chemical uses, is at present of such general utility; that it may be looked upon as an article of the first necessity.

Simple as the process by which it is prepared may appear to be, it is by no means unattended with difficulty; but it is principally when we wish to obtain this acid in its greatest perfection, that we find reason to acknowledge how much its qualities may be influenced by art, and how necessary it consequently is, that we should make ourselves well acquainted with what happens during the process of acetous fermentation, in order that we may be enabled to direct its progress, and calculate its product.

Influenced by these motives, the authors of the tenth and last volume of the *Cours complet d'Agriculture*, conceived that an Essay on Vinegar, as forming a natural appendix to

that which Chaptal had published on the manufacture of wine, would afford their readers an insight into the different changes which are experienced by liquors susceptible of the vinous and acetous fermentation, and thus enable them the better to appreciate the comparative worth of the processes followed in the common routine of manufacture, and those founded upon practice, enlightened by theory.

It is to Citizen Parmentier, one of the fellow-labourers of Rosier in the *Cours d'Agriculture*, that we are indebted for the essay on vinegar, of which we are about to present our readers with an extract.

Before entering upon this subject, the author has thought fit to inform us, that it is not the art of the vinegar-manufacturer that he means to publish; this art, he says, is fully explained in the *Collection of Arts and Manufactures*, printed in 4to. at Neuchâtel; but as the very copious and interesting details which it contains would be out of their place in a simple essay, which ought only to exhibit general views and the principal facts, he has thought it better to dwell upon the formation, preparation, preservation, and properties of the different sorts of vinegar most used in Europe, and to comprise, within a small treatise, all the advantages which may accrue from the employment of this acid to the arts, to pharmacy, and to economy.

In order to give a greater perspicuity to his treatise, Cit. Parmentier has divided it into several paragraphs: in the first, he presents us with general reflections on the theory of aceticification.

It appears that the ancients had but very confused ideas concerning the cause of conversion of wine into vinegar. And how, in fact, could they form any accurate notions upon this subject, when we know that they were far from being acquainted with the nature of the principles which act so important a part in the process of acetous fermentation?

We must acknowledge, that it is only since the gases and their properties have been discovered, that we have learnt to reason with greater precision concerning this species of fermentation; and it is also particularly since we have carefully observed all that happens during its different stages, that we have succeeded in establishing a theory, which lays the greater claim to adoption, as it is founded upon facts, the reality of which can no longer be called in question.

At the present day it cannot be disputed that oxygen, hydrogen, and carbone, are the principal agents that contribute to the formation of vinegar. These three principles, which are also found in the greater part of the other vegetable acids, cannot form vinegar, unless when combined in proportions so constant and so rigorously determined, that be they varied never so little, they immediately afford new products.

It is to this cause that we ought to attribute the frequent changes that take place in vinegar when the requisite precautions are not taken for maintaining, between the three principles which we have just mentioned, that species of equilibrium upon which the existence of this acid depends.

If the acetous fermentation exhibits phenomena analogous to those which accompany the vinous fermentation, it can also not be denied, that there are certain phenomena peculiar to each of these kinds of fermentation, and so open to observation, that it is very easy to distinguish them.

For example, it is very certain that, during the course of vinous fermentation, there constantly takes place an extrication of elastic fluids, which are formed at the expence of the liquid itself, which is subjected to the fermentation: whilst, in the acetous fermentation, the production and disengagement of æriform fluids take place only during certain stages of the process, and that at one period during its course a very sensible absorption may be observed.

Rosier, the first who insisted upon this fact, conceived that it was atmospherical air that was absorbed in this case; but it has since been proved, to demonstration, that the oxygen contained in the atmospherical air is the only principle that enters into combination with the other principles of the fermenting liquid, and that it essentially contributes to the formation of the acid which constitutes vinegar.

This being ascertained, we cannot be at a loss what to think of the assertion of Becher, who pretends that he has converted wine into very strong vinegar, by merely letting it digest for a long time over the fire, in a bottle hermetically sealed. If he really has succeeded, it could only be owing to his having operated upon a very small quantity of wine contained in a spacious vessel.

Amongst the number of operations formerly practised for converting wine into vinegar, many were useless or defective, the greater part did not answer the purpose for which they were intended; and it was undoubtedly for this reason that the necessity was felt of simplifying them, and substituting other more advantageous ones. *Caribeyser, Boerhaave, Demachy, Guyton-Morveau, Prozet, &c. &c.* have principally employed themselves on this subject. By pointing out the improvements which ought to be adopted, and the only operations which were proper to be employed, they rendered almost universally known the art of making vinegar, which was formerly practised only by a few individuals, whose processes were always concealed under a veil of mystery.

It must however be admitted, that the improvements proposed by the above-mentioned learned men, were not so generally adopted as was to have been wished. In many of the departments of France the ancient processes are still in use, and it is undoubtedly to the carelessness which exists with respect to this subject, that we have to ascribe the defective vinegars often met with in commerce, the quality of which is generally so bad as to render them altogether useless.

In the second paragraph, Citizen Parmentier points out the most general conditions requisite for the formation of good vinegar.

These are four in number:

1. The access of the external air into the vessel which contains the liquid intended to become acid.
2. A temperature higher than that of the atmosphere.
3. The addition of substances which perform the office of a ferment.
4. The presence of a certain quantity of alkali.

The access of the atmospherical air is so indispensably necessary to the formation of vinegar, that this acid cannot be produced without it. What has been said in an earlier part of this essay, concerning the manner in which this æriform fluid acts during the acetous fermentation, is so well known at the present day, that it seems unnecessary to revert to it. Neither can the necessity of the concurrence of heat be called in question; but the heat ought to be moderate. In general it ought not to exceed 18,20 degrees of Reaumur's thermometer: if a higher temperature is applied, it injures the quality of the product.

The following is a striking instance of the inconvenience which results from employing a higher degree of temperature than that which we have indicated.—A vinegar-manufacturer of Orleans, conceiving that the higher he raised the temperature in his workshop, the stronger his vinegar would turn out, heated his stove to such a degree as to raise the temperature of the atmosphere to 30°; but, upon examining the vinegar which he had obtained, he found, to his no small surprise, that it was not only very weak, but

also of a bad quality. He then applied to Citizen Prozet, who acquainted him with the proper degree of temperature, and since that time he has always obtained vinegar of very good quality.

But even though so conclusive an experiment should not be thought to prove the necessity of moderating the heat in the places where vinegar is manufactured, we need only reflect for a moment upon what happens in the process of acetous fermentation, to be convinced that if it be necessary to determine the formation of the different combinations from which, in their turn, an acid is to be produced, it is also necessary that, when these combinations have once been produced, we should prevent their separating from the liquid in which they are contained: now the surest means of preserving them is to avoid a too high degree of temperature, and it is precisely for this reason that pains have been taken to ascertain the degree at which we ought to desist from augmenting the temperature, which has been fixed at between 18° and 20° of Reaumur's thermometer.

The addition of substances proper for forming ferments, is a condition so indispensably necessary to the production of acetous fermentation, that it would be difficult to prove that it can be omitted without detriment. It is well known that the great art of the manufacturer of vinegar consists in establishing, at one and the same time, in the whole mass of vinous fluid, an internal motion, which agitates its constituent principles, compelling them to separate from each other, and afterwards re-unite into combinations different from those in which they previously existed. It would be in vain for us to expect to obtain such a motion by leaving the wine to itself; a part of this fluid might indeed become at length acidified, but before the whole could become completely so, it would require a great length of time, and then the first portions of acid that had been formed would be very near to a state of decomposition. Be that as it may, the choice of the substances proper for forming ferments is by no means a matter of indifference, and this choice ought always to be determined according to the quality of the fluid upon which one operates. The author enters into details relative to this subject, which are the more interesting as being the result of experience and observation.

Finally, the obligation imposed upon us, as the fourth condition, to employ wines of good quality if we wish to obtain excellent vinegar, is naturally deduced from the state of the constituent parts of these wines; it is easily conceived, that the more they possess of a species of perfection, the more they will also influence that of the new product which is about to be formed. Moreover, in this case experience entirely accords with theory, for it is universally admitted that the best kinds of vinegar are those that have been manufactured from generous wines.

The third paragraph presents us with a description of the operations requisite for the manufacture of different kinds of vinegar.

The author has not contented himself with describing the processes for making wine-vinegars; but he has also described those employed for obtaining the vinegars of cyder, of perry, of malt-liquors, of the bran of wheat, with such precision, that whoever may wish to repeat them may be spared the trouble of making any trials that may prove unsuccessful.

In the same paragraph, the author makes mention of several other acids, which, in certain places, are employed as substitutes for ordinary vinegar.

Such are verjuice, the acid of milk, that of honey, &c. &c.; though these acids, chemically considered, are somewhat different from those furnished by wine, it is no less true that

they afford great resources, and that in some departments of the republic, where they are principally consumed, they are in daily use, without producing any bad effects upon the health of the inhabitants.

The fourth paragraph is entitled, *Of the Acids used as Substitutes for Vinegar.*

The greater part of the vegetable acids stands in the same predicament with those that have been treated of in the preceding paragraphs. Though essentially different from wine-vinegar, they have, in certain respects, so great an analogy with the latter, that people have not hesitated to make use of them in its stead. It is for this purpose, undoubtedly, that the juice of the currant, barberry, &c. are expressly subjected to the acetous fermentation. The liquors procured by these means afford very useful substitutes for vinegar; but they have the disadvantage that they will not keep. In general they soon become covered with mould, soon after they have been prepared, and at length are entirely decomposed.

Before the revolution, vinegar formed a very important article of commerce with certain nations; the Dutch in particular carried on a very considerable traffic with it. The vinegars which they manufactured were exported to their colonial possessions, and, as they were of good quality, they bore long voyages without spoiling.

Citizen Parmentier imagines that this branch of commerce might also become very productive in the *Département de la Seine*, and that the inhabitants, by their commercial genius, might easily increase their exports, and thus add to the great advantages which they derive from their geographical position.

The manner of preserving vinegar forms the subject of the fifth paragraph.

Vinegar, be it ever so well prepared, is subject to the lot of all compound fluids; namely, that at the end of a certain period it undergoes sensible alterations.

There are however means by which these alterations may be retarded; they consist in defending the vinegar against the influence of the external air, by keeping it in proper vessels, well closed and placed in a cool situation.

Its alteration may also be retarded by depriving it of a portion of the water which it contains; for which purpose nothing more is necessary than to let it boil for an instant; but the vessels which are employed in this operation must not be made of copper.

The process proposed by Scheele, with a similar intention, is very simple: it consists in filling, with this acid, glass vessels, which are placed in boilers full of water. The water is then made to boil for a full quarter of an hour, after which the vinegar is taken out, and may then be kept for several years without undergoing any alteration.

Distillation has also been recommended as a means of preserving vinegar; but, besides that it is a tedious and difficult process, it deprives the acid of the agreeable smell and taste peculiar to it in its natural state, and which one always wishes to find in it.

In fact, distilled vinegar is not susceptible of alteration, and it is partly on this account, and partly also because it contains no substance foreign from its composition, that it is reserved for chemical operations, and employed in preference to the other in many pharmaceutical preparations.

The same is the case with vinegar that has been concentrated by freezing. The acid, by this simple process, becomes much stronger, and may be kept for a greater length of time; but it acquires an empyreumatic smell and taste, which render it unfit for being employed as a seasoning for aliments. This vinegar, like the distilled, is almost solely employed in chemical laboratories.

Finally, sea-salt, or muriate of soda, which some have recommended to be added to vinegar, as being able to preserve this acid, sometimes succeeds well enough; however it is not without its inconveniences; for the vinegars that contain this saline substance grow turbid, and at length lose their primitive qualities.

However, this process ought not to be neglected; and though it may not succeed quite so perfectly as we could wish, we may still employ it in certain cases with advantage, especially if the quantity of salt added to the vinegar be not too considerable.

The signs by which we may discover whether the vinegar be good, adulterated, or spoiled, form the subject of the sixth paragraph.

Nothing is more common than to meet, in commerce, with vinegars of bad quality. Two causes principally contribute to their being in that state: the first, that they have been manufactured with weak wines, or such as are already spoiled; the second, that they have either been mixed with acid substances, such as pimento, &c. or mineral acids, such as the sulphuric and muriatic, have been added to them.

When the buyer, unacquainted with the fraud, tastes these kinds of vinegar, he imagines that the effect which they produce upon his palate is to be ascribed to the strength of the vinegar, and frequently that alone is sufficient to make him conclude that the vinegar is of good quality. How grossly he is mistaken is very evident.

However, there is more easy than to detect such a fraud; it being sufficient to saturate a given quantity of potash with the vinegar that is suspected of being adulterated, and to compare the quantity of vinegar that we have been obliged to employ before we could obtain a complete saturation with that consumed in a similar experiment made with vinegar, the good quality of which we are assured of.

We ought afterwards to evaporate a portion of this vinegar till a pellicle is formed upon it, and examine if, when it has cooled, it has not deposited some saline precipitate. If it has, the form of the crystals will shew us what species of acid has been used for adulterating the vinegar.

As to the acid vegetable substances that may have been mixed with it, they will readily be recognized by their taste, which will be altogether different from that of vinegar, and which will become the more perceptible the more the acid has been concentrated by evaporation.

In general, vinegar that has not been adulterated, or which has not been spoiled by an incipient decomposition, is readily known by its acid taste, its transparency, and its agreeable smell, a smell which becomes still more developed when we rub some of the vinegar between the hands.

In the seventh and eighth paragraphs, the author treats of the use of vinegar in preserving fresh meat, fruits, and esculent vegetables.

Every one is acquainted with the great utility of vinegar in preserving flesh from the change which it speedily undergoes, particularly during the heat of the summer; it is also known that this acid, which is daily employed in our kitchens, has the property of giving to certain kinds of flesh meat an agreeable taste, and rendering them more tender, and consequently more fit to be eaten: but, in order to produce these effects, it is necessary that the vinegar should be of good quality; otherwise the result would be directly contrary to that which we hoped to obtain.

As to the preservation of fruits and esculent vegetables in vinegar, it is a practice almost universally in use: but in this case also it is necessary that the vinegar should be good; otherwise the fruits become soft, and at length unfit to be eaten.

The aromatic vinegars form the subject of the ninth paragraph.

The author dwells, in this article, upon the property which vinegar possesses of imbibing the aroma of plants; he mentions several aromatic vinegars, which are the most in use, both for the table and the toilet, and he points out the precautions that must be taken in order to make them keep for a long time. But this acid also imbibes the more active properties of the vegetables, and it is upon this that the art of making medicated vinegars is founded; the method formerly practised with the intention of forming such vinegars, by letting the medicinal plants ferment together with the wine, is now known to be grounded in an error.

In the tenth and last paragraph, Citizen Parmentier treats of the medicinal and economical uses of the vinegar itself: he shews the great utility of this acid in putrid and contagious diseases, whether administered internally, or applied externally. He quotes, under this head, the regulations by which the marine of France commands the captains of ships not to put to sea without a quantity of vinegar sufficient for washing their decks, cabins, &c. at least once every five days. He proves that it is frequently owing to a similar use of vinegar that crews have been preserved from the diseases prevalent in fleets, and that on this account alone more attention than ever ought to be paid to the execution of the regulations mentioned above.

Finally, the author dwells upon the utility of vinegar in the arts, and the impossibility of supplying its place by any other known acid.

From the exposition which we have given, it may be easy to see that the treatise on Vinegar in the *Cours complet d'Agriculture* fulfils all the conditions that were to be desired in such a treatise. If Citizen Parmentier has not thought it necessary to treat his subject with all the detail of which it was susceptible, it will at least be admitted, that he has dwelt upon those points which it was most essential to know, and that in this respect he has completely fulfilled the views proposed to themselves by the authors of the work for which this article was intended. We therefore have no doubt that the labours of Citizen Parmentier will be favourably received, and that, as we have already said, they will form a worthy counterpart to the article on wine by Citizen Chaptal, which, according to the avowal of all who have read and studied it, deserves to be ranked amongst the best productions of that chemist.

VINGORLA, a Dutch settlement in the peninsula of Hindoostan, on the coast of Concan, a little N. of Goa. Long. 73. 22. E. Lat. 15. 57. N.

VINGORIA ROCKS, rocks lying about seven miles from the coast of Concan, in the peninsula of Hindoostan, and 10 miles S.S.W. of the island of Melundy, or Sunderdoo. They are possessed by the Malwaans, a piratical tribe. Long. 73. 16. W. Lat. 15. 52. N.

VINTIMIGLIA, a town of Italy, in the republic of Genoa, with a bishop's see, a small harbour, and a strong castle on a high rock. It has been often taken and retaken, and is seated on the Mediterranean, at the mouth of the Rotta, 20 miles E.N.E. of Nice, and 70 S.W. of Genoa. Long. 7. 37. E. Lat. 43. 53. N.

VIRE, a town of France, in the department of Calvados, with several manufactures of coarse woollen cloths. It is seated on the Vire, 30 miles S.E. of Courances, and 150 W. of Paris. Long. 0. 45. W. Lat. 48. 48. N.

VIRGIN ISLANDS, about thirty islands and keys in the West Indies, between St. Juan de Puerto Rico and the Leeward Caribbee Islands. They were called *Las Virgenes* by the Spaniards, in honour of the 11,000 virgins of the legend. They are possessed by the English and Danes. In

the first division, belonging to the English, is Tortola, the principal, to which belongs Joff Van Dyke's and Little Van Dyke's, Guana ile, with Beef and Thatch Islands. In the second division is Virgin Gorda, to which belong Anegada, or Drowned Ile, Nicker, Prickly Pear, and Mulkito Islands, the Communes, Scrub and Dog Islands, the Fallen City (two rocky islets, close together, at a distance resembling ruins), the Round Rock, Ginger, Cooper's Salt Island, Peter's Island, and the Dead Chest. - Of the Danish division, the principal islands are St. Thomas and St. John. Long. from 63. 45. to 64. 55. W. Lat. from 17. 10. to 18. 30. N.

VIRNENBERG, a town and citadel of Westphalia, the capital of a county to which it gives name. It is 20 miles W. of Coblenz. Long. 7. 5. E. Lat. 50. 27. N.

VIRTON, a town of Austrian Luxemburg, 22 miles W. of Luxemburg. Long. 5. 41. E. Lat. 49. 36. N.

VISAGAPATAM, a town of the peninsula of Hindoostan, in the Circar of Cicacole, 50 miles S.W. of Cicacole, and 100 N.E. of Rajamundry. Long. 85. 40. E. Lat. 17. 45. N.

VISCHMA, a town of Russia, in the government of Tobolsk, 268 miles S.W. of Tobolsk. Long. 61. 22. E. Lat. 62. 36. N.

VISET, a town of the Netherlands, in the bishopric of Liege, seated on the Maese, seven miles N. of Liege. Long. 5. 40. E. Lat. 50. 44. N.

VISHNET-VLOTCHEK, a town of Russia, in the government of Tver, one of the imperial villages enfranchised by Catherine II. It has a canal, which, by uniting the Tverza and the Mafsa, connects the inland navigation between the Caspian and the Baltic; and the inhabitants, raised from the situation of slaves to that of freemen, seem to be awakened to a sense of their commercial advantages. The town is divided into regular streets. All the buildings are of wood, except the court of justice erected by the late empress, and four brick houses belonging to a rich burgher. It is seated on the river Zua, 50 miles N.W. of Tver. Long. 35. 0. E. Lat. 57. 23. N.

VISIAPOUR, or **BEJAPOUR**, a considerable city of the Deccan of Hindoostan, once the capital of a large kingdom of the same name, but now subject to the Poonah Mahrattas. It is 130 miles S.E. of Poonah, and 234 S.E. of Bombay. Long. 75. 19. E. Lat. 17. 26. N.

VISOGOROD, a town of Poland, in Masovia, with a castle, seated on the Visula, 50 miles N.W. of Warsaw.

UIST NORTH and SOUTH, two islands of the Hebrides, on the W. coast of Scotland; each about 20 miles in length, and of considerable breadth. They contain about 6,000 inhabitants. Kelp is the staple commodity, of which about 1100 tons are annually manufactured in these islands. North Uist is about 15, and South Uist 20 miles W. of the Isle of Skye.

VITERBO, a town of Italy, in the patrimony of St. Peter, with a bishop's see. It contains 10,000 inhabitants, 16 parish-churches, and many palaces and fountains. Near it is a spring, so hot, that it will boil an egg, and even flesh. It is seated at the foot of a mountain, from the top of which, the city of Rome and the Mediterranean Sea may be seen; the latter at the distance of near 50 miles. It is 20 miles S.E. of Orvieto, and 35 N. by W. of Rome. Long. 12. 26. E. Lat. 42. 25. N.

VITRE, a town of France, in the department of Isle and Vilaine. It has a trade in linen cloth, and knit stockings and gloves. It is seated on the Vilaine, 20 miles N.E. of Rennes, and 52 S.E. of St. Malo. Long. 1. 13. W. Lat. 48. 14. N.

VITRI LE-BRULE, a village of France, two miles N.E. of Vitri-le-François. It was formerly a considerable town, but was burnt (as its name imports) by Lewis VII.

VITRI-LE-FRANCOIS, a considerable town of France, in the department of Marne. It is well built, though the houses are of wood; and there is a fine square, in which the church stands. It has a great trade, particularly in corn; and is seated on the Marne, 15 miles S.E. of Chalons, and 100 E. of Paris. Long. 4. 38. E. Lat. 48. 44. N.

VITRING, a town of Germany, in the duchy of Carinthia, with an abbey of Cisterians. It is situate on a lake, called the Wordtsee, four miles S.W. of Clagenfurt.

VITRIOL, the name by which salts, produced by combining vitriolic (now called *sulphuric*) acid with different metals, has heretofore been distinguished. Thus we had *blue vitriol*, *green vitriol*, &c. according to the colour of the salt. The chemists of the new school call these substances *sulphates*, as the *sulphate* of copper; *sulphate* of iron, &c. (see Table of Nomenclature, CHEMISTRY); but the London College of Physicians call these substances by the name of *vitriolated*, and denominate the foregoing combinations, *vitriolated copper*, *vitriolated iron*, &c.

VITTEAUX, a town of France, in the department of Côte d'Or, seated on the river Braine, among the mountains, where there are quarries of marble, 12 miles S.E. of Semur, and 27 W. of Dijon. Long. 4. 27. E. Lat. 57. 20. N.

VITTORIA, or **VICTORIA**, a considerable town of Spain, capital of the province of Alaba, in Biscay. It is surrounded by double walls, and in the principal square are the town-house, two convents, and a fine fountain. The large streets are bordered with fine trees, which are a good defence against the heat of the sun. It has a great trade in hardware, particularly in sword-blades, which are made here in large quantities. It is seated on an eminence, at the end of a plain, fertile in corn and grapes, 32 miles S.E. of Bilbao, and 155 N. of Madrid. Long. 2. 56. E. Lat. 42. 55. N.

VIVARAIS, a late small province of France, part of that of Dauphiny, and now included in the department of Ardeche.

VIVERO, a town of Spain, in Galicia, seated at the foot of a steep mountain, near the river Landrova, whose mouth forms a large harbour on the Atlantic, 30 miles N.W. of Mondonnedo. Long. 7. 34. W. Lat. 43. 50. N.

VIVIER, a town of France, in the department of Ardeche, with a bishop's see. It is seated among rocks (on one of which the cathedral is built) on the river Rhone, 20 miles N. of Orange, and 70 N.E. of Montpellier. Long. 4. 46. E. Lat. 44. 20. N.

VIZA, a town of Turkey in Europe, in Romania, with a Greek archbishop's see. It is seated at the foot of a mountain, at the source of the river Glicenero.

UKENSKOI, a town of Russia, in the government of Tobolsk, situate at the confluence of the Irtisch and Oby, 196 miles N. of Tobolsk. Long. 69. 15. E. Lat. 61. 10. N.

ULEA, or **ULABONG**, a sea-port of Sweden, in East Bothnia. It is the largest town in East Bothnia, and situate at the mouth of a river of the same name, 320 miles N. of Abo. Long. 22. 20. E. Lat. 65. 40. N.

ULIERBECK, a town of Austrian Brabant, two miles E. of Louvain, and 11 S.E. of Mechlin. Long. 4. 52. E. Lat. 50. 53. N.

ULLSWATER, a lake of Westmoreland, 10 miles N. of Ambleside, and 14 S.W. of Penrith. It is eight miles long, and abounds with char, and a variety of other fish. The navigators of this lake find much amusement by discharging guns, or small cannon, in certain stations. The report is reverberated from rock to rock, promontory, cavern, and hill, with every variety of sound; now dying away upon the ear, and again returning like peals of thunder, and thus re-echoed seven times distinctly.

ULMEN, a town of Germany, in the archbishopric of Mentz, 30 miles N.E. of Treves. Long. 7. 8. E. Lat. 50. 7. N.

ULOTHO, or **VLOTHW**, a town of Westphalia, in the county of Ravenberg, near which is a medical spring. It is six miles S. of Minden.

ULRICSHAMN, a town in Sweden, in West Gothland, formerly called Bogefund, the present name being given it, in 1741, in compliment to Queen Ulrica Eleonora. It is 24 miles W. of Jonkioping, and 47 E. of Gotheborg. Long. 14. 22. E. Lat. 57. 10. N.

ULTZEN, or **VELTZEN**, a town of Lower Saxony, in the duchy of Lunenburg. It was formerly a hanseatic town, has now a considerable trade in wool, and is seated on the Ilmenau, 22 miles S. of Lunenburg. Long. 10. 38. E. Lat. 52. 55. N.

ULVERSTONE, a town in Lancashire, with a market on Monday. The country people call it Oulton, and it is seated at the foot of a swift descent of hills to the S.E. near a shallow arm of the Irish Sea. It is the port of the district of Furness. The principal inns are kept by the guides, who regularly pass the fands, to and from Lancaster, every Sunday, Tuesday, and Friday. It is 18 miles N.W. of Lancaster, and 267 N.N.W. of London. Long. 3. 12. W. Lat. 54. 14. N.

UMA, or **UMEA**, a town of Sweden, in West Bothnia, seated on the river Uma, in the gulf of Bothnia. The houses are built of wood; and it was twice burnt by the Russians. It is the residence of the governor of West Bothnia, and 280 miles N. of Stockholm. Long. 19. 9. E. Lat. 63. 58. N.

UMAGO, a sea-port of Venetian Istria, seated between the gulf Lagona and the mouth of the river Quieto.

UMBRIATICO, a town of Naples, in Calabria Citeriore, with a bishop's see, though now reduced to a small place. It is seated on the Lipida, 15 miles N. by W. of St. Severina. Long. 17. 10. E. Lat. 38. 20. N.

UNDERSWEN, or **UNDERSEEN**, a handsome town of Switzerland, in the canton of Bern, near which is the famous cavern of St. Pat. It is seated on the lake Thun, 25 miles S.S.E. of Bern, and 30 S.E. of Friburg. Long. 7. 32. E. Lat. 46. 32. N.

UNGHWAR, a town of Upper Hungary, capital of a county of the same name, in an island formed by the Ugh. It is strong from its situation among the mountains of Crapach, and is 47 miles E. of Cassovia. Long. 22. 23. E. Lat. 48. 48. N.

UNION (*Encycl.*). This term ceases to be applied exclusively to the political connection between England and Scotland; Ireland having, in 1800, experienced a similar fate. In Plate 91, we have given a sketch of the *enigms armorial of the united kingdom of Great Britain and Ireland*, as settled by the king in council. These are quarterly, first and fourth, England; second, Scotland; third, Ireland: on an escutcheon of pretence, the arms of his majesty's German dominions, ensigned with the electoral bonnet.

The union badges—the rose, thistle, and shamrock—issuant from the same stalk; namely, the rose between the thistle and shamrock, and alternated by the rose between the shamrock and thistle; both ensigned with the imperial crown.—See the plate.

The union flag combines the saltires of St. Andrew and St. Patrick, surmounted by the cross of St. George, as represented also in the plate.

The crest of Ireland is a tower, triple-towered proper; in the portal a hart, lodged, argent, attired, and hooped, or.

The badge of Ireland is a shamrock ensigned with the imperial crown.

The badge of the shamrock to be within the collar of St. Patrick, ensigned with the imperial crown.

The style of his majesty is as follows:—“*Georgius Tertius Dei Gratia Britanniarum Rex, Fidei Defensor, et in Terrâ*
Vol. X.

Ecclesiæ Anglicanæ e. Hibernicæ supremum Caput.” In English, “George the Third, by the Grace of God, of the united Kingdoms of Great Britain and Ireland, King, Defender of the Faith, and of the united Church of England and Ireland on Earth, Supreme Head.

The supporters, crest, and crown, remain without any alteration.

UNION, the county town of Fayette, in Pennsylvania, 14 miles from the Monongohela, and 58 S. of Pittsburg. Long. 79. 48. W. Lat. 39. 54. N.

UNNA, a town of Westphalia, in the county of March, formerly a considerable Hanseatic town. It is seated on a brook called Kottelbeck, 10 miles N.E. of Dortmund, and 35 S. of Munster. Long. 7. 49. E. Lat. 51. 28. N.

UNNA, a river of Turkey in Europe, which runs through Croatia, passes by Wihitsch and Dubitz, and falls into the Save.

UNNARY, a town of Sweden, in the province of Smoland, 43 miles W. of Wexio.

UNST, the most remote of the Shetland Islands, extending beyond 61° N. lat. It is eight miles long, and four broad.

UNTERSEEN, a town of Switzerland, in the canton of Bern, situate between the lakes of Brienz and Thun, 23 miles S.S.W. of Lucern, and 26 S.E. of Bern. Long. 7. 28. E. Lat. 46. 35. N.

UNZA, or **UNSHA**, a town of Russia, in a province of the same name, in the government of Kostroma. It is situate on the river Unza, 92 miles E.N.E. of Kostroma. Long. 44. 15. E. Lat. 57. 56. N.

VOERDEN, a town of the United Provinces, in Holland. It was taken by the French in 1672 and 1795. It is seated on the Rhine, 10 miles W. of Utrecht, and 20 S. of Amsterdam. Long. 4. 53. E. Lat. 52. 6. N.

VOGHERA, a fortified town of Italy, in the duchy of Milan and territory of Pavia. It is seated on the Staffora, 14 miles S.S.W. of Pavia, and 30 S. by W. of Milan. Long. 9. 10. E. Lat. 44. 59. N.

VOGLABRUCK, a town of the archduchy of Austria, which enjoys the privilege of granting protection to all slaves; and its burghers and merchants, together with their wares, are toll-free through all the Austrian countries. It is 27 miles S.S.E. of Passau. Long. 13. 40. E. Lat. 48. 1. N.

VOID, a town of France, in the department of Meurthe, seated on a rivulet of the same name, 10 miles from Toul.

VOIGTLAND, a territory of Upper Saxony, one of the four circles of the marquissate of Misnia; bounded on the E. by Bohemia, on the N. by the duchy of Altenburg, and on the W. by Thuringia and Franconia. Plawen is the capital.

VOIGTSEB, a town and citadel of Upper Saxony, belonging to the Elector of Saxony, 18 miles S.S.W. of Zurichau.

VOKELMARK, or **WOLCKEMARCK**, a town of Germany, in Carinthia, seated on the Drave, 26 miles S.E. of Clagenfurt. Long. 13. 56. E. Lat. 46. 45. N.

VOLANO, a sea-port of Italy, in the Ferrarese, seated on the gulf of Venice, at one of the mouths of the Po, 40 miles E. of Ferrara. Long. 12. 36. E. Lat. 44. 52. N.

VOLCANO, one of the most considerable of the Lipari Islands, in the Mediterranean, lying S. of the island of Lipari, from which it is separated by a deep channel, a mile and a half broad. It is 12 miles in circumference, and is a volcano, in the form of a broken cone, but now emits smoke only. Volcano, as well as all the rest of these islands, is supposed to have been originally the work of subterranean fire. Of the production of this island, in particular, Fazzello says, that it happened in the early time of the Roman republic, and is recorded by Pliny and others.

VOLGA, the largest river in Europe, which has its source in two small lakes, in the government of Plekorf, in Russia, about 80 miles W. of Tver. It begins to be navigable a few miles above that town, and is considerably augmented here by the junction of the Tverza, which is a broader, deeper, and more rapid river. By means of the Tverza, a communication is made between the Volga and the Neva, or, in other words, between the Caspian and the Baltic. This river waters some of the finest provinces in the Russian empire, passes by Yaroslaf, Kostroma, Nishnei-Novogorod, Kafan, Simbirsk, and Saratof, entering the Caspian Sea, by several mouths, below Astracan.

VOLHYNIA, a palatinate of Russian Poland, 300 miles long and 150 broad; bounded on the N. by Polesia, on the E. by Kiof, on the S. by Podolia, and on the W. by Austrian Poland. It consists chiefly of plains watered by a great number of rivers. Lucko is the capital.

VOLLENHOVEN, a town of the United Provinces, in Overijssel, capital of a territory of the same name, with a castle. It is seated on the Zuider Zee, eight miles S.W. of Steenwich, and 12 N.W. of Zwol. Long. 5. 42. E. Lat. 52. 44. N.

VOLO, a town of Turkey in Europe, in Janna, with a citadel and a fort. It was taken, and almost ruined, in 1655, by the Venetians. It is seated on a gulf of the same name, where there is a good harbour, 30 miles S.E. of Larissa. Long. 22. 55. E. Lat. 39. 21. N.

VOLODIMIR, or **VLADIMIR**, a government of Russia, formerly a province of the government of Moscow. The soil is extremely fertile, and in the forests are innumerable swarms of bees.

VOLODIMIR, or **VLADIMIR**, a town of Russia, capital of a government of the same name, and once the metropolis of the empire. It is seated on the Klafina, 110 miles E. by N. of Moscow.

VOLOGDA, a government of Russia, divided into the two provinces of Vologda and Veliki-Ustiug. It is a marshy country, full of forests, lakes, and rivers, and noted for its fine wool.

VOLOGDA, a town of Russia, capital of a province of the same name, and the see of an archbishop. It has a magnificent cathedral, several churches, a castle, and a fortress; and carries on a considerable trade. It is seated in a marsh, on the river Vologda, which falls into the Sukhona, 257 miles N. by E. of Moscow. Long. 39. 46. E. Lat. 59. 20. N.

VOLESK, a town of Russia, in the government of Saratof, situate on the Volga, 76 miles N.E. of Saratof. Long. 47. 45. E. Lat. 52. 15. N.

VOLTA, a river of Guinea, which runs from N. to S. and falls into the Atlantic Ocean, E. of Acra.

VOLTERRA, a town of Tuscany, in the territory of Pisa, with a bishop's see. It is surrounded by walls, contains several antiquities, is noted for its medicinal waters, and is seated on a mountain, 30 miles S.W. of Florence, and 32 S.E. of Pisa. Long. 10. 42. E. Lat. 43. 26. N.

VOLTRI, a town of Italy, in the Genoeve, near which the Austrians were defeated by the French in 1796. It is six miles W. of Genoa.

VOLTURNO, a river of Naples, which rises in the Apennines, passes by Isernia and Capua, and falls into the gulf of Gaeta.

VOLTURARA, a town of Naples, in Capitanata, with a bishop's see. It is seated at the foot of the Apennines, 20 miles W. of Lucera, and 52 N.E. of Naples. Long. 15. 14. E. Lat. 41. 26. N.

VOLVIC, a town of France, in the department of Puy de Dome. Here are immense quarries, formed by a current of

lava, which furnish materials for the buildings of the adjacent towns. The sculptors have employed no other for the statues in the churches, which are all of a black colour. Volvic is two miles from Riom.

VOORN, a fort of Dutch Guelderland, on an island formed by the junction of the Wahal and the Maese, at the E. end of the Bommel Waert.

VOORNLAND, a territory of the United Provinces, anciently part of Zealand. It consists of the islands of Voorn, Goree, and Overlackee.

VORALBERG, or **VORARLBERG**, a district of Upper Austria; bounded on the W. by the lake of Constance, on the E. by the mountains of Arlberg, which separates it from Tyrol, on the S. by the country of the Grisons, and on the N. by Suabia. It comprises the four counties of Feldkirch, Bregenz, Pludenz, and Sonnenberg.

VORDEN, a town of Westphalia, in the bishopric of Osnaburg, 10 miles E.N.E. of Osnaburg. Long. 8. 24. E. Lat. 52. 20. N.

VORINGEN, a town of Suabia, in the principality of Hohenzollern, situate on the Lauchart, 10 miles S.E. of Hohenzollern. Long. 9. 12. E. Lat. 48. 15. N.

VORONETZ, a government of Russia, the capital of which, of the same name, is seated on the Voronetz, below its junction with the Don, 217 miles S. by E. of Moscow. Long. 39. 14. E. Lat. 51. 36. N.

VOSGES, a department of France, including that part of Lorrain, which was lately a province of the same name. It is so called from a chain of mountains, covered with wood, that separates this department from the department of Upper Saone and Upper Rhine.

VOU-HOU-HIEN, a city of China, in the province of Kiang-nan, and jurisdiction of Tay-ping-fou; the most considerable, in point of riches, in that jurisdiction. It is 52 miles S.W. of Tay-ping-fou.

VOUILLE, a village of France, in the department of Vienne, 10 miles W. of Poitiers. Here Clovis gained a battle, in 507, against Alaric, king of the Visigoths, which extended the French empire from the Loire to the Pyrenées.

VOU-TCHANG-FOU, the capital of the province of Hou-quang, in China; the rendezvous, as it were, of all the commercial people in the empire. As every branch of trade is carried on here, its port, seated on the Yang-tse-kiang, is always crowded with vessels; the river being sometimes covered with them to the distance of two leagues. The beautiful crystal found in its mountains, the plentiful crops of fine tea, and the prodigious sale of the bamboo paper made here, contribute no less to make it famous than the continual influx of strangers. Its extent is compared to that of Paris. Its district contains one city of the second class, nine of the third, a fortified town, and several fortresses. It is 875 miles S. of Pekin. Long. 112. 25. E. Lat. 30. 30. N.

VOU-TCHEOU-FOU, or **FOU-TCHEOU-FOU**, a city of China, in the province of Kiang-nan, formerly one of the most beautiful in the empire; but, since the invasion of the Tartars, it has been a heap of ruins, which, however, still convey some idea of its ancient magnificence. Its district contains six cities of the third class. It is 350 miles S. by W. of Nanking. Long. 116. 25. E. Lat. 27. 30. N.

UPPINGHAM, a town of Rutlandshire, with a market on Wednesday; seated on an eminence, six miles S. of Oakham, and 90 N. by W. of London. Long. 0. 45. W. Lat. 52. 36. N.

UPTON, a town in Worcestershire, with a market on Thursday; seated on the Severn, 11 miles S. of Worcester, and 109 W.N.W. of London. Long. 1. 55. W. Lat. 51. 59. N.

URACH, a town of Suabia, in the duchy of Wirtemberg. Here are considerable manufactures of damask and other linens. It is 21 miles S.S.E. of Stuttgart, and 24 W. of Ulm. Long. 9. 15. E. Lat. 48. 27. N.

URAL, a river of Russia, which rises in Mount Caucasus, and watering Orenburg, Uralik, and Gurief, falls by three mouths into the Caspian Sea. See the next article.

URALIAN COSSACS, a Tartar tribe that inhabit the Russian province of Orenburg, on the S. side of the Ural. These Cossacs are descended from those of the Don; and are a valiant race. They profess the Greek religion; but there are dissenters from the established religion, whom the Russians called *Rokobukhi*, or Separatists, and who style themselves *Staroverkhi*, or Old Believers. These consider the service of the established church as profane, and have their own priests and ceremonies. The Uralian Cossacs are all enthusiasts for the ancient ritual, and prize their beards almost equal to their lives. A Russian officer having order a number of Cossac recruits to be publicly shaved in the town of Yaitik, in 1771, this wanton insult excited an insurrection, which was suppressed for a time; but, in 1773, the impetuous Pugatchef, having assumed the name of Peter III. appeared among them, and, taking advantage of this circumstance, roused them once more into open rebellion. This being suppressed by the defeat and execution of the impetuous, in order to extinguish all remembrance of this rebellion, the river Yaik was called the Ural; the Yaik Cossacs were denominated Uralian Cossacs; and the town of Yaitik was named Uralik. These Cossacs are very rich, in consequence of their fisheries in the Caspian Sea. Their principal fishery is for sturgeons and beluga, whose roe supplies large quantities of caviare; and the fish, chiefly salted and dried, afford a considerable article of consumption in the Russian empire.

URALSK, a town of Russia, in the government of Caucasus and province of Orenburg. It was formerly called Yaitik (see the preceding article), and is seated on the river Ural, 375 miles N.N.E. of Astracan. Long. 50. 10. E. Lat. 52. 0. N.

URANIENBURGH, once a magnificent castle of Denmark, in the island of Huen. It was built by Tycho Brahe, a celebrated astronomer, who called it Uranienburgh, or Castle of the Heavens, and here made his observations. It is now in ruins. Long. 12. 52. E. Lat. 55. 54. N.

URBANEA, a town of Italy, in the duchy of Urbino, with a bishop's see. It was built by Pope Urban VIII. on the river Metro, 12 miles S. of Urbino. Long. 12. 40. E. Lat. 43. 34. N.

URBANNA, a town of Virginia, on the river Rappahannock, 70 miles N.E. of Richmond.

URBINO, a duchy of Italy, in the Ecclesiastical State, 55 miles long and 45 broad; bounded on the N. by the gulf of Venice, on the S. by Perugia and Spoleto, on the E. by Ancona, and on the W. by Tuscany and Romagna. The air is not very wholesome, nor is the soil fertile.

URBINO, a town of Italy, capital of the duchy of Urbino, with a citadel, an archbishop's see, and a palace, where the dukes formerly resided. Great quantities of fine earthen ware are made here; and it is famous for being the birth-place of the illustrious painter Raphael. It was taken by the French in 1796. It is seated on a mountain, between the rivers Metro and Foglia, 18 miles S. of Rimini, 58 E. of Florence, and 120 N.E. of Rome. Long. 12. 40. E. Lat. 43. 46. N.

VREDEN, a town of Westphalia, in the bishopric of Munster, 26 miles W.N.W. of Munster, and 26 S.W. of Bentheim. Long. 7. 8. E. Lat. 52. 8. N.

URGANTZ, or **JURGANTZ**, a town of the country of the Turcomans, formerly a considerable place, four miles in cir-

cumference, but now in ruins, and no public buildings remain but a mosque. It is 240 miles E. of the Caspian Sea, and 70 S. of the lake Aral. Long. 60. 25. E. Lat. 40. 55. N.

URGEL, a town of Spain, in Catalonia, capital of a county of the same name, with a bishop's see. It is seated on the river Sagra, in a fertile plain, surrounded by mountains, planted with vineyards, 60 miles W. of Perpignan, and 75 N. by W. of Barcelona. Long. 1. 44. E. Lat. 42. 32. N.

URI, the most southern canton of Switzerland, and the fourth in rank. It is 30 miles long and 12 broad; bounded on the N. by the canton of Schweiz and the Lake of the Four Cantons, on the E. by the country of the Grisons and the canton of Glarus, on the S. by the bailiwicks of Italy, and on the W. by the cantons of Underwalden and Bern. See **SCHWEITZ**.

URMUND, a town of Westphalia, in the duchy of Juliers, 10 miles N.N.E. of Maastricht.

URSEL, a town of Germany, in the circle of Upper Rhine and county of Konigstein, five miles E.N.E. of Konigstein, and 18 N.E. of Mentz. Long. 8. 28. E. Lat. 50. 9. N.

URSEREN, a town of Switzerland, in the canton of Uri, situate on the Reufs, in a valley to which it gives name, 17 miles S.E. of Altorf. Long. 11. 20. E. Lat. 49. 8. N.

URSTIZ, Sr. a town of Switzerland, in the bishopric of Basle, capital of an extensive and populous though hilly bailiwick of the same name, in which steel is manufactured with great success. The town is indebted for its origin to a hermitage, built in the seventh century by St. Ursinus. It is seated on the Dubs, over which is a stone bridge, seven miles S. of Porentr.

USBEC TARTARY, a vast country of Western Tartary, bounded on the N. by the country of the Kalmucks, on the E. by Tibet, on the S. by Hindoostan, and on the W. by Persia and the Caspian Sea. These Tartars are divided into several tribes, governed by their respective khans, or princes. When under one sovereign, they were the most powerful of all the Tartarian nations. The principal khans pride themselves in being descended from Tamerlane, whose birth-place was the ancient city of Samarcand, the present capital of the country. The Usbeks, in their persons, are said to have better complexions and more engaging features than the Kalmucs. Their religion is Mahometanism; and they differ, in general, very little from the people of the northern provinces of Hindoostan.

USEDOM, an island of Prussian Pomerania, at the mouth of the river Oder, in the Baltic Sea, between which and the island of Wollin, is a passage called the Swin. It had formerly a considerable town of the same name, which was almost reduced to ashes in 1473. Long. 14. 11. E. Lat. 54. 6. N.

USERCHE, a town of France, in the department of Correze, seated on a steep craggy rock, at the foot of which flows the Vezere, 37 miles S.E. of Limoges, and 217 S. of Paris. Long. 1. 37. E. Lat. 45. 27. N.

USINGEN, a town of Germany, in the circle of Upper Rhine and principality of Nautau Weilburg, 22 miles N.E. of Mentz. Long. 8. 25. E. Lat. 50. 10. N.

USK, a town in Monmouthshire, with a market on Monday; seated on the river Usk, 12 miles S.W. of Monmouth, and 140 W. by N. of London. Long. 2. 56. W. Lat. 51. 41. N.

USSEL, a town of France, in the department of Correze, 32 miles N.E. of Tulle. Long. 2. 15. E. Lat. 45. 32. N.

USTANIO, a town of Italy, in the Cremonese, seated on the Oglio, 12 miles N.E. of Cremona. Long. 10. 8. E. Lat. 45. 17. N.

USTARTIZ, a town of France, in the department of

Lower Pyrenées, six miles S. of Bayonne. Long. 1. 30. W. Lat. 43. 23. N.

USTIUG, a town of Russia, in the government of Vollogda, and capital of the province of Veliki-Usting. It is seated on the Sukhona, 464 miles N.E. of Moscow. Long. 16. 30. E. Lat. 60. 56. N.

UTOXETER, a town in Staffordshire, with a market on Wednesday; seated on a rising ground, near the river Dove, 13 miles N.E. of Stafford, and 136 N.N.W. of London. Long. 1. 50. W. Lat. 53. 10. N.

UTRERA, a town of Spain, in the province of Seville, 20 miles S. of Seville. Long. 5. 20. W. Lat. 37. 12. N.

UTZNACH, a town of Switzerland, in a baliwic belonging to the cantons of Schwytz and Glarus. It was almost entirely burnt in 1762, but has since been elegantly rebuilt. It is three miles E. from the lake of Zurich, and 29 S.E. of the city of that name.

VURLA, a sea-port of Turkey in Asia, in Natolia, situate on the S. side of the gulf of Smyrna, on a bay to which it gives name, 21 miles W. of Smyrna. Long. 27. 58. E. Lat. 38. 27. N.

W

WAI

WAACKHAUSEN, a town of Lower Saxony, in the duchy of Bremen, 12 miles N. of Bremen.

WACHENHEIM, a town of Germany, in the palatinate of the Rhine, 15 miles W. of Mannheim, and 31 E. of Deux Ponts. Long. 8. 16. E. Lat. 49. 20. N.

WACHOVIA, a tract of land in North Carolina, situate between the rivers Dan and Yadkin, 10 miles S. of Pilot Mountain, in the county of Surry. It consists of 100,000 acres, purchased by the Moravians, in 1751, and named by them from an estate of Count Zinzendorf's in Austria. In 1755, by an act of assembly, it was made a separate parish, called Dobb's Parish, and it now contains several flourishing settlements, of which Salem is the principal.

WACHTENDONCK, a town of Prussian Guelderland, seated on a morass, on the river Niers, five miles S. of Gueeldres. Long. 6. 7. E. Lat. 51. 23. N.

WADSTENA, a town of Sweden, in the province of East Gothland, remarkable for its castle, built by Gustavas Vasa, in 1544, and inhabited by his son Magnus, who was assassinated. It is seated on the E. side of the lake Wetter, 160 miles S.W. of Stockholm. Long. 15. 37. E. Lat. 58. 18. N.

WAGENINGEN, a town of Dutch Guelderland, seated on the Leck, 10 miles N.W. of Nimeguen. Long. 5. 31. E. Lat. 52. 0. N.

WAGERIA, or WAGERLAND, a fertile territory in the duchy of Holstein, 20 miles in length, and 15 in breadth. Lubeck is the capital.

WAHREN, a town of Germany, in the duchy of Mecklenburg, seated on the lake Malcho, 10 miles S. of Malchin.

WAHLINGEN, a town of Suabia, in the duchy of Wurtemberg, seven miles E.N.E. of Stuttgart.

WAINFLEET, a town in Lincolnshire, with a market on Saturday. It is seated near the sea, in a fenny part of the country, and on the river Witham, 14 miles N.E. of

UXBRIDGE, a corporate town in Middlesex, with a market on Thursday. The Coln runs through it in two streams, and over the main stream is a stone bridge. A treaty was carried on here between Charles I. and the parliament, in 1644; and the house in which the plenipotentiaries met, is still called the Treaty House. Near this town are the remains of an ancient camp. Uxbridge is 15 miles W. by N. of London. Long. 0. 23. W. Lat. 51. 31. N.

UZEDA, a town of Spain, in New Castile, capital of a duchy of the same name, with a castle. It is seated on the Cogolludo, 20 miles N. by W. of Alcalá, and 26 N.N.E. of Madrid. Long. 3. 13. W. Lat. 40. 46. N.

UZEL, a town of France, in the department of the North Coast, 17 miles S.W. of St. Briceux. Long. 2. 52. W. Lat. 48. 16. N.

UZES, a town of France, in the department of Gard, seated in a country abounding in corn, oil, silk, and good wine, 12 miles N. of Nîmes, and 20 S.W. of Orange. Long. 4. 27. E. Lat. 44. 2. N.

WAL

Boston, and 130 N. by E. of London. Long. 0. 20. E. Lat. 53. 10. N.

WALTZEN, or WAITZ, a town of Hungary, with a bishop's see. A large annual fair is kept here. It has frequently been taken by the Turks, and retaken by the Imperialists. It is situate on the Danube, 72 miles E.S.E. of Preiburg. Long. 18. 38. E. Lat. 47. 29. N.

WALCOT, a village in Lincolnshire, on the borders of the fens, within one mile of Folkingham. It has a chalybeate spring, formerly much frequented.

WALCOUR, a town of the Austrian Netherlands, in the county of Namur, between the Meuse and Sambre. In 1615 it was entirely destroyed by fire. The French attempted to take it in 1689, but were defeated, and compelled to retire with great loss, by the Prince of Waldeck. It is seated on the Heura, 12 miles S. of Charleroy, and 27 S.W. of Namur. Long. 4. 30. E. Lat. 50. 10. N.

WALDBURGH, a town of Suabia, in a barony of the same name, 24 miles W. of Kempten. Long. 9. 50. E. Lat. 47. 40. N.

WALDECK, a principality of Germany, in the circle of Upper Rhine, 30 miles long and 20 broad; bounded on the E. and S. by Hesse-Cassel, and on the W. and N. by Westphalia. It is a mountainous country, covered with woods; and has mines of iron, copper, quicksilver, and alum.

WALDECK, a town of Germany, capital of a principality of the same name, with a castle, seated on the Steinbach, 25 miles W.S.W. of Cassel. Long. 9. 4. E. Lat. 51. 10. N.

WALDENBURG, a town of Upper Saxony, situate on the Muldaun. The old town of Waldenburg, which is directly opposite it on the other side of the Muldaun, is famous for its brown and white earthen ware. It is nine miles N. of Zwickau, and 44 W. of Dresden. Long. 12. 30. E. Lat. 50. 49. N.

WALDENBURG, or **WALLENBURG**, a town of Switzerland, in the canton of Basle, with a castle on a high rock. It is seated at the foot of Mount Jura, 15 miles S. of Basle, and 15 N.E. of Soleure. Long. 7. 35. E. Lat. 47. 22. N.

WALDKIRK, a town of Suabia, in Austrian Briggaw, and in an island formed by the river Elz, five miles from Friburg. Long. 8. 3. E. Lat. 48. 9. N.

WALDSCHUT, a strong town of Suabia, and one of the four Forest Towns, subject to the house of Austria. It is seated opposite the place where the Aar falls into the Rhine at the entrance of the Black Forest, eight miles N.E. of Lauffenburg, and 17 W. of Schaffhausen. Long. 8. 12. E. Lat. 47. 38. N.

WALDSTÄDTE, a name given to the Swiss cantons of Lucern, Uri, Schwitz, and Underwalden. It signifies *Forest Towns*; these cantons containing a great number of forests. This district must not be confounded with the Waldstädte, or Forest Towns of Suabia, which are Lauffenburg, Waldschut, Seckingen, and Rheinfelden.

WALDSTÄTTER SEE, or **LAKE OF THE FOUR CANTONS**, one of the finest lakes in Switzerland. It consists of three principal branches, called the lakes of Lucern, Schwitz, and Uri. The upper branch, or lake of Lucern, is in the form of a cross; the sides of which stretch from Kufnacht to Dullenwal, a village near Stantz. It is bordered toward the town by cultivated hills sloping gradually to the water, contrasted on the opposite side by an enormous mass of barren and craggy rocks; Mount Pilate, one of the highest mountains in Switzerland, rising boldly from the lake. Toward the E. of this branch, the lake contracts into a narrow creek, scarcely a mile across. Soon after, it again widens, and forms the second branch, or lake of Schwitz; on the W. side, the canton of Underwalden, on the E. that of Schwitz. Here the mountains are more lofty, and infinitely varied; some covered to the very summits with verdure, others perpendicular and craggy; here forming amphitheatres of wood; there jutting into the water in bold promontories. Near Brumen, commences the third branch, or lake of Uri, which takes a S.E. direction. It is deep and narrow, about nine miles long, bordered on both sides by rocks uncommonly wild and romantic, with forest of beech and pine growing down their sides to the very edge of the water.

WALHOF, a town of the duchy of Courland. In the year 1626 the Poles were defeated near this town by Gustavus, king of Sweden. It is 34 miles E. of Mittaw. Long. 24. 25. E. Lat. 56. 35. N.

WALKENREID, a town of Upper Saxony, in Thuringia, seated on the Sorge, 20 miles S.W. of Halberstadt. Long. 21. 5. E. Lat. 51. 33. N.

WALLENSTADT, a town of Switzerland, in the canton of Appenzel; incorporated into the bailiwick of Sargans, but enjoying many distinct privileges. It derives its existence from the passage of the merchandise transported from Germany, through the country of the Grisons, to Italy. The communication occasions the frequent resort of Italian merchants; and that language is understood by many of the inhabitants. This town is seated at the E. end of a lake of the same name, nine miles W. of Sargans, and 15 N.W. of Coire. Long. 9. 14. E. Lat. 47. 1. N.

WALLENSTADT, a lake of Switzerland, 12 miles long and two broad, bounded by high mountains, except to the E. and W. On the side of the canton of Glarus, the mountains are chiefly cultivated; enriched with wood or fine meadows; and studded with churches, cottages, and small villages; the Alps of Alarus rising behind, their tops covered with snow. On the other side, for the most part, the

rocks are grotesque, craggy, inaccessible, and perpendicular: but here and there a few cultivated necks of land are formed at the very edge of the lake, and at the bottom of these very rocks; exhibiting a beautiful contrast to the barrenness above and around them. Numberless waterfalls, occasioned by the melting of the snows, fall down the sides of the mountains from a very considerable height, and with an almost inconceivable variety. Through this lake flows the Mat, which, soon after, joining the Linth, forms the river Limmat.

WALLERSTEIN, a town of Suabia, with a castle belonging to the counts of Oettingen, six miles S.W. of Oettingen.

WALLINGFORD, a borough in Berkshire, with a market on Thursday and Saturday. It was once surrounded by a wall, and had a castle, now demolished, and four churches, of which one only is now in use. It is seated on the Thames, over which is a stone bridge, 14 miles N.W. of Reading, and 46 W. of London. Long. 1. 1. W. Lat. 51. 36. N.

WALLINGFORD, a town of the United States, in Connecticut, 13 miles N.E. of Newhaven.

WALNEY, an island on the coast of Lancashire. It is long and narrow, and serves as a bulwark to the hundred of Furness, against the waves of the Irish Sea.

WALPO, a town of Slavonia, capital of a county of the same name, with a castle. It is seated on the river Walpo, 20 miles W. of Ebeck, and 110 S. of Buda. Long. 19. 22. E. Lat. 45. 35. N.

WALPOLE (Horace), earl of Orford, was the youngest son of the celebrated Sir Robert Walpole, afterwards earl of Orford, by his first wife, Catherine, daughter of Robert Shorter, esq. of Bybrook in Kent. He was born 1716; and was educated, first at Eton school, and afterwards at Cambridge. At Eton he formed an intimate acquaintance with the celebrated poet Gray; and they went together on the tour of Europe, in the years 1739, 1740, and 1741. Unhappily they had a dispute in the course of their travels, which produced a separation.

Mr. Walpole was able to make a splendid figure during the remainder of his destined course; but poor Gray, after the separation, was obliged to observe a very severe economy. "This difference arose from the difference of their tempers: the latter being, from his earliest years, curious, pensive, and philosophical; the former, gay, lively, and inconsiderate. This, therefore, occasioned their separation at Reggio. Mr. Gray went before him to Venice; and staying there till he could find means of returning to England, he made the best of his way home, repassing the Alps, and following almost the same route, through France, which he had before gone to Italy. In justice to the memory of so respectable a friend, Mr. Walpole (says Mr. Mason, *Life of Gray*, 4to. p. 41) enjoins me to charge him with the chief blame in their quarrel, confessing that more attention, complaisance, and deference, to a warm friendship, and superior judgment and prudence, might have prevented a rupture that gave much uneasiness to them both, and a lasting concern to the survivor; though in the year 1744 a reconciliation was effected between them, by a lady who wished well to both parties."—This event took place after their return to England; but the wound in their friendship left a scar that never was totally effaced.

We do not, indeed, think that Horace Walpole and Mr. Gray were formed, either by nature or by habits, to continue long in a state of intimate friendship. Gray appears to have been a man of the purest moral principles, a friend to religion, pensive, and at least sufficiently conscious of his in-

tellectual powers and intellectual attainments. Walpole's morality was certainly of a looser kind; he seems to have had no religion; he was often unreasonably gay; and to an equal share of intellectual pride, though without equal reason, he added the pride of birth. It can therefore excite no surprise that a man of Gray's independent spirit could not bear the supercilious freaks of such a character.

Mr. Walpole was nominated to represent the city of Norwich, when his father visited it July 23, 1733, having acquired consequence, not only as the son of the minister, but as having attended the Prince of Orange to England in that year. He was chosen member for Collington, in Cornwall, in the parliament which met June 25th, 1741; was a second time in parliament as representative for Castle-Rising, in Norfolk, in 1747; and for King's Lynn in 1754 and 1761; and at the expiration of that parliament he finally retired from the stage of politics, and confined himself wholly to literary pursuits. He held to his death the office of usher of his Majesty's exchequer, comptroller of the pipe, and clerk of the escheats. Upon the death of his nephew, George, third earl of Orford, in 1791, he succeeded to the title and estates; but that event made no little alteration in his mode of living, that we know not whether he ever took his seat in the house of peers. During almost the whole course of his life he was the victim of the gout, which at last reduced him to a cripple; but it never impaired his faculties; and, to the very moment of death, his understanding seemed to bid defiance to the shock of nature. He died at his house in Berkeley-square, in 1796, having just entered his 80th year; and was interred in the family vault at Houghton, in a private manner, agreeably to his particular directions.

Horace, lord Orford, was never married, and, by one of his biographers, his chief mistress through life is said to have been the muse. It is certain that he devoted the greater part of his life to *belles-lettres* and *virtu*, though he ridiculously affected, in his letters to his friends, to despise learning and learned men, for which he was very properly reprimanded both by Gray and Hume. It was an affectation peculiarly absurd in him, who was constantly publishing something, and who wrote with uncommon acrimony against all who presumed to call in question the fidelity of the picture which he had drawn of Richard III. or indeed to controvert any of his opinions. Hence his antipathy to Johnson, because he was a tory, a Christian, and a rigid moralist; whilst he himself was a whig, an infidel, and such a moralist as could retail, without blushing, all the scandalous anecdotes, whether true or false, of that august family, from whom he acknowledged his whole fortune to be derived. He had, indeed, another reason for disliking Johnson. Lord Orford shone in conversation, and surpassed all his contemporaries in that kind of talk, which, without dazzling by its wit, always delighted: while Johnson, when roused, knocked down, as by a flash of lightning, his lordship, and every one else who had the confidence before him to talk profanely. Johnson's wit was original: Lord Orford's consisted of ludicrous stories, and of literary and political anecdotes. His works, of which by far the most valuable part has long been in the hands of the public, were collected in 1798, and published in five volumes, 4to. They resemble his conversation, being rather amusing than profound or instructing.

WALPOLE, a town of the United States, in New Hampshire, situate on Connecticut River, 108 miles W. of Portsmouth.

WALLSALL, a corporate town in Staffordshire, with a market on Tuesday and Friday. It has several manu-

factures in iron, such as nails, bridlebits, stirrups, spurs, buckles, &c. and is governed by a mayor. It is seated on the side of a hill, 15 miles S. of Stafford, and 116 N.W. of London. Long. 1. 56. W. Lat. 52. 46. N.

WALTHAM, North, a town in Norfolk, with a market on Tuesday, 10 miles E. of Norwich, and 125 N.N.E. of London. Long. 1. 31. E. Lat. 52. 40. N.

WALTHAM, or BISHOP'S WALTHAM, a town in Hampshire, with a market on Friday. It obtained this last name from a palace of the Bishop of Winchester, once situate here; and here are the ruins of an abbey, called by the country people, the Bishop's Abbey. The statute 9 George I. commonly called the Waltham Black Act, was occasioned by a party of the inhabitants of this town, who had retired to a reclusel dell in the New Forest, whence, being in disguise, or with their faces blacked, they issued in the night, committing great depredations, killing deer, sheep, &c. for their subsistence. Hence they were called the Waltham Blacks. The place of their retreat was accessible only by a subterranean passage: they dressed like foresters, and the crofsbow was their weapon. They were dispersed, at last, by the activity of the neighbouring gentlemen. Waltham is eight miles S. of Winchester, and 65 W. by S. of London. Long. 1. 20. W. Lat. 50. 57. N.

WALTHAM ABBEY, or WALTHAM HOLY CROSS, a town in Essex, with a market on Tuesday. It received its second appellation from a holy cross, pretended to have been miraculously conveyed here; and it obtained its first name from a magnificent abbey, founded, in honour of this cross, by King Harold, some fragments of which remain. Harold, and his two brothers, after the battle of Hastings, were interred here. A plain stone is said to have been laid over him, with this inscription, Haroldus Infelix; and a stone coffin, supposed to have been his, was discovered in the reign of Elizabeth. At Waltham Abbey are some gunpowder mills, and some manufactures of printed linsens and pins. It is seated on the river Lea, which here forms several islands, 12 miles N. by E. of London. Long. 0. 3. E. Lat. 51. 42. N.

WALTHAM CROSS, or WEST WALTHAM, a village in Hertfordshire, which takes its first appellation from a cross erected here by Edward I. in honour of his queen Eleanor; and has its second name from its situation W. of Waltham Abbey. It is seated near the river Lea, 12 miles N. by E. of London.

WALTHAM ON THE WOULD, a town of Liceshire, with a market on Thursday, almost disused. It is 19 miles N.E. of Leicester, and 113 N. by W. of London. Long. 0. 46. W. Lat. 52. 51. N.

WALTINBRUCH, a town of Suabia, in the duchy of Wurtemberg, seated on the river Aich.

WANDERSLEBEN, a town of Upper Saxony, in the principality of Altenburg, nine miles S.W. of Erfurt.

WANDIWASH, a town of Hindoostan, in the Carnatic, 27 miles S.S.E. of Arcot, and 38 N.N.W. of Pondicherry.

WANGEN, an imperial town of Suabia. The inhabitants are papists, and carry on a great trade in paper and hardware. It is seated on the Overarg, 17 miles N.E. of Lindau, and 30. E. of Constance. Long. 9. 56. E. Lat. 47. 38. N.

WANGEN, a town of Switzerland, capital of the bailiwick of Wangen, in Upper Argau. It is seated on the Aar, 10 miles E. of Soleure, and 23 N.N.E. of Bern. Long. 7. 30. E. Lat. 47. 16. N.

WANGEN, a town of France, in the department of Lower Rhine, seated on the side of a mountain, and sur-

rounded by a wall. It is eight miles N.W. of Strasburg. Long. 7. 42. E. Lat. 48. 38. N.

WANGFRIED, a town of Germany, in the circle of Upper Rhine and principality of Hesse Rhinfelds, situate on the Werre, 13 Miles W. of Mulhausen, and 30 S.S.E. of Cassel. Long. 9. 58. E. Lat. 51. 5. N.

WANTAGE, a town of Berkshire, with a market on Saturday. It is famous for being the birth-place of King Alfred, and is seated on a branch of the Ock, 12 miles S. by W. of Oxford, and 60 W. of London. Long. 1. 16. E. Lat. 51. 35. N.

WANTZENAU, a town of France, in the department of Lower Rhine. It was taken by the Austrians in October, 1793. It is six miles N. of Strasburg.

WANZLEBEN, a town of Lower Saxony, in the principality of Magdeburg, 10 miles W.S.W. of Magdeburg.

WARADIN, GREAT, a strong town of Upper Hungary, capital of a county of the same name, with a citadel, and a bishop's see. It was taken by the Turks in 1669, but the Austrians retook it in 1692. It is seated on the Sebes Keres, 117 miles N.E. of Peterwaradin, and 150 E.S.E. of Buda. Long. 21. 50. E. Lat. 47. 5. N.

WARADIN, LITTLE, a strong town of Slavonia, capital of a county of the same name. It is seated on the Drave, 28 miles W.S.W. of Kamifca, and 34 N. by E. of Zagrad. Long. 16. 15. E. Lat. 46. 48. N.

WARANGOLE (the Ainkill of Persia), once the capital of Golconda, in the Deccan of Hindoostan. The site of it is still evident from the old ramparts, which are amazingly extensive. A modern fortress is constructed within it, and is in the possession of the Nizam of the Deccan. Its 62 miles N.N.E. of Hydrabad. Long. 79. 30. E. Lat. 18. 6. N.

WARBURG, a sea-port of Sweden, in the province of Halland, with a castle, 30 miles S. of Gottenburg. Long. 11. 46. E. Lat. 57. 12. N.

WARBURG, a town of Germany, in the bishopric of Paderborn, formerly imperial and hanseatic. It is seated on the Dymel, 20 miles S.E. of Paderborn. Long. 9. 19. E. Lat. 51. 33. N.

WARDE, a town of Denmark, in North Jutland, near the mouth of a river of the same name, 15 miles N. of Ripen.

WARDHUY, a sea-port of Danish Lapland, on a small island of the same name, near the continent. It has an old fort, where the governor resides, and is 120 miles S.E. of the North Cape. Long. 31. 6. E. Lat. 70. 22. N.

WARBRIDGE, or WARDBRIDGE, a town in Cornwall, with a market on Saturday. It has a bridge over the river Camel, which is the handsomest in the county, and supported by 20 arches. It is 13 miles S.W. of Camelford, and 241 W. by S. of London. Long. 5. 9. W. Lat. 50. 36. N.

WAREHAM, a borough and sea-port in Dorsetshire, with a market on Saturday. It is seated between the Frome and Piddle, at their fall into Lochford Lake, the W. part of Poole harbour. It had several churches, now reduced to three; also a wall and castle; but has suffered much by the various turns of fortune, and the harbour is almost choked up. In 1762, two thirds of the town was destroyed by fire, but has been rebuilt. Above the bridge, over the Frome, is a good salmon fishery; and in the neighbourhood fine tobacco-pipe clay is dug, of which nearly 10,000 tons are annually exported to London, Liverpool, &c. Wareham is governed by a mayor, sends two members to parlia-

ment, and is 20 miles E. of Dorchester, and 114 W. by S. of London. Long. 2. 16. W. Lat. 50. 43. N.

WARKA, a town of Poland, in the palatinate of Masovia, seated on the river Pilä, Long. 21. 15. E. Lat. 51. 35. N.

WARMINSTER, a town in Wiltshire, with a market on Saturday, seated on the source of the Wilybourn, 22 miles N.W. of Salisbury, and 97 W. by S. of London. Long. 2. 15. W. Lat. 51. 11. N.

WARNEMUNDE, a sea-port of Germany, in the duchy of Mecklenburg. The Swedes had a house here to take toll; but, in 1710, when their affairs were upon the decline, the Duke of Mecklenburg put a garrison in it. It is seated on the Baltic, at the mouth of the Warne, 26 miles N.E. of Wismar. Long. 12. 26. E. Lat. 50. 4. N.

WARNETON, a town of Austrian Flanders, on the river Lis, eight miles N.W. of Lille. Long. 3. 4. E. Lat. 50. 45. N.

WARRINGTON, a town in Lancashire, with a market on Wednesday, and large manufactures of sailcloth, facking, cotton, pias, and glass. It is seated on the Mersey, over which is a bridge, 13 miles E. of Liverpool, and 183 N.N.W. of London. Long. 24. 5. W. Lat. 53. 23. N.

WARRIORE, a town of Hindoostan, in the Carnatic, 32 miles N.N.E. of Tanjore, and 55 S.S.W. of Pondicherry.

WARTA, a town of Great Poland, in the palatinate of Siradia, seated on the river Warta, 12 miles N. of Siradia, and 57 S.E. of Pofnania. Long. 18. 0. E. Lat. 51. 41. N.

WARTENBURG, a town of Silesia, capital of a lordship of the same name. In 1742 it was entirely reduced to ashes, except the castle. It is 22 miles N.E. of Breslaw. Long. 17. 42. E. Lat. 51. 10. N.

WARTON (Joseph, D. D.), was born either towards the end of the year 1721, or in the beginning of the year 1722. He was the eldest son of Thomas Warton, B. D. who had been fellow of Magdalen College, Oxford; poetry professor from the year 1718 to 1728, and vicar of Balinghoke in Hampshire, and of Cobham in Surrey. Where the subject of this memoir was born we have not learned, though, were we to hazard a conjecture, we would say that it was in Oxford, as his father probably resided in that city during his professorship.

Our knowledge of the private history of Dr. Warton is indeed extremely limited. We do not even know at what school, or in what college, he was educated; though it was probably at Winchester school, and certainly in some of the colleges in the university of Oxford. For many years, he was successively under and upper master of Winchester college; but resigned the last of these offices when he found the infirmities of age coming upon him; and was succeeded by Dr. Goddard, the present excellent master. He was likewise prebendary of the cathedral church of Winchester, and rector of Wickham in Hampshire, where he died, aged 78.

His publications are few, but valuable. A small collection of poems without a name, was the first of them, and contained the Ode to Fancy, which has been so much and so deservedly admired. They were all of them afterwards printed in Doddsley's Collection. He was also a considerable contributor to the Adventurer, published by Dr. Hawkesworth; and all the papers which contain criticisms on Shakspeare were written by him and his brother Thomas Warton, the subject of the next article.

The first volume of his Essay on the Life and Writings of Pope was published, had passed through several editions,

and an interval of between twenty and thirty years had elapsed before he gave a second volume of that elegant and instructive work to the world. He had not only meditated, but had collected materials for a literary history of the age of Leo X.; and proposals were actually in circulation for a work of that kind; but it is probable that the duties of his station did not leave him the necessary leisure for an undertaking which required years of seclusion and independence. His last and late work, which he undertook for the booksellers at a very advanced age, was an edition of Pope's Works, that has not altogether satisfied the public expectation. He retained, with great propriety indeed, many of the notes of Warburton; but is severely reprehended by the author of the Pursuits of Literature for suppressing the name of that prelate on his title-page, or including it only, as subordinate to his own, in the general expression *others*.

Dr. Warton was cheerful in his temper, convivial in his disposition, of an elegant taste and lively imagination: with a large portion of scholarship, and a very general knowledge of the belles-lettres of Europe, it may be presumed that Dr. Warton possessed, beyond most men, the power of enlightening classical society. He was the intimate friend of Dr. Johnson; was seen at the parties of Mrs. Montague, as well as at the table of Sir Joshua Reynolds, and was an original member of the Literary Club. He possessed a liberal mind, a generous disposition, and a benevolent heart. He was not only admired for his talents, and his knowledge, but was beloved for those qualities which are the best gifts in this imperfect state.

WARTON (Thomas), the brother of the preceding, was born in the year 1728. He received, as we have reason to believe, the first part of his education at Winchester; and at the age of 16 was entered a commoner of Trinity College, Oxford, under the tuition of Mr. Geering.

He began his poetical career at an early age. In 1745, he published five pastoral eclogues, in which are beautifully described the miseries of war to which the shepherds of Germany were exposed. Not long after, in the year 1748, he had full scope afforded for the exertion of his genius. It is well known that Jacobite principles were suspected to prevail in the university of Oxford about the time of the rebellion in the year 1745. Soon after its suppression, the drunkenness and folly of some young men gave offence to the court, in consequence of which a prosecution was instituted in the court of King's Bench, and a stigma was fixed on the vice-chancellor and some other heads of colleges in Oxford. Whilst this affair was the general subject of conversation, Mr. Mason published his *Isis*, an elegy, in which he adverts to the above-mentioned circumstances. In answer to this poem, Mr. Warton, encouraged by Dr. Hurd, the president of his college, published, in 1749, *The Triumph of Isis*, which excelled more in many expostulation and dignity than the poem that produced it did in neatness and elegance. With great poetical warmth, and a judicious selection of circumstances, he characterises the eminent men who had been educated in Oxford, and draws a striking and animated portrait of Dr. King, the celebrated public orator of that time. The whole poem shews the early maturity of his genius, and is finished with happy diligence.

In the year 1751 he succeeded to a fellowship of his college, and was thus placed in a situation easy and independent, and particularly congenial with his habits of retirement and study. In 1753 appeared his *Observations on The Faery Queene of Spenser*, in 8vo, a work which he corrected, enlarged, and republished, in two volumes crown octavo, in the year 1762. He sent a copy of the first edition

to Dr. Johnson, who, in a letter to him upon the subject, expressed this handsome compliment: "I now pay you a very honest acknowledgement for the advancement of the literature of our native country; you have flown to all, who shall hereafter attempt the study of ancient authors, the way to success, by directing them to the perusal of the books which these authors had read."

In 1754 Dr. Johnson visited Oxford for the first time after he had quitted residence there. Much of his time was spent with Mr. Warton; and there appeared to have been a considerable degree of confidential intercourse between them upon literary subjects, and particularly on their own works. A pleasing account of this visit was communicated by Mr. Warton to Mr. Boswell, afterwards inserted in his *Life of Johnson*.

In 1755 Mr. Warton exerted himself to procure for his friend the degree of master of arts by diploma from the university of Oxford; an honour which Johnson esteemed of great importance to grace the title-page of his dictionary which he was about to publish. In 1756 Mr. Warton was elected professor of poetry, which office he held for the usual term of ten years. His lectures were remarkable for elegance of diction and justness of observation. One of them, on the subject of pastoral poetry, was afterwards prefixed to his edition of Theocritus. In 1758 he contributed to and assisted Dr. Johnson in the subscription to his edition of Shakespeare, and furnished him with some valuable notes. The doctor remarks, in a letter to him, when soliciting his further aid, "It will be reputable to my work, and suitable to your professorship, to have something of yours in my notes."

From the Clarendon press, in the year 1766, he published *Anthologie Græcæ*, a Constantino Cephalâ condita, *Libri tres*, in two vols. 12mo. He concludes the learned and classical preface to this work, which is replete with accurate remarks on the Greek epigram, in the following words, which mark this publication for his own: "*Vereor ut hæcenus, in plexendis florum corollis otium nimis longum pertraxerim. Proximè sequetur, cui nunc omnes operas et vires intendo Theocritus. Interea quæ promulgidum convivii Lectoribus meis elegantias hæcæ vetustatis eruditæ propino.*"

In 1770 the academical press produced his *Theocritus*, in two vols. 8vo. He undertook this work by the advice of Judge Blackstone, then fellow of All-Souls College, and an ardent promoter of every publication that was likely to do credit to the Clarendon press. This elaborate publication reflects no small credit on the learning, diligence, and taste of the editor.

In 1771 he was elected a fellow of the Antiquarian Society, and was presented by the Earl of Lichfield to the small living of Kiddington, in Oxfordshire, which he held till his death. He likewise in this year published an improved account of "*The Life of Sir Thomas Pope*, Founder of Trinity College, Oxford. In composing these memoirs, he bestowed much labour and research, and shewed great judgment in the arrangement of his materials. But possibly, in his ardour to pay a debt of gratitude, he has not sufficiently considered what was due to his own fame. The same strength of description and vigour of remark would have better suited the life of some eminently distinguished character, and extended the reputation of the author as a biographer beyond the circle of those academical readers who are influenced by the same feelings of veneration, respect, and gratitude, which prompted Mr. Warton to compose this work. The preface contains some excellent remarks on biographical writing.

The plan for a history of English poetry was laid by Pope, enlarged by Gray: but to bring an original plan nearly to a completion was reserved for the perseverance of Warton. In 1774 appeared his first volume; in 1778, the second and third; which brings the narrative down to the commencement of the reign of Elizabeth in 1581. This work displays the most singular combination of extraordinary talents and attainments. It unites the deep and minute researches of the antiquary with the elegance of the classical scholar and the skill of the practised writer. The style is vigorous and manly; the observations acute and just; and the views of the subject are extensive and accurate.

In 1777 he collected his poems into an octavo volume, containing miscellaneous pieces, odes, and sonnets. This publication may be considered in some measure original; there being only seven pieces that had before appeared, and near three times that number which were then printed for the first time.

In vindication of the opinion he had given in his second volume of *The History of Poetry*, relative to the ingenious attempt of Chatterton to impose upon the public, he produced, in 1782, *An Enquiry into the Authenticity of the Poems attributed to Rowley*. In this excellent pamphlet the principles of true criticism are laid down, an appeal is properly made to the internal evidence of the poems; and upon these grounds it is proved, in the most satisfactory manner, that they could not have been written by a monk of the fourteenth century.

The year 1785 brought him those distinctions which were no less honourable to those who conferred than to him who received them. He was appointed poet-laureat on the death of Whitehead, and elected Camden professor of ancient history on the resignation of Dr. Scott. His inauguration-lecture was delivered in a clear and impressive manner from the professorial chair. It contained excellent observations on the Latin historians, and was written in a strong, periphrastic, and classical style. In his odes, the vigour and brilliancy of his fancy were not prostituted to an insipid train of courtly compliments; each presents an elegant specimen of descriptive poetry, and as all of them have only a slight relation to the particular occasion on which they were written, and have always a view to some particular and interesting subject, they will be perused with pleasure as long as this species of composition is admired.

He made occasional journeys to London to attend the Literary Club, of which he was some years a member; and to visit his friends, particularly Sir Joshua Reynolds. At his house he was sure to meet persons remarkable for fashion, elegance, and taste.

His last publication, except his official odes, consisted of Milton's smaller poems. A quarto edition appeared in 1790, with corrections and additions. The great object of these notes is to explain the allusions of Milton, to trace his imitations, and to illustrate his beauties.

Until he reached his sixty-second year, he continued to enjoy vigorous and uninterrupted health. On being seized with the gout, he went to Bath, and flattered himself, on his return to college, that he was in a fair way of recovery. But the change that had taken place in his constitution was visible to his friends. On Thursday, May the 20th, 1790, he passed the evening in the common room, and was for some time more cheerful than usual. Between ten and eleven o'clock he was struck with the palsy, and continued insensible till his death, which happened the next day at two o'clock. On the 27th, his remains were interred in the college chapel with the most distinguished academical ho-

nours. The inscription upon the flat stone which is placed over his grave contains only an enumeration of his preferences.

The following is a list of Mr. Warton's works: 1. "Five Pastoral Eclogues," 4to. 1745. Reprinted in *Pearch's Collection of Poems*. 2. "The Pleasures of Melancholy," written in 1745; first printed in *Dodley's Collection*, and afterwards in the *Collection of Mr. Warton's Poems*. 3. "Progress of Discontent," written in 1746. First printed in the *Student*, a periodical paper. 4. "The Triumph of Isis, a Poem," 4to. 1750. 5. "Newmarket, a Satire," folio, 1751. 6. "Ode for Music," performed at the theatre in Oxford, 1751. 7. "Observations on the Faerie Queene of Spenser," 8vo. 1754. 8. "Inscriptionum Metricarum Dilectus," 4to. 1758. 9. WARWICK, a town of the state of Rhode Island, the chief town of Kent County. It is situate at the head of Narraganset Bay, eight miles S. of Providence.

WARWICK, a town of Maryland, in Cecil County on the east shore of Cheapeake Bay, 57 miles S.W. of Philadelphia.

WARWICKSHIRE, a county of England, 47 miles long and 30 broad; bounded at its N. extremity by a point of Derbyshire, on the N.W. by Staffordshire, on the N.E. by Leicestershire, on the W. by Worcestershire, on the E. by Northamptonshire, on the S.W. by Gloucestershire, and on the S.E. by Oxfordshire. It lies partly in the diocese of Lichfield and Coventry, and partly in that of Worcester; contains four hundreds and one liberty, one city, 12 market towns, and 158 parishes; and sends six members to parliament. The air is very mild, pleasant, and healthy. The north part, called the Woodlands, is divided from the south, called the Feldon, by the river Avon; and the soil of both is rich and fertile. It produces corn, malt, wood, wool, cheese, coal, iron, and limestone. The principal rivers are the Avon, Tame, and Arrow. The capital is Warwick, but Birmingham is the largest town.

WASHING-MACHINE, an invention calculated to render more expeditious and effectual the necessary periodical operation of cleansing family linen, with the help of soap and alkaline solutions. Many of these have been invented, though few are free from some objection or other. We shall only, therefore, describe (from the *Domestic Encyclopedia*) a washing machine that has lately been invented in Germany by M. M. Fischer and Kerzig; and which promises to be superior to any similar contrivance hitherto suggested.

In Pl. 54. fig. 1. is a section of the washing cylinder, with its 16 ladles, projecting four inches; but of these ladles only 13 E

4 jut out internally, as represented by the dotted line *b, b, b, b*, *c*, the iron roller, which is on the outside, fixed to the bottom of the cylinder, by means of an iron cross at *d, d, d, d*, with screws or nails: it rests on the beam *e*, so as to be upheld in the four excavated columns or posts *f, f, f, f*, by the lever *g*, and to be either raised or lowered, and afterwards secured by the pins *h, h*, according to the greater or less depth of water: *i*, the cistern, at the sides of which the four posts are firmly inserted.

Fig. 2, is a plan or bird's-eye view of the machine. The laths between the ladies may be here distinctly seen, together with the roller *c, c*, as it rests on the beam or supporter *e, e, e, e*, and is secured by a cap, *K*: *l*, the boarded floor above the cistern or reservoir of water, on which the person stands, when the cylinder is to be placed higher or lower.

By means of this excellent contrivance, we understand from the inventors, by whom it was first used for cleansing the felts in an extensive paper-mill, that from 14 to 18 shirts may be completely washed within one hour; and that the friction is far less than in performing that operation by the hand; while the foul water is not suffered to flow back into the linen, but is continually renewed. If table-cloths, &c. happen to be greasy, they must be whirled round in the machine for the space of from 20 to 30 minutes; when it will be necessary to take them out; and, after rubbing them well with soap, to expose them again to the action of the engine for half an hour, when they will be found thoroughly cleaned. Fine linen may be inclosed in a bag, and washed in a similar manner, so as to prevent it from being injured by friction. There are, however, two points which ought to be strictly attended to; namely, the agitation of the water should not be too violent; and a sufficient quantity of foul linen must be thrown in at a time, in order to amount to such weight as will cause it to descend, after having been carried to the uppermost part of the cylinder. The only obstacle to the general introduction of this machine is, that it cannot be adopted in those situations which are not provided with a current or stream of water to work it; but, wherever a brook or rivulet occurs, such apparatus will be found highly serviceable in work-houses, great schools, prisons, and hospitals, not less than in private families; as 200 shirts may be washed by one person in the space of 12 hours. It may be erected in a mill-reach, so as to be set in motion by the immediate pressure of the water; or by connecting its mechanism with the main cylinder of the water-wheel.

WASHINGTON (George), whose name is likely to live as long as that of any monarch, was born on the 11th of February, 1732, in the parish of Washington, Virginia. He was descended from an ancient family in Cheshire, of which a branch had been established in Virginia about the middle of the 17th century. We are not acquainted with any remarkable circumstances of his education or his early youth; and we should not indeed expect any marks of that disorderly prematureness of talent, which is so often fallacious, in a character whose distinguishing praise was to be regular and natural. His classical instruction was probably small, such as the private tutor of a Virginian country gentleman could at that period have imparted; and if his opportunities of information had been more favourable, the time was too short to profit by them. Before he was twenty he was appointed a major in the colonial militia, and he had very early occasion to display those political and military talents, of which the exertions on a greater theatre have since made his name so famous throughout the world.

The plenipotentiaries who framed the treaty of Aix-la-Chapelle, by leaving the boundaries of the British and French territories in North America unfixed, had sown the seeds of

a new war, at the moment when they concluded a peace. The limits of Canada and Louisiana, negligently described in vague language by the treaties of Utrecht and Aix-la-Chapelle, because the greater part of these vast countries was then an impenetrable wilderness, furnished a motive, or a pretext, for one of the most successful, but one of the most bloody and wasteful wars in which Great Britain had ever been engaged.

In the disputes which arose between the French and English officers on this subject, Major Washington was employed by the governor of Virginia, in a negotiation with the French governor of Fort du Quebec (now Pittsburgh), who threatened the English frontiers with a body of French and their Indian allies. He succeeded in averting the invasion; but hostilities becoming inevitable, he was in the next year appointed lieutenant-colonel of a regiment raised by the colony for its own defence; to the command of which he soon after succeeded. The expedition of Braddock followed in the year 1755; of which the fatal issue is too well known to require being described by us. Colonel Washington served in that expedition only as a volunteer; but such was the general confidence in his talents, that he may be said to have conducted the retreat. Several British officers are still alive who remember the calmness and intrepidity which he shewed in that difficult situation, and the voluntary obedience which was so cheerfully paid by the whole army to his superior mind. After having acted a distinguished part in a subsequent and more successful expedition to the Ohio, he was obliged by ill health, in the year 1758, to resign his military situation. The sixteen years which followed of the life of Washington supply few materials for the biographer. Having married Mrs. Custis, a Virginian lady of amiable character and respectable connections, he settled at his beautiful seat of Mount Vernon, of which we have had so many descriptions; where, with the exception of such attendance as was required by his duties as a magistrate and a member of the assembly, his time was occupied by his domestic enjoyments, and the cultivation of his estate, in a manner well suited to the tranquillity of his pure and unambitious mind. At the end of this period he was called by the voice of his country from this state of calm and secure though unostentatious happiness.

For almost half a century symptoms of disaffection to the mother-country had been so visible in the New England provinces, that so early as 1734 the celebrated Bishop Berkeley had predicted a total separation of North America from Great Britain. That prelate, when a private clergyman, had lived three years in Rhode Island, and was an attentive and sagacious observer of the manners and principles of the people, among whom he perceived the old leaven of their forefathers fermenting even then with great violence. The middle and southern provinces, however, were more loyal, and their influence, together with perpetual dread of the French before the peace of 1763, put off the separation to a more distant day than that at which we have reason to believe, the bishop expected it to take place. Virginia, the most loyal of all the colonies, had long been in the habit of calling itself, with a kind of proud pre-eminence, *his Majesty's ancient dominion*; and it was with some difficulty that the demagogues of New England could gain over that province when the time arrived for effecting their long-meditated revolt. At last, however, they succeeded; and we find Mr. Washington as a delegate from Virginia in the Congress which met at Philadelphia on the 26th of October, 1774. As no American united in so high a degree as he did, military experience with respectability of character, he was appointed to the command of the army which had assembled in the New England provinces, to hold in check the British army which was then encamped under General Gage at Boston.

At this period there is some reason to believe that neither Mr. Washington nor his constituents entered heartily into the views of the New Englanders; but afraid lest the army of those rebellious fanatics, after shaking off the yoke of Great Britain, might give law to the continent, he took upon himself the command of that army in the month of July, 1775. To detail his conduct in the years which followed, would be to relate the history of the American war, which has been already related in a great variety of ways. Within a very short period after the declaration of independence, the affairs of America were in a condition so desperate, that perhaps nothing but the peculiar character of Washington's genius could have retrieved them. Activity was the policy of invaders. In the field of battle the superiority of a disciplined army is displayed. But delay was the wisdom of a country defended by undisciplined soldiers against an enemy who must be more exhausted by time than he could be weakened by defeat. It required the consummate prudence, the calm wisdom, the inflexible firmness, the moderate and well-balanced temper of Washington to embrace such a plan of policy, and to persevere in it: to resist the temptations of enterprise; to fix the confidence of his soldiers without the attraction of victory; to support the spirit of the army and the people amidst those slow and cautious plans of defensive warfare which are more dispiriting than defeat itself; to contain his own ambition and the impetuosity of his troops; to endure temporary obscurity for the salvation of his country, and for the attainment of solid and immortal glory; and to suffer even temporary reproach and obloquy, supported by the approbation of his own conscience and the applause of that small number of wise men, whose praise is an earnest of the admiration and gratitude of posterity. Victorious generals easily acquire the confidence of their army. Theirs, however, is a confidence in the *fortune* of their general. That of Washington's army was a confidence in his *wisdom*. Victory gives spirit to cowards, and even the agitations of defeat sometimes impart a courage of despair. Courage is inspired by success, and it may be stimulated to desperate exertion even by calamity; but it is generally palsied by inactivity.—A system of cautious defence is the severest trial of human fortitude; and by this test the firmness of Washington was tried. It must not, however, be concealed, that some of the British commanders gave him advantages, which he surely did not expect; for more than once, as it appears to us, they had it in their power to annihilate his army, merely by following up their victories. The issue of the contest is known.

Much has been said by the British and American democrats of the magnanimity of Washington during the ravages of a civil war, in which he acted so conspicuous a part; and we feel not ourselves inclined to refuse him the praise which he may have merited on this or any other account. But granting that duty required him to execute as a spy the accomplished *André*, true magnanimity would have prevented him from insultingly erecting, in the view of that unfortunate officer, the gallows on which he was to be hung, several days before his execution! When Earl Cornwallis was overpowered by numbers, and obliged at York-town to surrender to the united armies of America and France, a magnanimous conqueror would not have maliciously claimed, contrary to the usage of civilized war, the sword from the hands of that gallant nobleman. On these two occasions, and on some others, the conduct of Washington agreed so ill with his general character, that we are inclined to believe that he must have been influenced by the leaders of the French army, Rochambeau and Fayette. One thing is certain, that he was so little pleased either with his own conduct on particular occasions, or with

the general principle of the American revolution, that he never could be forced to talk on the subject. An Italian nobleman, who visited him after the peace, had often attempted, in vain, to turn the conversation to the events of the war. At length he thought he had found a favourable opportunity of effecting his purpose; they were riding together over the scene of an action where Washington's conduct had been the subject of no small animadversion. Count — said to him, "Your conduct, Sir, in this action has been criticized." Washington made no answer, but clapped spurs to his horse: after they had passed the field, he turned to the Italian and said, "Count —, I observe that you wish me to speak of the war; it is a conversation which I always avoid. I rejoice at the establishment of the liberties of America. But the time of the struggle was a horrible period, in which the best men were compelled to do many things repugnant to their nature." This, we think, is the language of a good man not altogether satisfied with the part which he had been compelled to act, and who, though he rejoiced at the establishment of the liberties of America, probably foresaw that she would reap no benefit from her favourite independence.

The conclusion of the American war permitted Washington to return to those domestic scenes, from which no views of ambition seem to have had the power to draw him. But he was not allowed long to enjoy this privacy. The supreme government of the United States, hastily thrown up, in a moment of turbulence and danger, as a temporary fortification against anarchy, proved utterly inadequate to the preservation of general tranquility and permanent security. The confusions of civil war had given a taint to the morality of the people, which rendered the restraints of a just and vigorous government more indispensably necessary. Confiscation and paper money, the two greatest schools of rapacity and dishonesty in the world, had widely spread their poison among the Americans. One of their own writers tells us, that the whole system of paper money was a system of public and private frauds. In this state of things, which threatened the dissolution of morality and government, good men saw the necessity of concentrating and invigorating the supreme authority. Under the influence of this conviction, a convention of delegates was assembled at Philadelphia, which strengthened the bands of the Federal Union, and bestowed on Congress those powers which were necessary for the purposes of good government. Washington was the president of this convention, as he, in three years after, was elected president of the United States of America, under what was called "The New Constitution," though it ought to have been called a *reform* of the republican government, as that republican government itself was only a *reform* of the ancient colonial constitution under the British crown. None of these changes extended so far as an attempt to new-model the whole social and political system.

Events occurred during his chief magistracy which convulsed the whole political world, and which tried most severely his moderation and prudence. The French revolution took place; Washington, who had experienced the evils of one revolution, augured, from the beginning, no good from the daring speculations of inexperienced visionaries; and the progress of the revolution was not calculated to cure his distrust. When, in the year 1793, France, then groaning under the most intolerable and hideous tyranny, became engaged in war with almost all the governments of the civilized world, it is said to have been a matter of deliberation with the President of the United States, whether the republican envoy or the agent of the French princes should be received in America as the diplomatic representative of France. But whatever might be his private feelings of repugnance and horror, his public

conduct was influenced only by his public duties. As a virtuous man, he must have abhorred the system of crimes which was established in France. But as the first magistrate of the American commonwealth, he was bound only to consider how far the interest and safety of the people whom he governed were affected by the conduct of France. He saw that it was wise and necessary for America to preserve a good understanding and a beneficial intercourse with that great country, in whatever manner she was governed; as long as she obtained from committing injury against the United States. Guided by this just and simple principle, uninfluenced by the abhorrence of crimes which he felt, and which others affected, he received M. Genet, the minister of the French Republic. The history of the outrages which that minister committed, or instigated, or countenanced, against the American government, must be fresh in the memory of all our readers. The conduct of Washington was a model of firm and dignified moderation. Insults were offered to his authority in official papers, in anonymous libels, by incendiary declaimers, and by tumultuous meetings. The law of nations was trampled under foot. His confidential ministers were seduced to betray him, and the deluded populace were so inflamed by the arts of their enemies, that they broke out into insurrection. No vexation, however galling, could disturb the tranquillity of his mind, or make him deviate from the policy which his situation prescribed. With a more confirmed authority, and at the head of a longer established government, he might perhaps have thought greater vigour justifiable. But in his circumstances, he was sensible that the nerves of authority were not strong enough to bear being strained. Persuasion, always the most desirable instrument of government, was in his case the safest. Yet he never overpassed the line which separates concession from meanness. He reached the utmost limits of moderation, without being betrayed into pusillanimity. He preserved external and internal peace by a system of mildness, without any of those virtual concessions of weakness, which so much dishonour and enfeeble supreme authority. During the whole of that arduous struggle, his personal character gave that strength to a new magistracy which in other countries arises from ancient habits of obedience and respect. The authority of his virtue was more efficacious for the preservation of America than the legal powers of his office.

During this turbulent period, he was re-elected to the office of the Presidency of the United States, which he held from April 1789 till September 1796. Probably no magistrate of any commonwealth, ancient or modern, ever occupied a place so painful and perilous. Certainly no man was ever called upon so often to sacrifice his virtuous feelings (he had no other sacrifices to make) to his public duty. Two circumstances of this sort deserve to be particularly noticed. In the spring of 1794 he sent an ambassador to Paris with credentials, addressed to his "dear friends the citizens composing the Committee of Public Safety of the French Republic," whom he prays God "to take under his holy protection." Fortunately the American ambassador was spared the humiliation of presenting his credentials to these bloody tyrants. Their power was subverted, and a few of them had suffered the punishment of their crimes, which no punishment could expiate, before his arrival at Paris. Readily as we admit the purity of the motives which induced him to send this embassy to Paris, we cannot possibly approve of his conduct in deviating so far from the usual diplomatic style, as to call Robespierre his friend: but he was beset by an absurd, though formidable, faction at home.

He had another struggle of feeling and duty to encounter, when he was compelled to suppress the insurrection in the western counties of Pennsylvania by force of arms. But here

he had a consolation. The exercise of mercy consoled his mind for the necessity of having recourse to arms. Never was there a revolt quelled with so little blood. Scarcely ever was the basest dastard so tender of his own life, as this virtuous man was of the lives of his fellow-citizens. The value of his clemency is enhanced by recollecting that he was neither without provocations to severity, nor without pretexts for it. His character and his office had been reviled in a manner almost unexampled among civilized nations. His authority had been insulted—his safety had been threatened. Of his personal and political enemies some might, perhaps, have been suspected of having instigated the insurrection; a greater number were thought to wish well to it; and very few shewed much zeal to suppress it. *Is habitus animorum fuit, at pessimum fascinus auderent pauci, plures vellent, omnes palerentur.* But neither repentment, nor fear, nor even policy itself, could extinguish the humanity of Washington. This seems to have been the only sacrifice which he was incapable of making to the interest of his country.

Throughout the whole course of his second Presidency, the danger of America was great and imminent almost beyond example. The spirit of change, indeed, at that period, shook all nations. But in other countries it had to encounter ancient and solidly established power; it had to tear up by the roots long habits of attachment in some nations for their government; of awe in others; of acquiescence and submission in all.—But in America the government was new and weak. The people had scarce time to recover from the ideas and feelings of a recent civil war. In other countries the volcanic force must be of power to blow up the mountains, and to convulse the continents that held it down, before it could escape from the deep caverns in which it was imprisoned:—in America it was covered only by the ashes of a late convulsion, or at most by a little thin soil, the produce of a few years' quiet.

The government of America had none of those salutary prejudices to employ, which in every other country were used with success to open the eyes of the people to the enormities of the French revolution. They had, on the contrary, to contend with the prejudices of the people in the most moderate precautions against internal confusion, in the most measured and guarded resistance to the unparalleled insults and enormous encroachments of France. Without zealous support from the people, the American government was impotent. It required a considerable time, and it cost an arduous and dubious struggle, to direct the popular spirit against a sister republic, established among a people to whose aid the Americans ascribed the establishment of their independence. It is probable, indeed, that no policy could have produced this effect, unless it had been powerfully aided by the crimes of the French Government, which have proved the strongest allies of all established governments; which have produced such a general disposition to submit to any known tyranny, rather than rush into all the unknown and undefinable evils of civil confusion, with the horrible train of new and monstrous tyrannies of which it is usually the forerunner. But of these circumstances Washington availed himself with uncommon address. He employed the horror excited by the atrocities of the French revolution for the most honest and praise-worthy purposes;—to preserve the internal quiet of his country; to assert the dignity, and to maintain the rights, of the commonwealth which he governed, against foreign enemies. He avoided war without incurring the imputation of pusillanimity; he cherished the detestation of Americans for anarchy, without weakening the spirit of liberty; and he maintained, and even consolidated, the authority of government, without abridging the privileges of the people.

The resignation of Washington in 1796 was certainly a measure of prudence, and we doubt not of patriotism; but the conduct of his successor has been such as to give the Americans reason to regret that the reins of government were thrown up by the only hand, perhaps, that was fit to guide them during so unsettled a state of public affairs. When he retired, he published a valedictory address to his countrymen, as he had before done when he relinquished the command of the army in 1783. In these compositions, the whole heart and soul of Washington are laid open. Other state papers have, doubtless, shewn more spirit and dignity, more eloquence, greater force of genius, and a more enlarged comprehension of mind; but none ever displayed more simplicity and ingenuities, more moderation and sobriety, more good sense, more prudence, more honesty, more earnest affection for his country and for mankind, more profound reverence for virtue and religion; or more ardent wishes for the happiness of his fellow-creatures, and more just and rational views of the means which alone can effectually promote that happiness.

From his resignation till the month of July, 1798, he lived in retirement at Mount Vernon. At this latter period, it became necessary for the United States to arm. They had endured with a patience, of which there is no example in the history of states, all the contumely and wrong which successive administrations in France had heaped upon them. Their ships were every-where captured, their ministers were detained in a sort of imprisonment at Paris; while incendiaries, clothed in the sacred character of ambassadors, scattered over their peaceful provinces the fire-brands of sedition and civil war. An offer was made to terminate this long course of injustice, for a bribe to the French ministers. This offer was made by persons who appeared to be in the confidence of M. Talleyrand, who professed to act by his authority; who have been since, indeed, disavowed by him; but who never will be believed not to have been his agents, till he convict them of imposture by legal evidence, and procure them to be punished for so abominable a fraud.

The United States resolved to arm by land and sea. The command of the army was bestowed on General Washington; which he accepted, because he was convinced that "every thing we hold dear and sacred was seriously threatened;" though he had flattered himself "that he had quitted forever the boundless field of public action, incessant trouble and high responsibility, in which he had long acted so conspicuous a part." In this office he continued during the short period of his life which still remained. On Thursday the 12th December, 1799, he was seized with an inflammation in his throat, which became considerably worse the next day; and of which, notwithstanding the efforts of his physicians, he died on Saturday the 14th of December, 1799, in the 68th year of his age, and in the 23d year of the independence of the United States, of which he may be considered as the founder. The same calmness, simplicity, and regularity, which had uniformly marked his demeanor, did not forsake him in his dying moments. He saw the approaches of death without fear—he met them without parade.—Even the perfectly well ordered state of the most minute particulars of his private business, bore the stamp of that constant authority of prudence and practical reason over his actions, which was a distinguishing feature of his character. He died with those sentiments of piety which had given vigour and consistency to his virtue, and adorned every part of his illustrious life.

WASHINGTON, the name of several counties in the United States of America: namely, in Rhode Island, in New York, in Pennsylvania, in Maryland, in Virginia, in Tennessee, in North Carolina, in South Carolina, and in Georgia.

These, and several towns of the same name, take their denomination from the illustrious General Washington, who was elected the first president of the United States in 1788.

WASHINGTON, a commercial town of the United States, in North Carolina, seated on the river Tar, 38 miles N. by E. of Newbern. Long. 77. 3. E. Lat. 34. 40. N.

WASHINGTON, a town in the State of Georgia, in the county of Wilkes. A mile and a half from this town, is a medicinal spring which has been found very beneficial in rheumatic cases: it rises from a hollow tree, the inside of which is covered with a coat of nitre, an inch thick; and the leaves around the spring are incrufted with a substance as white as snow. It is 50 miles N.W. of Augusta. Long. 82. 30. W. Lat. 33. 12. N.

WASHINGTON, a town of Pennsylvania, capital of a county of the same name, 300 miles W. of Philadelphia. Long. 80. 20. W. Lat. 40. 11. N.

WASSENBERG, a town of Westphalia, in the duchy of Juliers, nine miles E.S.E. of Ruremonde.

WASSERBURG, a town of Bavaria, with a castle. It is seated among mountains, 25 miles E. by S. of Munich, and 28 N.W. of Saltzburg. Long. 12. 13. E. Lat. 48. 4. N.

WATCHET, a town in Somersetshire, with a market on Saturday, seated on the Bristol Channel, at the mouth of a good harbour, much frequented by coal ships, which are freighted hence with lime-stone, alabaster, and kelp. It is 14 miles N.W. of Bridgewater, and 153 W. by S. of London. Long. 3. 25. W. Lat. 51. 12. N.

WATEEBOO, an island in the Pacific Ocean, discovered by Captain Cook. It is six leagues in circuit, composed of hills and plains, and the surface covered with verdure. The soil, in some parts, is light and sandy; but further up the country, a reddish cast was seen on the rising grounds, where the islanders build their houses, which are long and spacious. The manners of the people, their general habits of life, and their method of treating strangers, greatly resemble those of Otaheite, and its neighbouring islands. There is also a great similarity between their religious opinions and ceremonies. Long. 158. 15. W. Lat. 21. 1. S.

WATER (*Encycl.*). The following method of preserving fresh water sweet during long voyages at sea, by Samuel Bentham, esq. appears in the Transactions of the Society for the Encouragement of Arts, Manufactures, and Commerce, who conferred on the author their gold medal.

"The mode in which I conceived fresh water might be preserved sweet," says Mr. Bentham, "was merely by keeping it in vessels of which the interior lining at least should be of such a substance as should not be acted upon by the water, so as to become a cause of contamination. Accordingly, on board two ships, the greater part of the water was kept, not in casks, but in cates or tanks, which, though they were made of wood, on account of strength, were lined with metallic plates, of the kind manufactured by Mr. Charles Wyatt, of Bridge-street, under the denomination of *tinned copper-sheets*; and the junctures of the plates or sheets were soldered together, so that the tightness of the cates depended entirely on the lining, the water having no-where access to the wood. The shape of these cates was adapted to that of the hold of the ship, some of them being made to fit close under the platform, by which means the quantity of water stowed was considerably greater than could have been stowed, in the same space, by means of casks; and thereby the stowage-room on board ship was very much increased.

"The quantity of water kept in this manner on board

each ship, was about forty tons divided into sixteen tanks; and there was likewise, on board each of the ships, about thirty tons stowed in casks as usual.

"As the stowing the water in tanks was considered as an experiment, the water in the casks was used in preference; that in the tanks being reserved for occasions of necessity, excepting that a small quantity of it was used occasionally for the purpose of ascertaining its purity, or when the water in the casks was deemed, when compared with that in tanks, too bad for use.

"The water in thirteen of the tanks, on board one ship, and in all the tanks on board the other, was always as sweet as when first taken from the fource; but in the other three of the tanks, on board one ship, the water was found to be more or less tainted as in the casks. This difference, however, is easily accounted for, by supposing that the water of these tanks was contaminated before it was put into them; for in fact the whole of the water was brought on board in casks, for the purpose of filling the tanks, and no particular care was taken, to taste the water at the time of taking it on board.

"After the water kept in this manner had remained on board a length of time which was deemed sufficient for experiment, it was used out, and the tanks were replenished as occasion required: but in some of the tanks, on board one ship at least, the original water had remained three years and a half, as appears by the certificates herewith inclosed. About twenty-five gallons of the water, which had remained this length of time in the ship, are sent to the Society, in two vessels made of the same sort of tinned copper with which the tanks were lined."

A certificate from Capt. Bolton, commander of the vessel, accompanied this letter, stating that the water delivered to the Society was taken from a tank holding about seven hundred gallons, and which his predecessor, Capt. Portlock, had informed him had been poured into the tank in December, 1796, except about thirty gallons added in 1798, and had remained good during the whole time.

In a letter, dated January 27, General Bentham also states, that the water which had been preserved sweet on board his Majesty's sloops Arrow and Dart, and of which he had sent specimens to the Society, was taken from the well at the king's brew-house, at Weevil, from whence ships of war, lying at or near Portsmouth, are usually supplied with water for their sea-store, as well as for present use.

WATERLAND (*Encycl.*). Into the short account there given of Dr. Waterland, we wish to introduce a correction, equally necessary in all biographical works which we have yet seen. All say he was born at *Waseley*, in Lincolnshire. His baptism, however, is registered in the parish of *Walsby*, near *RASEN*, of which his father, Erasmus Waterland, had been rector and resident many years. We believe there is not any such place in the county of Lincoln as *Waseley*.

WATER-POTS, in Spain known by the name of *Alcarrazas*, are earthen vessels, extremely porous, destined to cool the water for drinking, by means of the continual evaporation which takes place on their whole surface. Every house in Madrid is provided with these vessels, which are known to have been introduced into the country by the Arabs, and to be equally used in Syria, Persia, China, Egypt, &c. Those of Madrid are made of a kind of marly earth, found on the banks of the river Tausoro, near the town of Auduxar, in Andalusia. On being carefully analysed, it is found to contain about one third of calcareous

earth, a third of alumine, a third of silex, and a very small portion of iron.

The process for manufacturing the *alcarrazas* is as follows: After the earth has been dried, it is separated into small lumps about the size of walnuts, which are thrown into a tub or vat, covered with water, and left to soak during twelve hours, after which it is kneaded. After it has been well wrought, it is spread in layers of about six fingers depth on a smooth surface covered with brick, over which has been sprinkled a small quantity of sifted ashes.

Here it is suffered to remain until it has become chapped: it is then cleared from the ashes, carried to a clean flagged floor, where it receives the addition of about the twentieth part of its weight of sea-salt if intended for the fabrication of large jars, or only a fortieth if destined to be made into vessels of smaller size. An observant traveller says, that a quantity of sand is also added.

This mixture is kneaded anew with the feet, and then wrought on the wheel, after having been sifted carefully cleaned from any bits of straw or gravel which might have adhered to it. The vessels, when made, are placed in the potter's oven, but not more than half baked. It is to this circumstance, and to the marine salt which they contain, that they are indebted to their porosity: for the very same earth is wrought into common pottery, without the addition of the salt, or the diminution of the baking.

In the hottest weather, water put into one of these vessels, and placed in the open air, more particularly in a current of air, becomes in a very short time agreeably cool.

In Estremadura, at a place called Salvatierra, are made red vases called *bucaros*, which serve also to preserve water cool. They impart to it a disagreeable clayey taste, which is, however, much admired by the women of Madrid. Girls are said to be particularly fond of this species of pottery, and eat it in the green-sickness. Nearly similar vases are used in Portugal for moistening snuff, which is done by placing them in water after they have been filled with the snuff.

WATER-PROOF, a term applied to those stuffs which have undergone certain chemical or mechanical processes, and thus become impermeable to moisture.

In 1801, a patent was granted to Messrs. Ackermann, Suardy, and Co. for their invention of a process, by which every species of cloth may be rendered *water-proof*.—As the patentees have not thought proper to publish the particulars of their process (though such concealment is contrary to the nature of *Letters Patent*), we shall briefly remark, from our own observation, that their method appears to be a simple impregnation of cloth with wax previously dissolved, and incorporated with water, by the addition of pure vegetable alkali, or pot-ash. This being the cheapest and most expeditious mode of reducing wax to a fluid state, we are further inclined to believe that our conjecture is well founded; because all the woollen cloth prepared in the manufactory of Messrs. Ackermann, Suardy, and Co. feels somewhat harder than such as has not been *waxed*: for the same reason, it will stand a shower of rain only so long as it has not been subject to friction; and we understand from those who have worn *patent water-proof coats*, that, in the sleeves particularly, they are very apt to admit moisture through the different folds. Nevertheless, their process is entitled to attention; and it deserves to be adopted principally in those cases where the manufacture is not liable to be impaired by friction; such as coverings for tents; for horries exposed to the rain when at rest; and espe-

cially for paper in which gunpowder, or steel and other goods, are to be packed.

The following simple process is stated to be that employed by the Chinese, for rendering cloth *water-proof*: Let an ounce of white wax be dissolved in one quart of spirit of turpentine, the cloth be immersed in the solution, and then suspended in the air, till it be perfectly dry. By this method, the most open muslin, as well as the strongest cloths, may be rendered impervious to the heaviest showers; nor will such composition fill up the interstices of the finest lawn; or in the least degree affect the most brilliant colours.

WATERSAY, one of the Hebrides, on the west coast of Scotland, about one mile fourth from South Uist, from which it is separated by a channel called Chifamul Bay.

WATER-WORKS (*Encycl.*) In a communication to the Editor of the Philosophical Magazine, Mr. Buchanan has justly observed, that there are many cases in which it is of importance to know the proportion of power necessary to give different degrees of velocity to a mill. But as the construction of mills, and the purposes they serve, are various, it is perhaps impossible to find any law of universal application. Mr. Banks, in his Treatise on Mills, pages 17, 18, 144, 145, 146, has drawn a conclusion, which he appears to consider as invariable, namely, that 'when a wheel acts by gravity, its velocity will be as the cube root of the quantity of water it receives.'

"But," says Mr. Buchanan, "if we suppose a wheel raising water, by means of cranks and pumps, on Mr. Banks's principle, it might easily, I think, be demonstrated, that, by reducing the velocity of the wheel to a certain degree, the wheel would raise more water than would be necessary to move it at that velocity; a thing evidently impossible.

"In this view, it would seem there is no actual case in which Mr. Banks's conclusions will hold true. But, however they may apply to other mills, the experiments which I am going to mention seem to me to prove, at least, that I do not apply to cotton mills. On the ground of these experiments, made at different times, and with all the attention in my power (and not from any abstract consideration), have I presumed to call in question an authority for which I entertain the highest respect.

"In January 1796 I measured the quantity of water the old Rothsay cotton mill required, 1st, when going at its common velocity; and, 2dly, when going at half that velocity. The result was, that the last required just half the quantity of water which the first did. It is to be observed, that in these experiments the quantities of water were calculated from the heads of water and apertures of the sluices.

"From these experiments I inferred, 'that the quantity of water necessary to be employed in giving different degrees of velocity to a cotton mill, must be nearly as that velocity.'

"I was satisfied with this experiment, and the inference I drew from it, till some gentlemen, well acquainted with the theory and practice of mechanics, expressed their doubts on the subject. I had then recourse to another experiment, which I considered as less liable to error than the former.

"The water which drives the old cotton-mill, falls, a little below it, into a perpendicular-sided pond, which serves as a dam for a corn-mill. To ascertain, therefore, the proportional quantities of water used by the old mill, nothing more was necessary than to measure the time the water took to rise to a certain height in that pond; and accord-

ingly, on the 1st of May, 1798, I made the experiments noted in the following table:

1	2	3	4	Number of experiments.
46	46	24	23	Revolutions of one of the upright shafts per minute.
5	5	5	5	Rise of water in the pond in inches
6.58	6.57	14.45	15.01	Time in minutes and seconds.

"The first and second experiments were made with the mill at its common velocity; the third and fourth at nearly half that velocity.

"The time which the mill required to use the same quantity of water in these experiments may be taken in round numbers; the proper velocity at seven minutes, and half that velocity at fifteen minutes.

"The result of these experiments approaches very nearly to that of 1796. The difference may be accounted for by the small degree of leakage which must have taken place at the sluices on the lower end of the pond; and the time being greater in the third and fourth experiments, the leakage would, of course, be greater.

"Mr. Smeaton and others have proved, in a very satisfactory manner, that 'the mechanical power which must be employed in giving different degrees of velocity to the same body, must be as the square of that velocity.' But it appears to me that the result of the above experiments may be easily reconciled to this proposition by considering what Mr. Smeaton says immediately afterwards:—'If the converse of this proposition (says he) did not hold true, viz. that if a body in motion, on being stopped, would not produce a mechanical effect equal or proportional to the square of its velocity, or to the mechanical power employed in producing it, the effect would not correspond with its producing cause.' Now, it is to be observed, that Mr. Smeaton's experiments were made on the velocity of heavy bodies *free from friction and other causes of resistance*; but in mills there is not only friction, but obstacles to be removed: and experiments made on friction have proved that the frictions of many kinds of bodies increase in direct proportion to their velocity. But the velocity of a cotton-mill at work may be considered as a mechanical effect, and, if so, must correspond with its producing cause."

The latest contrivance, within our knowledge, for facilitating the motion of machinery, is the *undershot water-wheel*, invented by the late Mr. Besant, of Brompton; on whose widow the Society for the Encouragement of Arts, &c. in 1801, conferred a reward of ten guineas: and, as it promises to be of great service in many situations, we have given a representation of it, in Pl. 54.

Fig. 1. A, represents the body of the water-wheel, which is hollow, in the form of a drum, and is so constructed as to resist the admission of water. B, is the axis on which the wheel turns. C, the float-boards, placed on the periphery of the wheel, each of which is firmly fixed to its rim, and to the body of the drum, in an oblique direction. D, is the reservoir, that contains the water. E, the pen-stock, for regulating the quantity of water which runs to the wheel. F, represents the current that has passed such wheel.

Fig. 2, is a front view of the water-wheel, exhibiting the oblique direction in which the float-boards, C, are placed on the face of the wheel.

In the common water-wheels, more than half the quantity of that fluid passes from the gate through the wheel, without affording it any assistance: the action of the floats

is resisted by the incumbent atmosphere, at the moment when these leave the surface of the tail-water; and, as a similar proportion of water with that which passed between the floats at the head, necessarily flows between them at the tail, the motion of the wheel is greatly impeded. On the contrary, by Mr. Besant's contrivance, no water can pass, excepting that which acts with all its force on the extremity of the wheel; and, as the floats emerge from the water in an oblique direction, the weight of the atmosphere is thus prevented from taking any effect. Although his new wheel is considerably heavier than those constructed on the old plan, yet it revolves more easily on its axis; the water having a tendency to float it. Lastly, repeated experiments have proved Mr. Besant's wheel to be so decidedly superior, that, when working in deep tail-water, it will carry weights in the proportion of three to one; on which account it will be particularly serviceable to tide-mills.

A machine, which is constructed on the principle of Hiero's Fountain, forms the subject of a plate in Dr. Darwin's admirable work, entitled "*Phytologia*," it is designed to raise water to a great perpendicular height, for the irrigation of land, in such situations as have the advantage of a small fall.

a b (Pl. 55.), is the stream of water; *b c c*, represents the water-fall, supposed to be ten feet; *d e*, are two leaden or iron vessels, containing a certain quantity of water, which may be computed to be about four gallons each; *f g h i k l*, are leaden vessels, each holding about two quarts; *o p*, two cocks, each of which passes through two pipes, opening the one and closing the other; *q r*, is a water-balance, that moves on its centre, *s*, and by which the two cocks, *o* and *p*, are alternately turned; *t u*, and *w x*, are two air-pipes of lead, both internally one inch and a quarter in diameter; *y z, y z, y z*, are water-pipes, each being one inch in diameter.

The pipe, *b c c*, is always full from the stream, *a b*; the small cisterns, *g i l*, and the large one, *d*, are supposed to have been previously filled with water. The fluid may then be admitted by turning the cock, *o*, through the pipe, *c e*, into the large cistern, *e*. This water, Dr. Darwin remarks, will press the air, confined in the cistern, *e*, up the air-pipe, *x z*, and will force the fluid out of the cisterns, *g i l*, into those marked *h k*, and *C*. At the same time, by opening *B*, the water and condensed air, which previously existed in the large cistern, *d*, and in the smaller ones, marked *f h k*, will be discharged at *B*. After a short time, the water-balance, *q r s*, will turn the cocks, and exclude the water, while it opens the opposite ones: the cisterns, *f h k*, are emptied in their turns by the condensed air from the cistern, *d*, as the water progressively enters the latter from the pipe, *b c*.

A curious machine, of which the figure, in Pl. 55. will convey an accurate idea, was executed at Oulton, in Cheshire, by Mr. Whitehurst, for the service of a brewhouse, and other offices, belonging to Philip Egerton, esq. Its design is, to raise water by the *momentum*, or force, which this fluid acquires when confined: it having effectually answered the purpose, we have been induced to give a description of its constituent parts, from the sixty-fifth volume of "*The Philosophical Transactions of the Royal Society*," for 1774.

A, represents the original reservoir, or spring; the upper surface of which corresponds with the horizontal line, *B C*, and also with the bottom of the reservoir, *K*. *D*, the main pipe, which is one inch and a half in diameter, and nearly two hundred yards in length. *E*, is a branch-pipe of simi-

lar dimensions, for the use of the kitchen-offices.—Mr. Whitehurst observes, that these offices are situated at eighteen or twenty feet, at the least, beneath the surface of the reservoir, *A*, and that the cock, *F*, is about sixteen feet below it. *G*, represents a valve-box; and *g* exhibits the valve. *H*, is an air-vessel; *o o*, represent the ends of the main pipe, which are inserted in the air-vessel, and are bent downwards, to prevent the air from being driven out, when the water is forced into it. *W*, denotes the surface of the water.

Mr. Whitehurst remarks, that, as water discharged from an aperture beneath a pressure of sixteen feet perpendicular height, moves at the rate of thirty-two feet in one second of time, its velocity from the cock, *F*, will be in a similar ratio. And, though the aperture of such cock be not nearly equal to the diameter of the pipe, *D*, yet the pressure of the fluid contained in the pipe will be very considerable: so that if a column of water, two hundred yards high, be thus set in motion, and then suddenly stopped by the cock, *F*, its great force will open the valve, *g*, and condense the air in the box, *H*, as often as the water is drawn from the cock. This condensation was sufficient to force the water into the reservoir, *K*, and even to burst the vessel, *H*, within a few months after its first construction; though it was made of sheet-lead, in the proportion of nine or ten pounds to one square foot, and was apparently very firm. Hence it may be rationally concluded, that the impetus of the water is far superior to the simple pressure of the column, *I K*, and is therefore equal to a greater resistance (if it were required) than a pressure of four or five feet perpendicular height.

This ingenious contrivance is now applied to a variety of machinery, by Mr. Boulton, of Soho, near Birmingham; who obtained a patent, in December, 1797, for an improved apparatus, and methods of raising water and other fluids.—Mr. Boulton has substituted valves for cocks, and manufactures the pipes of such materials as are calculated to prevent accidents from bursting.

WATFORD, a town in Hertfordshire, with a great corn-market on Tuesday. It is seated on the river Coln, seven miles S. by W. of St. Alban's, and 14 N.W. of London. Long. O. 17. W. Lat. 51. 41. N.

WATTLINGTON, a town in Oxfordshire, with a market on Saturday. It is seated on the Chiltern Hills, on a brook, which, with the continued ridge, divides the county from Buckinghamshire. It is 14 miles S.E. of Oxford, and 46 W. of London. Long. 1. O. W. Lat. 51. 37. N.

WATTEN, a town of France, in the department of the North, seated on the river Aa, five miles from St. Omer.

WATTON, a town in Norfolk, with a market on Wednesday, 18 miles S.W. of Norwich, and 90 N.N.E. of London. Long. O. 53. E. Lat. 52. 36. N.

WAVEREN, a town of the duchy of Brabant, situated on the Dyle, 12 miles S. of Louvain.

WAXHOLM, a fortress on the coast of Sweden, in the Baltic, situated on a small island at the entrance of the lake Malar, where all homeward-bound ships are searched. It is 16 miles E. of Stockholm.

WAYNESBOROUGH, a town of the state of Georgia, in the county of Burke, 30 miles S. of Augusta. Long. 82. 46. W. Lat. 33. 45. N.

WEAR, a river, which rises in the west part of the county of Durham, and divides it into two parts; flowing S.E. by Stanhope to Bishop Auckland, and thence N.E. by Durham to Sunderland, where it falls into the German Ocean.

M. Whitehurst's Invention for raising Water.

Yarn-Mill.

Fig. 1.

Fig. 2.

Fig. 3.

WEARMOUTH, a village in Durham, on the N. side of the mouth of the river Wear, opposite Sunderland. It is also called Monk Wearmouth, having, before the dissolution, belonged to the monks. Here is an iron bridge over the Wear, of one arch, 236 feet span, erected in 1796, and the first ever constructed of parts so formed as to unite in the manner of key-stones.

WEARMOUTH, BISHOP, a village in Durham, one mile S.W. of Sunderland. It has a manufacture of sail-cloth.

WEATHERSFIELD, a town of the United States, in Connecticut, noted for raising onions. It is five miles S. of Hartford.

WEDDENSCHIVEIL, a town of Switzerland, in the canton of Zurich. Near it is a remarkable water-fall. It is seated on the W. side of the lake of Zurich, 10 miles S.E. of that city.

WEERT, a town of Dutch Brabant, taken by the French in 1794. It is 12 miles W. of Ruremonde. Long. 5. 38. E. Lat. 51. 7. N.

WEEVER, a river, which rises in the N. part of Shropshire, runs across Cheshire, and receiving the Dane from the E. enters the estuary of the Mersey. It is navigable to Winsford, some miles above Northwich in Cheshire.

WEGELEBEN, a town of Germany, in the circle of Lower Saxony, and county of Halberstadt: five miles N. of Quedlingburg, and four E. Halberstadt.

WEGGIS, a town of Switzerland, in the canton of Lucerne, and capital of a bailiwick, situated on the north side of the Lake of Lucerne: seven miles E. Lucerne.

WEIBSTADT, a town of Germany, in the bishopric of Spire, 20 miles S.E. of Heidelberg. Long. 9. 23. E. Lat. 49. 19. N.

WEICHTERBACH, a town in Germany, in Weteravia, and in the county of Isenberg, seated on the river Kintz, with a castle, where the count resides.

WEIDEN, a town of Germany, in the upper palatinate of Bavaria, seated on the Nab, 10 miles N.W. of Leuchtenberg. Long. 12. 10. E. Lat. 49. 34. N.

WEIGHTS (*Encycl.*). Some account of these has been given under MEASURES (*Supp.*); but the following, we have no doubt, will be acceptable to our readers.

The principal measure of length is the *metre*, which is equal to 39.404 English inches: it is multiplied by prefixing the Greek numeral adjectives to the word *metre*: thus, the *decimetre* signifies 10 metres; *hectometre*, 8; *kilometre*, 1000; and *myriametre*, 10,000 metres. The measures below a metre are named in a similar manner; the Latin numeral adjectives being substituted for those of the Greek: hence, a *decimetre* denotes the tenth part; *centimetre*, the hundredth part; and *millimetre*, the thousandth part of a metre.

The standard measure of capacity is denominated a *litre*, which is equivalent to 61.1816 English cubic inches, or about 1.5-7ths of a pint, ale-measure, and 2 1-10th of a pint, wine-measure. Its multiplication and submultiplication are performed in a similar manner.

The *gramme* is adapted to weighing bodies, and is equal to 15.4457 English grains, troy weight. Its divisions and subdivisions correspond with those of the metre.

The French are employed for measuring the superficies of land, and is equal to 1076 2-5ths square feet, or 119 3-5th square yards, or about one fortieth part of an acre.

Lastly, the *stere* is used in measuring wood for fuel; it is equal to 35.31467 cubic feet.

VOL. X.

The following is a Comparative Table of the Units of the French Metres, Litres, and Grammes, with their corresponding English Inches, Gallons, and Grains.

Fr. Meas.	Metres in English Inches.	Litres in English.			Grammes in English Grs. Troy.
		Cubic Inches.	Ale Gall. 282 Inch.	Wine Gall. 231 Inch.	
1	39.404	61.1816	0.21695	0.26485	15.4457
2	78.808	122.3632	0.43390	0.52970	30.8914
3	118.212	183.5448	0.65085	0.79455	46.3371
4	157.616	244.7264	0.86780	1.05940	61.7828
5	197.020	305.9080	1.08475	1.32425	77.2285
6	236.424	367.0896	1.30170	1.58910	92.6742
7	275.828	428.2712	1.51865	1.85395	108.1199
8	315.232	489.4528	1.73560	2.11880	123.5656
9	354.636	550.6344	1.95255	2.38365	139.0113
10	394.040	611.816	2.1695	2.6485	154.457
20	788.08	1223.632	4.3390	5.2970	308.914
30	1182.16	1835.448	6.5085	7.9455	463.371
40	1576.16	2447.264	8.6780	10.5940	617.828
50	1970.20	3059.080	10.8475	13.2425	772.285
60	2364.24	3670.896	13.0170	15.8910	926.742
70	2758.28	4282.712	15.1865	18.5395	1081.199
80	3152.32	4894.528	17.3560	21.1880	1235.656
90	3546.36	5506.344	19.5255	23.8365	1390.113
100	3940.4	6118.16	21.695	26.485	1544.57

From the table here given, the English weights and measures, corresponding with those used in France, may be easily ascertained, by multiplying the hundreds, and adding the tenths and units, as circumstances may direct; or, if the number be less than one hundred, by adding the units to the tens. After the number required is thus found, it may be reduced to English feet or inches, to quarts or pints, to pounds, ounces, drachms, or grains, by means of the common rules of arithmetic.

A more ample specification of these weights and measures is published in the third volume of Mr. Nicholson's Journal; and which is abstracted from a report published in 1799, at Paris, by authority of the French government.

WEIL, or **WEYL**, a free imperial town of Suabia, in the duchy of Wirtemberg. The inhabitants are Roman-catholics. It is seated on the Worm, 12 miles W. of Stuttgart, and 20 N. of Tubingen. Long. 8. 50. E. Lat. 48. 46. N.

WEILBURG, a town of Germany, in the circle of Upper Rhine, and county of Naflau. It is seated on the Lohn, 22 miles N.E. of Naflau, 22 N.W. of Franfort, and 29 E. of Mentz. Long. 8. 26. E. Lat. 50. 18. N.

WEILHEIM, a town of Suabia, in the duchy of Wirtemberg, seated on the river Laurer.

WEILNAU, a town of Germany, in the circle of the Upper Rhine, and principality of Nassau Weiburg: thirteen miles S. Weiburg, and eighteen N.E. Mentz.

WEILTINGEN, a town of Germany, in the circle of Swabia, and duchy of Wurtemberg, on the Warnitz: forty miles S.W. Nuremberg, and fifty-four E.N.E. Stuttgart.

WEIMAR, a town of Upper Saxony, in Thuringia, with a magnificent castle, the residence of the Duke of Saxe-Weimar. It is seated on the Ilm, 20 miles N.E. of Erfurt, and 20 W.S.W. of Naumburg. Long. 11. 52. E. Lat. 51. 6. N.

WEINGARTIN, a town of Germany, in the palatinate

of the Rhine, seated on the Printza, four miles N.E. of Dourlach, and nine S. of Philipburg. Long. 9. 30. E. Lat. 49. 5. N.

WEINHEIM, a town of Germany, in the palatinate of the Rhine, 10 miles N. of Heidelberg. Long. 8. 46. E. Lat. 49. 35. N.

WEISBADEN, a town of Germany, in the electorate of Mentz, where there are hot baths in high esteem. It is eight miles N.E. of Mentz, and 13 W. of Francfort. Long. 8. 20. E. Lat. 49. 56. N.

WEISLMUNDE, a town of Western Prussia, seated at the mouth of the Vistula, below Dantzic, whose harbour it defends. Long. 18. 40. E. Lat. 54. 24. N.

WEISSENBURG, a town of France, in the department of Lower Rhine. Between this place and Lauterburg, are the famous lines from which the French drove the Austrians in 1744; and, in 1793, the Prussians drove the French from the same situation. It is seated on the Lauter, 10 miles S.W. of Landau, and 22 N.E. of Straburg. Long. 8. 11. E. Lat. 48. 53. N.

WEISSENBURG, a free imperial town of Franconia, in the bishopric of Aichtadt. The inhabitants are Protestants. It is seated on the Rednitz, five miles N. of Pappenheim, and 30 S.W. of Nuremberg. Long. 11. 2. E. Lat. 49. 4. N.

WEISSENBURG, a town of Germany, in the duchy of Saxony, 20 miles N. by W. of Wittemberg, and 20 N.E. of Dessau. Long. 12. 31. E. Lat. 52. 8. N.

WEISSENBURG, or ALBA JULIA, a city of Transylvania, capital of a county of the same name, with a bishop's see, and a university. It is seated on the side of a hill, near the river Ompias, 35 miles W. of Hermannstadt. Long. 24. 0. E. Lat. 46. 26. N.

WEISSENBURG, or STUHLWEISSENBURG, a town, of Lower Hungary, seated at the W. end of the Platten Sea, 36 miles S.W. of Buda. Long. 18. 30. E. Lat. 47. 22. N.

WEISSENFELS, a town of Upper Saxony, in Misnia, remarkable for a victory which the Swedes gained here over the Austrians. Above the town is a fine citadel, called Angutuburg, the residence of the Duke of Saxe-Weissenfels. It is seated on the Sala, 17 miles S.W. of Leipzig. Long. 12. 15. E. Lat. 51. 9. N.

WEILL, or WEDEL, a sea-port of Denmark, in N. Jutland, situate on a bay in the Little Belt, 35 miles S.S.W. of Arhusen, and 38 N.E. of Ripen. Long. 9. 30. E. Lat. 55. 45. N.

WEILTINGEN, a town of Suabia, in the duchy of Wirtemberg, situate on the Warrnitz, 40 miles S.W. of Nuremberg, and 14 E.N.E. of Stutgard. Long. 10. 21. E. Lat. 48. 58. N.

WEINSBERG, a town of Suabia, in the duchy of Wirtemberg. The valley in which it is situate is famous for its wine. It is 25 miles N. of Stutgard. Long. 9. 15. E. Lat. 49. 15. N.

WELL (*Encycl.*). The following method of procuring water, in almost every situation, has lately been suggested by M. Cadet de Vaux.—He directs the soil to be perforated with a borer: a wooden pipe is then to be placed in the hole, and driven down with a mallet; after which the boring must be continued, in order that a pipe may be driven to a greater depth. As the auger becomes filled with earth, it ought to be drawn up, and emptied; so that, by the addition of fresh portions of the pipe, the boring is carried to a considerable extent under ground, and water is in most instances obtained. Wells, thus formed, are preferable to those dug in the usual manner; being less expensive, while the supply of water is both copious and certain. Indeed, it often happens, in the

common practice of digging for wells, that the workmen are obliged to fix the windails, in order to prevent the springs from gaining on them: by this practice, a small quantity of water is the necessary consequence, and it is apt to fail during dry summers. Hence, M. de Vaux advises the earth to be perforated; a cylindrical pipe to be inserted; and to search for that element at a greater depth, in the manner before suggested.—This method is stated to be very useful in camps, or fortresses; and, in case the fluid near the surface be neither sufficiently sweet, nor of a good quality, he supposes his expedient to be the best that can be adopted, for obtaining water of a purer kind, at a greater depth.—Further, when wells have, in large towns, been rendered unfit or useless, in consequence of the ground having been tainted by privies, church-yards, &c. he very properly recommends such reservoirs to be emptied, and the bottom perforated in a similar manner, so as to reach the lower strata of water; which, being thus contained within the cylindrical pipe, will rise in a pure state into the body of the pump fixed for this purpose.—For an account of the relative salubrity of well-water, the reader will revert to the article WATER.

If wells be disused for a considerable time, the water generally becomes foul: the ambient atmosphere is corrupted; and thus arise mephitic vapours which have often proved fatal to animal life. Hence it has been suggested, to employ a pair of smith's bellows and a tube; but as these are too bulky to be conveniently carried to any distance, and frequently cannot be procured on the spur of the occasion, Mr. Salmon, of Canterbury, has invented the following apparatus, for dispersing noxious air from wells.—We are induced to recommend this ingenious contrivance to the notice of our country readers; as it is not very expensive, and will prevent many fatal accidents.

A, B, C, D, E, F (Plate 46.), represent six lengths of a metal pipe, each being eight feet long, and two inches in diameter: all these joints (except that marked F, which is made of copper, for the better support of heat) are manufactured of tin-plate. G, is a tin-kettle, or vessel (containing about two gallons), that is fastened to the upper pipe F, and the sides of which are perforated for the admission of air, and consequently for supporting the fire. This vessel must be fixed in such a direction as to have at least five feet of the pipe above its top. H, is a conical cap, designed to confine the heat to the sides of the tube.

When the machine is applied to the well, a wire must be passed through the holes a, a, in the upper part of the length A, and in the lower extremity of B, the joint ought to be luted with oil-putty, to render it air-tight; the upper end of each joint should be covered with wire, to prevent it from bending; and to form a receptacle for the putty. The other lengths are then to be managed in a similar manner, till that marked A, reach nearly to the surface of the water. The vessel G, ought to be placed on two pieces of timber laid across the well.

The apparatus, being now fixed, will speedily be filled with the foul air extracted from the well: and as the gravity of the external and internal air is equal, they become stationary. Burning coal or wood must next be put into the kettle G; by which the copper tube, F, is heated; and, the internal air being rarefied, while the external air presses downward, the noxious vapours are gradually dissipated; and a purer element is introduced into the well, whence it issues during the continuance of the fire.

Mr. Salmon remarks, that however small the current of air passing out of the funnel or pipe, F, may appear, the effect is considerable; because such discharge consists wholly of noxious vapour; whereas ten gallons of fresh air are probably

blown into the well, by means of the common bellows and leather pipe, before two gallons of mephitic vapour are removed. Such purification will be still more effectual, if the fire-kettle G, be placed at D, when the internal air becomes more rarefied: it ought, however, to be remarked, that this advantage is over-balanced by the atmosphere being rendered unfit for respiration, in consequence of the suffocating properties of the charcoal.

In the year 1794, the Society for the Encouragement of Arts, &c. conferred their silver medal on George Butler, esq. for his invention of a *bucket for drawing water from deep wells*. It consists of a common barrel, the head of which is taken out: across the top are fixed two thin bars of iron, having in the centre a small piece of the same metal, which Mr. Butler terms a *standard*. This is furnished with a collar, which has four moveable arms; and above it, there are a mortise containing a small brass pulley, and a loop to which the well-rope is secured: further, a cord is tied to one extremity of the collar, which, after passing over the pulley, communicates with a valve applied to the lower head of the vessel.—The bucket, thus constructed, when let down into the well by a rope, is filled through such valve; and, on being drawn up, the iron cross above mentioned is pressed against two parallel bars, so that the valve is opened, and the water discharged into a trough, or vessel, prepared for its reception.—The principal advantage arising from this contrivance is, that the bucket is not only filled expeditiously, but it is also brought up readily, so that no water is spilt; and, if any of it accidentally drop, it falls directly from the valve into the well, without wetting the descending rope, a circumstance of considerable importance; for, by such continual moisture (which is necessarily occasioned by the common buckets), it speedily decays, while the vessels are seldom drawn up completely filled.

The following method of procuring good water from wells, appears in the *Decade Philosophique*, &c.

"If you wish the water of a well to be clear, and free from any disagreeable taste," says the writer, "the excavation should be made considerably larger than is usually done. If, for example, you wish to construct a well five feet in diameter, the excavation ought to be from twelve to fifteen feet. A false well is made ten or twelve feet in diameter; in the middle of this large well the real well is constructed with a diameter of about five feet, but in such a manner that the water may filter through the interstices left between the stones, which form the outside of the inner well: the false well is then filled with sand and pebbles, so that the water must first filter through them before it reaches the real well. By this method you are sure of having filtered water perfectly clear and fit to drink. This operation is rather expensive, it is true; but the expense is amply compensated by the advantage of having limpid and wholesome water."

WELLAND, a river which rises in Northamptonshire, and separates that county from Leicestershire, Rutlandshire, and Lincolnshire; it passes by Market Harborough to Stamford, and is thence navigable to the Fosseike wash, which it enters below Spalding.

WELLINGBOROUGH, a town in Northamptonshire, with a market on Wednesday. A fire happened here in 1758, which consumed above 800 houses. It is seated on the side of a hill, on the river Nen, 12 miles N.E. of Northampton, and 68 N. by W. of London. Long. 0. 59. W. Lat. 52. 16. N.

WELLINGTON, a town in Shropshire, with a market on Thursday, seated near Wrekin hill, 12 miles E. of Shrewsbury, and 152 N.W. of London. Long. 2. 30. W. Lat. 52. 40. N.

WELLINGTON, a town in Somersetshire, with a market on Thursday, seated on the Tone, 15 miles N.E. of Exeter, and 147 W. by S. of London. Long 3. 25. W. Lat. 50. 57. N.

WELLS, a sea-port in Norfolk, which has a large church, and a considerable corn trade. It is 27 miles N. of Swaffham, and 121 N.N.E. of London. Long. 1. 1. E. Lat. 53. 1. N.

WELLS, a town of the United States, in the district of Maine, situate on a bay of the same name, 20 miles S.W. of Portland, and 88 N.E. of Boston. Long. 70. 32. W. Lat. 43. 20. N.

WELLS, a town 'of Upper Austria, seated on the Traun, 18 miles S. of Linz. Long. 13. 53. E. Lat. 48. 4. N.

WELSHPOOL, a town in Montgomeryshire, with a market on Monday. It is the principal trading town in the county, being the great mart for Welsh cottons, flannels, &c. The castle, called Fowis castle, is built of a reddish stone, and is a large stately structure. It is seated in a rich vale, on the river Severn, nine miles N. of Montgomery, 19 W. of Shrewsbury, and 169 N.W. of London. Long. 3. 5. W. Lat. 52. 33. N.

WEM, a town in Shropshire, with a market on Thursday, seated on the Roden, nine miles N. of Shrewsbury, and 164 N.W. of London. Long. 2. 40. W. Lat. 52. 10. N.

WENDLINGEN, a town of Suabia, in the duchy of Wirtemberg, situate on the Neckar, 12 miles S.E. of Stuttgart, and 28 N.W. of Ulm. Long. 9. 18. E. Lat. 48. 38. N.

WENDOVER, a borough in Buckinghamshire, with a market on Thursday. It sends two members to parliament, and is seven miles S.E. of Aylesbury, and 35 W. by N. of London. Long. 0. 35. W. Lat. 51. 46. N.

WENLOCK, a borough in Shropshire, with a market on Monday. It sends two members to parliament, and is twelve S.E. of Shrewsbury, and 147 N.W. of London. Long. 2. 30. W. Lat. 52. 36. N.

WENNER, the largest lake of Sweden, in W. Gothland, to the N.W. of the lake Wetter. It is 100 miles in length, and, in some places, 40 in breadth.

WENNERSBURG, a town of Sweden, in W. Gothland, which is the staple for all the iron sent from the province of Wermeland to Gotheborg. It is seated at the S.W. extremity of the lake Wenner, 15 miles E. of Uddevalla.

WENSYSSEL, a peninsula of Denmark, which makes the N. part of N. Jutland; bounded on the S. by the canal of Alburg, on the E. by the Categate, and on the N. and W. by the German Ocean.

WENSYSSEL, a town of Denmark, in N. Jutland, capital of a prefecture of the same name. It is seated on the Ryaa, 17 miles N.W. of Alburg. Long. 9. 40. E. Lat. 57. 4. N.

WEOLBY, an ancient borough in Herefordshire, with a market on Tuesday. It sends two members to parliament, and is eight miles N.W. of Hereford, and 141 W.N.W. of London. Long. 2. 41. W. Lat. 52. 9. N.

WERBEN, a town of Germany, in the old marche of Brandenburg, formerly a strong passage on the river Elbe, but now all the fortifications are ruined. It is seated at the place where the Habel falls into the Elbe, 60 miles N.W. of Berlin. Long. 12. 12. E. Lat. 53. 5. N.

WERCHTEREN, a town of Aultrian Brabant, seated at the confluence of the Demer and Dyle, nine miles E. of Mechlin. Long. 4. 49. E. Lat. 51. 0. N.

WERDEN, a town of Westphalia, in the country of Marck, with an abbey. The inhabitants are Protestants, un-

der the protection of Prussia. It is seated on the Roer, 10 miles N.E. of Dusseldorf, and 10 E. of Duisburg. Long. 7. 1. E. Lat. 51. 17. N.

WERDENBERG, a town of Switzerland, subject to the canton of Glarus, and capital of a county of the same name, which is separated from the canton by the county of Sargans, and bounded on the S. by the Rhine. It has a strong castle, the residence of the bailiff, seated on an eminence, commanding a beautiful prospect. It is 16 miles N.E. of Glarus. Long. 9. 25. E. Lat. 46. 58. N.

WERDENFELDS, a town and castle of Bavaria, which gives name to a county in the bishopric of Freisingen. It is 20 miles S. of Weilheim.

WERDOHL, a town of Westphalia, in the county of Marek, 31 miles N.E. of Cologne. Long. 7. 22. E. Lat. 51. 14. N.

WERFEN, a town and fortress of Bavaria, in the archbishopric of Saltzburgh, situate on the Saltza, 15 miles N.W. of Raftadt.

WERLE, a town of Westphalia, in the bishopric of Munster, seated on the river Sisek, 30 miles S. of Munster. Long. 7. 20. E. Lat. 51. 35. N.

WERMELAND, or **WARMELAND**, a province of Sweden, in W. Gothland, 100 miles long and 50 broad; bounded on the N. by Dalecarlia, on the E. by Westmania and Nerica, on the S. by the lakes Wenner and Dalia, and on the W. by the mountains of Norway. It is fertile, and diversified by mountains, rocks, hills, and dales, clothed with forests of birch, poplar, mountain ash, pine, and fir. It also abounds with lakes, which succeed each other almost without intermission; they are from four to forty miles in circumference; some so narrow as to appear like broad rivers, and others of a circular shape; their shores, in some parts, steep and rocky; in others gently sloping, and feathered with hanging wood to the margin of the water. Numerous rivulets flow from these lakes, and form, sometimes, small picturesque cascades. Carlstadt is the capital.

WERN, a town of Westphalia, in the bishopric of Munster, with a monastery, seated near the Lippe, 28 miles S. by W. of Munster. Long. 7. 30. E. Lat. 51. 35. N.

WERNIGERODE, a town of Upper Saxony, capital of a county of the same name, with a castle. The principal business of the town consists in brewing, distilling, and manufactures of cloth and stuff. It is 10 miles W. of Halberstadt, and 27 S.S.E. of Wolfenbuttel. Long. 11. 10. E. Lat. 52. 2. N.

WERTHEIM, a town of Franconia, capital of a county of the same name. It is seated at the confluence of the Tauber and Main, 20 miles W. of Wurtzburg. Long. 9. 53. E. Lat. 49. 46. N.

WERWICK, a town of Austrian Flanders, taken by the French in 1793. It is seated on the Lis, eight miles S.E. of Ypres. Long. 2. 58. E. Lat. 50. 46. N.

WESEL, a town of Westphalia, in the duchy of Cleves, with a strong citadel, near the confluence of the Rhine and Lippe. Here are two Calvinist churches, one for the Lutherans, and another for the papists; but the regency of the town is in the hands of the Calvinists. It was formerly an imperial and Hanseatic town, but it now belongs to the King of Prussia. It was taken by the French in 1759, but restored in 1762. It is 25 miles S.E. of Cleves, and 45 N. of Cologne. Long. 6. 37. E. Lat. 51. 27. N.

WESEL, a town of Germany, in the archbishopric of Treves, 20 miles S. of Coblenz, and 46 E.N.E. of Treves. Long. 7. 30. E. Lat. 50. 4. N.

WESENBURGH, a fortified town of Russia, in the go-

vernment of Esthonia, seated on the Wifs, 55 miles S.E. of Revel, and 55 N.W. of Narva. Long. 25. 48. E. Lat. 59. 10. N.

WESER, a considerable river of Germany, which rises in the county of Heineburg, being then called the Werra. It passes by Smalkald, crosses a corner of Thuringia, enters the duchy of Brunfwiek, and receives the Fulde at Munden. It then assumes the name of Weser, runs along the confines of the circles of Westphalia and Lower Saxony, waters Hamelin, Minden, and Hoya; receives the Aller below Verden; and passing by Bremen, enters the German Ocean.

WESTBURY, a borough in Wiltshire, with a market on Friday. It sends two members to parliament, and is 26 miles N.W. of Salisbury, and 101 W. of London. Long. 2. 13. W. Lat. 51. 16. N.

WESTERHAM, a town in Kent, with a market on Wednesday. It is the birth-place of Bishop Hoadley and General Wolfe: the latter is interred in the church. It is seated on the river Darent (which rises from nine springs near this town), 14 miles N.W. of Tunbridge, and 22 S.S.E. of London. Long. 0. 6. E. Lat. 51. 18. N.

WESTEROS, a town of Sweden, capital of Westmania, with a bishop's see, a citadel, and a famous college. It carries on a considerable commerce with Stockholm, across the lake Maeler; particularly in copper and iron from the neighbouring mines. Here are the ruins of an ancient palace, formerly inhabited by the kings of Sweden. The cathedral, built of brick, is celebrated for its tower, esteemed the highest in the kingdom. In this cathedral is the tomb of the unfortunate Eric XIV. Westeros is seated on the lake Maeler, 45 miles N.W. of Stockholm. Long. 17. 0. E. Lat. 59. 38. N.

WESTERBURG, a town of Germany, in Wetteravia, with a castle. It is the capital of a lordship of the same name, and 35 miles N. of Mentz. Long. 8. 18. E. Lat. 50. 26. N.

WESTERN TERRITORY, a country in North America, comprehending all that part of the United States which lies to the N.W. of the river Ohio. It is bounded on the W. by the Mississippi, on the N. by the Lakes, on the E. by Pennsylvania, and on the S.E. and S. by the Ohio. It contains 11,000 square miles, equal to 263,040,000 acres; from which, if we deduct 43,040,000 for water, there will remain 220,000,000 acres, belonging to the federal government, to be sold for the discharge of the national debt. This country, which is intended to be divided into several new states, is affirmed to be the most healthy and fertile spot in America, that is yet known to Europeans.

WESTERWICK, a sea-port of Sweden, in Smoland, seated on the Baltic, 50 miles N. of Calmar, and 120 S.W. of Stockholm. Long. 16. 0. E. Lat. 57. 40. N.

WESTHOFEN, a town of Germany, in the palatinate of the Rhine, five miles N.N.W. of Worms, and 20 N.W. of Mannheim.

WESTHOFEN, a town of France, in the department of Lower Rhine, 12 miles W. of Strasbourg.

WESTMANIA, or **WESTMANLAND**, a province of Sweden Proper, between Sudermania, Gestrícia, Nericia, and Upland. It is 75 miles long and 45 broad, and abounds in copper and iron mines. The face of the country is diversified like Wermeland. Westeros is the capital.

WESTPORT, a sea-port of Ireland, in the county of Mayo, seated at the mouth of a small river, which runs into Clew-Bay, eight miles W. of Castlebar. Long. 9. 22. W. Lat. 13. 48. N.

WESTRA, one of the Orkney islands, eight miles long, and from one to three broad. The number of inhabitants is about 1300. It is nine miles N N E. of Mainland.

WETHERBY, a town in the west riding of Yorkshire, with a market on Thursday, feated on the Wharf, 14 miles W. of York, and 177 N. by W. of London. Long. 1. 20. W. Lat. 53. 57. N.

WETTER, a lake of Sweden, in G. et h. l. d. S. P. of lake Wenner. It is 100 miles from N. to S. and 25 from E. to W.

WETTING, a town of Lower Saxony, in the duchy of Magdeburg, situate on the Saale, 34 miles S. of Magdeburg. Lon. 11. 40. E. Lat. 51. 31. N.

WETTINGEN, a town of Switzerland, on the Limmat, one mile S. of Baden. Its wooden bridge is a beautiful piece of mechanism, 240 feet long, and suspended 20 feet above the surface of the water. It is the last work of Grubbenman, the self taught architect, and is far more elegant than his bridge at Schaffhausen.

WEIZLAR, a free imperial town of Germany in Wetteravia, surrounded by ditches and walls flanked with towers. The inhabitants are Protestants, and have a council of 24 members. In 1693, the imperial chamber was transferred hither from Spire, on account of the wars which ravaged the palatinate. It is feated at the confluence of the Lahn, Dille, and Dillen, five miles S. of Solms, and 78 N. by E. of Spire. Long. 8. 32. E. Lat. 50. 26. N.

WEXIO, a sea-port of Sweden, in Smoland, feated on a lake, which contains a group of woody islands. Though a bishop's see, it is very small, and the houses mostly of wood. It is 50 miles W. of Calmar, and 155 S.W. of Stockholm. Long. 14. 57. E. Lat. 56. 41. N.

WEY, a river, which rises in Hampshire, flows through Surrey by Godalming and Guildford, and enters the Thames at Weybridge.

WEYMOUTH, a town in Dorsetshire, incorporated with that of Melcomb-Regis, but a distinct borough. It is feated on the W. side of an inlet of the sea: but its port is injured by the sand, so that its trade, which was once considerable, is much reduced, a few ships only being sent hence to Newfoundland. This decline is, in some degree, compensated by the great resort of persons of all ranks, for the purpose of sea-bathing, for which it is excellently fitted by its remarkable fine beach; and their majesties and the royal family have often honoured it with their residence for many weeks. A few plain and striped cottons are made here. Weymouth is 130 miles W.S.W. of London.

WHEAT (*Eucyel.*). The following important observations on the smut in wheat, blights, and the manner in which plants are nourished, by Sir John Call, bart. M.P. appear in the Communications to the Hon. Board of Agriculture.

"Having often reflected," says Sir John, "upon the nature of smut in wheat, and considered the various propositions and suggestions which had been made from time to time, for cleansing the grain, so as to prevent its affecting the flour, as also to prevent the smut from being propagated into the seed wheat so affected, I was led to deliberate in my mind whether the smut was a disorder, or disease, inherent in the seed, or an adventitious effect from the atmosphere, or some animalcula deposited in the ears of corn during their growth. In reasoning on this subject, it occurred to me, that if the disorder, or disease, called the smut, was inherent in, or latent in the seed grain, and that all such grain, when sown, would produce only ears full of smut; then, unless the disorder could be cured by some previous application, there would be a risk of having all the

crops rendered abortive, where a remedy was not applied; or if, as some persons had supposed, that the nature of the soil had contributed to produce the smut in wheat, then such soil, unless it could be corrected, would become unfit for, or dangerous to tillage. To satisfy myself at least how far the smut was a disorder liable to be propagated by seed grain taken out of smutty ears, or other grain mixed up with, and rubbed in smut, I resolved to make the following experiment.

"In the year 1797, when my men were threshing out my wheat, I desired them, as well as some of my neighbours, to save all the ears they met with affected with the smut; having collected all I could get, previous to the beginning of October, I found some ears wholly decayed, some with one, two, or more grains, apparently perfect, all which I caused to be rubbed out with the hand in a bag of paper, smut and all together; and after mixing and rubbing the grain in the smut, all I could get perfect out of smutty ears amounted to seventy-two grains, which were carefully dipped in, and marked in a ridge amongst other wheat, in a field then under tillage. Their growth from the first was similar to the rest of the field. The certificate which I deliver herewith, and the specimens of about sixty ears, gathered from the produce of the seventy-two grains, amongst which are contained every ear that appeared discoloured, or was thought by the examiners to be tending to smut, will serve to corroborate my opinion; which, as I observed before, is, that certain animalcula are deposited in the husks which cover each grain, about the time the wheat is in blossom, which are fed and brought to perfection by devouring the juice, or milky substance which rises at the root [*i. e.* the root of each grain in the husk], and that if not intercepted would form a complete grain: instead of which, as in many other cases of vegetation, the vegetable life, if I may so call it, is destroyed. And as a further proof that this is the case, and that the effect is not by the juices issuing from the earth, or rising through the tubes of the stalk, I need notice no other effect, than, that some grains perish and become smutty, while others flourish and become perfect in the same ear of corn; whereas, was the disease, which is supposed to occasion the smut, radical in the original grain of seed wheat, or infectious from the juice arising through the pores and tube of the stalk, all the grains in each ear would be affected, or those more particularly at the lower part; whereas the grains decayed are often found intermixed with others quite perfect, and dispersed throughout the ear. I therefore trust, that the prejudice conceived, that the smut in wheat is an inherent disorder, will be relinquished; or that another idea, that one kind of ground is more likely to produce smut than another, will be abandoned. I do not deny that a considerable degree of smutty wheat threshed out, and the smut of it mixed with other purer grain, will injure and prejudice the white casting of the flour, and that it may be necessary to wash and cleanse such wheat, previous to its being ground, where the smut evidently prevails; but I think my opinion of the origin of such smut is much strengthened by its prevailing more in one year than in another, and that it seldom happens the same complaint is made by farmers in the two succeeding years, notwithstanding there is no precaution taken, or remedy applied to the seed grain to prevent it; and with regard to my own experience, during twenty-nine years, I have neither mixed up my wheat with lime, nor steeped it in brine, nor washed it in any other liquid to prevent the growth of smut; nor do I believe any of my neighbours have made use of any such precautions.

"Analogous to this idea which I have just endeavoured

to explain, I am tempted, from observation, to hazard another respecting the blossoms and setting of young fruit, on fruit trees, but more particularly that of apple trees, in which a failure of fruit happens one, two, or three years together, and which is so detrimental to the produce of the orchards in Devon and Cornwall, that in the parish of Stoke Climland, where I reside, there have not been made, during the three last years, 500 hogheads of cyder, whereas in a good bearing year there are usually made from 1500 to 2000 hogheads. This defect is generally ascribed to frosty mornings, cold winds, and blights, particularly to the latter; and I am apt to believe that it is in, and from the latter, where the mischief arises; not from any simple effect of the atmosphere, but from the animalcula with which it is replete in such fogs, and which are deposited in the blossom, as in a nidus, and there brought to perfection by feeding on, and destroying the vegetable life by which they were originally nourished. Hence it is, that bunches of young fruit, set, and grown as big as hazle nuts, fall off from the branches of the tree at the stem, which seem to be eaten off, and deprived of the reception or conveyance of all nourishment, and often crumpled up by a kind of web and dry leaves. To prevent the supposed effect of blight, cold wind, and hoar frost, on wall-fruit, a net is often hung up before them, stuck full of dry fern, or other branches, to shelter the trees, without obstructing the air; and others stick in among the fruit trees, branches of fir, to cover and protect the blossoms, both which modes probably have some good effect, by intercepting and preventing the animalcula from taking post in the blossoms, or attaching themselves to the root of the young fruit.

"It is now three years that I have repeated the experiment of dibbling in, and sowing some of the best feed wheat, and some of the most shrivelled grains, or tail part of the same wheat, after winnowing; and from the result of the experiments, I am satisfied that a gallon of shrivelled grains of wheat, retaining the power of vegetation, will produce a return as good wheat in quality, and probably more in quantity, than a gallon of the finest grain of the same sort that can be sown by winnowing, or any other selection. The only advantage that I am disposed to grant, to fair, clean, and well screened feed wheat, is, that it will be more free from cockle, or any other extraneous feed, than the tail winnowings, or shrivelled feed, is likely to be; but on the other hand, a gallon of the shrivelled feed will contain three grains to two of the other, and probably will not be so much an object to be devoured by insects, birds, and vermin, as the more plump and full grains are; hence if my hypothesis is well founded, the advantage in favour of produce at the harvest will be in the shrivelled grains.

"The conclusion which I am disposed to draw from these experiments goes much beyond the advantage of converting the best kind of wheat, or other grain, to flour, and making use of an inferior sort for feed. I have been led to consider and revolve in my mind how far, and in what manner, any kind of manure contributes to the production of the crop: that it does so in the most essential manner, I do not entertain a doubt; but I differ from those who think that any kind of manure mixed with the earth, rises up through the roots, and forms any considerable part of the plant, fruit, or grain whatsoever: it may contribute to break the tenacity of the soil, to render it warm, open, and easy of perforation; so that the tender fibres and roots of any plant may find an easy passage, and genial protection therein; but I conceive that all the nourishment and juices necessary for the growth of the plants, and formation of their fruits and seeds, is derived from the atmosphere, that

it enters and descends by the buds and heart of all vegetables, and the earth is only a protecting matrix to retain and support all vegetable matter in a position to receive its nourishment. It is in forming, collecting, or attracting this nourishment, that manures are of such importance to all kinds of vegetation, either by attracting and fixing the circulating atmosphere, to hover over the earth where they are, so that the plants may imbibe what is proper for them; or by causing such a fermentation, or secretion in the earth, that by the attraction of heat it should throw up such a species of food and nourishment as is most congenial to that kind of vegetation for which the earth is cultivated.

"I will not pretend to enter into a nice discussion of the cause and powerful effects of vegetation, or attempt to controvert any opinions which have been long held on the subject; all I desire is, that the ideas I have thrown out may be favourably considered, or the experiments fairly repeated, and that I may be allowed to think that a large turnip, weighing five or six pounds, with a very strong and large top, held only to the earth by a small tap root, and a few little fibres; or that a cabbage weighing twenty or thirty pounds, standing high on a small stalk; were not wholly formed and grew to that size by moisture or substance rising through their roots out of the earth."

WHITCHURCH, a decayed borough in Hampshire, with a market on Friday. It sends two members to parliament, and is 24 miles E. by N. of Salisbury, and 58 W. by S. of London. Long. 1. 10. W. Lat. 51. 15. N.

WHITCHURCH, a town in Shropshire, with a market on Friday, 20 miles N. of Shrewsbury, and 161 N.W. of London. Long. 2. 40. W. Lat. 52. 0. N.

WHITEHORN, a royal burgh of Scotland, in Wigtonshire, governed by a provost. It is a place of great antiquity, and said to have been the first bishop's see in Scotland. It is eight miles S. of Wigton.

WHITEHORN, an island of Scotland, near the S.E. coast of the county of Wigton. Long. 4. 20. W. Lat. 54. 46. N.

WHITE MOUNTAINS, the highest part of a ridge of mountains, in the state of New Hampshire; in North America. They extend N.E. and S.W.; and their height above an adjacent meadow, is 5500 feet; and the meadow is 3500 feet above the level of the sea. The snow and ice cover them nine or ten months in the year; and during that time they exhibit the bright appearance from which they are denominated the White Mountains. Although they are seventy miles inland, they are seen many leagues off at sea, and appear like an exceedingly bright cloud in the horizon. Their highest summit is in lat. 44.° N.

WHITE-WASHING, a cheap kind of colouring of fair white given to brick or plastered walls by washing them over with a solution of quicklime. The process is the simplest imaginable. Some lumps of quicklime are plunged into a bucket of cold water, and stirred about till they are dissolved and mixed, after which a brush with a large head, and a long handle to reach the ceiling of the room, is used to spread it thinly on the walls, &c. When dry it is beautifully white, but its known cheapness has induced the plasterers to substitute a mixture of glue size and whitening for the houses of their polite customers; and this, when once used, precludes the employment of *lime-washing* ever after; for the latter, when laid on whitening, becomes yellow.

White-washing is an admirable means of rendering the dwellings of the poor clean and wholesome, as will be evident from the following account of the expence and benefit of frequently white-washing the rooms of a poor-house, by Wm. LAMM, esq. published by the Society for Bettering the Condition of the Poor.

"The poor-house of Bishop Auckland has been, during the preceding summers," says the account, "white-washed every six weeks. The method of preparing the lime (which is rock or stone-lime from Coxhoe, about ten miles from Auckland, and costs, including carriage, four pence a bushel) is as follows:—a large tub is procured to flake it in, and this is filled with lime nearly to the top, cold water being poured upon it by degrees, and it being stirred with a stick that is broad at one end, until the tub is filled with lime: when the lime and water are well incorporated, and of the confidence of mud, it is to be taken out of the tub with a wooden scoop, and strained through a hair or fine wire sieve into another vessel, where it settles to the bottom in a solid mass of white-wash. There will be some water at the top, not imbibed by the lime; this should be skimmed off. It is then to be mixed with cold water, till it is of the confidence of thin paint, being stirred occasionally while it is using. In this state it is laid on with a whitening brush by the man and his wife who have the care of the house.

"The quantity used for white-washing the fifteen rooms at Auckland poor-house, is half a bushel, which costs two pence; the expence of the four white-washings being, in the whole, not quite *eight pence a-year*. This trifling expenditure has produced a very great benefit to the poor in the work-house, to those who visit it, and indeed to the parish in general, that is not easily to be calculated.—I have the pleasure of being able to say, that there is neither disease nor vermin in our poor-house at present; but that the inhabitants are very comfortable and happy.

"It would be well for the inhabitants of cottages, as well as poor-houses, if the custom of very frequently white-washing them were prevalent throughout the kingdom. Clean white-washed walls not only contribute to prevent the existence of vermin, but induce habits of cleanliness in those who reside within them. It was observed by the late Mr. Howard, in his work on Lazarettos, that in the cottages on his estate in Bedfordshire, which had been made comfortable, *and white-washed both within and without*, the very same families, which were before slovenly and dirty, had upon this change of habitation, become neat in their persons, their houses, and their gardens."

"When it is generally known that the four white-washings of Auckland poor-house have produced the most beneficial effects, and have cost only a little trouble, and the *sum of eight pence a-year*, I flatter myself that there will be very

few poor-houses in England * which will not be frequently white-washed.—The price and quality of lime is very different in different parts of the kingdom. In London, and in some other places, it is as high as a shilling a bushel, and the lime chiefly in use is chalk lime, which does not answer so well as stone lime. The difficulty and expence, however, of obtaining the best stone lime, for this purpose, in any part of the kingdom, must be too inconsiderable to prevent its general use, if most approved of. In the neighbourhood of Manchester, a horse load of lime, which is sufficient to white-wash about a dozen cottages, costs fourteen pence; which for each cottage would be two pence halfpenny a year, supposing them regularly white-washed in spring and autumn. In some places the expence may be increased, perhaps as high as a shilling a cottage; but, as a general average for each cottage, two pence or three pence a year, expended by the landlord or the parish, in supplying the cottager with the materials for white-washing his cottage, would wonderfully contribute to the cleanliness and health of the poor throughout the kingdom.

"If the lime-wash is prepared with lime already flaked, it may, in many instances, require size to be mixed with it; but if the *quick lime* is used, and in the metropolis, and in most towns, it may be obtained at all times in the smallest quantities, it will not be necessary to mix size with it; and the good effects of the white washing in destroying vermin and removing infection will be much increased. The sooner, indeed, the lime is used after it is flaked, the better; especially if there is any apprehension of infection in the house. In that case, it is proper that the walls should be frequently washed with quick lime, fresh flaked in water, and put on while it continues bubbling and hot, as is the practice of the House of Recovery at Manchester.

"I suppose the matter of the poor-house to do the work himself. If a workman is employed to put it on, the additional expence would be about 6d. a room, which for the fifteen rooms would be 7s. 6d. a time, or 1l. 10s. a-year.—If indeed the overseer's brother or nephew is to be employed in the job by the yard, the increase of expence would be very considerable: and might, instead of eighteen pence a-year, amount to an annual expenditure of several pounds, and the cost prove almost equal to the benefit of the work being done."

WHITTLEBURY FOREST, a forest in the S. part of Northamptonshire, nine miles in length, and, in some parts, above three in breadth. Here the wild cat is still found. In

* The penitentiary house in Cold-Bath Fields was white-washed in 1796. The charge for the work was fairly made, according to the ordinary course of trade, and amounted to *one hundred and one pounds*. In 1797 it was white-washed again; the materials were bought, and a prisoner in the house employed in the work; which, as far as one could judge, was extremely well done: the expence of the materials was 1l. 7s. 6d.; the donation to the man for his trouble 2l. 12s. 6d.; in all four pounds.—In the Foundling Hospital, they have tried the experiment of white-washing some of the rooms. The greater kitchen is thirty-four feet by twenty-one, and twelve high; and the lesser kitchen, is twenty-one feet by seventeen; both of them arched, and containing a great deal of extra work: the materials, for white-washing both of them twice, cost 3s. Of the girls' dining-room over it, being 102 feet long by twenty-four feet wide, and twelve feet high; the expence of the materials, for white-washing the ceiling and cornice, and colouring of a straw colour that part of the sides of the room which was stucco, was 4s. 10d.: the workmanship, 5s. The two wards above this floor are, one of them 120 feet long by twenty-four feet wide, and twelve feet high, and the other 111 feet long by eighteen wide, and twelve feet high; all plain walls, without dado or surbase: the expence of white-washing the ceilings and cornice of both of these, and colouring the sides of the rooms, was, for the materials, 16s.; for the workmanship, 24s. In both instances size was used; which is included in the account, and was necessary, because the walls were not new plastered walls, but had been so white-washed or coloured before.—When it is known at how small a price the benefit of white-washing may be attained in poor-houses, and other public buildings, we trust the conductors of them will take care that they do not want those means of preventing vermin, filth, and infection among them.

1685, the first Duke of Grafton was appointed hereditary ranger of this forest, in which the present duke has a fine feat, called Wakefield Lodge.

WIBLINGEN, a town of Austrian Suabia, where is a Benedictine abbey. It is seated near the confluence of the Iller and Danube, three miles S.S.W. of Ulm.

WIBURG, a government of Russia, formerly Russia Finland, and comprised in Carelia. It was ceded by the Swedes to the Russians, partly by the peace of Nyfthad in 1721, and partly by the treaty of Abo in 1743. Beside pastures, the country produces rye, oats, and barley, but not sufficient for the inhabitants. It retains its own civil and criminal courts of justice: in general cases, not capital, the punishments prescribed by the provincial judicature are inflicted; but whenever a criminal is condemned to death, the Russian laws interpose, and depriving him from the sentence of beheading or hanging, as enjoined by the Swedish code, consign him to the knout and transportation to Siberia. In the governor's court, business is transacted in the Swedish, German, and Russian tongues. The peasants talk only the Finnish dialect; but the inhabitants of the towns understand Swedish also, and many of them German. Lutheranism is the established religion; but the Greek worship has been introduced by the Russians.

WIBURG, a commercial sea-port of Russia, capital of a government of the same name, with a bishop's see, and a strong citadel. It contains about 9000 inhabitants. A few houses are constructed with brick; but the greatest part are of wood. It is seated on the N.E. point of the gulf of Finland, 110 miles N.N.W. of Peterburg, and 250 N.E. of Riga. Long. 29. 10. E. Lat. 60. 56. N.

WICK, a borough and sea-port in Caithnessshire, seated on an inlet of the German ocean, S. of Nose Head. Long. 3. 2. W. Lat. 58. 30. N.

WICK, a fortified town of Dutch Limburg, seated on the Maese, opposite Maestricht, with which it communicates by a bridge. Long. 5. 41. E. Lat. 50. 52. N.

WICK-BY-DUERSTED, a town of the United Provinces, in Utrecht, with a strong castle. It is seated at the place where the Leck branches off from the Rhine, nine miles W. of Rhenen, and 15 S.E. of Utrecht. Long. 5. 22. E. Lat. 52. 6. N.

WICKWARE, a corporate town in Gloucestershire, governed by a mayor, with a market on Monday. It is 17 miles N.E. of Bristol, and 111 W. of London. Long. 2. 16. W. Lat. 51. 36. N.

WIDDIN, a fortified town of Turkey in Europe, with an archbishop's see. It has often been taken and retaken by the Turks and Austrians. It is the seat of the government of the pacha, Pashaw Oglou, who was lately, for several years, in open rebellion against the Porte, and repeatedly defeated all the Turkish forces sent against him, till at length the Porte thought proper to conclude a treaty with him almost on his own terms. Widdin is seated on the Danube, 88 miles N.E. of Nissa, and 150 S.E. of Belgrade. Long. 24. 27. E. Lat. 44. 12. N.

WIRD, a small principality of Germany, in the circle of Upper Rhine. The capital is Neuwied.

WIEDENBRUCK, a town of Westphalia, in the bishopric of Osnaburg, 32 miles S.S.E. of Osnaburg. Long. 7. 50. E. Lat. 51. 48. N.

WIELUN, a town of Great Poland, in the palatinate of Sieradia. It was ruined by the Swedes in 1656, but has been since rebuilt, and has a good cattle. It is seated on a river which falls into the Warta, 20 miles S. of Sieradia. Long. 18. 55. E. Lat. 51. 12. N.

WIELITSKA, a village of Poland, lately included in the

palatinate of Cracow, but now comprised in the Austrian kingdom of Lodomeria. It is celebrated for its salt mines, which lie eight miles S.E. of Cracow. In these inexhaustible mines, are several small chapels excavated in the salt, in which mass is laid on certain days of the year. One of these chapels is 30 feet long and 25 broad; the altar, crucifix, statues, and ornaments, all carved out of the salt. These mines are of a most stupendous extent and depth, and perfectly dry. There is, however, one small spring of water, which is impregnated with salt, as it runs through the mine. These mines have been worked above 600 years. Before the partition of Poland, in 1772, they furnished a considerable part of the revenue of the king, who drew from them an average profit of about 97,000l. sterling.

WIESENTEIG, a town of Suabia, capital of a lordship of the same name. It is 16 miles N.W. of Ulm, and 25 S. of Stuttgart. Long. 10. 2. E. Lat. 48. 35. N.

WIGAN, a borough in Lancashire, with a market on Monday and Friday. It is governed by a mayor, and sends two members to parliament. Here the strongest checks are made, and other articles of linen and cotton manufacture. That elegant species of coal, called Cannel, is found in plenty and great perfection in the neighbourhood. The river Douglas is made navigable hence to the Ribbles; and it is joined by a canal from Liverpool. Wigan is 30 miles S. of Lancaster, and 196 N.N.W. of London. Long. 2. 50. E. Lat. 53. 34. N.

WIGHTON, a town in the E. riding of Yorkshire, with a market on Wednesday, seated at the source of the Skellifer, 16 miles S.E. of York, and 192 N. by W. of London. Long. 0. 40. W. Lat. 53. 52. N.

WIGTON, a town in Cumberland, with a market on Tuesday, seated among the moors, 12 miles S.W. of Carlisle, and 304 N.N.W. of London. Long. 3. 4. W. Lat. 54. 50. N.

WIGTON, a borough and sea-port, the county-town of Wigtownshire. On the S. side are the vestiges of an ancient castle, and to the N.E. is a great morass, called the Moss of Cree. It is situate on a hill, which overlooks the bay of Wigtown, 95 miles S.W. of Edinburgh. Long. 4. 43. W. Lat. 55. 6. N.

WIGTONSHIRE, a county of Scotland, sometimes called **UPPER**, or **WEST GALLOWAY**; bounded on the N. by Ayrshire, on the E. by Kircudbrightshire, and on the S. and W. by the Irish Sea. Its greatest extent, in any direction, does not exceed 30 miles. The N. part, called the Moors, is naked and mountainous. Great numbers of sheep and black cattle are raised here; and they have a small breed of horses peculiar to this country: they are called galloways, and are very strong and gentle.

WIHITSCH, a frontier town of Turkey in Europe, in Cosinia, seated on a lake formed by the river Unna, 40 miles S.E. of Carladit. Long. 16. 10. E. Lat. 45. 4. N.

WILDBAD, a town of Suabia, in the duchy of Wirtemberg, celebrated for its warm baths, 24 miles W. of Stuttgart, and 30 N.E. of Straßburg. Long. 9. 35. E. Lat. 48. 43. N.

WILDBERG, a town of Suabia, in the duchy of Wirtemberg, situate on the Nagold, 19 miles S.W. of Stuttgart. Long. 8. 38. E. Lat. 48. 33. N.

WILDEHAUSEN, a town of Westphalia, capital of a small bailiwick, united to the duchy of Bremen. It is seated on the Hunte, 18 miles S.W. of Bremen. Long. 8. 27. E. Lat. 52. 55. N.

WILKEBOROUGH, a town of Pennsylvania, capital of the county of Luzerne. It is situate on the N. branch of

the Sufquehannah, 118 miles N.W. of Philadelphia. Long. 75. 59. W. Lat. 41. 13. N.

WILKOMIER, a town of Lithuania, in the palatinate of Wilna, feated on the Sweita, 45 miles N.W. of Wilna. Long. 24. 54. E. Lat. 55. 19. N.

WILLIS' ISLAND, a rocky ifland at the N. end of the ifland of Southern Georgia. It was difcovered in 1775, and contained the nefts of many thoufand flags. Long. 38. 29. W. Lat. 54. 0. S.

WILLISAW, a town of Switzerland, in the canton of Lucern, feated among high mountains, on the river Wiger, 25 miles N.W. of Lucern.

WILMANSTRAND, a town of Ruffia, in the government of Wiburg. In 1741, an obftinate battle was fought about a mile from this town, between 3,000 Swedes and 16,000 Ruffians; but, at laft, the former were obliged to yield to fuperiority of number. It is feated on the S. fide of the lake Saima, 40 miles N.N.W. of Wiburg, and 100 N.N.W. of Peterfburg. Long. 27. 54. E. Lat. 61. 20. N.

WILMINGTON, the largeft town of the ftate of Delaware, fituate on Chriftiana Creek, near two miles W. of the river Delaware, and 28 of Philadelphia.

WILMINGTON, a town of N. Carolina, fituate on the E. fide of the E. branch of Cape Fear River, 34 miles N. of Cape Fear, and 85 S.W. of Newburn.

WILNA, a commercial city of Lithuania, in a palatiate of the fame name, with a bifhop's fee, an univerfity, an ancient caftle, and a palace. The houfes are all built of wood. It was taken by the Ruffians in 1794; and is feated at the confluence of the Villa and Wilna, 15 miles E. of Troki, and 215 N.E. of Warfaw. Long. 25. 39. E. Lat. 54. 38. N.

WILSDRUP, or WILSDORF, a town of Upper Saxony, in the margravate of Meiffen, nine miles W. of Dresden, and 9 S. of Meiffen. Long. 13. 28. E. Lat. 51. 5. N.

WILSHOVEN, a town of Germany, in Bavaria, feated at the confluence of the Wils and Danube, 30 miles N.W. of Paffau.

WILSNACH, a town of Germany, in the margravate of Brandenburg, feated on a rivulet that falls not far from it into the Elbe.

WIMMIS, a town of Switzerland, in the canton of Bern, feated on the Sibnen, 18 miles S. of Bern. Long. 7. 8. E. Lat. 46. 34. N.

WIMPFEN, a free imperial town of Suabia, feated on the Neckar, eight miles N. of Hailbronn, and 22 E. of Heidelberg. Long. 9. 25. E. Lat. 49. 20. N.

WINBORN, or WINBORN MINSTER, a town in Dorfetfhire, with a market on Friday. It had a monaftery, in which were interred the Weft Saxon kings Etheldred and Sigeforth, and Queen Ethelburga. Its noble church, called the Minfter, was formerly collegiate. It is feated between the Stour and Allen, fix miles N. of Poole, and 102 S.W. of London. Long. 2. 1. W. Lat. 50. 47. N.

WINCAUNTON, a town in Somerfetfhire, with a market on Wednesday, feated on the fide of a hill, 24 miles S. of Bath, and 100 W. by S. of London. Long. 2. 18. W. Lat. 51. 1. N.

WINCHCOMB, a town in Gloucefterfhire, with a market on Saturday. It was formerly noted for its abbey, whose mitred abbot fat in parliament. It is feated in a deep bottom, 16 miles N.E. of Gloucefter, and 93 W.N.W. of London. Long. 2. 0. W. Lat. 51. 55. N.

WINCHENDON, a town of the United States, in Maffachufets. In October 1795 it fuffered confiderable damage by a dreadful tornado. It is fituate on Miller's River, 60 miles N.W. of Bofton.

WINDAW, a town of the duchy of Courland, with a caftle, Vol. X.

and a harbour at the mouth of the Wetaw, in the Baltic, 70 miles N.W. of Mitaw, and 100 N. of Memel. Long. 22. 5. E. Lat. 57. 20. N.

WINDERMERE-WATER, or WINANDER-MERE, the moft extenfive lake in England, lying between Weftmoreland and Lancashire. It extends 10 miles from N. to S. but in no part broader than a mile; and exhibits a greater variety of fine landfcapes than any lake in England. It is famous for its fine char, and abounds alfo with trout, perch, pike, and eel. It has a communication on the W. with Eftwaite-water; and its principal feeders are the rivers Rothay and Brathay. This lake is frequently interfeated by promontories, and spotted with iflands. Among thefe, the Holme, or Great Ifland, an oblong tract of 30 acres, croffes the lake in an oblique line furrounded by a number of inferior ifles, finely wooded. Not one bulrush, or fwampy reed, defiles the margin of this lake.

WINDHAM, a town of the ftate of Connecticut, capital of a county of the fame name. It is feated on the Shetucket, 31 miles E. of Hartford.

WINDISMERK, a territory of Germany, forming the E. part of Carniola. Metling is the capital.

WINDLINGEN, a town of Suabia in the duchy of Wirtemberg, feated on the Neckar, 12 miles from Stuttgart.

WIND-MILL (*Encycl.*). As wind-mills essentially contribute to agricultural and domeftic convenience, we prefent our readers with a delineation of a fpecimen of thofe employed in the vicinity of Lifbon; becaufe the construction of their sails is in fome refpects different from, and, in the opinion of Lord Somerville, fuperior to, thofe ufed in Britain (fee Pl. 56).

The advantages of mills on this construction are ftated by his lordfhip to be the following: 1. That the broad part of the sail is at the end of the lever, or branch, and thus an equal refiftance may be overcome with lefs length of branches, or arms. Thefe being confequently shortened a confiderable weight of timber will be rendered unneceffary, and a material faving of expence be obtained, in the height, prime coft, and fubfequent repairs of the mill. 2. The sails, constructed on the plan above reprefented, may be fet to draw in a manner fimilar to the *stay-fails* of a fhip; and, as they are fwelled more than thofe of common mills, Lord S. remarks, that they will render it unneceffary to bring the mill fo frequently to the wind; a practice which, in machines of the ufual construction, is always attended with confiderable trouble.

Parish WIND-MILL, a mill of the common kind, thus called becaufe it is employed, under the infpection of benevolent individuals, folely for the advantage of the poor in the *parish*, in times of fcarcity. The following excellent examples are taken from the Reports of the Society for bettering the Condition of the Poor.

The fcarcity of wheat in the fummer of 1795, led many of the inhabitants of Chislehurst into a wifh, that they might have a mill on their common, under fuch regulations that each perfon might be certain of having his own corn fairly ground, and returned to him in due meafure, and of its being drefsed to fuch a degree of finenefs as he fhould chofe; or that he might be able to purchafe, at a fair price, fuch kind of flour, mixed or unmixed, as he wifhed.

The building of one at the expence of the parish was there firft thought. But they were difsuaded from that, by its being pointed out to them, that fuch an expence would fall very heavy upon many perfons, who could already barely fupport the weight of the prefent rates. For, whether the principal were to be raifed upon the parish in the firft inftance, or the money to be obtained by granting life annuities

out of the rates, which last requires a special authority, in either case it would be felt as a very great burthen. It was therefore proposed to the parishioners, that if they would give their consent to the granting of a part of the common for that purpose, a set of ladies and gentlemen (the number of them being at last settled to be ten) would undertake the whole at their own expence, and build a parish mill. Two particular days in each week should be allotted to the working for the poor; or for such persons as should bring but small quantities of corn to be ground: the person who brought it should be allowed, if he chose, to stay and see it ground; and, after having it dressed just as he might choose, should take it away with him, upon paying in ready money 4d. per bushel for the grinding, and 2d. for the dressing, where it should be dressed: but that on other days, or when there was no grist-work sent in, the mill might be worked for the benefit of the proprietors; or it might be let by them to a tenant, under the same restrictions.—On these conditions the ground was granted: and on the failure of the conditions, it was agreed that it should be forfeited, and revert to the parish.

The original idea of the proprietors was to erect a mill, such as had been built a few years before on Dartford Brent. The basement of brick, the mill itself of timber, with the head alone turning to the wind. The cost of that at Dartford was said to have been 800*l*. The sum of 200*l*. more was intended to be added for a house for the miller; the shares being estimated at 100*l*. to each proprietor. Mr. John Hall of Dartford, who had been employed in the mill at that place, was consulted: and at last it was agreed that he should build that at Chislehurst. No precise terms were drawn up in writing concerning it. He offered to undertake it for 1000*l*.; or to build it as should be directed, and to be paid by measure and value when it was completed. The last proposal was preferred.

Orders were given to him accordingly; and he promised to lay the foundation early in the spring of 1796: and in the mean time to prepare every thing in forwardness, so as for the mill to work by the Michaelmas following.

The foundation was laid as had been proposed, and the outer frame was erected early in the summer of 1796: but the mill cannot be said to have worked till the end of April 1797; nor was it completed till September in that year.

In the mean time a neat miller's house was finished; and about 2 acres of land inclosed for his use. The work certainly appears to be well executed. The mill carries 3 pair of stones. Two pair of French ones for wheat; and one bed-stone, French, with a runner of Peak-stone, for barley, or hogs' meat. There is also a machine for dressing the meal; in which the revolution of the brushes is easily reversed, for their preservation; as also a bouting machine for cloths of any kind. The mill itself draws up the sacks, and sets them down upon any of the floors. The wind-shaft, and the cross, are of cast-iron. The head turns itself into the wind, by a fan-tail and rack work. The cap is a hemisphere very curiously formed, both for beauty, and for keeping out the weather, by means of bent planks. The weather boarding of the mill itself is also unusually good; every part being covered doubly. The joints at each angle (for the body of the mill is octagonal) are covered with sheet lead: which helps to form part of a metallic communication from the top to the earth, as a security against lightning.

The mill carries 3 pair of stones. But the wind seldom serves for working them all together; especially when the dressing machines are at work too. Yet it is reported that the proprietors of the Barham mill, which has but 2 pair of stones, wish their mill had been upon a larger scale. If that be really the case, it may deserve consideration, whenever a parish mill is undertaken, whether a mill of an intermediate size may not upon the whole be more advisable.

The design of the proprietors in erecting the mill, never was to undersell the fair dealer in any respect; or to let even the poor have their meal at a price below the market: but to put it in the power of each person, in every station of life, to obtain such flour of any sort of grain as he might choose; and to obtain it of a good quality.

This it is imagined that they have now done. Those who choose to send their own corn, may do it; and may see to its being fairly returned to them. On Mondays and Tuesdays, in every week, the smallest quantities are not to be refused to be ground for the poor: and each person may have his meal dressed in any manner he may desire. Those of any condition in life who choose to buy, may buy at the mill, of a good quality and at a fair price. All the effect intended to be produced on other millers, or on the retail dealers of the shops, was to make it their interest to deal fairly by their customers.

The mill at Chislehurst, certainly, is a convenience to the neighbourhood. It is not apprehended that it has, in any degree, hurt the millers around the place; though it has already almost as much work as it can perform. This seems to shew that a mill was really wanted: and it has put other millers, the shopkeepers, and bakers, on their guard, at the same time that it has injured nobody.

One effect intended by it has answered: the certainty of obtaining meal of what quality, of what degree of mixture with other kinds of grain, or of what fineness you choose; and the having the produce of your own corn returned fairly to you. This last may sometimes be doubtful at other mills; and probably sometimes is doubted where the return is fairly made. Here any one may assure himself that it is so, if he pleases.

It is proper to caution the reader against an error, into which the proprietors have fallen, and from which those of the mill at Barham Downs* have been exempt;—the want of sufficient care as to the expence of the undertaking.

The mill at Chislehurst has certainly been not only more expensive than was intended, but more so than was necessary. The builder offered to undertake it for 1000*l*.; or to build it as should be directed, and to be paid by measure and value, when it was completed; which last proposal was preferred.—The proprietors did not attend to the progress of the work, in the same manner as those would have done, who had their own profit in view; so that when the bills were sent in, they contained a charge of above 470*l*. for day work; all of it for articles, which the proprietors understood were to be charged by measure. In the whole, the mill-wright's bill has amounted to 176*l*.; besides 214*l*. the cost of the house, and 44*l*. for the fencing.

During the five months, from April to September, 1797, while the miller was interrupted by the workmen completing the mill, he paid the proprietors at the rate of 4 per cent, on 1000*l*. the money then advanced. From Michaelmas, 1797, he undertook it at the rate of 3½ per cent, on 1700*l*. and from Ladyday last at 73*l*. 10*s*. a-year, being 3½ per cent,

* The mill at Barham Downs cost only 336*l*.; the scales and utensils of different kinds 17*l*.; in all 353*l*.; only 33*l*. beyond the sum originally proposed.

on 1200*l*. the whole money expended. He seems to have no doubt but that he will be able by and by to pay a larger interest; but the fact is, that they cannot now let it to produce above four per cent.

It seems necessary to state these circumstances; in order that those who are desirous of benefiting their neighbourhood by a parish mill, may be cautioned against unguarded and extraordinary expence.—Parish mills are at present much wanted: the erection of them will be very useful in most parts of England; and, with a proper degree of attention, they will pay a sufficient interest upon the money to be expended in the erection of them.

WINDOW (*Encycl.*). In 1802, soon after the termination of the war with France, a considerable addition was made to the duties formerly imposed on windows. These will be best shewn by the following

TABLE OF THE DUTY ON WINDOWS.

Number of Win- dows.	Duties payable by 38 Geo. III. cap. 40.						Additional Duties payable by 42 Geo. III. c. 34.						Total Duties to be charged in one Sum for every Dwelling- house.

And for every such dwelling-house which shall contain more than 180 windows or lights, for every window or light exceeding the number of 180, 2*l*. 6*s*. each.

The said duties to be charged in respect of every inhabited dwelling-house, with the household and other offices, without any other exemptions being allowed than such as are contained in this act, notwithstanding any former statute. 42 Geo. III. c. 34.

The following clauses are included in the act 38 Geo. III. c. 40.

Every assise shall be in force for one year, and charged upon the occupiers of houses, cottages, or tenements; and shall be paid without any new assise, notwithstanding any change in the occupation.

No duty shall be levied for any cottage or tenement containing not more than six windows, the occupier whereof, by reason of poverty only, not for any other cause, is exempted from church and poor rates.

Every chamber in any inns of court or chancery, or in any college or hall in the universities, or in any hall or office belonging to any person or persons, body or bodies politic or corporate, or any public hospital, being severally in the tenure of any person chargeable to the said duties, containing eight windows or under, shall be charged thereto at the rate of [42 Geo. III. c. 40.] three shillings for every window; and every such chamber, which shall contain more than eight windows, shall be subject to the duties as if the same was an entire house.

Nothing herein shall charge any licensed chapel; nor any windows in dairies.

That is to say, by the stat. 36 Geo. III. c. 117. no duty shall be charged on any windows or lights in any dairies, or in any room or places kept and used for the sole purpose of drying and keeping cheese, or of making cheese or butter, and for no other purpose, whether the same shall be attached to, or detached from, the dwelling-house or not, and which shall be occupied by any person who shall sell, or be in any manner concerned in selling, the produce of dairies, or any kind of cheese.

But such windows or lights must be made with splines or wooden laths, or iron bars, and wholly without glass; also the dairies or rooms aforesaid must not be used to dwell or to sleep in, and on the doors thereto there must be painted, in large Roman black letters, of two inches in height, the words "Dairy and Cheese Room," or some of them, as the case shall require, otherwise such dairies and rooms shall be charged with the duties.

No window shall be deemed to be stopped up, unless stopped with stone or brick, or with the same materials as

the outside walls; but this is not to extend to any stopped up window in roofs, if stopped with like materials as the outside. And no window shall be newly made in any dwelling-house, or office belonging thereto; or if stopped up, be restored; nor shall any window be stopped up, without giving six days' previous notice thereof in writing, to the surveyor, on pain of ten pounds for every window newly made, restored, or stopped up.

If any surveyor shall receive any such notice, or discover that any window hath been newly made or restored, he shall certify the same by way of charge to the commissioners, who are to cause the abatement to be rectified according to such certificate; but such amended assessments may be appealed against.

No abatement to be subject to appeal or abatement unless it shall be proved that the windows were stopped up previous to the making of the assessment.

The following are clauses in the act 32 Geo. III. c. 34.

Every dwelling-house, cottage, or tenement, occupied at the time of making the assessment, shall be brought into charge by the assessors, according to the number of windows therein; and if any assessor shall omit to charge the occupier according to the number of windows, whether the occupier shall be entitled to be discharged from the same, in manner herein-after mentioned, or not, such assessor shall forfeit five pounds.

Where any house, cottage, or tenement, in England, containing not more than six windows, shall be brought into charge, and the occupier shall receive parochial relief, or shall, by reason of poverty only, and not for any other cause, be exempted from payment of the usual taxes towards church and poor, the assessors shall, on the certificate of assessors, set opposite the sum charged on the occupier, the fact of his receiving parochial relief, or from being exempted from payment of taxes, and shall return such facts, together with the assessments, to the commissioners; and the commissioners, before the allowance of any assessment, shall examine the assessor touching the return; and if the commissioners shall from such examination be satisfied that any occupier receives parochial relief, or is *bona fide*, by reason of poverty only, and not from any other cause, exempted from the payment of the usual taxes, it shall be lawful for the commissioners to strike out the charge against such occupier; and where any house, cottage, or tenement, in Scotland, containing not more than six windows, shall be brought into charge, and the occupier shall be poor, and shall receive relief from the kirk session, and shall keep no servant, carriage, horse, mule, or dog, the assessor shall, on the certificate of assessment, set opposite the sum charged the fact of his being poor, and of not having any servant, carriage, horse, mule, or dog, and shall return such facts, together with the assessments, to the commissioners; and in case the surveyor of the district shall be satisfied with the facts, and shall certify the same to the commissioners, the commissioners shall strike out the charge against the occupier; and in case the surveyor shall be dissatisfied, then the commissioners shall examine into the truth of such facts in like manner as the commissioners in England.

Every house unoccupied shall be inserted as such in the assessment, with the number of windows therein; and the assessors, and in their default the surveyors and inspectors, shall cause the same to be certified to the commissioners, from the time of such house coming into the occupation of any person, and such person shall cause notice thereof to be given to such surveyor or inspector within twenty days after his coming into the occupation of such house; and every person neglecting to do so shall forfeit five pounds, and shall be

liable moreover for such neglect to be charged to the said duties for the whole year in which such house became occupied, but on giving such notice shall be chargeable only from the time of his coming into the occupation.

Nothing herein shall subject any hospital, charity school, or poor-house, to the payment of the duties, except such apartments therein as are occupied by the officers or servants thereof, which shall be subject to the duty (according to the number of windows in each), provided that every such hospital, charity-school, or poor-house, shall be brought into charge by the assessors, and shall be stated on the certificate of assessments as such; and on proof of the fact the commissioners are to discharge such hospital, charity school, and poor-house, except as aforesaid, from the said duties.

No window shall be deemed to be stopped up, unless stopped up effectually with stone or brick, or with the same kind of materials whereof the outside walls doth consist.

Nothing herein shall charge any window in the roof of any dwelling-house, which shall be stopped up effectually with materials of the like nature of which the outside of the roof shall consist, nor any window which shall have been stopped up before, with other materials than herein described, and which shall not at any time since have been restored.

No window shall be newly made in any house, nor shall any window stopped up, be restored, or stopped up, without six days' previous notice in writing given by the occupier to the surveyor or inspector, on pain that the occupier shall forfeit ten pounds for every window.

If any surveyor or inspector shall receive notice, or otherwise discover, that any window hath been newly made or restored, which hath not been charged in the assessment, such surveyor or inspector shall certify the same, by way of charge, to two commissioners, and shall state to what amount the person liable to the duties hath been under-rated, and thereupon the commissioners shall cause such assessment to be amended, and the duties to be charged shall be levied from the commencement of the year. But if the commissioners shall be of opinion that any window restored shall have been stopped up when the assessment was made, with intent to evade the duties, they shall charge the occupier double the sum by which the assessment shall be increased by reason of such certificate; and every such assessment, when amended, shall be liable to be appealed against.

No assessment shall be subject to appeal, nor any abatement of the duties allowed in any year, by reason of any windows being stopped up, unless it shall be proved that the same windows were stopped up, according to the directions of this act, previous to the 5th of April next, before the making the assessment, in England, or in Scotland, previous to the term of Whitsunday; and that the same windows, if restored, were restored after six days' notice thereof, as before directed.

The parish in which any assessment shall be made, shall be answerable for the amount of the duties, and for the duties being duly demanded of the persons charged, within ten days after the same are payable, by the collectors, and also for such collectors' duly paying the sums received to the receiver-general; and if any collector shall neglect or refuse to demand payment of the duties of the persons charged, or leave a demand in writing at their last place of abode within the time limited, or, in case of default of payment thereof, upon such demand, shall neglect or refuse to execute the warrant of the commissioners for recovering the same, within two calendar months after the duties are payable, it shall not be lawful for such collector to insert in the schedule, to be by the receiver-general returned into the exchequer, the name of such person having made default, but the parish shall be

unfiverable; and no collector shall be allowed to infer in any schedule the name of any person as not having paid the duties, unless such collector shall make oath that the sum is wholly unpaid, either to such collector, or to any other person, to the best of his knowledge and belief; and that such person became insolvent or a bankrupt before the day on which the duties became payable, and had not goods sufficient whereon to levy within the parish, or that such person removed from the parish before the day on which the duties became payable; and that there was not nor are any goods of any person liable to the duties in arrear, whereby the same could be levied.

Any arrear of the said duties, arising by default aforesaid, or by the failure of any collector, shall be re-assessed upon the parish or place.

If any wilful delay or failure shall happen in demanding, receiving, or recovering, or paying over any of the duties, through the default or neglect of any collector, it shall be lawful for the commissioners to revoke the appointment of the collectors in default or neglecting, and by indorsement of the same precept of appointment, to appoint other collectors in their stead, for the remainder of the year.

Collectors in default, to deliver up certificates of their assessments, &c. on penalty of 20l. And if any two or more of the inhabitants, or the churchwardens or overseers, or guardians of the poor of any description, or two or more of them, or the select vestry, or any seven or more of them, where a select vestry shall be authorized to act for any parish, shall require security to be taken of the collectors, and shall name proper persons to be collectors, who shall respectively give security, it shall not be lawful for the commissioners to appoint collectors, until such security be given; and if the persons returned to the commissioners, shall not give security, then the said commissioners are to appoint such persons, and no other, who shall have been named to them. And the collectors, when required by the churchwardens, &c. shall deliver an account of the sums received, &c. on penalty of 20l.

If any person shall remove out of the limits of the collector without paying the duties, or without leaving sufficient goods, he shall forfeit 20l.

No goods to be taken by virtue of any execution, or other process, except at the suit of the landlord for rent, or of the king, unless the party shall pay the arrear of duty, not exceeding a year's, but in case of refusal, the collector may distrain and sell the goods.

One moiety of all penalties hereby imposed shall, if sued for within 12 calendar months, be to his majesty, and the other moiety thereof, with full costs, to the person who shall sue, and all such penalties exceeding twenty pounds shall be sued for in the superior courts. But his majesty's attorney-general in England, and advocate in Scotland, may stay proceedings, as well as to the share of the informer as to the share of his majesty. And in default of prosecution within the time before limited, no such penalty shall be afterwards recoverable, except in the name of his majesty's attorney-general, or advocate in Scotland.

Penalties not exceeding twenty pounds shall be recoverable before two commissioners, who may mitigate the same, not being in any case less than one moiety, and they are to assess the same upon the party, and charge the same in the assessment, in addition to the duty.

WINDSHEIM, an imperial town of Franconia, 28 miles S.W. of Wurtzburg, and 36 S.S.W. of Bamberg. Long. 10. 25. E. Lat. 49. 25. N.

WINDSOR, a town of Vermont, in the county of Windsor, where the assembly commonly holds its session, although

Bennington is the principal town. It is seated on the river Connecticut, 98 miles N.E. of Bennington.

WINDSOR, a town of the state of Connecticut, situate on the river Connecticut, three miles N. of Hartford.

WINDSOR, a town of North Carolina, situate on the Cathai, 23 miles W. of Edenboro.

WINDWARD ISLANDS, such of the Caribbean Islands, in the West Indies, as commence at Martinico, and extend to Tobago.

WINDWARD PASSAGE, the strait between Pont Maizi, at the E. end of the island of Cuba, and Cape St. Nicholas, at the N.W. extremity of St. Domingo.

WINNENDEN, a town of Suabia, in the duchy of Wirtemberg, 12 miles E.N.E. of Stuttgart. Long. 9. 16. E. Lat. 48. 49. N.

WINNICZA, a strong town of Poland, in Podolia, capital of a territory of the same name, with a castle. It was taken by the Cossaks in 1658, but retaken soon after. It is seated on the river Bog, 35 miles N. of Bracklaw. Long. 28. 12. E. Lat. 49. 23. N.

WINSCHOTEN, a town of the United Provinces, in Groningen. Here, in 1568, was fought the first battle between the revolted Dutch and the Spaniards, who were defeated by Prince Lewis, brother to William I. prince of Orange. It is six miles S.W. of Dollart Bay, and 16 S.E. of Groningen. Long. 6. 58. E. Lat. 53. 3. N.

WINSEN, a town of Lower Saxony, in the duchy of Lunenburg, seated at the confluence of the Elbe and Ilmenau, 13 miles N.W. of Lunenburg. Long. 10. 11. E. Lat. 53. 24. N.

WINSHEIM, an imperial town of Franconia, in the margravate of Anspach. It is surrounded by a good rampart, a double ditch, and thick walls flanked with 20 towers. The inhabitants are Protestants. In 1730, a fire reduced almost the whole town to ashes. It is seated on the Aisch, 30 miles N.W. of Nuremberg. Long. 10. 31. E. Lat. 49. 32. N.

WINSLOW, a town in Buckinghamshire, with a market on Tuesday, seven miles N.W. of Aylesbury, and 50 W.N.W. of London. Long. 0. 45. W. Lat. 51. 57. N.

WINSTER, a town in Derbyshire, which has a meeting for the sale of provisions on Saturday. It is five miles N.W. of Derby, and 152 N.N.W. of London.

WINTERBERG, a town of Westphalia, 37 miles S. of Paderborn, and 60 E. of Cologne. Long. 8. 15. E. Lat. 51. 5. N.

WINTERBURG, a town of Germany, in the circle of Lower Rhine and county of Sponheim, 10 miles W.N.W. of Creutznach.

WINTERINGHAM, a corporate town in Lincolnshire, governed by a mayor, who is chosen only out of one street. It has no market; and is seated near the Humber, 33 miles N. of Lincoln.

WINTERTHUR, a town of Switzerland, in the canton of Zurich, where there is a rich library and a mineral spring. It is seated in a fertile plain, on the river Ulach, 15 miles N.E. of Zurich. Long. 8. 45. E. Lat. 47. 31. N.

WIPERFURT, a town of Westphalia, in the duchy of Berg, seated near the source of the Wipper, whose water is of a peculiar quality for bleaching, 36 miles E.S.E. of Drefeldorf.

WIPRA, a town of Upper Saxony, in the county of Mansfeldt, situate on the Wipper, 10 miles W.N.W. of Eisleben, and 20 E. of Nordhausen. Long. 11. 20. E. Lat. 51. 30. N.

WIRKSWORTH, a populous town in Derbyshire, with a market on Tuesday. It is seated in a valley, near the source of the Ecclestone, and remarkable for having the greatest lead

market in England. It is 13 miles N. by W. of Derby, and 139 N.N.W. of London. Long. 1. 30. W. Lat. 53. 6. N.

WISBADEN, a town of Germany, in the principality of Nassau, capital of a lordship of the same name, subject to the Prince of Nassau-Saarbrück. It is famous for its warm baths, which were known to the ancient Romans, and is five miles N. of Mentz. Long. 8. 20. E. Lat. 49. 56. N.

WISBEACH, a town in Cambridgeshire, with a market on Saturday. It is seated in the life of Ely, between two rivers, and possesses a considerable trade in the export of corn, and of oil pressed from seeds at mills in its neighbourhood. Barges only can come up its river, large vessels stopping six miles below. It is 18 miles N. of Ely, and 80 N. by E. of London. Long. 0. 6. E. Lat. 52. 38. N.

WISBY, a sea-port of Sweden, in the isle of Gothland, with a castle. It is seated on the side of a rock, on the Baltic, 88 miles S.E. of Stockholm. Long. 18. 41. E. Lat. 57. 36. N.

WISCASSET, a town of the United States, in the district of Maine, which carries on a considerable trade. It is 56 miles N.W. of Portland. Long. 70. 5. W. Lat. 44. 47. N.

WISSET, a fortified town of the Netherlands, in the duchy of Limburg, seated on the Maese, seven miles N. of Liege, and 20 N.W. of Limburg. Long. 5. 40. E. Lat. 50. 41. N.

WISCHGROD, a town of Poland, in the palatinate of Plockko, seated on the Wislula, 18 miles E. by S. of Plockko, and 58 N.W. of Warsaw. Long. 19. 50. E. Lat. 52. 52. 44. N.

WISLOCHE, a town of Germany, in the palatinate of the Rhine, seated on the Elfat, eight miles S. of Heidelberg. Long. 8. 48. E. Lat. 49. 18. N.

WISMAR, a strong sea-port of Germany, in the duchy of Mecklenburg, seated at the bottom of a bay of the Baltic, 36 miles E. of Lubec, and 66 W. by S. of Stralsund. Long. 14. 44. E. Lat. 53. 54. N.

WISTON, a corporate town in Pembrokeshire, with a market on Wednesday. It is governed by a mayor, and was formerly strengthened with a castle, which is now a gentleman's seat. It is 10 miles N. of Pembroke, and 235 W.N.W. of London. Long. 4. 52. W. Lat. 51. 53. N.

WITCHWOOD, a forest in Oxfordshire, between Burford and Charlbury; the only considerable one now remaining in that county.

WITEPSKI, a town of Lithuania, capital of a palatinate of the same name, with a castle. The fortifications are so good, that the Russians besieged it several times in vain. It is seated in a morass, at the confluence of the Dwina and Widwa, 65 miles E. of Polotsk, and 80 W.N.W. of Smolensko. Long. 29. 40. E. Lat. 55. 43. N.

WITHAM, a town in Essex, with a market on Tuesday. Its church, an ancient Gothic structure, stands one mile from the town, at a place called Chipping Hill. It is eight miles N.E. of Chelmsford, and 37 E.N.E. of London. Long. 0. 41. E. Lat. 51. 51. N.

WITHAM, a river in Lincolnshire, which waters Lincoln, and enters the German Ocean, below Boston. From Lincoln it has a communication with the Trent, by a navigable canal, called the Fossdike, cut by King Henry I.

WITLISTH, a town of Germany, in the archbishopric of Treves, with a castle, seated on the river Lefer.

WITNEY, a town in Oxfordshire, with a market on Thursday. Here are manufactures of the finest blankets, and other thick woollens, called bearskins and kerseys. It is eight miles N.W. of Oxford, and 64 W.N.W. of London. Long. 1. 18. W. Lat. 51. 52. N.

WITSHAUSEN, a town of Germany, capital of a territory of the same name, in the landgraviate of Hesse Cassel. It is

seated on the Wefer, eight miles E.N.E. of Cassel. Long. 9. 46. E. Lat. 51. 24. N.

WITTENBERGEN, a town of Upper Saxony, in the mark of Prignitz, 60 miles N.W. of Berlin. Long. 11. 48. E. Lat. 53. 2. N.

WITTENSTEIN, a town of Russia, in the government of Livonia, 40 miles S.E. of Revel. Long. 24. 39. E. Lat. 58. 47. N.

WITTMUND, a town of Westphalia, in East Friedland, seated near the German Ocean, 15 miles N.E. of Embden. Long. 7. 4. E. Lat. 53. 41. N.

WITTESEA-MERE, a lake in the N.E. part of Huntingdonshire, six miles long and three broad. It is four miles S. of Peterborough.

WITTLICH, a town of Germany, in the electorate of Treves, 16 miles N.E. of Treves, and 38 S.W. of Coblenz. Long. 6. 27. E. Lat. 50. 7. N.

WITTSTOCK, a town of Upper Saxony, in the mark of Prignitz, 43 miles N. of Brandenburg, and 47 N.N.W. of Berlin. Long. 12. 30. E. Lat. 53. 10. N.

WIVLESCOMB, a town in Somersetshire, with a market on Tuesday, 20 miles N.N.E. of Exeter, and 155 W. by S. of London. Long. 3. 28. W. Lat. 51. 4. N.

WLOSIMEITZ, a town of Little Poland, capital of a duchy of the same name, in Volhunia, with a castle. It is seated on the Luy, which falls into the Bug, 36 miles W. of Lucko, and 56 N. of Lemburg. Long. 24. 30. E. Lat. 51. 3. N.

WOBNURN, a town in Bedfordshire, with a market on Friday. It is seated on a rising ground, and was formerly famous for its abbey, which now belongs to the Duke of Bedford, and is his country seat. Woburn was burnt down in 1724, but has been neatly rebuilt, and has a free-school, and a charity-school, founded by a duke of Bedford. Near it is found great plenty of fullers'-earth. It is 12 miles S. of Bedford, and 42 N.N.W. of London. Long. 0. 32. W. Lat. 52. 2. N.

WODNAY, a town of Bohemia, in the circle of Prach, seated on the Bianitz, 12 miles N.W. of Budweis, and 56 S. of Prague. Long. 14. 50. E. Lat. 42. 9. N.

WOERDEN, a town of the United Provinces, in Holland, seated on the Rhine, 18 miles S. of Amsterdam. It was taken by the French in 1672 and 1794. Long. 4. 51. E. Lat. 52. 6. N.

WOKEY, or OKBY, a village in Somersetshire, on the S. side of the Mendip Hills, two miles W. of Wells. Here is a famous cavern, called Wokey Hole, the mouth of which is only six feet high; but it soon expands into a spacious vault, 80 feet in height, resembling the inside of a cathedral; the roof composed of pendant rocks, whence a clear water, of a petrifying quality, continually drops. From this grotto a narrow passage descends to another of less height; and beyond a second narrow passage is a third grotto. The extremity is above 200 yards from the entrance.

WOLBECK, or WOLDBECK, a town of Westphalia, in the bishopric of Munster, seven miles S.E. of Munster.

WOLFERSDIKE, an island of the United Provinces, in Zealand, between North Beveland and South Beveland.

WOLKOSKOI, a town of Russia, in the government of Novogorod, 100 miles S.E. of Novogorod. Long. 34. 20. E. Lat. 57. 30. N.

WOLKOWSKA, a town of Lithuania, in the palatinate of Novogrodeck, seated on the Ros, 23 miles S.E. of Grodno. Long. 24. 46. E. Lat. 53. 4. N.

WOOLER, a town in Northumberland, with a market on Thursday. In a plain near this town the Scots, under the command of Earl Douglas, were defeated by Lord Percy and

M^r Harmar's Machine for Drefsing Woollen-Cloth, &c.

Portuguese Wind-Mill.

Earl March, on Holyrood-day, 1402. The battle was so bloody, that it gave the name of Redriggs to the place where it was fought. Wooler is seated on the Till, near the Chesiot hills, 14 miles S. of Berwick, and 318 N. by W. of London. Long. 1. 46. W. Lat. 55. 34. N.

WOLLIN, a sea-port of Germany, in Prussian Pomerania, capital of an island of the same name, in the mouth of the Oder. It is to miles W. of Cammin. Long. 14. 39. E. Lat. 54. 4. N.

WOLMAR, a town of Ruffia, in the government of Livonia, seated on the Aa, 38 miles N. of Riga. Long. 24. 25. E. Lat. 57. 32. N.

WOLSHINGHAM, a town in the county of Durham, 76 miles S.W. of Durham, and 259 N.N.W. of London.

WOLVERHAMPTON, a town in Staffordshire, with a market on Wednesday. It has an ancient collegiate church, annexed to the deanery of Windfor, and a handsome chapel. Here is a great iron manufacture, consisting of locks, hinges, buckles, corkcrews, and jappanned ware. It is seated on a hill, 13 miles S. of Stafford, and 124 N.W. of London. Long. 2. 0. W. Lat. 52. 47. N.

WOODBIDGE, a town in Suffolk, with a market on Wednesday, seated on the E. side of a sandy hill, on the river Deben, eight miles from the sea. It has docks for building ships, has a great corn trade, and is famous for refining salt. It had an abbey, of which there are no remarkable ruins. It is seven miles E.N.E. of Ipswich, and 76 N.E. of London. Long. 1. 25. E. Lat. 52. 11. N.

WOODBURY, a town of New Jersey, on the E. side of the river Delaware, nine miles S. of Philadelphia.

WOODS, LAKE OF THE, a lake of North America, which makes part of the N. boundary of the Western Territory of the United States. It is 150 miles long, and 60 where broadest, but is very irregular in its shape.

WOOLLEN-CLOTH, a kind of manufacture of which an account is given under the article CLOTH. The following is the specification of a patent granted to Mr. Harnar, of Sheffield, for a machine for raising a shag on all sorts of woollen cloths, and cropping or shearing them, which, together, come under the description of *dressing woollen cloths*, and also for cropping or shearing of fustians. It is dated March 29, 1794. See Pl. 56.

Fig. 1. exhibits a side and end view of shearing cloth from list to list. A, is the frame, with its pillars, legs, and rails. B, is the cushion or shear-board over which the cloth is extended. C, the cropper's shears in their situation for working, with their bobs or levers. D, the harness or breeches fitted to each end of the riding blade of C; at the near end is hollowed the bow of C, and at both ends fastened with screws passing through the blade, or else is grooved to admit the blade, and is fastened with wedges. It is composed of two strong pieces of plank, with holes to admit screws through to nut-screws fastened to their upper surface, and square holes through which pass small pillars; other two pieces of plank are frames for wheels turning on pins (as in drawing) situated under the pieces fastened to the riding blade; here the lower ends of screws are rivetted to plates, but so as to turn, which plates are screwed to the wheel-frames; also, in these lower pieces, small pillars are fixed, which, passing through the upper pieces, steady the harness; those screws turned to right or left bring the edges of C to the angle of B, for the work of shearing. E, the inclined planes down which the wheels of D roll when the machine is working. F, is the working axle, with its rods or rails; the gudgeons of this axle rest on the cross rails of A; the axle has the inclination of B and E, as in drawing. Its rods, fixed to the sides of it by projecting

pieces, are about four inches from its centre, and the thimbles of G ride down them to keep pace with C in its progress. G, is the line communicating at the lower end by a thimble with the rods of F, and at the upper end with the bob or lever of C, as in drawing. H, is an axletree, with its handle, cog-wheel, and stop, fixed by stops, on which it turns, to the pillars of A. I, the lines communicating with the extremities of K at one end, and the other with H. K, levers, turning on their pins, and, by the action of K and I, work against E, to raise C from B, for all necessary purposes. L, pulleys in their frames, to give a proper direction to I, that the turning of H may have the effect before named. M, is a crank attached to the lower gudgeon of F; the crank handle has an eye in it, through which a square leg passes, against which works the lower end of a screw, the nut of which is one side of the said eye. This screw, turned to right or left, loosens or fastens the leg in the eye at pleasure. The said leg at the other extremity has a handle where the near end of the catch N is fitted on. Now, as the leg is shifted by means of its eye and screw in that end where the handle is further from the centre of F, N works O with more speed. N, is the catch that works O. O, is the cog-wheel of N, with its screw pinion on its axle. P, is an iron axle, with pulleys near both ends, with a cog-wheel. R, is a small sword, fitted into the mortise of the projection on the lower extremity of F, and pinned, and the other end is fitted to the crank handle of S. S, is the crank axle and pulley that carries the band which goes to the power that works the machine. The situation for R, as to that end that fits on the crank of S, is directly behind the lower end of F, and under the further extremity of B, where the crank end of S rides on a stop fixed to the further rail of A; the pulley end where the stop is rides on X. Now the crank S being put in motion, gives R the necessary vibration, and R works F, which alternately raising or falling its rods or rails by G, C works, and, to effect the progression of C, F being in a working state, M works N, and O works P, and C is carried forwards by T, and to carry C forwards faster or slower, as necessary. For the due performance of shearing cloth, the handle of the leg of M, where N is fitted on, must be brought nearer to the centre of F for slackening, and more distant from the said-centre to increase the speed, as then N will take more or less teeth in O. Or the progression in this frame may be effected by the method described in the progression of fig. 3, under the letters M, N, O, P, T, the lines for carrying forwards C by P. U, is a projection fastened to D, and works against U when C is about to stop. V, is a rail and small sword passing through a mortise fixed to one of the legs of A, at nearly one end, and, by a working joint, goes up to near the extremity of W. W, is a lever, passing through its fulcrum, and pinned to the upper end of X; and near the other end rests on a small notch, sunk in the inside of the upper end of one of the pillars of A, and weighted in the extremity with lead or iron. X, is the step of the pulley end of S, and, by a small sword, goes up to W, on the near side of one of the pillars of A, through which X goes, and moves on a pin, and is the step of one end of O; and the further side of the said pillar, where the letter X stands, is the step of the pulley end of S. Now when U or D works against U or V, W is thrown from its notch, and W, sinking, raises X, and slackens the band on the pulley of S; then the machine stops, and X, raising the step of S on the further side of the pillar of A, on the near side of it sinks the step of O, and the screw-pinion is thrown out of the large cog-wheel of P. Y, is a small axle on steps, fastened to

D, with its handle and bands going to near the extremity of Z. Z, two small rails, with catches at their extremities, which fall into notches in D to fasten both the shears of C together. Now when the machine stops, by the means already described, the pressure of the handle of Y raises the catches of Z, from their notches in D, and the shears of C are at liberty, and may be driven by the hand to the necessary situation for shifting the cloth, first turning H to the right, to clear them from B. The cloth being shifted, bring the said shears of C to their proper situation, and the catches of Z will fasten them; then turn H to the left, throwing back its catch, and the shears of C are brought to their work: when lift up to its notch, the extremity of W, and the band on S, is tightened, and the machine works.

Fig. 2, a side and the two end views of shearing the length-way of the cloth. A, the frame, with its pillars, legs, and rails. B, a circular cushion, or shear-board, formed to the angle of the cropper's shears, and at each end resting on steps fixed to the top rail of A, to be moved round, as occasion shall require. C, the cropper's shears in its harness, or working position. D, the harness, attached to both ends of the ledger blade of the shears C, as particularly described in fig. 1, under the letter D; but this mode of shearing requires that the strong pieces, attached by screws to the ends of C, should be framed together near the back of the said laid ledger blade, to take the weight of the ends of the shears. When the whole width of a narrow cloth is shorn, the second shear of C is placed behind that in drawing, and has another, B, for it to work upon, and I, to be worked by. And that part of D attached to the heel of C and letter E, are lengthened as described (fig. 3) under the letter C; so in like manner the shears are situated behind each other in taking the width of a broad cloth. Here it must be noted, as in this mode of shearing the cloth having the progression, the wheels of D are omitted, and pieces of wood, half rounded, supply their place. E, is a small frame in its steps, with its arms and lices. The situation of E is seen under letter D, fig. 3; it is attached to the heel part of the harness, as there seen by the drawing. One of the lines of E goes down to the working-rail of E, in the aforesaid, fig. 3; and the other line communicates with the lever or bob of D. F, the roller, with its handle; on which the cloth to be shorn is wound. G, the small rollers, to guide the cloth to B; the middle one which swells riding on it, lighteneth the lists of the cloth as it rides forwards: the swells are moveable, for the purpose of suiting cloths more or less long-listed. H, the rod, cranked on every side, with the pulley for the progression, and that also which carries a band to the working power situated at the upper end of A, near Q. I, is the thimble fitted on the crank, with the line going up to near the extremity of the bob working C. K, an axle, with its cog-wheel and stop, as particularly described (fig. 1) under the letters H, I, K, L, and produce a like effect, and must be fixed to this figure the same as in that. L, the cheek to F, fastened by a pin at the near end, and passing under F, being hollowed to it, the further extremity (being carried under C and B) having a weight suspended on it. M, the roller, with a cog-wheel, to which the end of the cloth is attached; and being tightened by the handle of F, the weight on L keeps it in that tight state as it is carried through the work. N, an iron axletree, carrying a large pulley with one groove, and a five-groove pulley with its steps, that out of sight lies under A on a cross rail. O, an iron axletree, carrying a five-groove pulley and screw pinion on steps, as in drawing. P, bands

going from the small pulley of H to the large pulley of N; and from the five-groove pulley of N to the five-groove pulley of O. Now these five-groove pulleys gradually descend in their dimensions from fourteen inches to three inches in one, and the other may be the same dimensions, or very considerably smaller; or it may be reduced to a pulley of three inches diameter with one groove. These five-groove pulleys stand, in respect to each other, in contrary directions. Now when the crank by a band on the pulley on its upper extremity is set to work, the band B, from the other pulley, puts O and P in motion, and carries forward M. That M may have different speed, the band of the five-groove pulleys must be shifted for that purpose to the different grooves, which give them more or less speed.

The Stop-Frame.—Q, the stop where rides the upper end of H, which step at one end is tenoned into the pillar of A, and pinned. R, is a small sword, at the lower end tenoned into the extremity of Q, and pinned; and at the upper end is mortised, so as to admit the further end of S. S, is the lever, tenoned into the mortise of R, and pinned, and passing through a mortise in the pillar of A. Now to stop the machine, the near extremity of the lever S must be pressed down, and that slackeneth the band communicating from the acting power to the pulley of H. When set a-going the said extremity of S must be lifted up, and pinned there. To work this machine, put the cloth to work as directed under letter M; then throw back the stop of G, and the shears are brought to their work; then raise the extremity of S, and the machine works.

Fig. 3, shews a second mode of shearing cloth the length way: a side and end view. A, is the frame, with its pillars, legs, and side and end rails. B, the inclined planes, as fig. 1, under E. C, the shear-boards, over which the cloth is stretched from H to I: every shear has its board, and is placed by the side of each other, so as to take the width of the cloth; and the shears, situated for the like purpose on them, the harness H, and small working frame E, fig. 2, are lengthened accordingly. B, the cropper's shears in its harness, and bob or working lever, with E, fig. 2, in its proper situations, attached by the steps to the harness of D. E, the axle, with the line communicating with the bob at one end; and at the other with one of the axle rods, by a thimble, described under F and G, fig. 1. F, the line and thimble before named. G, a small axle, with its lines, levers, pulleys, &c, particularly described under letters H, I, K, L, fig. 1. H, rollers for the cloth, and their cog-wheels and stops. I, a lever, with its catch and stop to the wheel of H, which is on the other side of the pillar of A, near the middle of it, and falls into the cog-wheel of H, which line communicates with the lower end of the catches on H and L, and passeth through small pulleys, fixed under the catches, on the inside of the frame A, that, by the pressure of the upper extremity of the said lever, the catches are raised out of the cogs of their wheels, to give liberty for winding the cloth when shorn on the roller of H, situated near to I. K, a roller to guide the cloth, when wound forwards, that it may keep its situation on the surface of C: it is placed near the axle G, on steps, in the same direction fixed to the pillars of A. L, an axle, with its handles, cog-wheel, and stop, resting on B, with its near stop. This axle has an aperture through the middle of it lengthwise, to admit the cloth through. Now when the cloth is stretched from one of the rollers of H to the other, by turning L to the right, more regular tightness is given to the cloth, and better fits it for the action of shearing.

For effecting the progression in shearing and working the shears, M is a small sword, fitted on the handle of the projection of E at one end, and at the other on the crank handle of N. N, a crank, with its pulley with one groove, and a small five-groove pulley. Or this may be reduced to a small one-groove pulley, of about three inches diameter. The larger one-groove pulley carries a band to the power that drives the machine. The situation of this crank is nearly the same as S, fig. 1, and produces the like effect. O, is an axle, with a large five-groove pulley and screw pinion. These pulleys of N and O have their bands, and descend in their dimensions, as particularly described under letter P, fig. 2. P, a roller, with its cog-wheel, on which the bands wind that carry forward D, with all the other shears, more or less, fastened together by a rail, at their proper distances from each other (as in drawing), that each may take its proper share of cloth, being situated as described under letter C. Bands from P to D carry forward the shears of D.

For stopping this frame, the stop part of fig. 1, under letters U, V, W, X, must be put to it, fixed to the rails and pillars of A. Q, is a projection attached to D, and will stop this frame when the parts above directed are fixed to it in the manner directed, fig. 1. R, is a line attached to the shears of D, and passing through a small pulley fixed in the back rail of A, runs through another pulley fixed in a convenient situation over the frame of this said fig. 3, and by pulling its extremity draws back the shears of D when they have cut their board of cloth.

For working this machine, the cloth is wound on the upper roller of H, and round a small roller at the upper end of A, and extended down C, and under K, and to the other roller of H, where it is attached; the stop of the upper roller falling into its wheel, the cloth is tightened by the lower roller and the handles of the roller. L, their respective catches falling into the cogs of their wheels, which keep the cloth in a tight state, then throwing back the catch of G, the shears of D are let down to their work, when, by means of R, they are brought to their proper situation on B. Then lift up the lever of the stop-frame into its notch, as directed under letter S, fig. 2, and the machine works. When the machine stops, as before directed, and particularly described, fig. 1, under X, to shift the cloth for cutting another length, press down the near extremity of I of this third figure, and wind the cloth that is cut on H. When lifting up the said extremity of I, the cloth may be tightened as above described, and the shears of D shifted to continue their work.

Fig. 3. For raising a shag on cloth preparatory to shearing. A, the side and end rails, legs, and pillars, with its teals, frames, and cotters. B, the frames, one open and the other shut, which turn on hinges, and, when shut ready for work, are fastened by buttons screwed loosely to C. C, is a frame mortised, to fit four sides of B, when shut; and by small projections, or slides fixed to its four corners, rides in the groove of a third frame, fixed to the rails of F. D, a third frame in the inner grooves, or two sides of it; C rides this frame, is attached to F, its projection slides through the gutter or flutes of L, when working. E, the double crank, with its large pulley, which by a band goes to the working power. These cranks stand in contrary directions, on the same axle, that the frame may work alternately. F, working rails, fitted on the crank handles, and fastened on by screws. These rails have a working joint near the side of G, and on the further side of G are attached, by screws, to each end of D; and as E works the frames of D, which carry C and B, works round L, and so raise the shag. G,

the pulleys, fixed in their frames, over which F rides. H, the board for raising, in its inclined posture, with the cloth passing over it from one roller of I to the other. I, the rollers, situated before and behind H, and attached to the legs of A, by screws, the gudgeons riding on steps; and at the upper end of H is a small roller, to guide the cloth round the end of H, with swells for both lists of the cloth, after the manner of fig. 2, under the letter G. K, the check to the fore roller I, which at one end is attached to one of the legs of A, and near that end lies over the same roller, and hollowed to fit it, and at the other end carries a weight, as in drawing. L, two pieces of plank, situated on both sides H, at the upper termination of M. The inside of the said planks are fluted or guttered to the angles of L, which stands at the foot of A. The small projection at the top of L is a pattern of the slides fixed to the sides of D, which pass through the aforesaid angle when the frames are working, which raise them to and from the cloth. To effect the revolution of the slides that carry C, the top piece of L is fastened to the side of its plank, at or near the upper end, by a screw, on which it moves, and at or near the bottom end it is fastened to its plank, but with the liberty to play. Now when D, by its slides, has passed through the gutter, the lower end of the top piece of L falls, and forms a bridge, to carry the slides of L to the top of the gutter, for the making of another revolution. M, are small swords, terminating in L, and fastened with pins, and passing through sockets fixed to the rail of A, and mortised at the lower extremity into N, where they move on pins. N, a strong rail, extending along the side of A, having a joint in it, and turning on pins in a mortise fixed to the pillars of A. O, an axle, with small projections at its ends, in steps, lying on the lower rail of A, extending from one side of the machine to the other. P, small swords, one tenoned into the projection of O, and the other admitting the near extremity of N, through a mortise where it moves upon a pin. Q, an upright leg, fastened at the lower end to the axle of O, near the lower rail of A. Now by turning this leg to right or left, it moves O, and O, by its projection, raises and lowers the near extremity of N, and N raises and sinks L, which has a like effect on B, C, D; so that, by these mediums, B is brought into contact with H in all necessary degrees. R, is a cog-wheel, its situation is on the further extremity of the back roller of I. S, two catches, for carrying forwards R, attached to I at one end in mortises, and moving on pins, and the other working the cogs of R. T, the working leg, fixed to the further pillar of A by a screw, as in drawing. The upper extremity of the said leg goes through a socket, fixed to the further rail of F, near the upper part of it. Now, by the vibration of this said extremity of T, in its socket, by E working F, S carries round R, and by varying the pins of S nearer to, or more distant from, the centre of its motion, the said R is carried forwards either faster or slower.

For shifting B and C to right and left of H, for the purpose of raising more regularly, U, a cog-wheel and stop of the under-side, with a handle near the periphery of the said cog-wheel, to act as a crank on the top-side. V, three rails. The rail that crosses the top of H is tenoned into the extremities of those that form or lie to the right and left of it. W, the steps on which V rides, with pins to keep the rails of V in their place. X, bands fastened at one end to C, and the other extremity passing through nuts fixed to V, where they are fastened by the end screws working through the side of their nuts against them. Y, two legs, fastened together at the lower end by a working joint at the upper ends. The further is attached to the near rail of F,

and that nearer works upon a pin, a little short of its extremity, with a catch falling into the teeth of W; and as it works U round, there is another catch on the same side, which prevents the said U from working back. Now F works Y, and Y works U, and U works by its crank V, and X shifts C from right to left by turns in the degree necessary by tightening and slackening the band X. Z, is the near step of E, screwed to a short rail at one end, tenoned into the near pillar of A, near which the step of A is situated. The other extremity of the said rail is fixed under a pin, on a short upright leg, which at the lower is screwed to the inside of the near rail of A, near which the step of A is situated.

Now to set this machine to work, or stop it when working; for the latter, move the said rail from under its pin, and by raising it the band on E slackens, and the machine stops; and having extended the cloth from the near roller I, on which it is wound, to that behind H, and fixed the handles in B, with its cutters, and buttoned them down, you must then bring the extremity of Z under its said pin, and the machine works.

WOOLPIT, a town in Suffolk, supposed to be the ancient Sitomagus, and noted for making the best white bricks. It is eight miles E. by S. of Bury St. Edmund's, and 75 N.E. of London.

WORCESTER, the county town of Worcester, in the state of Massachusetts, and the largest inland town in New England. It is 47 miles W. of Boston.

WORCUM, a town of Dutch Brabant, seated on the S. side of the Maese, just below its junction with the Wahal, eight miles N.N.W. of Heusden, and 22 E. of Rotterdam. Long 4. 52. E. Lat. 51. 52. N.

WORCUM, a sea-port of the United Provinces, in Friesland, situated on the Zuider Zee, 18 miles S.W. of Lewarden. Long 5. 15. E. Lat. 53. 0. N.

WORDEN, a town of Lower Saxony, in the duchy of Holstein, situated on the Elbe, ten miles N.W. of Gluckstadt.

WORDEN, GROSSEN, a town of Lower Saxony, in the duchy of Bremen, ten miles N.N.W. of Stade.

WORDINGBERG, a sea-port of Denmark, on the S. coast of the island of Zealand, 43 miles S.W. of Copenhagen. Long 11. 58. E. Lat. 55. 3. N.

WORINGEN, a town of Germany, in the electorate of Cologne, seated on the Rhine, eight miles from Cologne.

WORKHOUSE (*Encycl.*). We have in that article, as well as under the article *House of Industry* (*Supp.*), pointed out some of the defects which render these receptacles of little benefit either to the poor themselves, or to the community at large. The following extract, however, from the Rev. Mr. Gilpin's account of the new poor-house at Boldre, in Hampshire, will shew how these defects are to be remedied.

The old poor-house of Boldre being a wretched place, and having been managed at a great expence, it was determined at a vestry, held in the year 1792, to build a new one on a better site; to put in a respectable master and mistress; and to give the overlooking of it to a monthly committee of the gentlemen and farmers of the parish.

Accordingly they borrowed the sum of 800l. and bought a piece of ground, about two acres and a half; elevated, dry, and airy; here they erected the house, at a little distance from the road; and yet near enough to be under the constant eye of observation. It is built substantially of brick; single, that the air may have free passage through it, and extending about eighty-two feet in front, and twenty in breadth. These dimensions give an excellent work-room

on the right, as you enter; and, on the left, a kitchen and back-kitchen: the master's room, which is also the committee-room, about eighteen feet by fourteen, occupies the centre, and has a window on one side, inspecting the work-room; and another, on the opposite side, inspecting the kitchen. Above stairs, the sleeping chambers are separated nearly as those are below; only, as there are commonly more women and children in a poor-house than men, a room at the end of the men's apartment is taken off for a sick room, with a separate staircase. Over the chambers are excellent garrets; behind the kitchen part of the house, are the pantries and other conveniences, among which is a store-room thirty feet long.

The ground between the house and the road, which is a falling space of about sixty yards, is divided, first, into a dry convenient play-yard for the children; and the remainder, about half an acre, running down to the road, is a garden; the larger garden, which is an acre, lies behind the house.

The house being finished, and sufficiently dry, the inhabitants of the old house, consisting of nine or ten men and women, and between twenty and thirty children, were brought into it, on the 19th of May, 1793; and the whole put under the care of Mr. and Mrs. Salter, who are both of them well acquainted with the whole business of spinning and weaving. He has set up a couple of looms, and a number of spinning wheels, and generally presides over this part of the business himself; Mrs. Salter attending to the economy and management of the house. The inhabitants are all employed according to their capacities: some of the old women in cooking, mending, and washing; the old men in the garden; the children, and some of the women, in spinning and weaving; children even of four or five years of age are employed, and earn about a penny a-day. In summer they come into the work-room at six; in winter as soon as it is light. At breakfast they have an hour's respite, and the same at dinner. They have all tasks; but so easy, that, if they work hard, they can finish them by two in the afternoon; and, without any exertion, by six.

Their table of diet is as follows:—on Sunday, meat, with plenty of vegetables and bread; the allowance of which is four ounces for grown persons, and three for children; on Monday, the remains of Sunday's dinner warmed with vegetables and bread; on Tuesday, each grown person has a pound of pudding, and the children three quarters of a pound; on Wednesday, the same as on Sunday; on Thursday, the same as on Monday; on Friday, ox-head stew with vegetables and bread; on Saturday, a clearance is made of all the remains in the house; and, if they fall short, the deficiency is made up with bread and cheese. For breakfast, beef broth, or milk porridge and bread, are provided; except for a few old women, who, having been in the habit of drinking tea all their life-time, are allowed that indulgence, on account of their good behaviour. At supper, the regular meal is six ounces of bread, and an ounce of cheese, for every grown person; and for children, four ounces of bread, and three quarters of an ounce of cheese; this is sometimes varied with potatoes, which the children like better. The children, including all under the age of fifteen years, sit at one table, and the grown persons at another. Every thing is good in its kind: the children seldom eat up all that is provided, and the remainder is fried up again the next day among the remains. During the late scarcity of bread-corn, Mrs. Salter used a less proportion of wheat, and a larger of potatoes, particularly for supper; and during the winter of the year 1795, she boiled potatoes and onions, and mixing them well together, fried them up with

a little lard ; the people were in general fonder of this dish than of their usual meal.

Four bushels and a half of malt are allowed each month for beer. We must add, that the master and mistress generally fare as the family does, though it is not required by the committee.

The clothing of the poor is equally good; every one has a new suit for Sunday, generally spun and woven in the house. It is carefully hung up at night; and the old clothes produced for the week.

Thus the poor are well lodged, well fed, and well clothed; and yet (on deducting their earnings) at *less than half the expence* that they cost the parish before, being about nine pence a-head weekly; whereas in the old house, with continual complaint, the allowance was double that; though provisions, at that time, were much cheaper than they are now.

In the article of clothing, much more is saved. Though the poor are now so decently clad, yet, by care and management, the whole expence of the clothing in the year 1795, including shoes, amounted only to 17l. 6s. 8d.; whereas the expence of clothing the poor in the old house, did not amount to less, one year with another, than 70l. annually. In one year it reached 90l.: for as no care was taken to keep the clothes in repair, nor any distinction made between old and new, they were always in rags, and yet always craving for new clothes.

Another article of saving is in the health of the poor; arising from the airiness and cleanliness of the present house, the good clothing, the wholesomeness and plenty of provisions, and from the care that is taken to keep the family clean. No epidemical, nor indeed any disorder, has appeared among them, since the new house has been opened.

By this alteration in the management of the house, a saving in the poor's-rates of the parish was made in the year 1795, of 157l. 1s. 6d. notwithstanding the then advanced price of provisions, and the variety of expences incident to a new establishment; and the average diminution in the rates, from Easter 1793 to the present time, has been 164l. a-year. The gardens belonging to the house are in high cultivation, and bear such quantities of potatoes and cabbages, the chief vegetables used in the family, that in general they are abundantly supplied. During the scarcity of the year 1795, they were obliged, indeed, to purchase potatoes.

But nothing is so delightful in the institution as the cheerfulness with which every thing is conducted. The old women, who behave well, have their little indulgences of tea and snuff; and the men, of tobacco. The children's tasks are made pleasing to them, by little gratuities out of their

earnings. The master has the art of turning even their play-hours to use, and yet making them more happy than if they were left to themselves.

Punishment in Boldre work-house is rare and gentle; and consists chiefly in confining the delinquent in a room by himself, and abridging him of a meal: if, however, the master is under the necessity of correcting a boy corporally, the punishment is always inflicted in the presence of some respectable person.—For devotion and religious instruction, the family assembles in the kitchen, every morning when the bell rings for breakfast. The master reads, and generally explains, some easy and practical part of the New Testament; after which they all join in prayer. On Sunday morning and evening, these exercises are enlarged, and accompanied with singing hymns, in which all the children join. They regularly attend church on Sundays: and it is a pleasing sight to see so many well-clothed figures, happy faces, and healthy countenances, issuing from a parish work-house. In the afternoon, on Sunday, the children attend the school, where they are catechised with the other children of the neighbourhood: the old people also attend with them.

The advantages of a *well-regulated poor-house* consist in superior comfort of the aged, the education of the young, the reform of the dissolute, and the diminution of poor's-rates. All these benefits have attended the new regulation of the poor-house at Boldre; so that a happy and useful society has been thereby formed out of the very dregs of the parish. The old people having all their wants supplied, and their wishes attended to, feel themselves more comfortable than they ever did before; and are glad to render cheerfully, in return, what little services they can: the children*, bred to industry and Christian virtue, promise to become useful members of society; and the penitence and good conduct of some persons in the house, who, for want of education and early good habits, had been involved in idleness and profligacy, do infinite credit to the institution. Mr. Gilpin adds, that the poor's-rate has been reduced from 654l. 12s. to 490l. a-year, at the same time that the comfort and happiness, the industry, and the moral and religious habits of the poor, and in its consequences to the whole parish, have been increased, with a reasonable confidence of still greater improvement and saving to the parish, by its effects and example on the rising generation.

WORKINGTON, a sea-port in Cumberland, seated on the Derwent, over which is a stone-bridge. From this port a large quantity of coal is exported. This was the landing-place of Mary queen of Scots, when she was driven to take refuge in England. In the neighbourhood is a large iron foundry. Workington is seven miles W. of Cockermouth, and 307 N. of London. Long. 3. 35. W. Lat. 53. 42. N.

* It should be observed that, in Boldre work-house, the children are kept separate and distinct from the adults: and that Mr. Gilpin has founded a school of industry and education, that provides for a great many of the children of the poor in that parish. Nothing less than such circumstances, with very good management, could render a poor-house, as at Boldre, a fit residence for children. The common occurrences of a parish will make it necessary to receive into a poor-house those whom idleness and vice have made very improper examples for youth; and children in work-houses are generally the subject of uneasiness and unpleasantness to the aged poor, who are too frequently the butt and sport of their thoughtless and uneducated little creatures which are to be found in most poor-houses. If all of them, above seven years of age, were to be removed from the work-house to some cottage, and there boarded, as in a parish-school, at a certain sum (the mistress having the benefit of their work), they would be more cheaply kept, and better educated; a parochial school might thereby be provided, and a deserving family supported; they would also get out at an earlier age, and into better services, than they do now; the objection to taking children into any family, out of a poor-house, being general, and almost insurmountable. A work-house, if well conducted, might be made as comfortable a retreat to the aged poor, who have no domestic connections, as any charitable foundation whatever; and that at less than the present expence.

WORKSOP, a town in Nottinghamshire, with a market on Wednesday. It is noted for a magnificent seat of the Duke of Norfolk. Here was once an abbey, the gate of which remains, and the room over it is converted into a school. On the west side of the town is a circular hill, which was the site of a castle. Quantities of licorice are grown in its vicinity, which is also peculiarly remarkable for the number of noblemen's seats. The canal from the Trent to Chesterfield, passes near this place. It is 24 miles N. of Nottingham, and 146 N. by W. of London. Long. 1. 0. W. Lat. 53. 20. N.

WORSTED, a town in Norfolk, with a market on Saturday. It is noted for being the place where worsteds were first made. It is 12 miles N. of Norwich, and 120 N.E. of London. Long. 1. 26. E. Lat. 52. 52. N.

WOTTON-BASSETT, a borough in Wiltshire, with a market on Friday. It sends two members to parliament, and is 30 miles N. of Salisbury, and 89 W. of London. Long. 1. 54. W. Lat. 51. 31. N.

WOTTON-UNDER-EDGE, a corporate town in Gloucestershire, with a market on Friday. The inhabitants are principally clothiers, and it is governed by a mayor. It is seated under the hills, 20 miles N.E. of Bristol, and 108 W.N.W. of London. Long. 2. 11. W. Lat. 51. 40. N.

WRAGBY, a town in Lincolnshire, with a market on Thursday, 11 miles E.N.E. of Lincoln, and 144 N. of London. Long. 0. 10. W. Lat. 53. 18. N.

WRATH, CAPE, a vast promontory in Southernlandshire, which form the N.W. point of Great Britain. Against its rugged cliffs lofts the rapid tide bursts with incredible fury.

WREKIN, a noted mountain in Shropshire, eight miles E.S.E. of Shrewsbury.

WREXHAM, a town in Denbighshire, with a market on Monday and Thursday. It is the most populous town in all North Wales, and a place of considerable traffic. It retains the language and appearance of an English town, and has a Gothic church, the lofty steeple of which is the boast of this part of the country. Near Wrexham is a large foundry for cannon and other articles. It is seated on a river, which falls into the Dee, in a country affording plenty of lead, 13 miles S. by W. of Chester, and 188 N.W. of London. Long. 3. 10. W. Lat. 53. 2. N.

WRINTON, a town in Somersetshire, with a market on Tuesday. The most noted mines for calamine are in its neighbourhood. It is the birth-place of Mr. Locke, and seated among the Mendip-hills, 11 miles N.N.W. of Wells, and 125 W. of London. Long. 2. 38. W. Lat. 51. 21. N.

WROTHAM, a town in Kent, with a market on Tuesday. It has a large church in which are 16 stalls, supposed to have been made for the clergy attending the Archbishop of Canterbury, who had a palace here, till Archbishop Ippley, in the 14th century, demolished it, and built another at Maidstone. It is 11 miles W.N.W. of Maidstone, and 24 S.E. of London. Long. 0. 24. E. Lat. 51. 18. N.

WROXETER, a town in Shropshire, five miles S.E. of Shrewsbury. It is said to have been built by the Britons, on the banks of the Severn, over which are the traces of a bridge, discernible at low water. The circumference was three miles, environed by a wall three yards broad, with a deep trench on the outside, which may be traced in several places. Roman coins are frequently found here, but none of the Saxon, which is looked upon as a proof that it was destroyed before their arrival.

WUNNENBERG, a town of Westphalia, in the bishop-

ric of Paderborn, which received its name from a victory gained by Charlemagne over the Saxons in 974. It is 14 miles S. of Paderborn. Long. 8. 15. E. Lat. 51. 26. N.

WUNSEDEL, a town of Franconia in the principality of Bayreuth. Near it are mines of copper and iron, and quarries of marble. It is 16 miles W. of Egra, and 34 E. of Bayreuth. Long. 12. 24. E. Lat. 50. 10. N.

WUNSTORF, a town of Lower Saxony, in the principality of Calenberg, 10 miles W.N.W. of Hanover.

WURZACH, a town of Suabia, in the county of Waldburg, situate on the Aitrach, 17 miles N. of Wangen, and 26 N.W. of Kempten. Long. 10. 5. E. Lat. 48. 6. N.

WURZEN, or **WURTZEN**, a town of Upper Saxony, in the territory of Leipzig, with a citadel. It was formerly a bishop's see. The principal trade is in beer, of which great quantities are exported. It is situate on the Muldaw 14 miles E. of Leipzig, and 44 N.W. of Dresden. Long. 12. 40. E. Lat. 51. 19. N.

WUSTERHAUSEN, a town of Upper Saxony, in the middle marche of Brandenburg, seated on the Döffe, 27 miles N. of Brandenburg, and 36 N.W. of Berlin. Long. 12. 30. E. Lat. 52. 53. N.

WUSTERHAUSEN, a town of Upper Saxony, in the middle marche of Brandenburg, 11 miles S.E. of Berlin.

WYCOMB, CHIPPING, or HIGH WYCOMB, a borough in Buckinghamshire, with a market on Friday. In 1744, a Roman tessellated pavement was discovered in an adjacent meadow; and in its neighbourhood are many corn and paper mills. This town is governed by a mayor, and sends two members to parliament. It is seated on the Wyck, 13 miles S.E. of Aylesbury, and 31 W.N.W. of London. Long. 0. 39. W. Lat. 51. 37. N.

WYE, a town in Kent, with a market on Thursday, seated on the Stour, 10 miles S. of Canterbury, and 56 S.E. of London. Long. 1. 4. E. Lat. 51. 10. N.

WYE, a river of South Wales, which issuing out of Plynlimmon Hill, very near the source of the Severn, crosses the N.E. corner of Radnorshire, giving name to the town of Rhyadergwy [Fall of the Wye], where it is precipitated in a cataract. Then flowing between this county and Brecknockshire, it crosses Herefordshire, and dividing the counties of Gloucester and Monmouth, falls into the mouth of the Severn, below Chepstow. The romantic beauties of the Wye, which flows in a deep bed, between lofty rocks clothed with hanging woods, and here and there crowned by ruined castles, have employed the descriptive powers of the pen and pencil.

WYE, a river in Derbyshire, which rises in the N.W. part, above Buxton, and flowing S.E. falls into the Derwent, below Bakewell.

WYE, a town of Switzerland, in a territory of the abbey of St. Gallen, with a palace. It is built on an eminence, 16 miles S.S.W. of Constance. Long. 9. 4. E. Lat. 47. 34. N.

WYMONDHAM, or WINDHAM, a town in Norfolk, with a market on Friday. The steeple of the church is very high, on it was hung Ket, the rebel, in the reign of Edward VI. It is nine miles S.S.W. of Norwich, and 100 N.N.E. of London. Long. 1. 6. E. Lat. 52. 36. N.

WYNENDALE, a town of Austrian Flanders, where General Webb, in 1708, with 6000 men only, defeated 24,000 French. It is eight miles E.N.E. of Dixmude.

WYRE, a river in Lancashire, which rises near Wyresdale, six miles S.E. of Lancaster, and passing by Garstang, enters the Irish Sea below Poulton.

X.

XABEA, a sea-port of Spain, in Valencia, 38 miles N.E. of Alicante, and 54 S.S.W. of Valencia. Long. 0. 25. E. Lat. 38. 40. N.

XACCA, or **SACCA**, a sea-port of Sicily, with an old castle. It is seated on the S. coast of the island, at the foot of a mountain, 20 miles S.E. of Mazara, and 41 S.S.W. of Palermo. Long. 13. 2. E. Lat. 37. 41. N.

XAGUA, a sea-port on the S. coast of the island of Cuba, one of the finest in America, 84 miles S.E. of Havana. Long. 80. 45. W. Lat. 22. 10. N.

XALAPA, a town of New Spain, in the province of Tlascala, with a bishop's see. It contains about 2000 inhabitants. This town is said to give name to the purgative root called jalap, or xalap. It is 60 miles E. of Angulos. Long. 98. 20. W. Lat. 19. 32. N.

XALISCO, a town of New Spain, in the province of Guadalajara Proper, seated on the Pacific Ocean, 400 miles W. of Mexico. Long. 110. 5. W. Lat. 22. 30. N.

XATIVA, a town of Spain, in Valencia. Having taken the part of Charles III. in 1707, Philip V. ordered it to be demolished, and a new town to be built, called St. Philip. It is seated on the side of a hill, at the foot of which runs the Xucar, 32 miles S.W. of Valencia, and 50 N.W. of Alicante. Long. 0. 14. W. Lat. 39. 4. N.

XAVIER, or **SABI**, the capital of the kingdom of Whidah, on the Slave Coast of Guinea. It is noted for its great market, which is held at the distance of a mile from the walls. The market-place is surrounded by sutlers' booths, which are only permitted to sell certain sorts of meat, as beef, pork, and the flesh of goats and dogs. Here slaves of both sexes are bought and sold, as well as oxen, sheep, dogs, hogs, fish, and birds. Here are to be found various commodities of Whidah manufacture, and every thing of European, Asiatic, or African production. Xavier is seated one mile from the river Euphrates.

XAVIER, a town of Spain, in Navarre, noted as the birth-place of the celebrated Romish saint and missionary of that name. It is 35 miles S.E. of Pampeluna.

XAVIEQ, St. a town of Paraguay, in the province of La Plata, 200 miles W. of Rio Janeiro. Long. 50. 6. W. Lat. 24. 0. S.

XENIL, a river of Spain, which rises in Granada, and falls into the Guadalquivir, three miles below Ecya.

XERES-DE-BADAJOS, a town of Spain, in Estremadura, and in the territory of Tra-la-Guadiana, seated on the rivulet Ardilla, 27 miles S.E. of Badajoz. Long. 6. 32. W. Lat. 38. 9. N.

XERES-DE-GUADIANA, a town of Spain, in Andalusia, seated on the Guadiana, 18 miles N. of Ayamonte. Long. 7. 15. W. Lat. 37. 30. N.

XERES-DE-LA-FRONTERA, a town of Spain, in Andalusia. It is famous for excellent wine; and hence, it is thought, is derived the name of that we call Sherry. It is called *de la Frontera*, because, when the Moors possessed Cadiz, it was the frontier of the Christians. It is seated on the Guadaleta, five miles N. of Port St. Mary, and 110 S. by W. of Madrid. Long. 5. 59. W. Lat. 36. 42. N.

XERES-DE-LA-FRONTERA, a town of New Spain, in the audience of Guadalajara. Long. 104. 25. W. Lat. 22. 35. N.

XERES-DE-LOS-CABALLEROS, a town of Spain, in Estremadura, 51 miles S.W. of Merida, and 72 N.N.W. of Seville. Long. 6. 25. W. Lat. 38. 17. N.

XERUMENHA, a town of Portugal, in Alentejo, 13 miles S.W. of Badajoz, and 36 E. of Evora. Long. 6. 9. W. Lat. 38. 35. N.

XICOCO, an island of Japan, between Niphon, and Saikoka.

XIMO, an island of Japan, the second in size, an emittance, situate to the S.W. of Niphon, from which it is divided by a narrow channel. It is 300 miles in circumference.

XIXONA, a town of Spain, in Valencia, and in the territory of Segura, with a strong castle. It is seated among mountains, in a country that produces excellent wine, 15 miles S.W. of Alicante. Long. 0. 10. W. Lat. 38. 6. N.

XUCAR, a river of Spain, which rises in New Castile, in the Sierra-de-Cuenca. It passes by Cuenca, and entering the province of Valencia, runs into the gulf of Valencia, at the town of Cullera.

XUDNAGROD, a town of Turkish Croatia, 17 miles N. of Sebenico, and 37 E. of Kzara. Long. 16. 51. E. Lat. 40. 34. N.

Y.

Yan-arm of the Zuider Zee, which enters that sea, five miles E. of Amsterdam. It forms the boundary between N. and S. Holland, and is pronounced *Ey*.

YAKUTSK, one of the four provinces of the Russian government of Irkutsk; in the eastern part of Siberia.

YAKUTSK, a town of Siberia, capital of a Russian province of the same name, seated on the river Lena. Long. 129. 53. E. Lat. 62. 1. N.

YALE, the capital of a province of the same name, in the island of Ceylon.

YAMBO, a sea-port of Arabia, with a castle, on the coast of the Red Sea, 60 miles S.W. of Medina. Long. 40. 10. E. Lat. 23. 40. N.

YAMBURG, a town of Russia, in the government of Petersburg, situate on the Luga, 20 miles E. of Narva. Long. 28. 16. E. Lat. 59. 15. N.

YANG-TCHEOU, a populous city of China, in the province of Kiang-nan. Being intersected by a number of canals, it has 24 stone bridges, each consisting of several arches. It is 45 miles N.E. of Nanking.

YANG-TESE-KIANG, a great river of China, which rises in the province of Yun-man, and having crossed Hou-quang and Kiang-nan, enters the Eastern Ocean, opposite the isle of Tsong-ming, which is formed by the sand accumulated at its mouth.

YARN-MILL. The following is extracted from the specification of a patent granted in 1787 to Mr. Kendrew, and Mr. Porthouse, of Darlington, for a mill or machine, upon new principles, for spinning yarn from hemp, tow, flax, or wool. It may be worked by water, or as a horse-mill, or in any other way, and is made and used in the following way: There is a cylinder, marked A in the drawing, fig. 1 (Plate 56.), three feet diameter, and ten inches broad, made of dry wood or metal, turned true, and covered on its circumference with a smooth leather, upon which are placed the rollers marked D, covered with leather, and supported in their situations by the slits in the covered piece of wood marked K, in which the iron axes of the rollers turn, but suffers them to press on the wheel marked A. There must be another piece similar to the above to support the other end of the rollers. These rollers are of different weights. The upper roller marked D 1 is two stone, the rest decreasing to the last, which is only two pounds weight and one half. There is an iron fluted roller, marked F, furnished with a toothed wheel at each end, and a wood one, marked G, covered with cloth, and over it a smooth leather. There is an assisting roller, marked H, of fluted iron. These rollers are supported by their axes, turning in the slit, marked 2, of the piece of wood marked M (fig. 3), which is here separated from the end of the frame marked 8, to shew the rollers and wheelwork. The rollers marked G and F are squeezed together by means of the lever marked p, and its weight marked w (fig. 3). The roller marked H is pressed to the mark G by its axis, acting upon the inclined plane marked x (fig. 3). There is a rubbing roller covered with woollen cloth, and on its axis is a small wheel, marked I, driven by the wheel marked S. This roller rests upon the roller marked G, and by its motion prevents any dirt or

fibres from adhering to it. There is a cloth, marked N, revolving over two rollers marked O, O, which has motion given to it from the wheel marked C, by means of another wheel marked P. This cloth moves at the same pace as the surface of the wheel marked A. There is a supporter, marked Y, of the axis of the wheels marked O, P, but is removed, in order to shew them; it is fixed by its tenons in the mortises marked Z, Z. The roller marked B is kept in action by its endeavour to slip down the inclined plane at the top of the piece marked Y, thereby pressing against the revolving cylinder; and another piece, similar to this, must be understood to support the other end of the roller's axis. By the side of this revolving cloth is a table placed, of the same length and breadth as the cloth is, to which belong two smooth cloths or leathers, of the same size as the table. The machine being thus prepared, the attendant or workman must take a quantity of hemp, tow, flax, or wool, more or less, according to the fineness of the thread to be made, and lay or spread it evenly upon one of the smooth cloths on the table, then place it on the revolving cloth marked N, motion being communicated to the roller marked F, by wheel-work, as usual, from a water, horse, or other kind of mill, which wheel-work is communicated to the wheel marked Q, on whose axis is a nut, which turns the wheel marked C, and thereby the cylinder marked A moves, and with it all the rollers, by which motion the hemp, tow, flax, or wool, is drawn forward. The cloth turns down, but the hemp, tow, flax, or wool, go upon the cylinder marked A, under the roller marked B, and so forward under all the rollers marked D, then falls in between the rollers marked G, F, turns under the roller marked G, and over the roller marked H, which, as it gives the rollers hold of the hemp, tow, flax, or wool, in two places, enables them to draw forward the long fibres thereof, though many of them are to draw from under the marks 4 or 5 of the pressing rollers, marked D; it then falls into a cannister, marked R, and as by the wheel-work the rollers marked F, G, H, move three times faster than the cloth and cylinder, the sliver must be three times longer than when presented. By the time this is drawing, the other cloth is filled with hemp, tow, flax, or wool, as before, and laid upon the revolving roller, laying the hemp, tow, flax, or wool, over the end of the other, which goes forward as before, and thus a continued sliver is produced as long as the machine continues its motion. But in order that this sliver may come out of the cannister marked R, without entanglement, it must pass through an instrument marked 5 (fig. 3), placed over the rollers marked F, G, its open side marked T, to the cylinder at mark 4, supported by its ends marked V, V, in the slits marked W, of the before-described pieces marked K. The aperture X is so small as to press the fibres close to each other in their passage through it previous to their passing the rollers, by which means they remain pressed side by side in the sliver, and will not entangle. These thick slivers are drawn smaller by a similar process, and in the same manner as used for cotton, but the machines for drawing are all of the same structure as the above, except that they have no revolving cloth. The sliver is applied to the

cylinder under the roller marked B, which draws it forward under all the rollers, as before described, drawing it out, or lengthening it, every fresh machine through which it presses, till it be small enough for the spinning machine. It must be remarked, that the cylinders are made less in diameter, according to the different smallness of the sliver intended to be drawn upon them at the first; whilst the sliver is at its greatest thickness, the cylinder is required to be three feet diameter, as above described, the next rather less, and so on to the last, which is only two feet. The aperture of the bottom of the contractor belonging to each machine is also made one third part smaller than another in succession, from the greatest to the smallest cylinder; as also the drawing rollers marked F, G, H are furthest from the pressing roller marked D in the longest cylinder, and nearest at the smallest cylinder. At the largest cylinder the distance is about nine inches, and the smallest about four inches; but their distance cannot in all cases be fixed, as it depends on the different length of the fibres of the hemp, tow, flax, or wool; long ones requiring the distances mentioned, and short ones requiring the distances much shorter than is here specified.

The following several letters or marks are in the machine figured 2. The spinning machine, as to its drawing principle, is the same as the drawing machine. The slivers are presented to it in cannisters marked A, and drawn over a cylinder marked B, covered with rollers marked D. The fibres which are to form the thread are drawn from the cylinder by the rollers marked C, the under roller of which is made of fluted iron, the other of wood, covered with leather; they move six or eight times faster than the cylinder marked B; are enabled to draw the hemp, tow, flax, or wool, forward from under the pressing rollers marked D, by being squeezed together with the weights and crooks marked a, a, locked to the small part of the rollers marked C. There is a belt of smooth cloth, marked E, moving on two rollers, which are turned by the wheel marked F, on the axis of the fluted roller; at the opposite end of which, as at the mark G, is a nut, which turns the wheel marked H, on whose axis is another nut, turning the wheel marked I, and thereby the cylinder marked B, with all its rollers. These rollers move in curved pieces of wooden metal, marked K, which, to prevent confusion, are not represented in their places: they have slits in them, in which the rollers' axes are guided, but so deep as at all times to suffer the rollers to press upon the cylinder. These rollers are covered with cloth and leather. The top roller is about ten pounds weight, decreasing to the sixth roller, which is only about one pound weight: the yarn is turned by the spindles marked L, and rubbed over the wet cloth belt if spinning linen yarn, but if spinning worsted yarn the belt must be removed, that it may not touch it as it passes to the spool, which it coils round as fast as the rollers let it out. The spindles marked L, are turned by a belt from the wheel marked M, which derives its motion from the mill, and by a wheel on its axis communicates it to the roller under the mark C by the wheel marked F, and so to the rest, as above described. The hemp, tow, flax, or wool, is twined in the same manner as cotton is by mills.

YAROSLAF, a government of Russia, formerly a province of the government of Moscow.

YAROSLAF, a town of Russia, capital of a government of the same name. It is seated at the confluence of the Volga with the Kotorosl, 140 miles N.E. of Moscow. Long. 38. 59. E. Lat. 57. 35. N.

YARUM, a town in the N. riding of Yorkshire, with a market on Thursday. It is seated on the Tees, over which

is a stone bridge, 40 miles N.N.W. of York, and 238. N. by W. of London. Long. 1. 12. W. Lat. 54. 31. N.

YAXLEY, a town in Huntingdonshire, 14 miles N. of Huntingdon, 78 N. by W. of London.

YELLOW RIVER, or **HOANG-HO**, a large river of Asia, which, after a course of nearly 600 leagues across Tartary and China, enters the Eastern Sea, to the N. of the mouth of the Yan-tse-kiang. It is very broad and rapid, but so shallow, that it is scarcely navigable. It is called the Yellow River, because the clay and sand which it washes down, especially in time of rain, make its water appear of a yellow colour.

YELLOW SEA, a gulf of China, between the provinces of Pe-tcheli and Chang-tong on the W. and the peninsula of Corea on the E.

YENISEI, or **JENISA**, a river of Siberia, which running from S. to N. enters the Frozen Ocean, to the E. of the bay of Ob.

YENISEISK, or **JENISKOI**, a large and populous town of Siberia, in the province of Tomsk, seated on the river Yenisei. Long. 92. 35. E. Lat. 57. 46. N.

YEN-PING-FOU, a city of China, in the province of Fokien. It has in its district seven cities of the third class, and is seated on the brow of a mountain, at the foot of which is the river Minho. It is 275 miles S. of Nan-king.

YEN-TCHEOU-FOU, a city of China, in the province of Chang-tong. Its district contains four cities of the second, and 23 of the third class; and it is seated between two rivers, 275 miles S.E. of Peking.

YEN-TCHING, a city of China, in the province of Chang-tong, and jurisdiction of Tsi-nan-fou. Here a kind of glass is made, so delicate and brittle, that it cracks when exposed to the smallest injuries of the air.

YEOVIL, or **IVEL**, a corporate town in Somersetshire, with a market on Friday. Here is a manufacture of cloth, but the principal one is of gloves. It is seated on the Ivel, 20 miles S. of Wells, and 123 W. by S. of London. Long. 2. 37. W. Lat. 50. 55. N.

YESD, a town of Persia, in Irac Agemi, on the road from Kerman to Ispahan. It has a silk manufacture; and here are made the finest carpets in the world. It is 200 miles E.S.E. of Ispahan. Long. 56. 50. E. Lat. 32. 0. N.

YONNE, a department of France, containing part of the late province of Burgundy. It is so called from a river that rises in the department of Nievre, and passing by Chateau Chinson, Clameci, Auxerre, Joigny, and Sens, falls into the Seine. Auxerre is the capital.

YORIMAN, a province of Guiana, about 150 miles in length, on the river Amazon. The native inhabitants are strong, robust, and active, and both sexes go naked.

YO-TCHEOU-FOU, a commercial city of China, in the province of Hou-quang. Its district contains one city of the second, and seven of the third class; and it is seated on the Yang-tse-kiang, 275 miles S.W. of Nan-king.

YOUGHALL, a town of Ireland, in the county of Cork. It is surrounded by walls, has a very commodious harbour, with a well-defended quay, and sends two members to parliament. It has a manufacture of earthen ware, and is seated on the side of a hill, at the mouth of the river Blackwater, 28 miles E. by N. of Cork. Long. 7. 45. W. Lat. 51. 59. N.

YPRES, a large city of Flanders, with a bishop's see. It has a considerable manufacture of cloth and serges; and every year in lent there is a well-frequented fair. It was one of the barrier towns belonging to the Dutch, till 1781, when Emperor Joseph II. obliged them to withdraw their

garrison. It has been often taken and retaken; the last time by the French in 1794. It is seated on the Yperlee, 12 miles W. of Courtray, 15 N.W. of Lisle, and 130 N. of Paris. Long. 2. 48. E. Lat. 50. 51. N.

YRIEX, St. a town of France, in the department of Upper Vienne. It derives its name from a saint who built a monastery here, and is seated on the river Isle, 20 miles S. of Limoges.

YSENDYCK, a strong town of Dutch Flanders, in the isle of Calsand, seated on a branch of the river Scheld, called Blie, eight miles E. of Sluys, and 48 N.W. of Ghent. Long. 3. 38. E. Lat. 51. 20. N.

YSSELBURG, a town of Dutch Guelderland, 12 miles E. of Cleves, and 22 N.E. of Gueldres. Long. 6. 15. E. Lat. 51. 42. N.

YSSELMOND, an island of Holland, situate between the Merve on the N. and another branch of the Maese on the S. It has a town of the same name, near three miles W. of Rotterdam.

YSSELSTEIN, a town of the United Provinces, in Holland, with a castle, seated on the river Yssel, five miles S.W. of Utrecht. Long. 5. 5. E. Lat. 52. 7. N.

YSSENGEAUX, a town of France, in the department of Upper Loire, 10 miles N.E. of Puy.

YSTAD, or YSTAD, a sea-port of Sweden, in the province of Schonen, 26 miles S.E. of Lund. Long. 13. 44. E. Lat. 55. 22. N.

YUEN-YANG-FOU, a city of China, in the province of Hou-quang. Its district contains one city of the second, and six of the third class. It is 300 miles W. of Nanking.

YVERDUN, a strong town of Switzerland, in the Pays de Vaud, capital of a bailiwick of the same name, with a castle. It is seated at the head of a lake of the same name, on the rivers Orbe and Thele, 30 miles S.W. of Bern. Long. 6. 50. E. Lat. 46. 50. N.

YVETOT, a town of France, in the department of Lower-Seine, five miles N.E. of Caudebec.

YU-HING-FOU, a city of China, in the province of

Ho-nan. Its district contains two cities of the second, and 12 of the third class. It is 175 miles N.W. of Nan-king. YUMA, one of the Bahama Islands, in the West Indies, lying to the N. of Cuba, 55 miles in length, and 17 in breadth.

YUMETO, one of the Bahama Islands, in the West Indies, to the N. of the isle of Yuma, lying under the tropic of Cancer. It is 37 miles in length.

YUN, the largest canal in China, called also THE IMPERIAL CANAL. This celebrated canal, which extends from Canton to Peking, forms a communication between the N. and S. provinces. The traffic upon it is exceedingly great, and it is, in various other respects, an object of wonder and admiration to Europeans.

YUN-PING-FOU, a city of China, in the province of Petcheli. Its district contains one city of the second, and five of the third class; and it is 87 miles E. of Peking.

YUNG-NAN, one of the most fertile and opulent provinces in China; bounded on the N. by Se-tcheuen and Thibet, on the E. by Quang-si and Kwei-tcheou, on the S. by the kingdoms of Laos and Tonquin, and on the W. by those of Burmah and Pegu. Its gold, copper, and tin mines; its amber, rubies, sapphires, agates, pearls, marble, musk, silk, elephants, horses, gums, medicinal plants, and linen; have procured it the highest reputation. Its commerce and riches are immense.

YUN-NAN-FOU, the capital of the province of Yunnan, in China, once remarkable for its extent and the beauty of its public buildings, all which have been destroyed by the Tartars, in their different invasions. Its district contains four cities of the second and third class. It is 430 miles N.W. of Canton.

YURCUP, a town of Turkey in Asia, in Caramania, 125 miles N.E. of Cogni, and 270 E. of Constantinople. Long. 34. 30. E. Lat. 39. 40. N.

YVOY, a town of France, in the department of the Ardennes, seated on the Cher, 10 miles S. of Sedan. Long. 5. 4. E. Lat. 49. 32. N.

Z.

ZABERN, a town of Germany, in the palatinate of the Rhine, 15 miles W. of Philipsburg. Long. 8. 10. E. Lat. 49. 11. N.

ZABOLA, a town of Transylvania, on the confines of Moldavia, five miles S.W. of Neumark.

ZABURN, a town of France in the department of Lower Rhine, 15 miles N. of Strasburg. Long. 7. 50. E. Lat. 48. 50. N.

ZACATECAS, a city of New Spain, in the audience of Guadalajara. It is surrounded by very rich silver mines, and 312 miles N.E. of Mexico.

ZACHN, or **SOCHAN**, a town of Upper Saxony, in Hinder Pomerania, 14 miles E. of Stargard, and 52 S. of Colberg. Long. 15. 16. E. Lat. 53. 18. N.

ZAFRA, a town of Spain, in Elfremauria, with a castle. It is seated at the foot of a mountain, near the river Guadalajara, 20 miles S.W. of Medina. Long. 6. 12. W. Lat. 38. 19. N.

ZAGATULLA, a town of New Spain, in the audience of Mexico, 200 miles S.W. of that city, at the mouth of a river of the same name. Long. 104. 35. W. Lat. 17. 50. N.

ZAGARA, a famous mountain of Turkey in Europe, in Livadia, on the Gulf of Corinth, near mount Parnassus, and almost always covered with snow. It was the ancient Helicon, from which issued the fountain Hippocrene, and was sacred to the Muses, who had here a temple.

ZAGRAD, a strong town of Slavonia, capital of a county of the same name, with a bishop's see. It is seated on the Save, 25 miles N.E. of Carlstadt, and 137 S.W. of Buda. Long. 15. 41. E. Lat. 46. 20. N.

ZAHARA, a strong town of Spain, in Andalusia, seated on a craggy rock, and defended by a citadel. It is 47 miles S.E. of Seville. Long. 4. 55. W. Lat. 36. 52. N.

ZAHARA, or THE DESERT, a vast country of Africa, bounded on the N. by Barbary, on the E. by Fezzan and Cashna, on the S. by Tombuctoo, and on the W. by the Atlantic Ocean. The air is very hot, but wholesome to the natives. The soil is generally sandy and barren, inasmuch that the caravans crossing it to and from Negroland are often reduced to great extremities. The inhabitants are wild and ignorant. They have a number of petty princes; and the Mahometan religion is professed throughout the country.

ZAHNA, a town of Upper Saxony, 34 miles S.S.W. of Potsdam. Long. 12. 40. E. Lat. 51. 53. N.

ZAIRE, a large river of Africa, which, rising in the kingdom of Macoco, divides the kingdoms of Loango and Congo, and falls into the Atlantic Ocean, below Sogno.

ZALAMEA, a town of Spain, in Seville, 12 miles N. of Niebla, and 38 W.N.W. of Seville. Long. 5. 55. W. Lat. 37. 38. N.

ZAMORA, a strong town of Spain, in Leon, with a bishop's see. In its environs fine turcois stones are found. It is seated on a hill, on the river Douero, over which is a bridge of 17 arches, 35 miles N. of Salamanca, and 150 N.W. of Madrid. Long. 5. 18. W. Lat. 41. 41. N.

VOL. X.

ZAMORA, a town of Peru, in the audience of Quito. In its neighbourhood are rich mines of gold, and it is seated near the Andes, 230 miles S. of Quito. Long. 75. 55. W. Lat. 5. 6. S.

ZAMORA, a town of Spain, in the province of Guadalajara, 30 miles S.E. of Guadalajara. Long. 104. 30. W. Lat. 20. 30. N.

ZAMORA, a town of Algiers, in the province of Constantine, 250 miles W. of Hamamet. Long. 6. 25. E. Lat. 36. 20. N.

ZAMOSKI, a strong town of Poland, in Red Russia, now the Austrian kingdom of Lodomeria. It has a citadel, and is 37 miles N.W. of Lemburg. Long. 23. 26. E. Lat. 50. 52. N.

ZAMPANGO, a town of New Spain, in the province of Mexico Proper, 25 miles N. of Acapulco.

ZANFARA, a kingdom of Negroland, to the W. of the kingdom of Zegzeg. The inhabitants are tall in stature, of a very black complexion, with broad faces, and savage dispositions. It is very little known to Europeans.

ZANZIBAR, an island of Africa, on the coast of Zanguebar, between the islands of Pemba and Moufia, with the title of a kingdom tributary to Portugal. It abounds in sugar-canes and citrons. The inhabitants are Mahometans. Long. 38. 25. E. Lat. 6. 0. S.

ZARA, a strong city of Venetian Dalmatia, capital of a county of the same name, with an archbishop's see, a citadel, and a harbour. It was formerly much more considerable, the circumference of the walls being now but two miles, and the inhabitants not above 6000. Near the church, which the Greeks call St. Helia, are two fluted columns of the Corinthian order, supposed to have been part of the temple of Juno. There are fine paintings in the churches, done by the best masters; and they pretend to have the body of St. Simeon, brought from Judea, and kept in a shrine, with a crystal before it. Zara is seated on a small peninsula, in the gulf of Venice, 80 miles S.W. of Jaiciza, and 150 S.E. of Venice. Long. 16. 6. E. Lat. 44. 30. N.

ZARENG, or **SEGESTAN**, a town of Persia, the capital of the province of Segestan, celebrated for its beautiful pottery. It is 220 miles W. of Candahar.

ZARIK, a town of Turkey in Europe, in the Morea, 22 miles E. of Misira. Long. 22. 8. E. Lat. 37. 5. N.

ZARNATE, a strong town of Turkey in Europe, in the Morea, seated on an eminence, 20 miles W. of Misira.

ZARNAW, a town of Little Poland, in the palatinate of Sandomir, 63 miles N. of Cracow. Long. 19. 56. E. Lat. 51. 13. N.

ZASLAW, a town of Poland, in Volhinia, seated on the Horin, 15 miles S.E. of Ostrog. Long. 27. 41. E. Lat. 50. 20. N.

ZATMAR, a strong town of Upper Hungary, capital of a county of the same name. It is seated on a small lake, formed by the river Samos, 50 miles E. by S. of Tockay, and 130 E. of Buda. Long. 22. 34. E. Lat. 47. 50. N.

ZATOR, a town of Poland, capital of a starosty of 13. N.

the same name, in the palatinate of Cracow, with a castle. It is seated on an eminence, near the river Vistula, 20 miles S.W. of Cracow, and 50 S.E. of Ratibor. Long. 19. 42. E. Lat. 49. 54. N.

ZAWEH, a town of Persia, in the province of Khorasm, situate on the Tedjen, about 20 miles from the Caspian Sea, 80 miles N. of Mesched, and 135 N.N.E. of Astrabad.

ZBARAZ, a town of Poland, in Podolia, 70 miles N. by W. of Kaminiack.

ZBOROW, a town of Austrian Poland, in the palatinate of Lemburg. Here, in 1649, John Casimir, king of Poland, with 20,000 men, was attacked in his camp by 110,000 Cossacs and Tartars, for three days successively, but defended himself so bravely, that the latter were glad to consent to terms of accommodation. Zborow is 25 miles W. of Zbaraz, and 52 E. by S. of Lemburg. Long. 25. 46. E. Lat. 49. 46. N.

ZEBID, a city of Arabia, in the province of Yemen, 52 miles N. of Mocha. Long. 43. 15. E. Lat. 14. 13. N.

ZEBU, or CEBU, one of the Philippine islands in the Indian Ocean, between those of Leyte and Negros. It is 140 miles long and 30 broad.

ZEDIC, a town of Barbary, principal place of a district, in the country of Tripoli. It is seated on a bay of the Mediterranean, to which it gives name, 180 miles E.S.E. of Tripoli.

ZEGEDIN, or SZEGED, a strong town of Hungary, situate near the confluence of the Maros and Theisse, 60 miles N.W. of Temeswar, and 68 N. of Belgrade. Long. 21. 5. E. Lat. 46. 8. N.

ZEGZEG, a kingdom of Negroland, lying on the river Niger, by which it is separated, on the north, from the empire of Cashna. On the east it is bounded by Zanfara, on the south by Benin, and on the west by unknown deserts. It consists partly of plains and partly of mountains. The latter are extremely cold, while the former are intolerably hot; but abound with water, and are exceedingly fruitful.

ZEIGHENHEIM, a town of Germany, in the landgraviate of Hesse Cassel, 30 miles S. of Cassel. Long. 9. 19. E. Lat. 50. 52. N.

ZEIL, a town of Suabia, capital of a county of the same name, in the Algau, with a castle. It is seated on the little river Aitrach, 70 miles S. of Ulm.

ZEITON, a town of Turkey in Europe in Janna, with a castle and an archbishop's see. It is a small place, and seated on a hill, by a gulf of the same name, near the river Eyalada, 50 miles S.E. of Larissa.

ZEITZ, a town of Upper Saxony, in the duchy of Naumburg, with a castle and a well-frequented college. It is seated on the Ester, 25 miles S.W. of Leipsic, and 45 E. of Erfurt. Long. 12. 8. E. Lat. 50. 59. N.

ZELL, a town of Lower Saxony, capital of a duchy of the same name, which devolved to the house of Hanover by marriage. It is surrounded by ditches and ramparts, on which are planted chestnut and lime trees. It is a small town, without trade or manufactures; but the high courts of appeal for all the territories of the electoral house of Brunswick-Lunenbourg are held here, and the inhabitants derive their principal means of subsistence from this circumstance. The castle, a stately building, surrounded by a moat, was formerly the residence of the dukes of Zell; and was repaired by George III. king of Great Britain, for the residence of his unfortunate sister, the queen of Denmark, who died here. In 1757 the French reduced the suburbs of Zell to ashes, and even set fire to the orphan hospital, in which a great number of helpless children are

said to have perished. Zell is seated on the Aller, 31 miles N.W. of Brunswick, and 47 S. by W. of Lunenburg. Long. 10. 12. E. Lat. 52. 49. N.

ZELL, an imperial town of Suabia, seated on the Kintzig, 28 miles S. of Baden, and 52 W.S.W. of Stutgard. Long. 8. 8. E. Lat. 48. 22. N.

ZELLI, an imperial town of Staabiz, seated on a lake of the same name, otherwise called the Zeller See, or lower lake of Constance, 14 miles N.W. of Constance.

ZELL, a town of Germany, in the electorate of Treves, seated on the Moselle, 33 miles N.E. of Treves.

ZELL-IN-THE-PINZGAU, a town of Germany in the archbishopric of Salzburg, seated on a lake 37 miles S.W. of Salzburg.

ZELLERFELD, a town of Lower Saxony, in the Hartz forest. Silver to the value of 20,000 imperial crowns is annually coined here. It is six miles S.S.W. of Goslar.

ZEMLIN, or ZEMPLIN, a town of Upper Hungary, capital of a county of the same name. It is seated on the Bodrog, 25 miles S.E. of Cassovia, and 27 N.E. of Tockay. Long. 21. 35. E. Lat. 48. 36. N.

ZENGAN, a town of Persia, in the province of Irac, 80 miles N.N.E. of Amadan.

ZENGUA, a town of Turkey in Asia, in the pachalic of Aleppo, situate on the Euphrates, 55 miles N.N.E. of Aleppo, and 90 E. of Alexandretta. Long. 37. 50. E. Lat. 36. 25. N.

ZENIA, a town of Hungary, memorable for a signal victory gained in 1697 by Prince Eugene over the Turks, commanded by Emperor Mustapha II. It is 52 miles N. of Belgrade, and 52 W. of Temeswar. Long. 21. 30. E. Lat. 46. 5. N.

ZERBST, a town of Upper Saxony, capital of a district of that name, in the principality of Anhalt, with a castle, where the princes commonly reside. The inhabitants are partly Lutherans and partly Calvinists, and are famous for brewing good beer. It is 27 miles N.W. of Wittemberg. Long. 12. 13. E. Lat. 52. 0. N.

ZEREA, a town and fortress of Persia, in the province of Farsistan, 18 miles N.N.E. of Schira. Long. 54. 30. E. Lat. 29. 52. N.

ZERIGA, a town of Persia, in Irac-Arabia, seated in a narrow plain, between mountains. It has produced several very famous Arabian horses.

ZIA, an island of the Archipelago, one of the Cyclades, to the south-west of Negropont, 15 miles long and eight broad. It abounds in barley, wine, and silk; also a fine sort of oak, whose fruit, called Villam, is the best trading commodity of the island, it being used by dyers and tanners. The principal town, of the same name, is seated on an eminence, 30 miles from the harbour, at the further end of a valley. It resembles an amphitheatre, and contains 2500 houses, all flat at the top. It belongs to the Turks, but most of the inhabitants are Greeks, and have a bishop.

ZIBIT, a territory in Arabia Felix, extending from the principality of Mecca to that of Mocha, being bounded on the east by the principality of Tehama, and on the west by the Red Sea. The Turks were formerly masters of this country, but it now belongs to an Arabian prince.

ZIMR, a trading town of Arabia Felix, capital of a territory of the same name. It is seated on the Zibit, 150 miles N.W. of Aden.

ZIEGENHAYN, a town of Germany, in the circle of the Upper Rhine and principality of Hesse, 26 miles S. of Cassel. Long. 9. 5. E. Lat. 50. 42. N.

ZIGET, a strong town of Hungary, which has been several times besieged and taken by the Turks and Imperialists. It is 44 miles S.E. of Canischa, and 130 S.S.E. of Vienna. Long. 17. 42. E. Lat. 46. 21. N.

ZINC (*Enchyl.*). The following is extracted from the specification of the patent granted to Mr. Browne, of Derby, for the method of making extract of zinc. He says, "the extract of zinc is made or composed of the vegetable or animal acid, saturated with the oxyd of zinc, in whatever state it may be found, whether in the state of ore, as calaminaris of every description, blend, or black-jack, or by whatever other name it may be called, or in the state of flowers, or soot from furnaces where brass or spelter is made, called tutty-pompholix, or oven-bruck, or the flowers or oxyd made directly from the ore, or in its metallic state, by heat, or any kind of acid. The acid necessary for this purpose may be made by acetous fermentation, as common vinegar, either in its natural or distilled state, or any acid produced from any vegetable, by chemical acid, or any vegetable or animal oil, whether disengaged by any process, or used in the state of oil; all or any of the above being saturated with the oxyd of zinc, produce extract of zinc."

ZIRICZEE, a strong town of the United Provinces in Zealand, and the principal of the isle of Schowen. It was the ancient residence of the counts of Zealand, and was then a place of much more consequence, the port having been since filled with sand. It was taken by the Spaniards in 1676. It is 12 miles N.E. of Middleburg, and 18 S.W. of Briel. Long. 4. 10. E. Lat. 51. 36. N.

ZITTAU, a fortified town of Germany, in Lusatia, subject to the elector of Saxony. Besides the suburbs and handsome gardens that surround it on all sides, there are a number of fine villages that depend on it. The principal business of the inhabitants is brewing beer; but there are above 100 clothiers, and in the neighbouring villages above 1000 weavers. Its merchants trade with those of Prague and Leipsic, and extend their commerce as far as Holland. The cathedral of Rittaw has three organs and two high steeples. Near it is a college, where the languages, drawing, and other arts, are taught gratis. Joining to the cloisters is a library, the finest in all Lusatia; and at a small distance from it, is the orphan-house. Zittaw being occupied by the Prussians in 1757, was taken by the Austrians, who pillaged the town, and almost entirely destroyed it, notwithstanding the inhabitants were the subjects of their ally, the Elector of Saxony. It is seated on the Neisse, 17 miles S.W. of Gorlitz, and 25 S.E. of Dresden. Long. 15. 5. E. Lat. 50. 59. N.

ZNAIM, a strong town of Germany, in Moravia, with a castle, in which are a great many Pagan antiquities. It is seated on the river Teya, 24 miles S.W. of Brinn, and 32 N. of Vienna. Long. 16. 40. E. Lat. 48. 38. N.

ZOARA, a fortified town on the coast of Barbary, with a good harbour, 60 miles W. of Tripoli. Long. 11. 55. E. Lat. 32. 45. N.

ZOBELITZ, a town of Upper Saxony, in the territory of Erzgebürg. The inhabitants subsist principally by working the serpent stone, which is found in the neighbourhood, into pitchers, bowls, tea and coffee cups, &c. A red species of this stone is also found here, which is considered as the finest, and therefore claimed by the sovereign as his property. It is 17 miles S. of Freyburg.

ZOBTEN, a town of Silesia, in the principality of Schweidnitz, nine miles E.N.E. of Schweidnitz.

ZOFFINGEN, a town of Switzerland, in the canton of Bern, with an elegant church and a public library, con-

taining several curious manuscripts. The inhabitants, about 2000, have their own magistrates, and what is peculiar, their own courts of justice, both civil and criminal, which decide in the last resort, without an appeal to Bern. It is seated near a large forest, which contains the best pine-trees in all Switzerland, three miles from Arburg. Long. 7. 6. E. Lat. 47. 5. N.

ZOLNOCK, a town in Upper Hungary, capital of a county of the same name. It was taken by the Turks in 1534, and retaken in 1685. It is seated on the Teyssy, where the Sagelia falls into it, 62 miles N.E. of Colecsza, and 62 E. of Buda. Long. 20. 50. E. Lat. 47. 10. N.

ZONS, a town of Germany, in the archbishopric of Cologne, with a castle, 13 miles N.N.W. of Cologne. Long. 6. 55. E. Lat. 51. 8. N.

ZORNDORF, a village in Germany, in the new marche of Brandenburg, one mile north of Custrin. Here in 1758 the King of Prussia, after a dreadful conflict, totally defeated the Russians.

ZOUT PAN, a curious salt lake in the country of the Hottentots, a few miles north of Point Padron. It is in a plain, much above the level of the sea, and three miles in circumference. At some seasons it is formed into an entire mass of fine white salt.

ZUCKMANDEL, a town of Silesia, in the principality of Neisse, with a bishop's see, 10 miles S. of Neisse.

ZUEELA, a town of the kingdom of Fezzan, situate in a district of remarkable fertility, in which the remnants of ancient buildings, the number and size of the cisterns, and the construction of the vaulted caves, intended perhaps as repositories of corn, exhibit wonderful vestiges of ancient splendour. It is 140 miles E. of Moorzook. Long. 16. 34. E. Lat. 27. 59. N.

ZVENIGOROD, a town of Russia, in the government of Moscow, situate on the Moskva, 28 miles W. of Moscow. Long. 37. 2. E. Lat. 55. 40. N.

ZUG, a town of Switzerland, capital of a canton of the same name, seated on a beautiful lake, in a fertile valley, abounding with corn, pasture, and wood. In 1435, a street which was on the side of the lake was swallowed up. There are several handsome churches, and a good town-house. It is remarkable that Oswald, a saxon king of Northumberland, in the seventh century, is the tutelary saint of this place. Zug is 12 miles N.E. of Lucern, and 42 S.E. of Basil. Long. 8. 16. E. Lat. 47. 10. N.

ZUIDER-ZEE, a great bay of the German Ocean, which extends from south to north in the United Provinces, between Friesland, Overysse, Guelderland, and Holland.

ZUILLICHAU, a town of Silesia, in the province of Crossen, 16 miles N.E. of Crossen. Long. 16. 12. E. Lat. 52. 12. N.

ZULPHA, a town of Persia, almost close to Ispahan, to which it is a sort of suburb, and separated from it by the river Sanderon. It is peopled by a colony of Armenians, who were brought into Persia by Shah Abbas. It is an archbishop's see, and contains several churches and monasteries.

ZULPICH, or **ZULCH**, a town of Germany, in the duchy of Juliers, belonging to the archbishop of Cologne. It is seated on the Nassel, 10 miles S. of Juliers, and 10 W. of Bonn. Long. 6. 40. E. Lat. 50. 46. N.

ZURITA, a town of Spain, in Old Castile, with a castle, seated on the Tajo, very near Toledo. Long. 3. 17. W. Lat. 39. 50. N.

ZURZACH, a town of Switzerland, in the county of Baden, remarkable for two fairs much frequented by the merchants of Germany and France. It is seated on

the Rhine, just above the junction of the Aar with that river.

ZUTZ, a town of Switzerland, in the country of the Grisons. Though not the largest, it is the principal of the district of Upper Bagadina, because it contains the criminal court of justice.

ZUYST, a village of the United Provinces, five miles from Utrecht. It abounds in plantations and shady walks, and is greatly ornamented by the spacious buildings which Count Zinzendorf appropriated to the fraternity of Hurrenhuters or Moravians. The brethren are employed in various kinds of manufacture; and as many of them have been either educated in England, or have worked there, their workmanship far exceeds that of any other part of Holland; but the articles are proportionably dearer. Zuyst is much frequented, in the summer months, by a substantial class of Dutch merchants (particularly from Amsterdam) who have no country seats of their own.

ZWETL, a town of the archduchy of Austria, at the confluence of the Zwetl and Kamp, 26 miles W.N.W. of Krems, and 56 W.N.W. of Vienna. Long. 15. 2 E. Lat. 48. 30. N.

ZWICKAU, a town of Upper Saxony, in Misnia, formerly imperial, but now subject to the Elector of Saxony. The place where the inhabitants are buried is in Voigtland; and therefore it is commonly said, that they are Misnians while alive, but Voigtlanders after they are dead. Zwickau is seated on the Muldaw, 15 miles S. of Altenburg, and 20 N.E. of Plawen. Long. 12. 26. E. Lat. 50. 45. N.

ZWINENBERG, a town of Germany, in the land-

grave of Hesse Darmstadt, eight miles S. of Darmstadt, and 12 N. of Worms.

ZWITTAU, a town of Moravia, in the circle of Olmutz, 30 miles N.W. of Olmutz, and 84 E. of Prague.

ZWOLL, a town of the United Provinces, in Overysse, and in the district of Zailant. It is defended by some fortifications, and the canal, which begins near this place, and extends to the river Yssel, is defended by several forts. Near it is the mountain of St. Agnes, where there was formerly an Augustin convent, in which Thomas Kempis lived 71 years, and died in 1471. It was formerly an imperial and hanseatic town, and is seated on an eminence on the rivers Aa and Yssel, five miles S. of Hasselt, and eight S.E. of Campen. Long. 6. 10. E. Lat. 52. 33. N.

ZWONIGRAD, a town of Imperial Dalmatia, capital of a district. It is 36 miles S. of Bihacs, and 60 S.E. of Segna. Long. 14. 40. N. Lat. 44. 42. N.

ZWORNICK, a town of Bosnia, 60 miles N. of Seralo, and 68 S.W. of Belgrade. Long. 18. 45. N. Lat. 44. 24. N.

ZYGETH, a strong town of Lower Hungary, capital of a county of the same name, with a citadel. It was besieged in 1566, by Solyman II. emperor of the Turks, and taken three days after his death; but was afterwards retaken by the Austrians. It is seated in a morass, made by the river Alma, 50 miles N.W. of Esseck. Long. 18. 58. E. Lat. 46. 17. N.

ZYTOMIERZ, a town of Poland, in Volhinia, seated on the Cieciwief, 70 miles W. of Kiof, and 120 E. of Lucko. Long. 29. 22. E. Lat. 50. 35. N.

FINIS.
